Auto da Fé (Port. 'act of faith'; the Spanish form is *Auto de Fe*), the public reading of the sentences pronounced by the Inquisition on heretics, at which the culprits themselves were present; if absent or dead, they were represented by their effigies or bones. When an execution was to take place, a procession was held, generally on a Sunday between Whitsunday and Advent, the Dominicans leading with the flag of the Inquisition, the condemned following, and ecclesiastics bringing up the rear. A blow on the breast from an officer of the Inquisition gave the condemned over to the secular arm, and in a few hours afterwards the sentence was carried into effect. On May 21, 1559, thirty-one persons were burnt at Valladolid, and twenty-four at Seville on 24th September following. The last *A.* is said to have taken place about the middle of the 18th c. Napoleon abolished the tribunal in 1808; its suppression was confirmed by the Cortes in 1813; it was reinstated in 1814 by Ferdinand VII., and again abolished in 1820; yet in 1826 a schoolmaster named Ripoll was executed at Valencia, on a charge of Deism, under the forms of an *A.*

Autograph (Gr. *autographon*, what is written with one's own hand, and so the opposite of *apographon*, or copy), at first denoted a writing of any kind, any MS. executed by the author himself, but about the middle of the 18th c. came to acquire its present restricted meaning. The passion for collections of autographs arose in France about the end of the 16th c., and the earliest great collection was made by Loménie de Brienne (died 1638). From France it spread to England, and thence to Germany in the 18th c. The autographs of eminent individuals are now articles of commerce, their value depending on their scarcity, and on the eminence of the writers. The interest attaching to them is personal, there being an impression that character is indicated by penmanship. But this is true only to a certain extent, for the hand of the scholar is frequently fashioned in imitation of his teacher's. From Richard II. downwards, there is an unbroken series of autographs of the sovereigns of England, of which facsimiles were given by John Gough Nichols in a work in folio (Lond. 1829). France and Germany are particularly rich in collections of autographs.

Autolycus, a Greek astronomer, born at Pitane, in Æolia, and flourished about the middle of the 4th c., author of treatises on the revolving spheres, and on the rising and setting of the fixed stars, printed at Strasbourg in 1572. They show that *A.* was ignorant of spherical trigonometry.

Automaton (Gr. *autos*, self, and *maō*, to move, or rather to strive after, as if possessing volition), a machine so contrived as to imitate the actions of animals. There are many records of such in past times, as the flying pigeon of Archytas of Tarentum, the speaking head of Albertus Magnus, the flying eagle of Regiomontanus, and others, but their existence is not supported by satisfactory evidence. During the 18th c., however, Vaucanson, a Frenchman, exhibited several ingenious automata, a flute-player, a flageolet-player, and a most perfect imitation in form and behaviour of a duck. In 1809 Maelzel produced a trumpeter, which played a selection of French and Austrian tunes

and marches. The chess-player of Kempelen, long regarded as the most perfect of automata, is now a solved mystery, a crippled Russian officer having been hid in the interior. In 1845 Mr Clark of Bridgewater exhibited an *A.* Latin versifier, which he himself described as 'neither more nor less than a practical illustration of the law of evolution.' Besides these, there have been numerous other ingenious, but almost useless, contrivances imitating more or less the action of living animals. Of more practical inventions may be mentioned calculating machines, and automata for setting up type.

Autonomy (Gr. *autonomia*, self-government, or rather self-legislation) is the condition of a state or corporation which legislates for itself, and manages its own government. In the Kantian ethics *A.* denotes the sovereignty of the pure reason, when a man is a law to himself, and thus enjoys perfect liberty.

Autumnal Fever, a name given in some parts of America to enteric or typhoid fever. It is sometimes also called *Fall fever*. Both of these terms indicate the fact that this fever is usually most prevalent in autumn, or the fall of the year. See ENTERIC FEVER, TYPHOID FEVER.

Autun, a town in the department of Saône-et-Loire (Burgundy), France, on the Feron, 179 miles S.E. of Paris. It is the seat of a bishop, and has a cathedral of the 11th and 12th centuries. Talleyrand among others was bishop of *A.* Its manufactures are serge, carpets, cotton-velvet, leather, and paper. *A.* is the ancient Bibracte, the capital of the Ædui, and was made a Roman colony under Augustus, and named Augustodunum, of which its present name is an abbreviation. In 731 the Saracens burned it, and in 888 it was partly destroyed by the Normans. The town contains many Roman remains. Pop. (1872) 9729.

Auvergne, a former province of France, nearly corresponding to the modern departments of Cantal and Puy-de-Dôme (q. v.). It is a mountainous region, diversified with valleys fruitful in corn and wine, and is watered by the Allier and Dordogne, and their numerous branches. The hills are of volcanic origin, and are rich in iron, lead, copper, antimony, coal, and mineral springs. Some of the chief heights are Cantal (6093), Mont-d'Or (6188), and Puy-de-Dôme (4806). The name *A.* is derived from the Arverni ('Highlanders'; Celt. *Ar Fuarann*, the high country), who under Vercingetorix stubbornly defended their rugged fastnesses against Cæsar, but were finally blent with the Frankish conquerors of Gaul. The modern Auvergnese furnish Paris with industrious and honest workmen, as the Highlands of Scotland do Glasgow and Edinburgh.

Auxerre (anc. *Autissiodorum*), capital of the department of Yonne, France, on the river Yonne, 90 miles S.E. of Paris by rail. The district, of which the atmosphere is very salubrious, produces much wine. The cathedral of St Etienne, the choir of which dates from 1216, is in the Flamboyant style, and has fine windows of stained glass, of the 13th c. Its crypt, as well as that of the church of St Germain, is much admired. A boulevard surrounds the town on three sides. It has excellent educational institutions, and a valuable public library. The chief trade is in wine, but there are manufactures of woollen cloths, hosiery, earthenware, and leather, and timber and charcoal are exported. *A.* gives its name to a light Burgundy wine. Pop. (1872) 12,919.

Auxiliary Screw. See SCREW PROPELLER.

Auxiliary Verbs. See VERBS.

A'va or **Kava**, the name given by the Polynesians to the root or rhizome of *Macropiper methysticum*, formerly called *Piper methysticum*, a plant belonging to the order Piperaceæ. It has narcotic properties, and is used in cases of rheumatism and other complaints. An intoxicating beverage is also prepared from it, which the natives partake of before engaging in any religious rite. It is largely drunk in Fiji, and when taken in excess produces various skin diseases. Another beverage of a similar kind is prepared from a different plant, which, according to Dr Seemann, has the flavour of soap-suds combined with jalap and magnesia. The approved method of preparing *A.* is to chew the root, and thus extract the juice. It has a soothing effect when partaken of in the raw state, but when fermented it becomes in-

toxicating. A. leaves are, in some of the South Sea Islands, chewed with the areca-nut, in place of those of the betel-pepper. See **ARECA** and **BETEL**.

Ava, like Amarapura (q. v.), is only the ruin of what was several times the capital of Burmah, and stands on the Irawaddy, opposite the once famous city of Tsah-gyne. It consisted of an inner and outer city, both strongly fortified, and was built at a bend of the river, being surrounded on the land side by a deep ditch or fosse. Crumbling walls, ruined pagodas, desolate streets lined with grand old tamarind and mango trees, are all that is now, however, left of what was long the capital of Burmah in its palmy days.

Av'anches are large masses of snow or ice which are precipitated from high mountains into the valleys beneath. There are four kinds distinguished: *Drift A.*, produced by the action of the wind on snow rendered loose and powdery by the frost; *Rolling A.*, when a detached piece of snow rolls down the steep, gaining in size and impetus as it descends; *Sliding A.*, when gravity overcomes the force of adhesion, and the mass slides down the incline like a landslide; *Glacial A.*, when masses of frozen snow and ice are loosened by the heat of summer, and precipitated into the plains below.

Avall'on, a town in the department of Yonne, France, on the river Cousin, 26 miles S.E. of Auxerre, with a curious old church. The district produces corn and wine, and has rich pasture grounds. There are paper and woollen manufactures, distilleries and tanneries. A., the Gallic *Aballo*, a city of the Aldui, suffered frequently from sack and pillage from the 8th to the 16th c. Pop. (1872) 5029.

Avanturine, a variety of quartz found in different parts of Europe and Asia, and much used in the manufacture of imitation gems. It reflects light with great brilliancy.

Av'ari, a people of Eastern origin, belonging probably to the Uralo-Altaian branch of the Turanian family, and allied to Huns and Magyars. They first appear in the regions north of the Caucasus, between the Don and the Caspian Sea. About the middle of the 6th c. they settled in Dacia, helped the Longobards to destroy the kingdom of the Gepidæ, and by the close of the same century had made themselves masters of Pannonia. Still later they conquered Dalmatia, made destructive forays as far W. as Thuringia, and even penetrated into Italy. The Slavic nations N. and S. of the Danube were for a time compelled to acknowledge their authority, but in 640 A.D. the A. were driven out of Dalmatia. Subdued by Charlemagne in 796, soon after completely crushed by the Moravians, they vanish from history early in the 9th c. The A. of the Caucasus, a people of Lesghian stock, are in no way related to the ancient A. of Pannonia.

Avast', a nautical term, used on board ship to express an order or command, generally a command to stop the particular operation going on at the moment, e.g., 'avast heaving;' but it also enters into the phraseology of seamen in many ways for which it is not easy to find an equivalent in ordinary English, e.g., 'avast there,' either 'hold your tongue,' or 'get out of the way.'

Avatar, a Sanscrit word used to denote the 'descent' of a Hindu deity on earth in some visible form, and therefore conveying a similar idea to what is expressed by the term *incarnation* in Christian theology. Its rhetorical use in English is inaccurate. The sudden appearance of a great thinker, statesman, priest, or warrior, is *not* an A.

Avatch'a, a spacious bay on the E. coast of Kamchatka, into which flow the rivers A. and Paratouka. The city of Petropaulovsk lies on the bay, and 20 miles N. there is a volcanic mountain called A., 9055 feet high.

Avebury, or **Ab'ury**, a village of Wiltshire, on the Kennet, a small branch of the Thames, 25 miles N. of Salisbury, is notable for possessing the largest stone circle in Europe. This circle, popularly assumed to have been a Druidical temple, consists of one hundred large blocks of stone, placed on end, forming a circle 470 yards in diameter. It is bounded by a deep ditch and an embankment, and encloses two small circles of similar character. The stones are oblong in shape, from 5

to 20 feet high, and from 3 to 12 thick. This ancient work is approached by two avenues, each upwards of a mile long, and defined by a double range of stones similar to those of the temple itself. Although it has long been the belief that these stone-circles were associated with Druidical worship, there is a lack of evidence to warrant any positive belief on the point. The first to broach the 'Druidical' theory was Dr Stukeley in his *Stonehenge and Avebury, Two Temples restored to the British Druids* (1740). In the neighbourhood of A. there are many curious barrows, cromlechs, and other monuments of antiquity.

Aveiro, or **Bragança Novo**, a seaport in the province of Beira, Portugal, 33 miles S. of Oporto, on a lagoon at the mouth of the Vouga. It was a famous trading place in the 16th c., is still the seat of a bishop, and has some trade in oil, wine, sea-salt, and oranges; but its situation is unhealthy. Pop. 4600.

Avell'a, the *Malifera Abilla* of Virgil, so called from the abundance of its apples, an ancient Italian town in the province of Avellino, 20 miles E.N.E. of Naples, with many remains of antiquity. Pop. of commune, 5228.

Avelli'no, the capital of a province of the same name in S. Italy, lies at the base of Monte Vergine, on which stands the monastery founded 1119, by St Guglielmo da Vercelli, on the site of a temple of Cybele. Its chief manufactures are woollens, paper, and macaroni; and it has some trade in corn and hazelnuts. A. was visited by earthquakes in 1694, 1731, and 1805. Near it is the Val de Gargano, where, in 320 B.C., the Samnites captured an entire Roman army. The old *Abellinum*, a town of the Iiispini, a Samnite people, lay at a little distance from the present town, but was destroyed by the Lombards. Pop. 13,446.

Ave Mari'a, the commencement of an invocation to the Virgin Mary, used by Roman Catholics, and taken from the salutation of Gabriel (Luke i. 28). It was enlarged by Urban IV. in 1261, and the form now in use was completed and sanctioned by Pius V. in 1508. The A. M. is generally recited after the Pater Noster. The name A. M. is applied, in Italy, to the ringing of bells about half an hour after sunset as a summons to prayer, though it is elsewhere also termed Angelus. Readers of Byro's *Don Juan* will remember the exquisite use of this application of the term (canto 3, st. cii.-ciii.). The small beads of the rosary are termed Ave Marias, because by these the Aves are reckoned.

Ave'na, a genus of grasses. See **OAT**.

Avenger of Blood. See **BLOOD**, **AVENGER OF**.

Av'ens, the common name for *Geum* (q. v.).

Aventin'us, **Johannes**, a German historian, was born at Abensberg, Bavaria, in 1466. His proper name was Thurmair or Turmair, but he is better known as *Aventinus* from his birth-place, the Aventinum of the Romans. A. studied first at Ingolstadt, and then at Paris, where he graduated; taught publicly at Cracow and Vienna, and in 1512 became tutor to the son of the Duke of Bavaria. From the first edition of his *Annales Bojorum* (History of Bavaria), published in 1554 (later ed. 1710), twenty years after his death, the editor Ziegler had excised numerous passages depreciatory of the Church of Rome, which were restored by Cisner in 1580. A. wrote also the *Chronicon Bavarie* (1522), and a life of the Emperor Henry IV., now very rare. He died at Regensburg, January 9, 1534. See the Biographies of Wiedemann (Freising, 1858) and Dittmar (Nördl. 1862).

Average is a quantity intermediate to other quantities, so that the sum total of its excesses above those which are less, is the same as the sum total of its defects from those which are greater, and is found by dividing the *sum* of the quantities by the *number* of quantities.

Average, in maritime contracts and in insurance has several meanings. It means the compensation due by the underwriter when there is a partial loss of anything insured, as when goods are partly lost or injured. This is called 'Particular A.' When the captain of a ship throws goods overboard under distress, this loss is brought into what is called 'General A.:' that is, the loss is allotted proportionally to all concerned in ship, freight,

or cargo. The insurer of each owner, if he have any, must compensate him. 'Particular A.' is the term applied to the liability which the underwriters come under on specified articles. The term is plainly an incorrect one. The allotment of such expense as extra wages, pilotage, is called 'Petty A.' 'Average bond' is a deed which those liable to General A. usually execute, to empower an arbiter to value and allot the loss.

AVERNUS (Gr. *Aornos*), now Lago d'Averno, a small circular lake in the crater of an extinct volcano, about a mile and a half in circumference. It lies between Cumæ, Puteoli, and Baiæ, and was said to give off mephitic vapours destructive of animal life. Hence probably its Greek name, which signifies 'without birds.' Homer makes it the entrance to the lower world, and here were placed the grove of Hecate and the grotto of the Cumæan sybil.

AVERHOËS, or **AVERRHOËS**, a Græcised or Latinised form of the Arabic *Aben- or Ibn-Roshd*, is the name of an illustrious Moorish physician and philosopher, born at Cordova, according to El Ansari, in 1120. He belonged to a very good family of Andalusia. His grandfather, Abul-Walid-Mohammed Ibn-Roshd, the Cadi of Cordova, was a distinguished jurisconsult, and A. resolved to follow the same profession. He studied theology, jurisprudence, medicine, and philosophy under the best masters, and was intimate with men who were the leaders of scientific thought in Spain in the 12th c. Meanwhile great political changes were taking place in the country. The dynasty of the Almoravides (q. v.) was, in 1130, violently replaced by that of the Almohades (q. v.), and a new impetus was given to literature and science. The Sultan Yusuf (1163-84) was a great friend of A., and conferred on him high honours; but his successor, Al Mansur (1184-99), though for a time extremely friendly, was essentially a religious fanatic, and finally lent his ear to the groundless accusations of a malignant orthodoxy. A. was banished from Cordova, and died at Morocco 12th December 1198. It is difficult to understand in what his heresy consisted. As told by the Arab historians, it is enveloped in vague and puerile circumstantialities, but according to Ibn-Abi-Oceibia, the real cause was the hatred of the Mohammedan priesthood to the culture of philosophy and the study of the ancients. This is somewhat confirmed by the fact that A. did not suffer alone. A general persecution raged; everywhere philosophers, physicians, poets, &c., were in danger, and before the close of the century the light of scientific genius in Southern Spain had gone out. A's writings are numerous, and embrace almost every subject of human knowledge. According to a MS. in the Escorial, there are nearly eighty, most of which treat of philosophy, medicine, and the kindred sciences. Some are known only by Latin or Hebrew translations, others remain unedited. Of the former, the most valuable, and those that exercised the greatest influence upon the philosophy of Latin Christendom in the middle ages, were his commentaries and paraphrases upon Aristotle, of which a Latin version was published at Venice in 11 vols. 1552-53. See Renan's *Averroës et l'Averroïsme* (Par. 1852).

AVERHOA, a genus of plants belonging to the order *Oxalidaceæ*. See CARAMBOLA.

AVERSA, a town in the province of Caserta, S. Italy, midway between Naples and Capua. It lies in a delightful district of vineyards and orange-groves, is the see of a bishop, and has a cathedral. The Normans built A. in 1029, on land granted by Duke Sergius of Naples. In 1345 Andreas of Hungary was murdered here, with the connivance of his wife, Joanna I. of Naples. Near to A. is the site of the old Oscan Atella. See ATELLANÆ. Pop. 15,902.

AVES. See ORNITHOLOGY.

AVEYRON, a department of France, in the basin of the Garonne, with the highlands of Auvergne on the N., and on the W. the Cévennes, by the offsets of which it is traversed. Two-thirds of the surface are cultivated, and yield corn, rye, potatoes, fruit, and truffles; the rest affords excellent pasturage for cattle, goats, and sheep. Its cheese is famed. The department is watered by the A., Lot, Tarn, and other feeders of the Garonne. It is rich in iron, coal, lead, zinc, copper, antimony, and vitrol; and besides mining, there is much cotton-spinning, tanning, and carpet-weaving. Rhodéz is the chief town. Area,

3402 sq. miles; pop. (1872) 402,474.—The river A., 90 miles long, rises near Severac-le-Château, flows W. to Montauban, where it joins the Tarn, a branch of the Garonne.

AVEZZANO, a town in the province of Aquila, S. Italy, 22 miles S. of Aquila, lies on the Via Vateria, and is a possession of the Barberini family. Lake Fucino, from which numerous marbles with inscriptions have been recovered, is about a mile distant. These marbles are carefully preserved in the churches of the town. Pop. 5146.

AVIARY (Lat. *aviarium*, from *avis* a bird), a place for keeping birds. Aviaries are of different kinds and sizes, from the domestic cage up to the extensive arrangements seen in zoological gardens. When the birds belong to warm regions, the aviaries are generally in connection with hothouses for the purpose of artificially regulating the temperature; if natives of temperate climates, the open garden is enough. The enclosure of each bird is usually covered with netting.

AVICENNA, a Latinised form of Ibn-Sina, the name of a famous Eastern physician and philosopher, born (according to Ibn-Khallikan) in 980, in the neighbourhood of Bokhara, to which city his parents removed while A. was still young. At Bokhara he commenced his studies, and exhibited a wonderful precocity, acquiring, at an incredibly early age, a competent knowledge of the Koran, of arithmetic and algebra, of the categories of Aristotle, the elements of Euclid, and jurisprudence. At sixteen he applied himself with ardour to the study of natural philosophy and medicine, and with the aid of the commentary of Abu-Nasr Alfarabi, mastered the logic and metaphysics of Aristotle. At twenty-one he wrote an *Encyclopædia* of the sciences, and not long after gave public lectures on logic and the *Almagest* of Ptolemy. His fame as a scholar and physician procured for him in turn the patronage of the rulers of Khorassan, Khwarezm, and Hamadan. He passed the last fourteen years of his life at the court of the Emir of Ispahan, where he wrote the greater part of his works on logic, metaphysics, astronomy, and geometry. He died at Hamadan in 1037, his end having, it is said, been hastened by indulgences unbecoming a philosopher, hence the proverb, that his philosophy could not give him wisdom, nor his medicine health. The writings of A. number more than a hundred. His principal work, *Kutab-al-kanuni-fil-Tibb* (Book of the Canon of Medicine), was printed in Arabic at Rome in 1593, in 4 vols. folio. It is selected for the most part from the works of the Greek physicians, and was long in great repute. Several translations were made into Hebrew, one of which, attributed to the Rabbi Nathan Amathi, was published at Naples in 1491, in 3 vols. fol. Latin translations are very common; there were at least fourteen before the end of the 15th c., the earliest was by Gerardus Cremonensis, a revised and corrected edition of which, with notes, was printed at Venice in 1595, in 2 vols. fol. A's metaphysical writings, and his numerous contributions to physical science, were highly prized, and found many editors; but a large number of his works have never been edited, and the MSS. are scattered over the great libraries of Europe. See Wüstenfeld's *Geschichte der Arabischen Aerzte und Naturforscher* (1840).

AVICENNIA, a genus of Dicotyledonous trees and shrubs belonging to the order Verbenaceæ (q. v.). They grow in swampy estuaries in tropical countries, and are called white mangroves. *A. tomentosa* is used for tanning in Rio, and its ashes are employed for cleaning cotton cloth in India. The bark of *A. nitida* is used for tanning in the W. Indies. In New Zealand a resinous substance got from *A. resinifera* is eaten.

AVICULA, a genus of *Lamellibranchiate* Mollusca, forming the type of the family *Aviculida*, in which the shell is inequi-valve oblique, and fixed by a *bysus* or 'beard'; the hinge is toothless, the mantle-lobes free, the posterior adductor muscle being larger than the anterior; the foot is of small size. The genus is represented by the *Avicula*, by the *Pinna* or 'wing-shells,' and by the pearl-oysters (*Avicula* or *Meleagrina Margaritifera*), &c.

AVIGLIANO, a town in the province of Basilicata, S. Italy, 10 miles N.W. of Potenza, with a collegiate church. There are rich pasture lands in the neighbourhood, on which a celebrated breed of cattle is reared. Pop. 9236.

AVIGNON, the chief city of the department of Vaucluse, in

the S.E. of France, on the left bank of the Rhone, and a station on the railway from Lyon to Marseille, has a population (1872) of 27,409. It is an archiepiscopal see, and its ecclesiastical structures are numerous and imposing. The most celebrated are *La Chapelle des Doms*, containing the mausoleum of Pope John XXII., which is considered a masterpiece of the 16th c., the papal castle, a singular structure of vast size and diverse architecture, the church of St Peter, and that of the Coelestines. The city is rich in valuable collections, classic and mediæval. At one time A. possessed a university, but it was abolished in 1794, after having existed nearly five centuries. The vicinity is pleasant; the district produces grain, fruits, and wine, and there are manufactures of silks, muslins, calicos, tanneries, brass and iron-foundries. From 1305 to 1377 A. was the residence of seven occupants of St Peter's chair, as well as of some anti-popes. Two ecclesiastical councils were held here (1326 and 1337). It was at A. that Petrarch first saw Laura, and her tomb is in the Franciscan church.—A. the *Avenio Cavarum* of the Romans, first became a possession of the French crown in 1226, but was sold to Pope Clement VI. for 80,000 gold florins.

Avila, the capital of a province of the same name, Old Castile, Spain, on the Adaja, 53 miles N.W. of Madrid. It is the see of a bishop-suffragan, with a grand cathedral, and a university. Though now much decayed, it was formerly one of the richest cities in Spain. The nobles of Old Castile met at A. in 1465 for the purpose of raising Alfonso V. to the throne; and here also assembled the Third Estate or Holy League in 1520, at which almost every city of Castile was represented. A. was the birthplace of the voluminous pedant Alfonso Tostado de Madrigal, created bishop of A. in 1449, and of 'our seraphic mother, the holy Teresa, spouse of Jesus,' who was made lady-patroness of Spain by Philip III., and was canonised by Gregory XV. in 1622. The town abounds in rich sculpture. Pop. 6420.

Avila Y Zuñiga, Don Luiz de, a Spanish soldier and historian about 1490, born at Placencia, Estremadura. He was appointed ambassador from Charles V. to Popes Paul IV. and Pius IV., and engaged in the war waged by Charles in 1546-47, against the princes of the league of Schmalkald, of which he wrote a graphic account under the title *Commentarios de la Guerra de Alemania, hecha por Carlos, 5 en 1546 y 1547*. It was first printed in Spain in 1547, then at Amsterdam in 1550, turned into Italian (Ven. 1548) by the author himself, and has been repeatedly translated into French and German.

Avila, Gil Gonzalez de, a learned Jesuit, author of many historical works, was born at Avila, Old Castile, in 1577, and died April 25, 1658. The most valuable are his *Historia de la Vida y Hechos del Rey Don Henrique III. de Castilla* (Madr. 1638); *Historia de la Vida y Hechos del Monarca Don Felipe III.*; *Historia de Salamanca* (Salam. 1806); and *Teatro Eclesiastico de la primitiva Iglesia de las Indias Occidentales* (2 vols. Madr. 1649-56).

Aviles, an ancient town in the province of Oviedo, Spain, 19 miles N. by W. of Oviedo, at the mouth of a navigable branch of the Aviles. Copper and coal are found in the vicinity, and there are manufactures of glass and earthenware. The original charter granted by Alonzo VII. in 1135 is still preserved in the municipal archives. Pop. 7400.

Aviz, a Portuguese order of knighthood, instituted, like the Spanish order of Calatrava, to resist and quell the Moors. It dates from the reign (1185-1211) of Sancho, second King of Portugal, and still exists as an order of merit.

Avoca'do Pear, the name given to the fruit of *Persea gratissima*, a tree belonging to the order Lauraceæ (q. v.). It is common in tropical America and the West Indian Islands, where the fruit is highly esteemed. The pulp has a buttery taste, and is generally eaten with spice, or pepper and salt. An excellent oil for burning is expressed from the pulp, and a black dye is obtained from the seeds. The fruit has also been called alligator pear, vegetable marrow, and midshipman's butter.

Avocet' (*Recurvirostra*), a genus of Grallatorial or Wading birds, distinguished by the elongated bill, which is curved upwards at the tip. The legs are elongated, and the toes are more fully webbed than in the majority of true wading birds.

The average length of the British species (*R. avocetta*) is about eighteen inches, the plumage being coloured white and black. It is now comparatively rare in England, but was formerly common in marshes and fens. It occurs also in Europe, Asia, and S. Africa. In the American A. (*R. Americana*), the bill is less curved than in the British species. The wings in both species are well developed. Other species inhabit N. America, India, and Australia.

Avocet.

Avoid'ance is a term of English ecclesiastical law, signifying that a benefice is vacant.

Avoir'dupois, or **Aver-dupois**, usually said to be derived from the French *avoir du pois*, to have weight, but, considering the older form of the word, the verb from which it comes is probably not *avoir*, but the middle-age Latin verb *averare* (obsolete French *averer*, to *aver* or *verify*), is the system of weights used in this country for all goods, except the precious metals and medicines. The *ton* contains 20 *hundredweights* (cwt.), 80 *quarters* (qr.), and 2240 *pounds* (lb.); the *pound* contains 16 *ounces* (oz.), 256 *drams* (dr.), and 7000 *grains* (gr.) Troy. A *stone*, which is in extensive use, is 14 lbs., or half a quarter. In New York, and some other American districts, the cwt. contains only 100 lbs., and the ton 2000 lbs.

Avon, a Celtic word signifying a river. The Welsh form is *Afon*; the Manx, *Aon*; the Gaelic, *Abhainn* (pron. *Avain*). The root is seen in the Sansk. *Ap* or *Ab*, water. See AA. A. is the name of many streams in England and Scotland, and enters into the composition of many words denoting streams in every Celtic country in Europe. Of the British Avons, the first in point of fame is the Warwickshire A., which rises in Northamptonshire, and flows, mainly in a south-westerly direction, through the counties of Warwick and Worcester, past Rugby, Warwick, Stratford, and Evesham, till it joins the Severn at Tewkesbury, after a course of 100 miles. Two other Avons in England merit notice, one of which, in the lower part of its course, forms the boundary between Gloucester and Somerset, and after passing Bath and Bristol, discharges itself into the Bristol Channel below the latter city; the other, rising in the Wiltshire Downs, flows S. through Salisbury Plain and the W. side of Hampshire, past Amesbury and Salisbury, entering the English Channel at Christ Church. The Welsh Avons are very small, and so are the Scotch, the largest being the Lanarkshire A., which rises on the borders of Ayrshire, and flows N.E. past Strathavon, joining the Clyde at Hamilton.

Avanches, a town in the department of Manche, France, 55 miles S.W. of Caen, near the mouth of the Séez, which enters the Bay of Mont St Michel. It has some trade in hemp, flax, lace, bricks, cider, and sea-salt, and possesses a museum, botanical garden, and public library of 25,000 volumes and 200 manuscripts. A. is a favourite resort of English families. Pop. (1872) 7324. A. is the old Ingena of the Gallic Abrincatui, who have given name to the modern town. It was the seat of a bishop from the 6th c. to 1791, was fortified by Charlemagne as a frontier defence against the Celts of Brittany, and under Lanfranc (q. v.) became a great school of philosophy. In the Hundred Years' War between France and England, it was repeatedly taken by both parties, and suffered a similar fortune in the 16th c. during the Huguenot wars. Its fine cathedral, ruined during the revolution of 1789, had to be taken down in 1799 for safety. A stone on which Henry II. of England is said to have knelt to receive absolution from the papal legate is still preserved.

Awe, Loch (Gael. *Abh*, the water), next to Loch Lomond, the largest lake in Scotland, lies in the heart of Argyleshire, overshadowed by lofty mountains. It is about 24 miles long, from a mile to 1½ miles broad, and extends N.E. and S.W. Its surface, which seldom freezes, lies 108 feet above the sea. At its N.W. end are many picturesque islands, on one of which

(Fraccheilean) are the ruins of a castle built in the reign of Alexander III. Here also, on a peninsula, stands Kilchurn Castle (Gael. *Chaoil-chuirn*, 'the narrow cairn'), built in 1440, and garrisoned by royal troops till 1745. The river A., 7 miles long, connects the lake in the N. with Loch Etive, an arm of the sea. Near the point where the river issues is the grand 'Pass of A.,' or Pass of Brander, above which Ben Cruachan rises to a height of 3669 feet. Loch A. abounds in salmon and trout, its chief feeders are the Orchy and Strae, and anglers can now find excellent quarters at the inn of Port-Sonachan.

Awn, or **Arista**, the name given to the beard of corn (oat), or any such slender process. Examples of it are also seen in barley, rye, and bearded wheat.

Axe, a form of *Exe* (Cymric, *Uysg*, Latinised into *Isca*, thence *Exe* or *Ax*), the name of two small English streams, one of which rises on the southern slope of the Mendip Hills, not far from Wells, and flows N.W. into the Bristol Channel, near Weston-super-Mare; the other has its origin on the sides of the Dorsetshire Downs, and flows S. through the eastern border of Devonshire, past Axminster, into Lyme Bay, on the English Channel.

Axel, or **Ab'salon**, Archbishop of Lund, one of the great promoters of Christian civilisation in the N. of Europe, was born at Finnestoe, in the isle of Zealand, in 1128. He was a kinsman of Waldemar, afterwards King of Denmark, and on his return from Paris, whither he had gone to complete his studies, he was made Bishop of Roskilde, and a member of the king's council. A., though a churchman, was also a strong patriot, and the Norse fire burned in his blood. He chased the Wendish pirates from the Danish coasts, and forced them to accept Christianity in the isle of Rugen, after burning the temple of their god Svanovit at Arkona. In 1178 he became Archbishop of Lund. A fortress which he erected on the Sound as a defence against the Baltic pirates was the origin of Copenhagen. A. energetically defended against the German emperor the rights of the King of Denmark over the Baltic provinces wrested from the Wends, and extended Danish authority over Mecklenburg and Esthonia. The code of Waldemar was partly his work. A. was no less diligent in the affairs of the church than in those of the state. He reformed the 'rules' of the Danish monasteries. Literature is also indebted to him. It was at the request of A. that Saxo Grammaticus (q. v.) wrote his valuable *History of Denmark*; and he is also believed to be the person who ordered the monks of Sorø to draw up the annals of the kingdom. He died in 1201. See Estrup's *Ab'salon considered as a Hero, a Statesman, and a Bishop* (Sorø, 1856).

Axe'stone, a hard greenish-coloured stone, considered a variety of nephrite (q. v.), or jade. It is so named because the New Zealanders, and the inhabitants of other islands in the S. Pacific, fashion it into axes and other weapons.

Axholme Isle, a flat fertile tract in the N. of Lincolnshire, formerly a 'river island,' completely encircled by the rivers Trent, Don, Torme, and Vicardyke. It is 18 miles long, about 5 broad; contains seven parishes, also two market towns, Crowle and Epworth, and abounds with gypsum and beds of peat. It was a marsh till 1634, when it was drained by Cornelius Vermuyden, a Dutchman, at a cost of £56,000. Many Dutch and French Protestants having settled here, a tedious lawsuit (1691) established their right to 2868 acres, the original residents receiving 10,532. The name is a hybrid, the first syllable being the Celtic *Ax*, 'water,' and the second the Danish *holm*, 'an island.' To this, 'Isle' has been superfluously added in later times.

Axil, in botany, is applied to the angle formed between the axis and any organ that grows from it; for example, buds are formed in the A. of leaves.

Axill'a is the armpit. When the arm is extended at the shoulder-joint, the A. is a pyramidal space, the apex of which is situated between the clavicle and first rib, while the base is formed by the skin. It contains a large quantity of loose areolar tissue, fat, lymphatic glands, the axillary artery, veins, and numerous nerves. It is frequently the seat of abscesses and tumours.

Axi'nomancy (Gr. *axinē*, an axe; and *mantia*, divination), a Greek mode of divination, by which a guilty person was pointed out by the motion of an axe balanced on a pole, or by that of an

agate put on a heated axe-blade. He was deemed the criminal at the recital of whose name the axe moved. See DIVINATION.

Axiom (Gr. *axiōma*, lit., what is thought fit; hence what should be accepted), a term used in scientific inquiry to denote what is already assumed as the basis of demonstration; and in mathematics is specifically applied to what is or seems to be a self-evident proposition. Geometry is based by Euclid on a few axioms, or common notions, the truth of which is admitted as soon as the terms in which they are expressed are understood, and which could not be made plainer by any attempted demonstration. The distinction, now accepted, between postulates and axioms, viz., that the former are assumed problems, and the latter assumed theorems, does not exist in Euclid. It was first adopted by Simson, but the author is unknown. Axioms, though universally received, are not necessary truths.

Axis, in geometry, is an arbitrary straight line which is convenient for reference with respect to any motion or other phenomenon. Thus we have axes of rotation, co-ordinates, polarization, inertia, &c. We have the magnetic A., the axes of a crystal, the A. of a lens and of a telescope, &c. For further information, the reader is referred to the special articles.

Axis is the second vertebra, and forms a pivot on which the atlas and head rotate. The body of the vertebra supports the odontoid process which passes through the posterior part of the ring of the atlas. This process is kept in position by a powerful transverse ligament, while too great an extent of rotation is prevented by the action of two small ligaments passing from the occipital bone to the odontoid process termed the check ligaments. Fracture of the odontoid process of the A. causes instant death, by pressure on the *medulla oblongata*.

Axis, in botany, is applied to the stem and root, or any centre round which leaves or other organs are arranged; thus the stem is called the *ascending A.*, the root the *descending A.*, and the stem on which the flowers are developed, the *floral A.*

Axminster, a town in Devonshire, on the Axe, 25 miles S. of Taunton. It has some manufactures of druggets and woollens, and was formerly famed for its carpets, but this industry has been removed to Wilton. A. is said to have been founded by King Æthelstan in 937, and has a very old church. Pop. (1871) 2861.

Ax'mouth, a fishing-village in Devonshire, at the mouth of the Axe, near which, in 1839, occurred an extraordinary landslip, forming a chasm nearly a mile long, 200 feet wide, and 250 deep. It resulted from the action of the sea on the greensand strata of which the coast consists.

Axolotl, a genus of *Urodela*, or 'Tailed' Amphibians, found in Mexican lakes, possessing four limbs, the front pair each having four, and the hinder five toes. The Mexican A. (*Siredon pisciforme*) is the best-known form. It is a *perennibranchiate* amphibian, retaining the external gills or branchiae of early life throughout its entire existence, and possessing lungs in addition to these branchiae. The gills appear as three external fringe-like processes borne on each side of the neck. In confinement, the Axolotls may lose their gills; one species—*Siredon lichnomoides* of Western America—exemplifying this change. These animals possess dorsal and caudal or tail fins. They average 8 or 9 inches in length, and are eaten in Mexico.

Ax'um (anc. *Auxumē*) in the province of Tigré, Abyssinia, formerly the capital of the Ethiopian empire of A., which included Abyssinia, and portions of S.W. Arabia. The empire formed the southern boundary to the power of Rome, commanded the commerce of the Red Sea, traded with India. Greek philosophy and Christianity were introduced from Egypt, the first bishop being Frumentius, and A. contained probably the first Christian community in Abyssinia. A. incurred the enmity of the Arabs in the 6th c. by interfering on behalf of the Arabian Christians, the result of which was a succession of contests, which culminated in its fall, and the dissolution of the empire. The modern A. is a place of from 2000 to 3000 inhabitants, and is rich in remains of antiquity, obelisks, altars, catacombs, tablets, inscriptions, &c. It is even yet a holy city for Abyssinian Christians, where all feuds must cease.

Ayacuh'o, the capital of a department of the same name, Peru, famous as the place where the Colombian and Peruvian

allies defeated the Spanish forces, 9th December 1824, and so ended the Spanish rule on the continent of America. The battle field is called *La Puerta de los Muertos* ('The Gate of the Dead'). The town of A. has 24 churches, and carries on considerable trade. Pop. 28,000.

Aya'la, **Perdo Lopez de**, Spanish historian and poet, born in Murcia 1332. A cadet of one of the best Castilian families, he filled high offices of state under four successive monarchs. In 1367, at the battle of Najera, he was captured and imprisoned by the English; and again by the Portuguese at the battle of Aljubarota (1385). His *Crónicas de los Reyes de Castilla*, *Don Pedro*, *Don Henrique II.*, *Don Juan I.*, y *Don Henrique III.* (2 vols. Madr. 1779-80), is the first Spanish work in which a philosophical review of events, and not a mere simple narrative of facts, is attempted. His poem, *El Rimado de Palacio* ('Rhymes of the Court'), is a satirical poem, in which for the first time the popular early ballad form is abandoned, and a more modern style of composition attempted. A. was also the first translator of Livy into Spanish.

Ayamonte, a fortified town in Spain, province of Huelva, on an acclivity near the mouth of the Guadiana, where it separates Spain from Portugal. Fishing is the principal industry. Boat-building and lacemaking, formerly largely engaged in, have much fallen off, and there are unimportant manufactures of soap and earthenware. Pop. 5500.

Aye-Aye (*Cheiromys Madagascariensis*), a Quadrumanous mammal or monkey, belonging to the *Strepsirrhine* ('twisted-nostrils') section of the Quadrumana (q. v.), and found exclusively in Madagascar. The nostrils are curved, and placed at the extremity of the nose. This animal resembles a large squirrel, the tail being bushy. No canine teeth exist, the molars and incisors being widely separated, and the latter teeth growing throughout life as in Rodentia. All the feet have five toes, but the thumb is hardly opposable to the other fingers, the hind toe being opposable. The middle finger is as long as the ring finger, and the second toe is terminated by a long claw-like nail. The ears are large. The A. is of nocturnal habits, and feeds on insects and fruits.

Aye-Aye.

Ayeshah, the favourite wife of Mohammed, to whom she was married when only nine years old, was born in 610 or 611 A.D. As she was the only one of the Prophet's wives who was a virgin, her father's name was changed from Abdallah to Abu-Bekr, 'the father of the virgin.' In his last illness Mohammed had himself carried to her house, where he died in her arms. An accusation of adultery having been brought against her, Mohammed composed the twenty-fourth chapter of the Koran to demonstrate her purity, and declared that every calumniator deserved eternal damnation. After the assassination of Othman, she opposed the accession of Ali, who had at first believed in her guilt. Ali, however, defeated her troops, took herself prisoner, but dismissed her with permission to reside anywhere in Arabia she pleased, as long as she kept aloof from affairs of state. As a prophetess, her interpretations of the Koran were authoritative. She died at Medina in 677 A.D.

Aylesbury, a town in Buckinghamshire, to the S. of the Thame, 40 miles N.W. of London by rail. It overlooks the picturesque vale of A., through which a rivulet flows to the Thame. The occupations are chiefly agricultural, but there are also strawplait, 'bone-lace,' and silk manufactures. The rearing of ducks for the London Christmas market is largely carried on. A. was a stronghold of the Britons, and was not taken by the Saxons till 571, when it was called *Aeglesbyrig*, perhaps in honour of Eigel, the hero-archer. It sends two members to parliament. Pop. (1872) 28,760.

Ayliffe, **Sir Joseph**, a meritorious English antiquary, was born about 1708, near Framfield, Sussex. In 1731 he was chosen a fellow of the Royal Society; in 1732 a fellow of the Society of Antiquaries, and ultimately vice-president. He was

one of three commissioners appointed for the preservation of the papers in the new State-Paper Office, on its establishment in 1763. In 1772 he printed *Calendars of the Ancient Charters*, &c., in the Tower of London, and also edited Leland's *Collectanea* (9 vols.), Hearn's *Curious Discourses*, &c. At his death, 19th April 1781, he was engaged on a work on *Sepulchral Monuments*, afterwards completed by Gough.

Aymon, the surname of Alard, Richard, Guiscard, and Renaud, sons of Aymon, Count of Dordogne, favourite heroes of the chivalric literature of the middle ages. Their exploits are mainly mythical, forming part of the marvels attributed to Charlemagne and his followers. Huon de Villeneuve, a French poet, who flourished in the reign of Philippe Auguste, makes them the heroes of a novel, *Les Quatre Fils Aymon*, and Ariosto's *Roland* treats chiefly of the adventures of Renaud, traditionally the bravest of the brothers. Tieck's well-known work on the exploits of the brothers, and of their horse Bayard, is drawn apparently from a different source.

Ayora, a town in Valencia, Spain, 50 miles S.W. of Valencia, on the river A. Husbandry and the manufacture of oil are the chief industries. The ruins of an old castle crown the summit of a hill in the vicinity. Pop. 5412.

Ayr, the capital of Ayrshire, on the left bank of the A., 33 miles S.S.W. of Glasgow. The river is spanned by the 'Auld Brig' and 'New Brig' celebrated by Burns. The town is ancient, its charter, granted by William the Lion, dating from about 1202. During the wars of Edward I. it was (according to Blind Harry) the scene of some of Wallace's earliest exploits, but no earlier Scottish writer associates the hero with the place. The modern town is clean and well-built, and many handsome villas have been erected to the S. and W. A. exports annually about 200,000 tons of coal, and the trade will be much increased when the wet dock, at present in course of construction, and estimated to cost £140,000, is completed. Pop., including Newton-upon-Ayr (1871), 17,954. A., in conjunction with Campbelton, Irvine, Luverary, and Oban, sends a member to parliament. The town and the county receive their name from the river A., a name which is probably a survival from the old times of the Strathclyde Britons, signifying in Cymric 'the gentle wate.'

Ayrshire, a maritime county in the S.W. of Scotland, area 1149 sq. miles. The surface undulates, reaching no great elevation except in the S. and S.E., which are somewhat mountainous, while there are a few hills on the N. The principal rivers, all short, are the Ayr and the Doon, traversing the centre of the county, the Girvan and Stinchar the S., and the Irvine and Garnock the N. Coal has been long worked extensively and profitably, freestone and limestone abound, and there are rich beds of ironstone. The soil on the coast is sandy, clayey in the interior, and on the E. there are extensive moorlands. Agriculture is in a flourishing condition, and the farms, generally small, are in a high state of cultivation. Dairy-husbandry prevails, Dunlop cheese being still deservedly famous, though cheese-making by the Cheddar process is carried on to a large extent; and A. milch-cows are unsurpassed for dairy purposes. In 1874 there were 311,529 acres in crop or pasture. Woollen and cotton manufactures, ironworks, and engineering, are carried on largely at Kilmarnock. There are cotton-works at Catrine, and there is a pottery at Cumnock. Extensive ironworks have been erected at Muirkirk, Kilwinning, Dalry, Ardeer, Hurlford, and Dalmellington. Fancy woodwork, in the shape of snuff-boxes, card-cases, &c., employs numerous hands in Mauchline and Old Cumnock. Anciently A. was divided into Carrick, S. of the Doon; Kyle, between the Doon and the Irvine; and Cunningham, N. of the Irvine. The district between the Ayr and the Doon was sometimes called Kyle-Stewart. Pop. (1871) 200,809. A. returns two members to parliament, one for N. A., and one for S. A. The chief towns are, Ayr, Kilmarnock, Irvine, Ardrossan, Maybole, and Largs. A. is famous for its struggles and sufferings for the Covenant.

Ayrshire Cattle. The characteristics of these cattle are a plentiful flow of milk, varying from twenty-four to thirty-four quarts daily. The head of a pure Ayrshire should be broad, gradually tapering downwards to the nostrils, which should be expanded, and dark. The colour of the animals varies much, from white,

with light-brown and yellow patches, to dark-brown with white spots, and from orange to dark-brown with marbled flecks. The butter-colour, other things being equal, is preferred. The eye should be full, the shape wedge-like, the shoulders being the thin edge. Thence to the tail the body should gradually deepen to the loins, and width across the backbones is essential to sustain the udder, which is the most important point in this breed. The udder should be so distended as to fill out the whole space between the hind legs, and tapering thence towards the belly. The legs should be straight, tapering gradually. The horns should curve slightly upwards. Tail long and bushy. Bulls should be broader in shoulders, deeper round the heart than cows, and rounder in the quarters. The milk given by Ayrshires is much esteemed, and is mostly devoted to cheese-making.

Ayton, Sir Robert, poet, born at Kinaldie, Fifeshire, 1570; studied at St Andrews, and graduated there in 1588; and completed his studies in France. He held in succession important positions in the courts of James I. and Charles I. His poems are written in pure and elegant English, and Burns has paraphrased several of them, one of which at least he has not improved. A. seems to have been an accomplished scholar, as he wrote verses in Greek, Latin, and French. He enjoyed the friendship of the wits of his day, among others of Ben Jonson. He died at Whitehall in March 1638. A.'s poems have appeared in part in several publications. Ten are to be found in Watson's *Collection of Scottish Poems* (1706-11). His Latin poems are given in Johnston's *Delicia Poetarum Scotorum*, i. 40, et seq.; and a collected edition of his poems was edited by Dr Charles Rogers, from a MS. in his possession and other authentic sources (Edinb. 1844).

Aytoun, William Edmondstone, poet and humourist, was born at Edinburgh 1813, studied there, and subsequently in Germany. He was called to the Scottish bar in 1840, was appointed professor of Rhetoric and Belles-Lettres in the University of Edinburgh in 1845, and Sheriff of Orkney and Shetland in 1852. A. is joint author with Theodore Martin of a volume of clever parodies and humorous pieces called the *Bon Gaultier Bailads* (1854), and of a volume of translations of Goethe's minor poems (Lond. 1859); and in 1849 he published the work on which his reputation as a poet rests—*Lays of the Scottish Cavaliers, and other Poems. Firmilian, a Spasmodic Tragedy*, a caricature of the school of poets of whom Bailey, Dobell, and Alexander Smith were the chief representatives, was published in 1854, and *Bothwell* in 1856. Not the least valuable of his works is his *Ballads of Scotland* (2 vols. Edinb. 1858). A. was one of the brightest journalists of his day. Of his tales, published in *Blackwood*, of which he was long a valued contributor, the best known for their broad and robust humour are *The Glenmutchkin Railway*, and *How I Became a Yeoman*. His professorial lectures were a series of admirable readings, remarkable for their graceful and picturesque style. His latest work was a novel entitled *Norman Sinclair* (Edinb. 1861). A. died at Edinburgh, August 4, 1865. See *Memoir of W. E. A.*, by Theodore Martin (Edinb. 1867).

Ayuntamiento, the name given in Spain to the municipal council, or governing body of towns. During the long wars with the Moors, when it was necessary for each town to hold itself constantly prepared to resist sudden attack, the A. rose to great influence and power. During the last three centuries its influence and efficiency flourished or waned with the vicissitudes of the national liberty. By a statute of 1837, the A. is declared a body freely elected by the people, presided over by the alcalde, and having full control of municipal affairs—police, taxes, local funds, &c. A subsequent Act (1840), which proposed to deprive the A. of all political power, led to insurrection, and the expulsion of the queen, Maria Christina; but in 1844 an Act similar in its provisions was passed.

Azadirach'ta Indica, an Indian tree belonging to the order *Meliaceæ*. An acrid oil is obtained from its fruit, which is used in India for burning as well as for dyeing cotton. Its bark is a tonic, and its root has been used as a vermifuge.

Azalea, a genus of shrubby plants belonging to the order *Ericaceæ*, or Heath family. Many of them have showy, sweet-scented flowers, and bear a general resemblance to Rhododen-

drons (q. v.). There are about twenty-five species, natives of N. America and Asia. *A. pontica* is a yellow-flowered, fragrant species, found in the countries around the Black Sea, and being quite hardy in Britain, is common in gardens. It possesses dangerous narcotic qualities, which poison cattle and sheep which chance to eat it. It has been stated that it was from the flowers of this plant that 'the bees of Pontus collected the honey that produced the extraordinary symptoms of poisoning described as having attacked the Greek soldiers in the famous retreat of the Ten Thousand. Xenophon says that after eating it the men fell stupified in all directions, so that the camp looked like a battlefield covered with corpses.' *A. Indica* is a beautiful greenhouse shrub when in flower; there are several varieties of it, of various tints of colour. *A. procumbens* is a small trailing species found on the Scotch mountains, as well as on the Alps of Central Europe and in N. America.

Azeglio, Massimo Taparelli, Marchese d', a celebrated writer, artist, and statesman of Italy, was born at Turin in 1798. His father, of a noble family of Piedmont, having gone as ambassador to Rome, A., when fourteen years old, followed him. He devoted himself with much enthusiasm to the study of painting, music, and belles-lettres, but his studies were cut short by his being appointed an officer in the Piedmontese cavalry. Still his passion for art and literature continued unabated, and the severity of his studies was so great that he fell seriously ill, and was obliged to leave the army. On his recovery, he proved himself to be more than an amateur in the fine arts, for his picture representing the *Origin of the Sforza Family* is reckoned a masterpiece. Italian politics also engaged his earnest attention; and his novels *Ettore Fieramosca* (1831), and *Niccolò di Lapi* (1841), did much to fire the national spirit of Italy. A. is understood to have had an influence in determining Pio Nono in favour of that liberal policy that marked the beginning of his pontifical rule, and it was at this period he published his important pamphlets on the Laws of the Press, the Emancipation of the Jews, &c. In 1848 he marched from Rome at the head of the Papal troops charged to co operate with Charles Albert against the Austrians. He commanded a legion at the battle of Vicenza, where he was somewhat severely wounded. In 1849, after the battle of Novara, Victor Emanuele made him President of the Cabinet. At the close of the war in 1859 he received the temporary office of Military Commissioner Extraordinary for the Roman States. In these high offices the influence of A. was always exerted in an unselfish and patriotic spirit; and on his retirement his advice—ever temperate, but never weak—continued to be of infinite benefit to his country. He died 15th January 1866. His first wife was a daughter of Manzoni. His Memoirs appeared in 1867 (Germ. transl. 1869); and his Political Correspondence (1847-65) was published by Rendu in 1866. See Ratti's *Vita e Meriti di M. A.* (1868).

Azerbaijan (anc. *Media Atropatene*), a fertile province in the N. of Persia, bordering on Turkish Kurdistan on the W., and on Russia on the N., intersected by many mountain ranges rising from 7000 to 9000 feet high. It yields rice, wheat, barley, maize, flax, hemp, cotton, saffron, and tobacco; iron, lead, copper, sulphur, salt, and salt-petre are found; and the chief manufactures are velvet, silk stuffs, woollens, and leather. Many camels, horses, cattle, and sheep are reared. The largest rivers are Aras or *Araxes*, the Kara Su, the Kizil-Uzen, and several others which fall into the Urumiyah, the largest salt lake in Persia. The alternations of temperature are extreme, but the climate is healthy. Tabriz (q. v.) is the capital. The highest peak in the province is Savalan, 13,000 feet, and on the N.W. frontier rises Mount Ararat. Area, 30,000 sq. miles; pop. estimated at 900,000.

Azimabad, or **Tirow'li**, a fortified town of Sirhind, India, 9 miles N.W. of Kurnal, with a spacious caravanserai within an embattled wall, and surrounded by a ditch to which water can at any time be admitted. Pop. some 6000.

Azinghur or **Azim's Fort**, a town in a district of the same name, N.W. Provinces, division of Benares, India, on the Tons, a branch of the Gogra, 109 miles N.W. of Allahabad. The river, which is navigable, is here crossed by a bridge of boats. During the mutiny the sepoys revolted at A., and on July 18, 1857, an engagement with a small English force took place, in which nearly 200 rebels were slain. Pop., apart from the garri-

son (1872), 14,543. The district of A. is 2550 sq. miles in extent, with a pop. in 1872 of 1,531,410, chiefly employed in the manufacture of cotton and silk.

Az'muth of a heavenly body, is the angular distance of that point on the horizon directly under the body from the N. or S. point of the horizon. The word is probably a corruption of the Arabic *as-sumūt*, signifying *the way, path, tract, or quarter*. The A. circle is a circle all of whose points have the same A., that is, a vertical circle.

Az'incourt. See AG'INCOURT.

Azores (Port. *Ilhas Açores*, i.e., 'hawk islands,' called also *Ilhas Terceiras*), a cluster of nine islands in the N. Atlantic, between 36° 50' and 39° 50' N. lat., and 24° 30' and 31° 20' W. long., about 800 miles W. of Portugal, of which kingdom they form a province, not a dependency. Their names are: St Mary, St Michael, Terceira, Gracioso, St Jorgo, Pico, Fayal, Flores, and Corvo. Their total area is 999 miles, the pop. (1871) 258,933, and the capital Angra, in Terceira. The islands are volcanic, and much loss of life and property has been occasioned by eruptions, especially by that of May 1808. The islands are in general mountainous, the highest elevation (*Pico Alto*), which is in Pico, being 7613 feet. The soil is fertile, and produces abundantly vines, oranges, and lemons; and wheat, Indian-corn, and pulse are exported in considerable quantities. There is also some export trade in coarse linens, corn, cheese, and salted meat. The purity and mildness of the climate attract many persons affected with pulmonary complaints. That the A. were known to the Carthaginians is proved by the Punic coins found in Corvo. The Arabs and Normans also appear to have visited them, but it is to the Portuguese Gonçalo Velho Cabral that Europe owes its first definite knowledge of them. He rediscovered them in 1431-32, and in 1436 we find them laid down in a map of the world by the Venetian Andreas Bianco. Alfonso V. gave Fayal to his aunt Isabella, Duchess of Burgundy, in 1466, who peopled it with Flemish colonists. Hence the name *Ilhas Flamengas* which was often given to the A., though some erroneously suppose that this name arose from the islands having been first discovered in 1439 by a Flemish captain, Vanderborg of Bruges.

Azote, the name given by Lavoisier to nitrogen.

Azotised Bodies are literally those which contain *azote* or nitrogen, but the term is usually employed in a more limited sense to designate nitrogenous substances of animal or vegetable origin only. The chief A. B. are fibrine, albumen, casein, gelatin, urea, uric acid, hippuric acid, gluten, &c., and many alkaloids. Detailed information concerning these bodies will be found under their respective headings.

Azo'tus, the Ashdod of the Old Testament, and the modern Esdud, on the Mediterranean, midway between Gaza and Joppa. Though nominally a possession of the tribe of Judah, it was held by the Philistines, and was one of the seats of the worship of Dagon. A. is mentioned only once in the New Testament (Acts viii. 40). In the 7th c. B.C., the Egyptians under Psammetichus captured it after a blockade of twenty-nine years. The Romans, on their conquest of Judæa, restored A., which had been lying in ruins since its destruction by the Maccabees about the middle of the 2d c. B.C. It is now an insignificant village.

Az'ov, a fortified town in the government of Jekaterinosslov, Russia, on the most southern of the thirteen arms of the Don delta, 20 miles from its mouth. Until recently it was supposed to be the place founded by Greek colonists as Tanais, but undoubted remains of Tanais have been found near Nedvidovka, on the N.E. arm of the Don delta. In the 13th c. it was occupied by the Genoese, under the name of Tana. Timur took it in 1395, and in 1471 it was seized by the Turks. After a protracted struggle it was ceded to Russia in 1774. It was formerly

a place of wealth and importance, but the gradual deposit of mud at the mouth of the river has greatly reduced its trade. Pop. 10,945.

Azov, Sea of (anc. *Palus Mæotis*), a large gulf in the N. of the Black Sea, from which it is almost cut off by the peninsula of the Crimea. It is about 14,000 sq. miles in extent, receives the river Don at its N. end, and communicates with the Black Sea by the narrow strait of Kertch. Its waters are shallow, and from its abundance of fish the Turks call it Balük-Denis or Fish Sea. At the time of the Crimean war it was occupied by an expedition of the allies (1855), which stopped the supplies for Sebastopol and stormed the ports. Along the coast of the Crimea extends a series of swamps, broken by shoals and sandbanks, called the Putrid Sea (*Sivash*), separated from the Sea of A. by the Tongue of Arabat, a long sandy spit.

Az'toca, the dominant tribe in Mexico from the beginning of the 13th c. till the Spanish conquest in 1519. See MEXICO.

In 1853 two children, a male and a female, said to be descended from the A., were exhibited in Britain by an American, who affirmed that they had been brought from Iximaga, an ancient city of Central America, where they had been venerated as deities. His story was a transparent fabrication. The children, who were less than three feet in height, and of low intelligence, especially the male, were pronounced by Professor Owen to be mere dwarfs. They were doubtless mere Indian cretins. The Aztec children, for a time popular attractions, soon ceased to excite interest.

Azu'a, a town 60 miles W. of St Domingo, island of San Domingo, W. Indies. Pop. 6000.

Azu'a'ga, a town of Spain, province of Badajoz, the centre of a grain-producing country, diversified by oak forests. Pop. 6400.

Azu'ni, Dominico Alberto, an eminent jurist, born at Sassari, in the island of Sardinia, August 3, 1749. His special study was maritime law, which he attempted to reduce to fixed principles in his *Sistema Universale dei Principi del Diritto Marittimo dell' Europa* (Flor. 1795), which he subsequently turned into French under the title of *Droit Maritime de l'Europe* (Par. 1805). The ministry of Napoleon charged him with the preparation of the maritime portion of their new commercial code. He was appointed President of the Court of Appeal at Genoa in 1807. Some time after the fall of Napoleon he retired to Sardinia, and was made by King Carlo Felicio judge of the Consulate and University Librarian at Cagliari, where he died 23d January 1827. Among his other writings may be mentioned *Dizionario Universale Ragionato della Giurisprudenza Mercantile* (Legh. 1786-88); *Histoire Géographique, Politique et Naturelle de Sardaigne* (Par. 1802); *Mémoires pour Servir à l'Histoire des Voyages Maritimes des Anciens Navigateurs de Marseille* (Gen. 1813); *Recherches pour Servir à l'Histoire de la Piraterie* (Gen. 1816).

Azure (It. *azzurro*, *azzuolo*, blue colour, from Pers. *lâzur*, seen in *lapis lazuli*, the sapphire of the ancients), in heraldry, signifies one of the colours used in blazonry. In the engraving of arms it is represented by horizontal lines.

Azurine (*Leuciscus caruleus*), or 'blue roach,' a species of fishes belonging to the family of Carps (*Cyprinidae*), and nearly allied to the chub, dace, and roach. It occurs in the Swiss lakes, and also in certain fresh waters of Lancashire (*Yarrell*).

Azurite, the blue carbonate of copper, or blue malachite, a valuable ore of copper. It occurs in very beautiful azure-blue crystals at Chessy, near Lyon, on which account it is sometimes known as Chessy copper or Chessylite. It is found in the Cornish and Devonshire mines, at Matlock, and in the Leadhills, Scotland, besides many foreign localities, associated with other forms of copper ore. The name A. has also been given to lazulite, a mineral composed of phosphate of alumina and magnesia.

B.

the second letter in the Hebrew or Phœnician alphabet, and in all alphabets which have been derived from it. In Hebrew it is called *beth*, of which the Gr. *beta* is only a modification, a word signifying house, and entering into the composition of many Scripture names, as Bethel, 'house of God'; Bethlehem, 'house of bread,' &c. The name points back to a time when the language was hieroglyphic or pictorial, and when a rude outline of a house or tent was the symbol used to represent the letter. In the classification of consonants, B belongs to the order of labials or lip-letters, so called from the organ by which they are pronounced; and in the subdivision of labials it ranks as a medial or flat. On examining the Aryan family of languages, it is found that the English B is represented in Latin by *b*, as Eng. 'bear,' Lat. 'ferre,'—Eng. 'be,' Lat. 'fui,'—Eng. 'beech,' Lat. 'fagus,' &c.; in Gr. by *ph* or *p*, and in other members of the family by other labials. The phonetic law which regulates this change will be explained under the heading GRIMM'S LAW. As a sign of abbreviation B. is not much used; the most frequent case is the compound L. B. for *lector benevolus*, 'gentle reader,' or for *beatus*, 'blessed,' applied to the dead.

B, in music, is a note at the distance of a 'major seventh' from C. When truly in time, its vibrations are $\frac{1}{16}$ as fast as those of C below it; upon the pianoforte they are slightly faster. In Germany B \flat is called B, while our note B is called H.

Ba'al, the supreme male deity of the nations of Hither Asia. As a proper name (Heb. *master, owner, lord*), B. means 'the lord' (i.e., of heaven); in the plural (Baalim) it denoted the different modifications under which he was worshipped by the various nations, all being called by the common name B., only distinguished by a particular epithet, and was synonymous with the phrase 'other gods,' as opposed to Jehovah (Jud. viii. 33). He was the sun-god; as distinguished from Moloch (q. v.), the sun in his fertilising operations, the generative and reproductive power of nature.

With regard to the nature of the worship of B. into which the Israelites fell, according to the Book of Judges, soon after the death of Joshua, it is evident, e.g., from the ephod made by Gideon, which was of the same nature as that used in the worship of Jehovah (cf. Jud. viii. 27, and 1 Sam. xxiii. 9, 10), that it did not imply distinct opposition to the worship of Jehovah, but was simply an intermingling of the two. To the early Israelites Jehovah was probably one of many gods, and they imagined they could worship the Baals of the other nations along with him: in Jud. xi. 24, Jehovah and Chemosh are put upon the same level; and the worship of B. and Ashera was carried on in the very temple of Jehovah (2 Kings xxiii.) without any intention of ousting him. This explains the frequent lapses of the people into what the later advocates of a spiritual monotheism regarded as idolatry. The sensuous worship of the Baals of the neighbouring nations (Num. xxv.) was more agreeable to human nature than the Jehovah religion with its demands for sanctification of life.—**B.-berith** (Jud. viii. 33) = 'covenant-B.,' i.e., in covenant with the worshippers.—**B.-peor** (Num. xxv.) = 'B. of the opening,' i.e., of the *hymenem virginum*, a practice in his worship forbidden (Lev. xix. 29).—**B.-zebul**. See BEEB-ZEBUB.

Baalbek, formerly one of the largest, richest, and most strongly fortified cities of Syria, now noted only for its beautiful ruins, situated near the base of Anti-Lebanon, about midway between Damascus and Tripoli, and distant nearly 40 miles from each. It lies at the entrance of a small valley, through which runs a streamlet, divided into numerous rills for the purpose of irrigation. The name Heliopolis, given to it by the

Seleucidæ, is a translation into Greek of B., the 'city of Baal,' the sun-god, doubtless the original Semitic name of the place, and which it probably recovered after the Arab conquest of Syria. The chief ruins are the Temple of the Sun, a smaller building known as the Temple of Jupiter, and a mixed Ionic and Corinthian edifice, at one time used as a Christian church. Although a flourishing city at an early date, and an emporium of trade between the Levant and Inner Asia, next to nothing is known of the history of B. previous to the time of Julius Cæsar, who made it a Roman colony. The Emperor Trajan twice consulted an oracle at B. in the 2d c. A.D., and the great temple was rebuilt by Antoninus Pius. This temple is said to have been converted into a Christian church in the reign of Theodosius. The Arabs sacked B. in 748. In 1401 it was pillaged by Timur, and in 1759 was reduced to ruins by an earthquake. Pop. (1873) 500. See Wood and Dawkin's *Ruins of B.* (Lond. 1757), Volney's *Voyage en Syrie* (5th ed. Par. 1822), and Bâdeker's *Syrien und Palæstina* (1875).

Bâbâ, the Turkish form of *papa* (comp. Syr. *Abba*, q. v.), an onomatopœic word framed by children in their first attempts to speak. It is prefixed as a title of honour, both in Turkey and Persia, to the names of eminent ecclesiastics, particularly to such as are famous for their ascetic mode of life—e.g., B. Nasibi (a Persian poet who died 1537)—and also as a title of courtesy in other cases. In Hindustani *bâbâ* signifies 'prince,' but in ordinary life has the force of the English 'sir.'

Baba, Cape (anc. *Lectum*), a rocky promontory forming the most westerly point of Asia Minor, 86 miles N. of Smyrna. On the headland stands the small town of B., near which is the ruined city of Assos.

Babadag', or Babatag, a town of Turkey, in the province of the Danube, situated near the mouths of the Danube, 280 miles N. of Constantinople. It is the chief place of trade in the Dobrudscha, and has a port on the Black Sea. Pop. (1871) 10,000. In most of the Russo-Turkish wars, B. has been the rendezvous and headquarters of the Turkish force. B. is also the name of a peak in the S.E. of the Caucasus, 12,640 feet high.

Babb'age, Charles, F.R.S., an eminent mathematician, was born December 26, 1792, at Teignmouth, in Devonshire, took his degree of Bachelor at Cambridge in 1814, was Lucasian Professor from 1828 to 1839, and died October 18, 1871. Of his works, the principal are the *Differential and Integral Calculus*, the *Decline of Science* (1830), *On the Economy of Manufactures and Machinery* (1832), *Tables of Logarithms* (1834), besides various other treatises and papers read before scientific societies. B.'s great inventions are his *Calculating Machines* (q. v.).

Babb'lers (*Zimalina*), a sub-family of Perching or Insectorial birds, included in the Icthyrostris section of that order, and distinguished by the long bill with the ridge of the upper mandible curved, by the slightly-notched tip of the bill, by the nostrils being situated in a groove at the base of the upper mandible, by the rounded form of the wings, by the tapering tail, and by the larger size of the claw of the hinder toe. The B. are all of small size, and are confined to India, Australia, and the islands of the Eastern Archipelago. The best-known species are the laughing thrush (*Pterocylus cachinnans*) and laughing crow (*Garrulax leucolophus*) of India, the Indian black-faced thrush (*G. Chinensis*), the Australian *Cinclosoma punctatum*, &c.

Babel, Tower of, according to the 11th chapter of Genesis, was a structure of brick on 'a plain in the land of Shinar,' and the ruins of which are probably those at Birs Nimrud, to the S.W. of Hillah, near the Euphrates. The most accurate measurement of the tower, supposed to be identified with it, makes the circumference 762 yards, with a conical elevation on the western side of 198 feet. The bricks, which are fire-burnt, bear inscriptions,

and even at this day are so firmly embedded in the mortar, that to extract one is an affair of difficulty. The top of the cone has been vitrified by the action of fire, conjectured to have been lighting—a fact singularly in accordance with the tradition of its original destruction, though the mode of this is not indicated in Genesis. Mr George Smith has deciphered among the Assyrian tablets of the British Museum the legend of the building of the T. of B., and has described it in his *Chaldean Account of Genesis* (Lond. 1875).

Bab-el-Man'deb, 'the Gate of Tears,' so called from the dangers to light craft attending its navigation, the strait which connects the Red Sea with the Indian Ocean; also the name of a lofty cape (the ancient *Palindromos*) in the vicinity, opposite the Abyssinian coast, at a distance of 20 miles. Perim (q. v.), an island in the strait, on which the English have recently erected a fort, separates the channel into the Little Strait, on the Arabian side, and the Great Strait on the African. The Eight Brothers are eight small islands, or rather rocks, situated near the W. coast.

Bab'ar, or **Babûr** (in full *Zuheir-ed-dîn-Mohammed-Baber-Padishah*), founder of the Mogul dynasty in India, was the son of Omar-Shaikh-Mirza, a descendant of Timur, who ruled the petty kingdom of Kokan or Ferghana, in the N. E. of Transoxiana, and who died about 1493. B. had a severe struggle with the neighbouring princes to retain possession of his paternal dominions, but in the end he was successful, and in 1497 found himself master of Samarcand. More formidable enemies then appeared in the Usbeks, led by their Khan Shahilbek, who crossed the Oxus and wrested Samarcand from B. Although this important city was recovered by him in 1500, B. was again defeated and forced to seek refuge in Persia. He then made himself master of Cabul, and after an unavailing attempt to win back his native state, turned his attention to India—by celestial inspiration says the courtly historian Abul-Fazl. First of all, however, he set himself to the reduction of Candahar and the rest of what is now known as Afghanistan, and it was not till 1524 that he made a serious attack on the region E. of the Indus. The great battle of Paniput (q. v.), fought on the 21st of April 1526, secured him possession of the empire of Delhi. A second triumph over the Rajah of Oudipore in 1527 obtained for him the title of *Ghazi* or Defender of Islam. Subsequently he reduced the sovereigns of Malwa and Bengal; but his intemperance, particularly in wine, shortened his life, and he died 26th December 1530. The chief authority for his career is the *Vakiati Baberi* (Memoir of Baber), translated into English in 1826 by Erskine and Leyden. The work is divided into two parts, the first giving, among other things, a variety of sketches of those princes who were contemporaries and neighbours of B.; the second, which is in the form of a journal, containing the autobiography of B., with interesting details about Hindustan, Cabul, &c.

Babeuf, **François Noël**, a French political writer, born in 1764 at St Quentin, department of Aisne. For his vehement advocacy of the principles of the Revolution in *Le Correspondant Picard* of Amiens, he was tried at Paris, but acquitted, 14th July 1790. He was again tried at Paris in 1794 for advocating in *Le Tribun du Peuple*, under the signature of *Caius Gracchus*, the absolute equality of all men. A plot to which he had lent himself to re-establish the democratic constitution of 1793 being discovered, he was seized, tried, and condemned, 24th

May 1796. When his sentence was pronounced, he stabbed himself under the eyes of his judges. On the following day he was brought to the scaffold in a dying state, and guillotined. His communistic clime was promulgated with the obstinacy of a fanatic, who was the slave of a single and a senseless idea. See F. Buonarrotti, *Conspiration pour l'Égalité, dite de B.* (Par. 1823, 2 vols.).

Babillard.

Babillard, the term applied to an incessant bird (*Currucula garrula*), better known by the names of 'white-breasted fau-vette,' 'lesser whitethroat,' and 'nettle-creeper.'

Babington, Antony, a Derbyshire gentleman, who with thirteen other young Catholics, most of them connected with the household of Elizabeth, conspired to kill the English queen, and release Mary Queen of Scots. The murder of Elizabeth was undertaken by one Savage, while B. entered into correspondence with Mary, and received in return letters that bore to be from her, and approving of the entire plot. But plot and approval passed alike through the hands of Walsingham, Elizabeth's secretary, who had B. and six of his accomplices brought to trial, and condemned on their own confession. They were executed, September 20, 1586. The correspondence was held to reveal Mary's guilt, and the justice of her execution four months later was based mainly on her implication in B.'s plot. To the last she denied all knowledge even of the letters ascribed to her, and many have thought that Walsingham forged them himself, that he might with some show of justice dispose of one whose life was a standing menace at once to Elizabeth and to English Protestantism.

Baboon (*Cynocephalus*), the name applied to a genus of monkeys included in the section *Catarhini* of the order Quadrumana. The baboons are confined to Africa and Arabia, the latter country being zoologically 'African' in its character. These monkeys are regarded as the lowest or most brute-like forms of the true apes. They possess a short or rudimentary tail. The nostrils are oblique and set closely together. The head is of large size; the jaws being prolonged to form a dog-like muzzle, from the possession of which the generic name *Cynocephalus* ('dog-headed') has been derived. The facial angle in the baboons is about 30°. The skin of the nates or hips is destitute of hair, and assumes a hoary consistence, constituting the so-called *natal callosities*, and these in some baboons (e.g., mandrill) may be brightly coloured. In the mandrill the cheeks are also striped red and blue. The teeth correspond in number to those of man, but the incisors, and especially the canine teeth, are large and projecting. The baboons are mostly of large size. They employ the fore-limbs in running more frequently than any of the other quadrumana. Cheek-pouches, in which food may be temporarily stored, exist in these forms. The baboons are generally fierce in nature, and more unamiable than other species of monkeys. They live chiefly on fruits. They approach man's structure most nearly of all the apes in the sigmoid curve of the spine; in the concavity of the sacrum; in the convexity of the nasal bones; in the transverse breadth of the pelvis when compared with its depth from the sacrum to the pubis; and in the length of the foot when compared with the length of the spine, &c.

Mandrill.

The best-known species of baboons are the common B. (*Cynocephalus papio*), the derrias (*C. hamadryas*), the chacma (*C. porcarus*), the mandrill (*C. maimon*), and the drill (*C. leucophaeus*). The two latter forms occur chiefly in Guinea, and are avoided as fierce and predatory in habits.

Bab'rius, a Greek choliambic poet, who flourished probably in the 2d or 3d c. of the Christian era, and turned the fables of Æsop into verse. His work formed the basis of succeeding collections, that of Maximus Planudes, for instance, being evidently a prose rendering of the work of B. Bentley (q. v.) first pointed this out in his *Dissertatio de Babrio*, and it was still more clearly shown by Tyrwhitt in 1778. The edition of Knoche (Halle, 1835) contained all of B. then known; but in 1844 there was published at Paris, by Boissonade, a collection of 123 hitherto unknown fables of B. from a manuscript discovered in a convent on Mount Athos by Minoides Minas, a Greek in the service of the French government. Among the best of later editions are those of Lachmann (Berl. 1845), Lewis (Oxf. 1846-59), and Weise (Leips. 1855). See also Eberhard's *B.* (1865).

Babylon, **Babylonia**, a city and country of that flat region of W. Asia watered by the Euphrates in its lower course, and by the Shat-el-Arab, the combined stream of the Euphrates and Tigris. The city, known variously as Babylon and Babylonia, was in the days of its greatness of vast size, and occupied a site at least near to the Babel (q. v.)

of Genesis, of which B. is a Græcised form. The etymology is disputed, some contending that Babel owes its name to the circumstance of the confusion of tongues having occurred there, while others, with greater probability, interpret it as implying the gate or court of Bel, or Belus, the chief Babylonian deity. No mention is made in Scripture of Babel or Babylon from the confusion of tongues till the reign of Hosea, about 730 B.C., when the Samaritans were carried captive thither; and it is more than probable that it did not rise early into importance, but was long tributary to Nineveh. The first who brought the city into prominence was Nabopolassar, the father of Nebuchadnezzar, and the conqueror of Nineveh, who transferred the seat of government of Western Asia from Nineveh to B. But its glory was not of long duration. Though in the reign of Nebuchadnezzar it was, perhaps, the most splendid city in the world, yet in less than a century it was forced to surrender to Cyrus, and was shorn of all political greatness. The only trustworthy description we have of ancient B. is that of Herodotus, who speaks apparently with the precision and authority of an eye-witness, though the magnitude he ascribes to it has caused some to question his accuracy. The form of the city was an exact square; the streets ran at right angles to each other; there were a hundred gates of brass; and among its most remarkable structures were the brazen-gated temple of Belus, the royal palace, and the bridge over the Euphrates, with the castle forts at each extremity—structures, the erection of which, despite the magnitude assigned to them, is not incredible under a despotism where labour could be enforced by the monarch. The Scripture narrative of the capture of B. by Cyrus, and of the slaughter of Belshazzar, is brief but picturesque. The city never recovered its former splendour, though the reigns of Darius and Xerxes were not without magnificence. Alexander the Great found the temple of Belus in ruins, and wished to restore it to its ancient splendour. But the task exceeded even his energy and resources, and he did not succeed in clearing away the rubbish, though he employed 10,000 men in the work. As late as the reign of Augustus, a portion of B. was still inhabited, the remaining area being under cultivation. The ruins of Babylon were described by Mr Rich in 1811, and by Sir Robert K. Porter in 1818, with no substantial discrepancy. Mr Rich's narrative was questioned by Major Rennell, but in a reply published in 1817, Mr Rich was considered to have vindicated his accuracy satisfactorily.

The boundaries of the province of Babylonia, which is generally termed in Scripture the land of the Chaldees, cannot be strictly determined, as at different times they varied considerably. But the geographers of Rome described it as separated on the N. from Mesopotamia by the Median wall, and bounded on the E. by the Tigris; on the S. by the Persian Gulf, and on the W. by the desert of Arabia. The inhabitants, though for the most part designated Babylonians, are not unfrequently termed Chaldeans, but it is probable that these did not represent a distinct nationality, but simply a superior native caste. B., in consequence of its position between two large rivers, and its flatness (there being no elevations of consequence), was from the earliest times celebrated for its fertility, producing grain yielding in ordinary years two-hundred-fold, and in the best years three-hundred-fold. Trees were scarce. Of these, the date-palm was the most abundant, and from this the natives manufactured a heady wine, of which Xenophon makes mention in the *Anabasis*; indeed, the serviceable qualities of the date-palm were evidently exaggerated, Strabo describing it as supplying the natives with bread, honey, wine, and vinegar, and even textile materials. The weeping-willow (*Salix Babylonica*) is, despite its name, not only not a native of B., but is not grown there. An incontrovertible proof of the fertility of the district is presented by Herodotus, when he narrates that it furnished a third of the produce of the whole dominion of the Persian king. This excessive fertility was in great measure due to the excellent means of irrigation furnished by the two great rivers and their connecting canals. These were not formed by depressions in the land, but were contained in aqueducts constructed on the surface, the water being forced into them by dams, as into modern mill-races. Canals were also converted into means of defence against enemies, and to prevent invasion; of these, the most celebrated was that constructed by Queen Nitocris, which consisted of a diversion of the course of the Euphrates, and of which Herodotus has given a particular description. The canals so formed, and which Xenophon de-

scribes in the *Anabasis*, were large enough to carry provision-ships; two others (according to Ptolemy, Arrian, and other writers) were used as outlets into the sea for the superfluous waters of the Euphrates.

The general depression of the country, traversed by two full-flowing rivers, tends to the formation of marshes. These produce luxuriantly reeds and rushes; are the favourite haunts of buffaloes, and when partially dried in summer, furnish splendid crops of rice. As these marshes form natural reservoirs for the waters of the Euphrates, they have the unusual effect of making its lower occasionally narrower than its upper reaches, diminishing in places from 200 to 60 yards of breadth, though they afterwards resume their former proportions. One thing is noticeable in connection with B., that the accounts of modern travellers, so far from conflicting with those of the ancient authors, in almost every instance confirm them.

The Babylonians were members of the Aramaic branch of the Semitic family. According to the writer of Genesis (x. 10), Nimrod, son of Cush, founded the kingdom of Babel, a distinction, however, claimed by Greek historians both for the god Bel and for the mythical Semiramis. The early history of B. is involved in great obscurity. The so-called Chaldean period begins 2234 B.C., and closes 1273 B.C. From this date till 747, B. was dependent on Assyria. In 604 the seat of empire was transferred from Nineveh to Babylon; in 538 Cyrus took the city, and Babylonia became a Persian satrapy. The downfall of the Persian monarchy brought B. under the dominion of Alexander the Great, who died there 323 B.C. The Romans held it temporarily more than once. It came into the possession of the Arabs in 650, and since 1638, when the Turks wrested it from the Persians for the second time, it has formed part of the Ottoman empire in Asia.

Under Babel, an account has been given of the vast brick-mound of Birs Nimrûd; but the explorations of successive travellers have brought to light others scarcely less important,—an irresistible proof of the greatness of the early civilisation of the 'land of Shinar,' and of the magnitude of the works undertaken and completed by its rulers. Among the writers on this subject are Rich, *Babylon and Persepolis*; Porter, *Travels*, vol. ii.; Ainsworth, *Researches in Assyria*; Chesney, *Expedition for Survey of the Euphrates*; Rawlinson, *Journal of the Asiatic Society*, vol. xii.; Rawlinson, *Herodotus* (Lond. 1858); Oppert's *Expedition Scientifique en Mésopotamie* (Par. 1863), whose book marks a new era in the discussion of the subject; and Ménant's *Babylone et Chaldée* (Par. 1875).

Babylonish Captivity. In B.C. 588 Nebuchadnezzar, after the capture of Jerusalem, carried off to Babylonia Zedekiah, King of Judah, the chief inhabitants of the city, and indeed all Judah, except 'the poor of the land' (2 Kings xxv. 12). Their captivity, which lasted only fifty years, seems to have been attended by many ameliorating circumstances, for the captives lived according to their own law, and were indulged in the exercise of their religion. Their hopes of the Messianic kingdom were also raised and confirmed by the prophetic utterances of Ezekiel (Ezek. xxxvii. 20-28). On the conquest of Babylon by Cyrus in 538 B.C., liberty was given to all the Jews to return to their country. This applied also to the descendants of the ten tribes of Israel, who had been carried off long before (B.C. 722) by the Assyrian king Salmanassar, but only the 'Jews' proper, that is, the tribes of Judah, Benjamin, and Levi, availed themselves of the privilege. The other tribes, though frequent attempts have been made to identify them with existing races (Kurds, Afghans, American Indians), have not as yet been discovered.

Babyroussa Hog (*Sus Babyroussa*), a genus of the Swine family (*Suidæ*) inhabiting the islands of the Eastern Archipelago and the Malayan Peninsula, and allied to the wild boars (*Sus scrofa*) of Europe. The upper canine teeth in this form are of very large size, and are curved backwards, those of the males piercing the upper lip. The legs are elongated and of slender make.

Babyroussa Hog.

Bacchiglio, a river of Venetia, N. Italy, rises in the Alps, passes Vicenza and Padua, and enters the Adriatic 3 miles S. of Chioggia, after a course of 90 miles, of which 30 are navigable.

Bacchus (the Gr. *Dionysos*), the god of wine, and according to the most popular version of the varying myth, the son of Zeus and Semele. Before his birth, his mother, artfully instigated by the jealous Hera, requested Zeus to visit her in the full splendour of his godhead. The god, who had sworn by the Styx to grant her whatever she should ask, reluctantly consented, and Semele was consumed by lightning. B., then six months old, was enclosed for three months in his father's thigh, and some time after his birth he was consigned to the charge of the nymphs of Nysa, in Thrace, where he first taught men the cultivation of the vine. He afterwards travelled as far as India to disseminate his discovery, and was everywhere hailed as the benefactor of mankind. His worship, introduced into Greece by Melampus, was celebrated with music and song, and those who opposed it were punished by the god with madness and metamorphosis. His type in works of art varies much. Sometimes he is represented as an effeminate youth; sometimes as a man in years with a sweeping beard, and known as the Indian B.; sometimes as a warrior, having for his shield a panther's hide; and sometimes even with horns. It is in the youthful form that he is essentially the god of wine. The chief seat of his worship in Greece was Boeotian Thebes, the offering consisting of goats and oxen, and especially rams. He was associated with Demeter in the celebration of the Eleusinian mysteries, and his worship was also occasionally conjoined with that of Apollo. His festivals, observed at the vintage season, were occasions of excessive hilarity. Of these, the lesser Attic Dionysia, one of the most striking amusements of which was the Askolia, or leaping of the young on full smeared wine-skins, were accompanied with dramatic entertainments, and a banquet at the expense of the state. The great Dionysia were distinguished by the representation of new comedies and tragedies, whence B. is sometimes mentioned as the god of the theatre. The Triateric Dionysia, celebrated, as the name imports, every third year, are first met with in Boeotia, and were always distinguished by the nocturnal orgies of *Mænades* or *Bacchantes*, clad in the skins of fawns, and swinging the thyrsus with the wildest excitement and gesticulation. The worship of B., introduced from Greece into Rome, 496 B.C., where after a time it grossly degenerated, and at last was accompanied with rites so impure, that the senate, 186 B.C., after stringent inquiry, prohibited the *Bacchanalia* under severe penalties.

Bacciocchi, Marie-Anne-Elise Bonaparte, born at Ajaccio, Corsica, in 1777, was the eldest sister of Napoleon I. At Marseille, when twenty years of age, she married Felicio Pasquale Bacciocchi, a Corsican in the service of France, and rising with her brother's good fortune, in 1809 she was made Grand Duchess of Tuscany; but her administration was arbitrary and unpopular. She left Florence in 1814, on the fall of Napoleon, and died at Villa Vicentina, near Trieste, August 7, 1820. Her husband died 28th April 1841. Their daughter, **Napoléone Elise B.** (born 1810), was remarkable for her devotion to Napoleon's son, the Duke of Reichstadt, whom she is said to have nearly carried off from Austrian custody. In June 1825 she married Prince Camerata, from whom she was separated in 1830, and died in Normandy, February 3, 1869.

Baccio della Porta, otherwise **Fra Bartolomeo di San Marco**, from his having resided some time in the monastery of St Mark of Florence, born in 1469 at Savignano, Tuscany, was a distinguished painter of religious subjects. From Leonardo da Vinci he learned the art of effective colouring, and he acquired just notions of perspective from his younger contemporary, Raphael. B. died in 1517 at Florence, and in the Pitti Palace in that city his finest works are preserved. His 'St Sebastian' is much esteemed.

Bach, Alexander Anton Stephan, Baron von, an Austrian politician and statesman, born 4th January 1813, at Loosdorf, Lower Austria. After completing his education in law he entered the imperial service, and soon perceived the necessity of organisation of the empire. During the disturbances that followed the French revolution of February 1848, his known integrity and ability procured his election as one of the representatives of Lower Austria in the central commission of the provincial states. While strongly opposing the entry of the Austro-Germanic provinces into the German confederation, he advocated the recognition of their right to exercise a greater parliamentary influence on public affairs. He also proved himself a

zealous law-reformer. His determined opposition to the recognition of the independence of Hungary, made him so much an object of suspicion and dislike to the democratic party, that he deemed it prudent, in 1848, to retire temporarily from public notice; but a change of government having occurred, he became Minister of Justice; in May 1849 he was made Minister of the Interior, in which office he carried on the work of centralisation begun by Stadion, organised the political administration of the crown lands, and took part in drawing up the *Concordat* with the Pope. From 1859 to 1870 he was Austrian plenipotentiary at Rome.

Bach, Johann Sebastian, the greatest of the older German composers, belonged to a family originally Hungarian, but settled in Thuringia since the beginning of the 17th c., and was born at Eisenach, Saxe-Weimar, 21st March 1685 (the year also of Handel's birth), became court-organist at Weimar in 1708, concert-master in 1715, and cantor and musical director at Leipsic in 1723. B., who never left his native country, died 28th July 1750. He had four sons, all of them eminent for their musical gifts. Much of B.'s finest music was written for the German Protestant Church, his compositions for which include *five entire series* of cantatas for all the Sundays and holidays in the year, numerous motets, and at least two sets of 'Passions-musik.' His greatest choral work is his 'Matthew-Passion,' for performance in the Lutheran Church on Good Friday evenings. It is a kind of oratorio, at once most dramatic and most solemn, and describes the events related in the 26th and 27th chapters of Matthew in the words of the text, interspersed with comments upon them in the form of hymns and chorales. Nowhere does Bach's genius appear greater than in his treatment of the *chorale*, the German hymn-tune. 'These old melodies, as harmonised by him, seem to be transfigured. In appearance the under parts are as formal and heavy as the chorale itself (which is in the soprano); but when once they are heard, all the formality disappears; you are unconscious that what you listen to is written in conformity to a hundred artificial rules; you hear only the great soul of the most religious of musicians pouring out its noblest thoughts, and are lifted unresistingly into some calmer, serener atmosphere, above all the littleness and commonplaces of life.'

The most widely known of B.'s works are his forty-eight preludes and fugues for the pianoforte (entitled *Das Wohltemperirte Klavier*), and the gavottes, bourrees, and other dances from some of his orchestral suites, &c. Mendelssohn was an enthusiastic admirer of B., and did much to revive his music; and his endeavours have been well followed up by the living representatives of the more advanced school of music. See the biography of B. by Bitter (1865).

Bacharach (Lat. *Bacchi Arx*), an old town in the division of Coblenz, Rhenish Prussia, on the Rhine, with some river trade. Blucher here crossed the Rhine, 1st January 1814. The vicinity is noted for its wine. Pop. (1872) 1687.

Bachelor, a man who has never been married. The etymology of the word is uncertain, most probably it is connected with the Latin *baculus*, a stick, and conveys the notion of a transition or shooting forth (like a branch or twig), from a lesser to a more advanced condition. Ducange in his *Glossarium ad Scriptores Medie et Infime Latinitatis* (3 vols. Par. 1678) enters very fully into its various applications. It was given to ecclesiastics, scholars, and knights in the first grades of their professional discipline. As an academical title, B. appears to have been first used in the theological classes of the University of Paris in the 13th c. The condition of bachelorship was in ancient times viewed with disfavour by the community, the laws of Greece and of Rome imposing penalties and disabilities on unmarried men; and latterly, the laws of Rome imposed penalties on unmarried women also. Widows were allowed but one year to mourn; and the legatee was obliged to marry within a hundred days of the testator's death, or else he forfeited his legacy. However inexpedient it may seem to us that men and women should be obliged to marry under the penalty of disabilities, it will probably be generally admitted that there is at least a strong argument in favour of an extra taxation of bachelors relatively to that of married men, the latter having usually several to provide for, while the former has commonly but himself. And this principle has in times not yet old been recognised in England. In the reign of William

III. bachelorship and widowhood were taxed for the purpose of carrying on the war against France; and the servants of bachelors were put under extra taxation by Mr Pitt in 1785. Yet there is another side to the question. The tendency of human nature is not towards undue delay in marriage, but the reverse. There can be no doubt that the enormous infant mortality which prevails in the civilised world generally, is mainly owing to marriages in which the couple have not means properly to support a family. The mortality registers, and the labours of our actuaries and other men of science, give useful and interesting evidence of the varying force of the prudential check to marriage in different countries and places. See **VITAL STATISTICS**; **LIFE**, **MEAN DURATION OF**.

Bachelor, Knight. Those who have the dignity of knight-hood conferred on them, without being placed on any order, are called K.B. Knight-hood of this kind is now only conferred in Great Britain. The honour is not hereditary. See **KNIGHT**.

Back, a maritime expression of many technical meanings and applications. To *back and fill*, is a mode of tacking with the tide, and against the wind. To *back the sails*, i. e. so to arrange them as to make the ship move stern first; and when any sail is *backed*, the effect is to slacken the speed at which the vessel is progressing.

Back, Sir George, born at Stockport in 1796, and for five years a prisoner of the French in the wars with Napoleon, was associated with Franklin in his voyage in the *Trent* (1818), his expedition to Coppermine River and Fort Chippewyan (1819), and in that of 1825-27, when B. was left in charge of Fort Franklin. B.'s most important voyages were those of 1833-35, when, starting in search of Ross, he discovered Artillery Lake, and followed the Oot-koo-hi-ca-lih (Great Fish River, called also after him, Back River) to its mouth, and of 1836-37, when he brought the *Terror* through terrible difficulties off Northampton Island, obtaining for this the gold medal of the Geographical Society. He published in 1836 an account of his voyage of 1833, and in 1838 *Narrative of an Expedition in H.M.S. Terror*. B. was a Vice-President of the Royal Geographical Society, and President of the Arctic Committee. He died June 23, 1878.

Backergunge (*Bakarganj*), a ruined village of Bengal, British India, 12½ miles E. of Calcutta. It was capital of the district of B. till 1801, when the seat of government was removed to Burisaul. The district of B., intersected by many streams of the Ganges and Brahmaputra, produces rice, sugar, cotton, &c. In 1876-77 the registered exports by boat were valued at more than a million sterling; the imports at £823,000. Area, 4066 sq. miles; pop. (1872) 1,874,201. On Nov. 1, 1876, the Sundarbans portion of the sea-board was swept by a terrible storm-wave, and multitudes of lives were lost.

Backgammon (Old Eng. *bacc*, back, *gamen*, game), a game of chance played by two persons, upon a table divided into twelve points, coloured alternately, six white and six black. There are two sets of fifteen pieces or men, one set white, the other black; also two dice and two dice-boxes; the dice common to both, while each player uses his own box, and the throws are alternate. The sides of each die are marked with dots, counting from 1 to 6, and called *ace*, *deuce*, *tre*, or *trois*, *quatre*, *cinq*, *six*; at each throw of the two dice any number may turn up, from 2 to 12—doublets counting double; that is, both dice being the same number, each is twice its value, two deuces, for example, counting not 4, but 8. The numbers uppermost on the dice refer to points on the tables, on which the men are placed in an order prescribed by the rules of the game. The object of a player is to get his set of men, white or black, round into the half of the table which contains the ace-points, removing them from point to point according as the dice turn up; the dots may be reckoned separately or collectively—that is, a tre and a cinque would warrant the moving of one man 3 points, and another 5; or, provided a point be open to suit the move, one man may be advanced 8 points. No point can be moved to if it is covered by two men belonging to the other player. If the point indicated by the dice is a 'blot'—that is, if it is covered by only one man—the man can be removed and its place taken by the one which has secured it; and the removed man remains out of the game till the dice turn up a point corresponding to one which is open on the other player's table. When restored, it has to be worked round like the other pieces in the set to which it belongs. There are two

kinds of victory—a hit and a gammon, two hits reckoning equal to one gammon. To win by being the first to play the men off the points is a hit. When the other player has one man out, to win before he gets it replaced is a gammon. As in whist, two games won out of three is a rub.

Backhuysen, or Bakhuisen, Ludolf, a famous Dutch marine painter, born 1631, at Emden, died at Amsterdam, 1709. He was remarkable for the devotion and assiduity with which he studied from nature. Storms called him out to sea, in his small boat, to sketch and observe. The result was, that for truthfulness his pictures took the first rank. His best work was bought for 1300 florins and presented to Louis XIV., and this, together with seven other examples of his manner, may still be seen in the Louvre. His grandson, also named Ludolf, first a merchant, then a soldier, and finally a painter, has executed some fine battle-pieces.

Back-Stays, the name given to the long ropes reaching from the topmast-heads to the sides of a vessel, and so attached as to be a support to the masts.

Backwarda'tion. See **EXCHANGE**.

Bacolor, the capital of the province of Pampanga, in the E. Indian island of Luzon, on a canal connecting it with the river Pampanga, 38 miles N.W. of Manila. Pop. 8737.

Bacon, the cured or salted flesh of the domestic pig. Its composition and properties as an article of food will be described under **PORK**, which is the same meat in a fresh state.

Bacon, John, an able sculptor, born in London, 1740. He was trained as a porcelain painter, commenced to model 1763, won the Royal Academy's first prize 1769, and died 1799. He is best known for his monuments of Lord Chatham in Westminster and Guildhall, and his fine statues of Howard and Dr Johnson in St Paul's.

Bacon, Sir Nicholas, father of Lord Bacon, was born at Chiselhurst, Kent, in 1510. After an education at Cambridge, which he improved by foreign travel, he studied law, and, in 1537, was made Solicitor to the Court of Augmentations. In 1546 he was appointed by Henry VIII. Attorney of the Court of Wards, an office which he retained under Edward VI., but was deprived of it by Mary, because he had adopted the Protestant faith. Elizabeth, however, intrusted him with the Great Seal (December 1558), making the appointment by letters-patent, and consequently permanent. Three months later he was called on to preside over the abortive conference held at Westminster to discuss several differences between Protestants and Roman Catholics. He experienced a transient eclipse of the royal favour, from having been supposed accessory to the writing and publishing of a book questioning the title of Mary of Scotland to succeed to the English throne on Elizabeth's death. B. died 20th February 1579, leaving behind him the reputation of a wise councillor, a sagacious statesman, and an honest Englishman.

Bacon, Francis, Lord Verulam, Viscount St Albans, known generally by Pope's characterisation as 'the wisest, brightest, meanest of mankind,' was born in London, January 22, 1561. His father was Sir Nicholas B., his mother was Ann Cooke. From a very early age he showed a keen love of knowledge, and this, taken with his precocious gravity, is said to have made Queen Elizabeth playfully style him her 'young Lord Keeper.' He studied at Trinity College, Cambridge, where, it is said, he acquired his hatred of Aristotelianism, and began to sketch his own scheme of philosophy. Leaving college, he went to Paris, under the care of Sir Amias Paulet, ambassador at the French court. There he occupied himself with diplomacy and scientific investigation until 1580, when the death of his father recalled him to England. After an unavailing attempt to obtain a sufficient provision from government to enable him to pursue his studies in science and literature, he sought to obtain preferment by studying for the law and taking part in court intrigues. His professional promotion was slow. His bright talents excited the alarm of his uncle, Lord Burleigh, then Premier, who saw in him a most formidable rival to his own son Robert. Although B. then paid court to Burleigh's rival, Essex, the latter was not powerful enough to prevent him from being defeated in his contest in 1594 for the Attorney-Generalship. To make up for this defeat, Essex presented B. with an estate at Twickenham worth £2000 a year. Yet B. is found as the chief persecutor of Essex,

both by pen and tongue, for conspiracy against the queen, and although various attempts have been made to explain this away, it is impossible to acquit him of ingratitude. B., who had entered Parliament as member for Middlesex in 1595, rose rapidly in the reign of James I. He was knighted in 1603, became Attorney-General in 1613, in which office he also shows himself in an unfavourable light, as countenancing the torture of an old clergyman of the name of Peacham by the rack; Keeper of the Great Seal in 1617, and in 1619 Lord Chancellor, with the title of Lord Verulam. Next year he was made Viscount St Albans. It seems undoubted that B. abused the high position he had now attained, by taking advantage of his judicial functions to increase his revenues, which, although he had married the daughter of a wealthy alderman, were not large enough to meet his extravagances, and there seems to be no doubt that he took bribes from suitors. The scandal became so great, that neither the king nor his favourite Villiers, to whom he had truckled in the most abject manner, could shield him from popular indignation; a parliamentary inquiry was instituted in 1621; B. confessed to twenty-three acts of corruption, and was sentenced to a fine of £100,000, to be confined in the Tower during the king's pleasure, and to be banished for life from the court and from public employment. Although the fine was remitted, and the imprisonment only lasted two days, B. never returned to public life, but on a pension of £1200 a year devoted himself to literature and science. His death took place in 1626, the common story being that he caught a chill while endeavouring to test the power of snow to preserve flesh. His debts amounted to £22,000.

Considering his lamentable failure in public life, it is to be regretted that B. did not devote himself absolutely to literature and science. As it is, his intimacy with every department of human knowledge except mathematics is marvellous; while few writers have been more eloquent, more imaginative, or more witty. The titles of some of his books, his *Essays*, a moral treatise, his *Advancement of Learning*, considerably enlarged in its Latin form, *De Augmentis Scientiarum*, his *Wisdom of the Ancients*, his *Novum Organum*, meant, like the *De Augmentis*, to form part of a *Magna Instauratio*, or *Great Restoration of Philosophy*, which was never completed, and the *Theory of the Reign of Henry VII.*, themselves show the extent of the field over which he travelled. But great as are his claims to fame as a moralist, an historian, a writer on politics, and a rhetorician, he will be best known as, 'if not absolutely the father of Inductive Philosophy, in the sense of the inventor of the method of interrogating nature by experiment and observation, the populariser of that philosophy.' Mr Spedding says that British Philosophy 'was born about B.'s time, and B.'s name (as the brightest which presided at the time of its birth) has been inscribed upon it:—

"Hesperus, that led
The starry host, rode brightest."

Not that Hesperus did actually lead the other stars; he and they were moving under a common force, and they would have moved just as fast if he had been away; but because he shone brightest, he looked as if he led them. Various editions of B.'s works have been published; by far the best is that of Messrs Spedding, Ellis, and Heath (Lond. 1858-74). The *Novum Organum* has been admirably edited by Fowler of Oxford (Lond. 1878).

Bacon, Roger, an English monk of the 13th c., remarkable for his great scientific and philosophical knowledge, and conspicuous as one of the earliest assertors of the true experimental nature of physics, was born at Ilchester, Somersetshire, in 1214. After studying at Oxford and Paris, he entered the order of St Francis in 1240, and thenceforward ardently devoted himself to chemical, physical, and mathematical science. His experiments and discoveries excited the jealous suspicions of his brother monks, which feeling deepened into one of implacable hatred on his denunciation of their ignorance and immorality. Accused of being a magician, he was confined in his cell, without the privilege of seeing even his friends. He enjoyed a brief space of tranquillity while Clement IV. was pope, but in 1278 he again suffered imprisonment for ten years. B. died at Oxford, June 11, 1292. His great work is his *Opus Majus* (Jebb, Oxf. 1733). According to Whewell, it is 'at once the encyclopedia and the *novum organum* of the 13th c.' He had a knowledge of the nature of lenses, and is held by some to have been the inventor of the telescope; he was extensively acquainted with astronomy and geography; and is supposed to have been acquainted with

the nature and composition of gunpowder. It may be added that his linguistic knowledge was also extraordinary. He had a profound knowledge of Latin, Greek, Hebrew, and Arabic, and ransacked the treasures of antiquity in pursuit of scientific truth. The *Opus Minus*, *Opus Tertium*, and other writings of B., were published by Brewer (Lond. 1859). See also Siebert, *R. B., sein Leben und seine Philosophie* (Marb. 1861); Charles, *R. B., sa Vie, ses Ouvrages, ses Doctrines* (Bruss. 1861); and Green's *Short History of the English People*, pp. 133-36 (Lond. 1875).

Bacon-Beetle. See DERMESTES.

Bacsan'yi, János, a Hungarian novelist and poet, born May 11, 1763, at Tapolcza, became known at first by his *A Magyarok Vitézsége* ('The Valour of the Magyars,' Pesth, 1785). He worked on the *Magyar Museum* (which he assisted in founding) from 1788 to 1795, and took part later in editing the *Magyar Minerva*. In 1805 he married Gabrielle Baumberg, the German poetess ('Amor und Psyche,' Vienna, 1807). On the capture of Vienna by the French, B., having translated Napoleon's proclamation into Hungarian, was obliged to flee to Paris. He died at Linz, 12th May 1845. B. published a collection of his works at Pesth in 1827, which reached a second edition in 1835.

Bacteria, the name applied to certain microscopic rodlike bodies, which appear in infusions of organic matter, and in fluids exposed to the air. Some naturalists maintain that they are formed by the union of the organic molecules or minute particles of the fluids. B. exhibit independent movements, and probably represent stages in the development of some of the lower forms of plant-life. They are interesting in connection with the subject of SPONTANEOUS GENERATION (q. v.).

Bact'ria, or **Bactria'na**, the ancient name of the district which, though its exact boundaries are uncertain, coincided in the main with the modern Balkh or Afghan province of Turkestan. See BALKH and TURKESTAN. It was to a large extent mountainous, with intervening steppes and sand-tracts, and fertile vales along its numerous diminutive streams. Hence it was well peopled. B., the capital, was the cradle of the old religion of Persia, and the principal seat of the Magi. Zend was the language of the Bactrians, and being akin to the Sanskrit, it is not surprising that on the coins of the Greek kingdom of B. there are not only Greek characters, but characters of an Indo-Scythian dialect, which have been happily deciphered by Prinsep. After the death of Alexander, B. became a province of the Græco-Syrian kingdom of the Seleucidae, but secured its independence under Diodotus I. (B.C. 256). See Wilson's *Ariana Antiqua* (Lond. 1841), and Lassen's *Indischen Alterthumskunde* (Bonn, 1849).

Bact'rian Camel (*Camelus Bactrianus*), a species of camel distinguished from the Arabian camel or dromedary by the

Bactrian Camel.

possession of two humps on the back. The native regions of this species lie to the S.E. of Arabia, and extend over Central Asia and China even to India. In Asia, its northernmost limit appears to extend to the 60° of latitude. It occurs in the Crimea, and extends from Arabia westwards to the territory between the Caspian and Black Seas. See also CAMEL.

Bactrites, a genus of fossil Cephalopods or cuttlefishes, belonging to the family *Ammonitida*. The shells of these forms occur in strata ranging from the Lower Silurian to the Devonian formations.

Baculites, a genus of extinct cuttlefishes included in the family *Ammonitida*, the shells forming simple, straight, elongated cones. These forms are found in strata ranging from the Lower Greensand to the Cretaceous rocks, and are most abundant in the latter formations.

Bacup, a flourishing town of Lancashire, 12 miles S.E. of Blackburn, and 15 N. of Manchester, with large cotton factories, brass and iron foundries, and dye-works. It is the centre of a rich coal-mining district, and in the vicinity are extensive woollen factories. Pop. (1871) 17,199.

Badag'ry, a town on the Gold Coast, 315 miles W. of Cape Coast Castle, formerly a centre of the slave trade. It now belongs to Britain, and has some export trade. Pop. 10,000.

Badajoz (a corruption of the Moorish *Beledaix*, 'land of health,' and the *Pax Augusta* of the Romans), the capital of the province of Estremadura, Spain, about 5 miles from the Portuguese frontier, on the Guadiana, here spanned by a bridge of twenty-eight arches. It is a fortress of the first rank, and the seat of a bishop, with a cathedral containing a magnificent organ and several fine paintings. It lies in a fertile region, and, as one of the keys of Spain, has suffered much from war. The French besieged it thrice (1808, 1809, and 1811), and on the last occasion it surrendered. It was also invested three times by the English under Wellington, twice in 1811, and again in the following year, when it was taken by storm (April 6, 1812), after a fierce conflict and great loss of life, the killed and wounded on the British side amounting to about 5000. B. has manufactures of coarse woollens, soap, and leather, and carries on a considerable contraband trade with Portugal. The celebrated painter 'El Divino' Morales, was born here in 1509. Pop. 22,895.

Badakhshan, a state in Turkestan, Central Asia, lies between the Hindu Kush mountains and the river Amu-Daria (anc. *Oxus*), within lat. 36°–38° N., and long. 69°–73° E. It is a well-watered, richly-cultivated hill country, abounding in beautiful valleys, and covered with extensive woods. The mountain chains contain ruby-mines, and occasional deposits of lapis-lazuli, a mineral chiefly found in this region. The pop. is estimated at 500,000, principally Tajiks, an Aryan people, professing the Mohammedan religion and speaking the Persian language. B. is ruled by a 'Mir,' and may be regarded as an independent kingdom, although it has frequently been annexed to Afghanistan, and is still struggling for independence. B. is also the name of the chief town. See Yule's *Marco Polo* (new ed. Lond. 1875); *Quarterly Review*, April 1873; and *Edinburgh Review*, July 1873.

Bädeker, Karl, whose name at least is known all over the Continent, belongs to an old publishing family originally from Bremen, and was born at Essen, 3d November 1801. In 1827 he started business for himself at Coblenz, and in 1839 published the first of his admirable series of handbooks of travel (now translated into English and French) under the title of *Rheinlande* (18th ed. 1874). It was followed by his *Belgien und Holland* (13th ed. 1875), his *Deutschland und Oesterreich* (16th ed. 1874); *Schweden* (16th ed. 1875); *Paris und Nord-Frankreich* (9th ed. 1874); *Italien* (3 vols. 4th ed. 1875), &c. B. died 4th October 1859. The business of the firm is now carried on by a younger son, who has continued the series in his *Syrien und Palästina* (1875).

Ba'den, a grand duchy in the S.W. extremity of Germany, about 150 miles long, and from 10 to 97 miles broad, with an area of 5910 sq. miles. It is bounded on the N. by Bavaria and Hesse-Darmstadt; on the E. by Würtemberg and Bavaria; and on the W. and S. by the Rhine, which separates it from Rhenish Bavaria, Alsace, and Switzerland. With the exception of the western portion along the right bank of the Rhine, the country is mountainous, the most prominent range being the Schwarzwald or Black Forest (q. v.), which extends from the Swiss frontier northward through B. and Würtemberg. The portion lying to the N. of the Murg, as far as the Neckar valley, is known as the Neckar highlands. The principal rivers are the Rhine, flowing out of the Bodensee, with its tributaries the Wutach, Wiese, Elz, Kinzig, Acher, Murg, Pinz, Salbach, and Neckar, one of the most beautiful of purely German streams; on the N.E. the Main, on the Bavarian border, with the Tauber, an affluent from Würtemberg; and in the S.E. the Danube.

Besides the Bodensee, the largest and the finest of German lakes, there are in the Black Forest numerous small lakes or tarns, as the Zellersee, Titisee, Feldsee, and Mummelsee.

Owing to the great variations in altitude, the climate of B. presents considerable variety; and consequently there is a great diversity in the produce. There are vegetables and cereals of all kinds, including maize; also tobacco, hemp, succory, &c., from which a large revenue is raised annually; chestnuts, walnuts, almonds, apples, pears, and other fruits, grow in abundance; about 16,500,000 gallons of wine are produced yearly. Of minerals, there are silver, lead, iron, gold, and several kinds of precious stones. B. is also rich in mineral springs, and there are consequently numerous favourite watering-places, such as Baden-Baden, Badenweiler, Rippoldsau, Ueberlingen, Griesbach. The principal manufactures are cotton fabrics, trinkets, tobacco, chicory, paper, leather, beer, and articles of straw. The chief exports are wine and timber; the imports are colonial goods, horses, wool, cotton, silks, iron, &c.

In 1871 the pop., two-thirds of which are engaged in agricultural pursuits, numbered 1,461,562; of which 64.6 per cent. were Roman Catholics, 33.53 per cent. Protestants, 1.76 per cent. Jews, and the rest Dissidents and Mennonites, or Baptists. The estimated expenditure for 1875 was £1,510,046, and revenue £1,494,824. The general debt in 1874 amounted to £2,468,962; the railway debt to £12,465,665. The government of B. is a monarchy, constitutional and hereditary, based upon the charter of August 22, 1818. Two chambers compose the Parliament, which meets every two years, the first chamber consisting of representatives of the nobility, of the landed interest, of the Church, and of the universities; the second of 22 deputies for certain towns, and of 41 for the country districts. The army, which is under the control of the state, amounts in peace (1875) to 14,228 men, in war to 25,843.

The Alemanni, the original inhabitants of B., were conquered by the Franks; and owing to their repeated endeavours, especially under their 'Duke' Gottfried, from whom the present rulers of B. claim descent, to regain their freedom, Pippin the Little abolished the dukedom in 748. Still the family did not become extinct, and in an obscure way struggled to maintain a kind of hold on the land in that region. We read of Gerolds and Gebhards who dimly figure as counts there. At last, in the 11th c., one of these, Berthold, favoured by the Emperor Heinrich III., established himself as a 'Duke,' and from him, at any rate, through his second son, Hermann, we have an unbroken series of princes of the Badenese house of Zähringen; but the family vicissitudes were numerous, and every now and again the main line died out, and recourse was had for princes to subordinate branches. The Markgraf Christoph (died 1527) united all the Badenese lands; but divided them anew among his three sons. The family of one of these soon became extinct; the other two founded the houses of Baden-Baden and Baden-Durlach; but in 1771 the former died out, and the family possessions were again reunited. Karl Friedrich, who began to rule in 1746, greatly increased by his policy the influence and importance of B. His reign is one of the longest on record—65 years. Karl favoured the policy of Napoleon, and was raised to the dignity of Grand-Duke when he joined the Confederation of the Rhine. His grandson, Karl Ludwig Friedrich, went a step further, and married (1806) Stephanie Louise Adrienne Napoléone, an adopted daughter of the French Emperor, but after the battle of Leipzig abandoned the Confederation of the Rhine, and in 1815 joined the national *Bund*.

From 1815 to 1848 the history of B., like that of most other German states, is the history of parliamentary struggles to secure a liberal administration, to which, as a rule, the sovereigns and their advisers were obstinately opposed. But in 1846, it became necessary to call the Liberal party into power to quell the agitation in the country, and a number of wise and conciliatory reforms were passed. The outbreak of the French revolution, however, in 1848, stirred up discontent anew. The left wing of the Liberal party became clamorous for a republic, the troops fraternised with the insurgent democracy, and the Grand-Duke fled (May 1849). But Prussia was resolved that Germany should not dissolve into political chaos. By her help the Grand-Duke recovered his dominions in a couple of months, and although numerous executions took place, many important reforms were introduced, and B. gradually abandoned both reactionary and radical politics, and settled down into a mode-

rate Liberalism, which ecclesiastical conflicts have disturbed, but not destroyed. In 1870 B. took an active part in the Franco-Prussian war, and became a member of the German Empire, November 15, 1871. See Bader, *Badenia, oder das bad. Land und Volk* (new ed. 1858-62, 2 vols.); Hennisch, *Das Grossherzogthum B.* (1857); Pflüger, *Bad. Vaterlandskunde* (1866); and Friedberg, *Der Staat und die Kathol. Kirche in B.* (1871).

Bad'en, a Swiss town, canton of Aargau, with warm baths (the *Therma Helvetica* of the Romans), and the seat of the Swiss Diet till 1712. Pop. (1870) 3412.

Bad'en-Ba'den, a town in a valley of the Schwarzwald, Grand Duchy of Baden, celebrated for its hot springs, the salubrity of its atmosphere, and the picturesque beauty of the surrounding scenery; hence from May to October it is crowded with visitors in search of health. Its famous, or rather infamous, gaming-tables were closed in 1872, with the other licensed gambling-houses of Germany. In 1860 there were as many as 46,842 visitors to B., but the number has since declined. Pop. (1873) 10,080.

Bad'en bei Wien, the *Therma Cælia* or *Pannonia* of the Romans, an Austrian watering-place, 15 miles S. of Vienna by rail, which has sometimes over 15,000 visitors. The baths, from being used by both sexes in common, are called 'society-baths.' Pop. (1869) 7590.

Bad'enoch (the derivation of the word is uncertain), a district in the S.E. of Inverness-shire, traversed by the Spey, is chiefly notable as having been for a time held by the house of Comyn, on whose forfeiture it was bestowed by Bruce on his nephew Randolph. In 1371 it was given by King Robert II. to his son, known as 'the Wolf of B.,' reverted on the failure of his descendants to the crown, and in 1456 was granted to the Earl of Huntly. The greater part of it is covered with forests.

Badge. Emblems denoting titles and dignities in general are called badges; and in certain orders the word is used especially to denote the pendant which forms part of their insignia. In all the affairs of life, mankind love the emblems of rank and pomp; the quality and quantity of them frequently forming the subject of serious dispute, even of bitter conflict, political or ecclesiastical; a fact which might almost lead us to acquiesce in the satire conveyed in Swift's account of the *Pig* and *Little Endian* warfare of Lilliput. Recently, the throne of France was declined on account of a B. While it is often difficult to see, or even to conjecture, what is the virtue, prowess, or legend of which badges are meant to be emblematic, the subject is nevertheless generally interesting, and not without special value to the archaeologist. The following are a few of the most famous badges:—

France—The *fleur-de-lis* and the imperial eagles.

England—The red rose and the white rose, with crown.

Scotland—The thistle with crown.

Ireland—The harp and crown, and the shamrock and crown.

Order of the Garter—
Insignia.

Order of the Garter.—A dark-blue ribbon edged with gold, bearing the motto *Honi soit qui mal y pense* in golden letters, with buckle and B. of gold. The collar is of gold. The George—which is the figure of St George and the Dragon—is worn to the collar. The star is silver, with the cross of St George in the centre, encircled with the garter. See GARTER, ORDER OF THE.

Order of the Thistle.—A star, with the motto *Nemo me impune lacessit*; also collar and B., with the cross and figure of St Andrew. See THISTLE, ORDER OF THE.

Order of St Patrick.—A collar of gold, with a crown in the centre, within which a band of blue enamel, with the motto *Quis separabit*, MDCCCLXXXIII. Attached to the crown is a harp of gold, from which hangs a golden B. or jewel.

See PATRICK, ST, ORDER OF.

Badger (*Melos*), a genus of Carnivorous mammalia, forming the type of the family *Melidae*, the members of which are *plantigrade*—that is, apply the whole sole of the foot to the ground in walking. The body in the badgers is elongated. The legs are shortened. The carnassial tooth—the last tooth but one in the upper, and the last tooth in the lower jaw—of the badgers has only a part of its edge sharp and cutting, and it is only partly tuberculate, or provided on its surface with small points or tubercles. The common B. (*Melos taxus*) inhabits Britain, Europe, and Central Asia. It averages 2½ feet in length, and in height measures from 10 to 12 inches. It is coloured greyish-brown on the upper, and black on the under parts. The head is white, and marked on the cheeks by a longitudinal black band. The fur is of coarse texture. It is nocturnal in habits, and appears to be of inoffensive disposition, although when attacked—as by dogs, in the sport formerly pursued and known as 'badger-baiting'—it can bite very severely, and defend itself with pertinacity and courage. It feeds chiefly on roots, but also eats fruits, and all kinds of animal substances. It burrows in the ground, and lives within the excavation. The flesh, though coarse, is eaten, especially in China. If taken young, the B. may be domesticated. The 'Sifleur' (*Melos Labradoricus*), or American B., occurs in Canada and the United States. It is an expert burrower, and hunts the smaller mammalia. It is of a grey colour in winter, and yellowish-brown in summer. The Indian B., or *Balsaur* (*Melos collaris*), inhabits the mountainous districts of Hindostan. This latter species much resembles the common B. in size, but it possesses a muzzle-like snout, and the tail is small and destitute of long hairs. A Japanese species (*M. amakinna*), Temminck, has also been described.

Badger.

The honey-badgers, or rats (*Melivora*), found in Southern and Eastern Africa, &c., are so named from their partiality for honey. They resemble the common B. in appearance, but present certain structural differences from that form. The *Melivora Capensis* of the Cape and the Indian ratel (*M. Indica*) are familiar species.

Badi'a-y-Leblieh, Domingo, an African and Asiatic traveller, born at Barcelona, 1st April 1767. Being early smitten with the love of travel and adventure, he departed for Africa in 1803 disguised as a Mussulman, having previously acquired a competent knowledge of Arabic, and of the manners and habits of those he meant to visit; and to give colour to his pretence of being descended from the Abbasides, assumed the name of Ali-Bei-el-Abbassi. The Emperor of Morocco invited him to his court, whence he set out in 1805 for Mecca, which he reached in 1807. After travelling for a short time in Palestine, he reached Constantinople, where the genuineness of his faith was suspected, and he retired to Spain. Here his patriotism yielded to his interests, and he submitted to the sway of the French on their conquest of Spain. After the English had expelled the invaders from the Peninsula, B. retired to Paris, where in 1814 he published a narrative of his travels:—*Voyages de Ali-Bei en Afrique et en Asie pendant les Années 1803 à 1807*. During a second journey in the East, of which no record has been preserved, he died suddenly, August 30, 1818, at Aleppo.

Bael or **Bhel Fruit**, the fruit of *Aegle marmelos*, a plant closely allied to the orange. The fruit, which possesses a very delicate taste and a fine odour, is the original source of marmalade. The rind of the unripe fruit is stringent, and is an official remedy for diarrhoea and dysentery.

Baer, Karl Ernst Von, a Russian naturalist, born in Esthonia, 17th February 1792. After studying medicine at Dorpat from 1810 to 1814, he proceeded in the latter year to Germany to complete his scientific education; thence to Königsberg in 1817, where, besides exercising the functions of professor of zoology, he organised the zoological museum. In 1834 he was called to St Petersburg, and in 1837 he was sent by the Czar on an arctic expedition. On his return he published an interesting account of the fauna and flora of the northern coasts of Russia. In 1858 he was elected a corresponding member of the French Academy

of Sciences. In addition to valuable researches in embryology embodied in his *De Ovi Mammalium et Hominis Genesi* (Leips. 1827), B. has published *A History of the Development of Animals* (Königs. 1828-37), and *Studies on the Russian Empire and the Neighbouring Countries of Asia* (St Petersburg. 1856). During 1851-56 he devoted his attention to the Russian fisheries in the Baltic, the Caspian, and Lake Peipus, and the results of his investigations are contained in 4 vols. (St Petersburg. 1857-59). Numerous valuable papers of B.'s are contained in Helmersen's *Beiträge zur Kunde des Russischen Reichs* (vol. i.-xxii., St Petersburg. 1839-61). He died at Dorpat, 28th Nov. 1876.

Bae'na, a town of Spain, province of Cordova, on the river Marbella, 24 miles S.S.E. of the city of Cordova, has considerable trade in oil and grain. It is built on the site of a Roman town, many remains of which have been discovered. The climate, water, and fruits of the district are delicious. Pop. 11,600.

Bae'za (anc. *Bratia*, or *Biatia*), an old town in the province of Jaen, Spain, near the Guadalquivir, 22 miles N.E. of the city of Jaen. It was the scene of the defeat of Hasdrubal (B.C. 209) by Scipio the Elder; became an important place under the Moors; but in 1239 was sacked by St Ferdinand, and has never flourished since. There are, however, some noble buildings of the 16th c., chief of which is the cathedral, modernised in 1587. The sculptor Gaspar Becerra was born here in 1520. It also claims to be the birthplace of 'the 11,000 virgins of Cologne.' Pop. 13,400.

Baff'a, a small seaport of Cyprus, on the S.W. coast of the island, occupies the site of the New Paphos, which was destroyed by an earthquake in the time of Augustus, but was soon rebuilt. To the S.E. stood Old Paphos, the chief seat of the worship of Venus, with innumerable splendid temples. It was believed to be the favourite residence of the goddess, and the point where she first landed when she rose from the sea. Under the Venetians B. was a flourishing place, but it is now a decayed town with an inconsiderable trade.

Baffin's Bay, so called from its discoverer, William Baffin, who in 1616 sailed along its eastern fringe, and believed it to be a bay. During the 17th and 18th c. the honesty of Baffin was disbelieved, and his discoveries expunged from the charts. In 1818 Sir John Ross sailed over the track of Baffin, and verified his discoveries. Arriving, however, at the extreme N. of B. B., Ross imagined he beheld the land closed in this direction by a line of mountains running E. and W. In the following year Sir Edward Parry sailed over these supposed mountains into Smith's Sound, thus proving that what is generally termed B. B. is really a great inland sea extending between the W. coasts of Greenland and the shores of the most easterly of the islands forming the Arctic Archipelago of N. America. Length about 600 miles, breadth about 300. It is open and navigable only for about two months in the year.

Bagaria, or **Bagheria**, a town of Sicily, 9 miles E. by S. from Palermo by rail, beautifully situated between the bays of Palermo and Termini, and a favourite resort of the Sicilian nobility. Pop. 12,950.

Bagasse, the refuse of sugar-canes after they have been passed through crushing-rollers and the saccharine juice extracted. It is used as fuel in the concentration of the juice by boiling, and the ash left after burning is returned to the soil as manure.

Bagatelle (*Fr.* a trifle), a game in some respects like billiards, but played on a small board or table, circular at one extremity, where a series of nine cups are arranged for receiving the balls. The game is usually played with nine balls,—four white, four red, and a black 'tee' ball. The methods of playing and the rules of the game vary considerably, but being chiefly a domestic or family amusement, players have much liberty to please themselves as to regulations.

Bagdad, the chief town of the vilayet of B., Asiatic Turkey, 220 miles S.E. of Aleppo. Originally built on the right bank of the Tigris, it is now intersected by the river, the two portions being connected by a bridge of boats, which is defended by a citadel on the left bank. A wall of brick and mud, 5 miles in circumference, encloses the town, the houses of

which are constructed of brick. B. has been built on no regular plan, and the narrow, tortuous, unpaved streets teem with impurities, which would greatly endanger the public health were they not speedily removed by the troops of hungry dogs, which swarm here, as in the other cities of the East. The meanness of the exterior of the houses is frequently compensated for by their gorgeous internal decorations. The public buildings are mainly the mosques, the caravanserais, and the bazaars. The mosques, 100 in number, are distinguished by massive and lofty minarets, but the bazaars yield in magnificence to those of many Eastern cities. The principal trade of B. is with Aleppo and Damascus; and its chief manufactures are of leather, and stuffs of silk and cotton. B., founded in 763 by the Calif Almansur (q. v.), and enlarged and beautified by his successor, Harun-al-Rashid, has been successively conquered by Seljukide Turks, Tartars, Persians, and Ottoman Turks, to whom it has been subject since 1638. Pop. (1873) 60,000. The vilayet of B. 550 miles by 350, area about 93,000 sq. miles, supposed pop. 2,000,000, comprehends Khuzistan, Kurdistan, Algesirah, Irak-Arabi, and a barren waste W. of the Euphrates; products, maize, rice, tobacco, dates, &c.; and is notorious for the lawlessness of its inhabitants.

Baggage. According to the marching regulations of the British army, a private soldier is allowed to carry nothing except what his knapsack can hold. Married men have a small extra allowance. See CARRIERS, LAW REGARDING.

Baggesen, Jens, a popular Danish poet, well known also in German literature, was born, February 15, 1764, at Korsör, in the island of Zealand. He went to the University of Copenhagen in 1782; and, while a student there, gained some reputation as a writer of songs, odes, and comic tales. B. published at Copenhagen, 1790, in Danish, *Holger Danske*, an opera; in 1803, at Hamburg, a collection of poems in German; in 1806, also in German, *Parthenais oder Alpenreise*, an idyllic epic written in hexameters, which was very successful. In 1811 he was appointed professor of the Danish language and literature at Kiel; but never fairly settling down to the work of this chair, he went to Copenhagen in 1814, where he received a pension of 1500 dollars (£165) a year. Here he criticised with unseemly severity the works of Oehlenschläger, a younger dramatist, whose brilliancy and popularity had put B. considerably in the shade. This created a literary quarrel between the two poets and their partisans, which lasted till 1820, when B. finally left his native country. His Danish dramas have little merit; but the lyrics and comic epics are highly esteemed by his countrymen. He shone at his brightest in the serio-comic treatment of a theme. In *Der Vollendete Faust*, left by him in MS., he satirises the scientific and political follies of his time; and in *Adam und Eva, oder die Geschichte des Sündenfalls*, published shortly after his death, he treats a very grave subject rather gaily. He died at Hamburg, October 3, 1826. His lasting monument in literature is an edition of his *Poetische Werke in Deutscher Sprache* (Leips. 5 vols. 1836), edited by his son, who contributes a biography. His Danish writings in 12 vols. were published at Copenhagen (1827-32, new ed. 1845-48). His correspondence with Reinhold and Jacobi appeared at Leipsic in 1832, and some posthumous fragments edited by his son August at Copenhagen in 1855.

Baglivi, Giorgio, an Italian physician, born at Ragusa, September 1669; studied at Padua and Bologna; removed to Rome in 1692, and was there made professor of anatomy by Clement XI. He advanced medical science by discarding humoral pathology, which made the fluids of the body the original source of disease, for 'solidism,' which maintains that the solids are first affected, and the fluids only secondarily—a doctrine which has since his time gradually gained ground, Hoffmann and Cul'en having further elaborated it. B. died at Rome in 1706. There have been several reprints of his complete works, *Opera Omnia Medico-Practica*, since their first publication at Leyden in 1704.

Bagna-Cavallo ('the horse's bath'), a town of Italy, province of Ravenna, 12 miles W. from Ravenna by rail, has a cathedral dedicated to Michael the Archangel, and was the birthplace (1484) of Bartolomeo Ramenghi (better known as Bagnacavallo), a famous artist. Pop. 4000.

Bagna'ra (lat. *Portus Orestis*), a seaport in the province of Reggio (Calabria), S. Italy, situated near the extremity of the peninsula, in a rich wine country. Pop. 8517.

Bagnères, the name of two well-known watering-places in the S. of France.—1. **B. de Bigorre** (Lat. *Agua Bigerrionum* and *Aguensis Picus*), in the department of Upper Pyrenees, at the mouth of the fine valley of the Campan, overhung by Mont-alivet, has over 40 saline springs from 20° to 60° R., which attract about 20,000 visitors yearly. B., known as the French *metropole des eaux thermales*, has also some manufactures of woollens, linens, and barèges. Pop. (1872) 7239.—2. **B. de Luchon** (Lat. *Agua Convenarum*), in the department of Upper Garonne, at the junction of the rivers Pique and One, near the entrance to the *Val d'Aran*. It has 54 sulphurous springs, from 16° to 58° R., and is one of the most picturesque and flourishing bathing-places in France. Pop. (1872) 3750.

Bagnes, the name given to the convict prisons of France. In former times, labour at the galleys was the severest punishment short of death inflicted on criminals. The Galley (q. v.) was worked by the convicts, or galley-slaves, chained to the oars. This system was abolished in 1748, and labour in the B. put in place of it. In these establishments, in later times at least, the plan and discipline appear to have been good. Under the *Code Napoleon*, convicts were employed in work profitable to the state, and various handicrafts were taught under the superintendence of skilled teachers. Good behaviour was rewarded with relaxation, and the industrious were allowed to retain a portion of their earnings. In 1852 the B. were suppressed by the imperial government, and transportation to Guiana put in place of them, the choice being left to those in prison at the time to remain or be transported.

Bagnes-le-Chable, a village on the left bank of the Dranse, canton of Valais, Switzerland. It has suffered much from inundations. Pop. of the village, 4254; of the parish, 9000.

Bagno (plur. *bagni*), the Italian form of 'bath,' entering into the name of numerous places in Italy noted for their saline or other springs. Among these may be mentioned :—1. **Bagni di Lucca**, a village in the province of Lucca, and a favourite resort on account of its hot springs and the amenity of its neighbourhood. Its prosperity depends much on its foreign visitors, who constitute a great part of its population. Gambling, formerly a favourite pursuit here, was suppressed in 1846. Pop. of commune (1861) 8238.—2. **Bagno a Ripoli**, a fashionable bathing-place in the province of Florence, a few miles E.N.E. from Florence. Pop. 14,385.—3. **Bagno in Romagno**, 35 miles E. by N. from Florence, with hot springs and an old church. Pop. 7165. The surrounding country is fertile, and the mast of the forests on the neighbouring mountains supports numerous swine.—4. **Bagni di S. Giuliano**, near Pisa, much frequented in early times by the Romans. Pop. 16,777.

Bagno10, the name of a town of Piedmont, province Cuneo, 12 miles N.W. from Saluzzo; also of a small town near Brescia; and of another in the province of Lucca, in S. Italy, besides of many small Italian villages.

Bagpipe, one of the oldest musical instruments, which seems to have been used at some time in its history by almost every nation. As now used in Scotland, it consists of a leathern bag inflated from the performer's lungs, and the wind by the pressure of his arm is expelled through several pipes. One of these is called the *chanter*, and is provided with a reed and with eight finger-holes for playing upon; the others are called *drone*s, and sound continuously the same note. The effect of its music depends more upon the nationality of the listener than upon its intrinsic qualities. Although rude and harsh in the extreme, there are few Highlanders who do not feel it exciting and inspiring.

Bagra'tion, **Peter**, **Prince**, born in 1765, entered the Russian service as sergeant in 1782. He distinguished himself in Suwarow's Caucasian, Turkish, and Polish campaigns, being made colonel on the critical field of Oczakow (17th December 1788). He also followed Suwarow in the Italian campaign of 1799, taking Brescia (10th April 1799), and contributing to the decisive defeat of the French at Novi. Falling into disgrace with Paul I., he was restored to command by Alexander, and rendered important service during the retreat of Kutusow before Murat, which was shortly followed by the battle of Austerlitz (1805). As lieutenant-general under Bennigsen, B. fought at

Preuss-Eylau and Friedland in the war of 1807. The following year, in accordance with the provisions of the Treaty of Tilsit, he occupied Friedland, defeating Doebeln and Lowenheim, and in 1809 commanded the Moldavian army against the Turks at Silistria. After a brilliant retreat before Davout upon Smolensk in the Russian campaign of 1812 (in the course of which, however, he was defeated at Mohilev on the Dnieper), B. was mortally wounded on the retreat to Moscow after the battle of Borodino, and died October 7, 1812. His grandson, **Prince Peter Romanovitch B.**, is a major-general in the Russian service, and since 1862 has been governor of Tver. He recently discovered in the mines near Slatoust an unknown fossil species, which has been named after him *Bagratiouit*.

Bagshot Beds, so called because first examined on Bagshot Heath, Surrey, belong to the strata of the Middle Eocene, and are met with in a full state of development in the Isle of Wight. The upper division consists of thick sands, generally poor in fossils; the middle division comprehends the Barton and Bracklesham beds, consisting of clays and sand, and rich in fossil remains, such as Nummulites, with reptiles, fishes, and mollusca,—which also occur in the *Calcaire grossier* of Paris. The lower division consists of various coloured sands and pipe-clays, and forms the basis of the Middle Eocene formations. The maximum thickness of the B. B. is about 1200 ft.

Bagul, or **Baghul**, a native state in the N. W. of India, dependent on the Punjab government. It pays an annual tribute of £360, and maintains a force of 222 men, having a revenue of about £6000. The country is mostly mountainous. Area, 150 sq. miles; pop. (1872) 22,000.

Bahamas, a chain of British W. Indian islands, extending from about 50 miles off the N. American peninsula of Florida in a S.E. direction to within about 100 miles of the N. coast of Hayti—a distance of 700 miles. The average width of the chain is over 100 miles. The basis of the islands is coralline, and they have the usual configuration of the reef—long, narrow, and low. About twenty of the B. are inhabited, and of these the chief are New Providence, with the capital and seat of government, Nassau, Eleuthera, Harbour Island, Exuma, St Salvador, Andros, Great Bahama, Crooked Island, and Rum Cay. The islets (called keys) are very numerous, and the coral rocks of the chain are countless. Area, 3021 sq. miles; pop. (1871) 39,162. The soil is not deep, but—the porous rocks forming magazines of moisture—is very fertile. Chief productions, coffee, sugar, indigo, Brazil wood, cotton—since the American civil war—guinea-corn, maize, pineapples, lemons, oranges. Climate ranging from 73° to 93° F. in summer, but in winter delightfully temperate—the islands being much resorted to in this season for pulmonary diseases. The B. were the first American discovery of Columbus, who landed on what is now called Watling's Island (October 12, 1492): the native Carib population disappeared before the Spaniards, who did not colonise the island. In 1629 they were acquired by the English. See A. Trollope's *Travelling Sketches* (1866); Baco's *Bahamas* (1869); and Kingsley's *At Last: A Christmas in the W. Indies* (1871).

Bahar, or **Behar**, the chief town of an old Mohammedan province of the same name, situated in the British commissioner-ship of Patna, near a branch of the Ganges, 34 miles S.E. of the town of Patna, and 159 W. of Benares. It was sacked by the Mahrattas about 1742, and was afterwards in great part depopulated by a famine, but of late years it has gradually recovered, and is now a place of some importance. Pop. (1872) 44,295. The old province of B. was formerly part of the empire of Delhi. Area, 42,417 sq. miles; pop. (1872) 19,736,101. In 1765 it passed under English rule, and was portioned into the two divisions of Patna and Bhagulpore, and again into ten executive districts. This entire region, lying in the valley of the Ganges, is fertile and populous, but is subject to inundations, and has bad roads. The British district of B., named officially Gya, has an area of 4718 sq. miles, and a pop. (1872) of 1,949,750.

Bahi'a, or **San Salvador**, the capital of a province of the same name, Brazil, on a promontory forming the northern side of All-Saints' Bay. Next to Rio de Janeiro it is the largest seaport of the empire, and has a splendid harbour and strong fortifications. It was founded in 1549, and is the oldest town in Brazil, of which it was capital till 1763. In 1874, by the con-

tinuation of the cable from Pernambuco, B. was placed in telegraphic communication with Europe. The trade of the port has recently declined very much. In the financial year 1872-73 the value of the imports was £2,367,003; of exports, £1,871,212. The exports are chiefly sugar, tobacco, coffee, cotton, rum, Brazil wood, diamonds, and piassava; imports, manufactured goods, drugs, wines, flour, coals, and hardware. Pop. (according to the official report of 1874) 152,000.

Bahia, a maritime province in the S.E. of Brazil, is intersected by lofty sierras, and watered by the great river San Francisco. It is covered with forests of valuable timber, and is rich in metals and precious stones, but the country is almost inaccessible for want of roads. A railway to the interior, however, is now almost completed. The diamond-mining of B. was nearly ruined by the discovery of the fields at the Cape of Good Hope, but in 1874 large deposits of amethysts were found near the town of Caetite, and the extensive digging operations begun are yielding promising returns. B. exports more sugar now than all the rest of Brazil taken together, and the cultivation of coffee is rapidly increasing. Area, 127,911 sq. miles; pop. (official return 1873) 1,450,000, of whom 280,000 are slaves.

Bahia-Hon'da (Port. 'deep bay'), a seaport of Cuba, on the N. coast of the island, 60 miles W.S.W. of Havana, formerly much resorted to by privateers. Pop. 4000.

Bahna'sa, or **Behne'seh** (anc. *Oxyrynchus*), a small town in Central Egypt, on the *Bar Yusuf* ('Joseph's Canal'), containing some interesting ruins of the old Greek city. In Christian times, Oxyrynchus became the seat of a bishop, and numerous monasteries once existed here, of which the ruins are still visible.

Bahr, an Arabic word, signifies a large body of water, and is applied to both rivers and lakes. For instance, the two chief branches of the Nile are called Bahr-el-Abiad ('the white river'), and Bahr-el-Azrak ('the blue river'), while Bahr-Assal means Lake Assal, or 'salt lake.'

Bähr, Johann Christian Felix, a German philologist and antiquarian, was born at Darmstadt, June 13, 1798; educated at Heidelberg; appointed (1826) ordinary professor of philology in the same university; and died November 27, 1872. His principal writings are an annotated edition of Plutarch's *Alci-biades* (Heid. 1822); *Philopomen, Flaminius, and Pyrrhus* (Leips. 1826); the fragments of *Ctesias*, with careful elucidations; and above all, a *Geschichte der Röm. Literatur* (Karls. 1828, 4th ed. 1869). To this clear and comprehensive history three supplements were added—*Die Christl. Dichter und Geschichtsschreiber Roms* (1836); *Die Christl.-Röm. Theologie* (1837); and *Geschichte der Röm. Literatur im Karolingischen Zeitalter* (1840). Another very valuable work was his version of *Herodotus* (1832-35, 2d ed. 1855-61). In 1835 he published his *De Universitate Constantinopoli Quinto Sæculo Condita*. He was a frequent contributor to Jahn's *Jahrbücher für Philologie*.

Bahrdt, Karl Friedrich, a German theologian, born August 25, 1741, at Bischofswerda, Saxony. He studied at Leipzig, and was a professor successively at Leipsic, Erfurt, and Giessen, but became unpopular from his heterodox preaching, and undertook in 1755 the direction of a Philanthropin in the Grison country. He then went as general superintendent to Dürkheim, Leiningen-Dachsburg; established another Philanthropin at Heidesheim in 1777; but being declared by the Aulic Council, on account of the gross frivolity displayed in his translation of the New Testament, incapable of holding any ecclesiastical office, he withdrew in 1779 to Halle, where he suffered two years' imprisonment for his writings entitled *Das Religionsedikt* and *Die Deutsche Union*, and where he died, 23d April 1792. In addition to his theological works, which are all of a deistical tendency, B. wrote *Geschichte seines Lebens, seiner Meinungen und seiner Schicksale* (4 vols. 1790). See *Leyser, K. F. B.* (1867).

Bahrain Islands, or **Avail Islands**, a group of islands belonging to Muscat, and lying in the Persian Gulf, with a pop. of about 40,000. The inhabitants are chiefly engaged in the pearl-fisheries, which are estimated to yield nearly £300,000 annually. The largest of the islands is 27 miles long and 10 broad. It gives its name to the group, and its capital is *Me-nama*, a centre of considerable trade, with a pop. of 3500.

Baiæ, anciently a town on the coast of Campania, famous for its warm springs, became towards the close of the republic a favourite resort of the wealthy Romans, who, with insolent ostentation of wealth, sometimes built their villas out into the sea. Julius Cæsar, Pompey, and other distinguished citizens, had country seats here; and it was a chosen retreat of the Emperors Nero, Caligula, Hadrian, and Alexander Severus. Horace preferred B. to every spot of earth besides. As the resort of the idle and the wealthy, it soon acquired the fame of being a hotbed of the vices. Some ruins of temples, baths, and villas still mark the site of B. The name is preserved in the modern *Castello di Baja*, built in the reign of Charles V.

Baikal (Turk. *Beikul*, 'rich lake'; Mongol. *Dalai Nor*, 'holy lake'), the largest fresh-water lake in Asia, lies in the Russo-Siberian government of Irkutsk, and sweeps S. and S.W. in the form of a sickle, from 103° to 110° E. long. Length, 400 miles; area (estimated), 14,000 sq. miles. It is surrounded by the Baikal Mountains, is fed by the Selenga, 700 miles in length, and many other streams, and has an outlet in the Lower Angara to the Yenesci river, which, however, carries off only a tenth of the volume of water received from affluents. It is the deepest lake known—3766 metres. Fisheries, especially of sturgeon and seal, are important. There are two ports; steamers ply in summer; and from November to April, when the lake is frozen over, traffic is carried on over the ice.

Bail is a term of English and Scotch law; but in England it applies both to criminal and civil procedure, in Scotland only to the former. In England, the justice before whom a prisoner is brought must after examination either discharge him, commit him, or require him to give B.; by which is meant, that he must find sufficient sureties for his appearance in court at a specified time. The accused is meanwhile at liberty. In former times all felonies were bailable, but many are now excepted by statute. No justice of peace can take B. on a charge of treason, murder, arson, or manslaughter, unless the case against the accused be a very flimsy one. The Court of Queen's Bench may B. for any crime; but the accused cannot demand that it should do so as his right. Two sureties are required to B. for felony, and the amount of B. will depend on the circumstances of the accused and on the nature of the offence. In a civil process, one surety is legally sufficient; but the sheriff may require two, or, under certain circumstances, even more; and by accepting one he may incur personal liability.

In Scotland, the law as regards B. in criminal cases is essentially the same as in England; at least it is so practically. The Court of Justiciary may take B. even in capital cases; but it would certainly be only in very extraordinary circumstances that this would be done. The Lord Advocate may do so also, and may fix the B. at any sum he pleases. The analogous term to B. in a civil process in Scotland is caution. See CAUTIONARY, CAUTION.

Bail Court, the name of a court at Westminster which may be held by any one of the puisne judges of one of the courts of Common Law when his court is sitting. The judge sits apart, and hears and decides on questions of special bail, administering oaths, &c. Hitherto this court, constituted under William III., has only been used as an adjunct by the Court of Queen's Bench.

Bailee. See BAILMENT.

Bailey, Philip James, an English poet, born at Basford, Notts, in 1816, attended two years at Glasgow University, began to study law in 1833, became a member of Lincoln's Inn in 1835, and was called to the bar in 1840. His most remarkable poem, *Festus*, was begun in 1836, and published in 1839. In 1877 it had reached its tenth edition in this country, and in America it has been even more admired and read than in England. With this poem *The Angel World* was incorporated in 1850. Later works by B. are *The Mystic*, 1855; *The Age*, 1858; and *The Universal Hymn*, 1867. B. has outlived the fame of thirty years ago. *Festus* took the popular ear by its boldness and its philosophic pretension; but much of its boldness is unbridled extravagance, and much of its 'thinking' is aimless vagary and puerile speculation. Still the work has its memorabilia. Its imagery is often strangely original, and unmistakably marks a new mind, which, unhappily, never ripened into fullness of life. The lyrical scenes are frequently fine, and contain songs which the world will not willingly let die.

Bailey, Samuel, an eminent writer and thinker, particularly on metaphysics and political economy, was born in 1791 at Sheffield, where he followed the profession of a banker, and died January 18, 1870, leaving £90,000 to his native town. He wrote a number of books, essays, and pamphlets, those on the *Pursuit of Truth*, *Parliamentary Reform*, and *Joint-Stock Banks*, making a very considerable impression at the time they were published. The most important of his philosophical works are his three series of *Essays on the Philosophy of the Human Mind*, published in 1855, 1858, and 1863. B., who was a Lockian in philosophy and a Utilitarian in ethics, was an able thinker and a clear writer.

Baillie (Fr. *baille*, Med. Lat. *ballium*, a corruption of the Class. Lat. *vallum*, a rampart), was the space enclosed within the outward walls of a castle, except the portion covered by the keep. The entrance was generally by a drawbridge over the ditch. The B. usually held accommodation for the soldiers, with a well, chapel, &c.

Bailie, a magistrate belonging to a municipal corporation in Scotland is so called. The office is analogous to that of an alderman in England. By common law, a B. is held to have the same power within his territory as the sheriff has in his county. He has also statutory powers. In a Scotch corporation, the chief magistrate or Provost (q. v.), and bailies, are *ex officio* in the commission of the peace. The *B. of the Abbey* is appointed by the Duke of Hamilton, as hereditary keeper of the Palace of Holyrood. He has jurisdiction in civil debts contracted within the sanctuary. B. formerly denoted a functionary required in Scotch conveyancing, but under the Titles to Land Act the office has become unnecessary.

Bailiff, according to its etymology (Med. Lat. *ballivus*, from the Class. Lat. *bayulus*, a burden-bearer), means an overseer acting for a superior. This word, which is the same as the Fr. *bailli*, Sc. *bailie*, Ital. *balio*, had an extensive application during the middle ages. In France, the royal *bailis* at one time exercised supreme military and civil jurisdiction in the districts allotted to them. Among the Knights of St John we find the word used to denote the eight members of their chapter. In England, under William the Conqueror, the superintendents of counties were called *balliue*.

Bailiff, is a legal officer in England under the sheriff, whose orders or decrees it is his business to execute; the sheriff himself being the Queen's B.; his county is called his bailiwick. *Bound* bailiffs are so called because the sheriff being to a considerable extent responsible for them, he binds them annually in a legal obligation, with sureties. The *special* B. is appointed by the sheriff on application of the plaintiff in a suit. There are also officers connected with royal castles, lordships of manors, &c., called bailiffs.

Bailiff, High, is an officer of the law in England who executes the duties of bailiffs in districts exempt from the ordinary supervision of the sheriff. The term is now generally applied to the superior classes of the bailiffs.

Bailiwick. See BAILIFF.

Bailleul, a town in the department of the Nord, France, with tanneries and manufactures of thread and lace. Its church of St Vaast is very ancient. The neighbourhood is celebrated for its cheese. Pop. (1872) 6348.

Baillie, Joanna, a poetess of the last and present centuries, who may be said to have prepared the way for the psychological poetry and fiction of the present day, for Browning on the one hand, and George Eliot on the other, was born in 1762, in the manse of Bothwell, Lanarkshire, her father, a Scotch Presbyterian minister, being descended from the celebrated family of B. of Jarviswoode. She removed to London at an early age, lived there a happy, peaceful, and retired life, dying at Hampstead, 23d February 1851, at the age of eighty-nine. In 1798, Miss B. published 'a series of plays, in which it is attempted to delineate the stronger passions of the mind, each passion being the subject of a tragedy and a comedy.' It is now generally admitted that the principle upon which the authoress proceeded was an erroneous one, as human beings are ruled not by one passion, but by a variety of often conflicting passions. But her plays are interesting as careful psychological studies. A second volume was published in 1802; and, indeed, she continued at

intervals to publish such volumes till 1836. The most powerful and popular of her dramas is *De Montfort*, which was brought upon the stage by Kemble. When an attempt was made to revive it in 1821, however, Kean said it was a fine poem, but not fitted to be an acting play. Besides dramas, Miss B. published a volume of miscellaneous poetry, including songs, in 1841. A new edition of her *Dramatic and Poetical Works* appeared in 1851, and *Fugitive Verses* in 1860. Her pieces are characterised by softness of diction, unaccompanied by maudlin sentimentality; and she is at her best when she is quietly playful, as in *The Kitten*. She was much esteemed by her literary contemporaries, particularly by Sir Walter Scott; and it was to her that, as we learn from the late Archdeacon Sinclair's *Old Times and Distant Places* (1875), that the author of the *Lay of the Last Minstrel* communicated the somewhat curious fact, that although he had written a description of Melrose Abbey by moonlight, he had not himself seen it under such circumstances.

Baillie, Matthew, M.D., brother of Joanna B., and one of the most eminent physicians and anatomists of his time, was born in the manse of Shotts, Lanarkshire, 27th October 1761. His father, Dr James B., removed first to the pastorate of Bothwell parish, and then to the professorship of divinity in the University of Glasgow; his mother was the sister of the celebrated anatomists and physiologists, William and John Hunter. After the usual curriculum at Glasgow University, he passed to Balliol College, Oxford, as a Snell exhibitioner. There he took degrees in arts and physics. At the same time that he was attending Oxford, he commenced, in 1780, anatomical studies under his uncle Dr William Hunter, in London, being frequently employed by him as demonstrator in his theatre at Great Windmill Street. So successful was his career, that, on the death of his uncle in 1783, he was appointed his successor. In 1784 he began to lecture, and, from the clearness of his style and his power of rendering intelligible abstruse and technical points, he gained a very high reputation as an expounder of anatomical science. As a medical practitioner he became after a time highly popular, and from his quick perception of the seat of a disease, and of the proper remedy to apply to it, as well as from his kindly manner, he was in especial request as a consulting physician. So great was his practice, that in one year his fees amounted to £10,000. Appointments and honours fl. ed in upon him. In 1810 he was made physician to George III., and was offered a baronetcy, which, however, he declined. Incessant labour wore him out, and although he retired to his seat at Luntisbourne, in Gloucestershire, he died September 23, 1823, in the sixty-third year of his age. His will showed a personality of £83,000, much of which was directed by him to be given to medical institutions and public charities. Dr B. wrote many works, the most important of which, published in 1795, is *The Morbid Anatomy of some of the most Important Parts of the Human Body*. This book, containing a large amount of valuable information, and also the results of a number of experiments made by his uncle and himself, had a European fame, and marks an era in medical science, showing the value of induction as not only a scientific, but a professional process.

Baillie, Robert, one of the most learned, influential, and moderate of the Scotch Presbyterian clergymen of the 17th c., was born at Glasgow in 1599. On the father's side, he was connected with the Baillies of Lamington, on the mother's, with the Gibsons of Durie, both old and well-known Presbyterian families. Educated at the university of his native city, he, in 1622, received episcopal ordination from Archbishop Law (Episcopacy being then the established religion in Scotland), and was shortly afterwards presented to the parish church of Kilwinning. Although he had become not only an Episcopalian, but an advocate of the doctrine of passive obedience, the discussions of the stormy years between 1630 and 1636 on Arminianism, and the ecclesiastical regulations introduced into Scotland by Archbishop Laud, made him change his views, and he became a keen champion of the Presbyterian cause. In 1638 B. sat as a member of the General Assembly which met in Glasgow to protest against Episcopacy being thrust upon the people of Scotland, and in 1640 he was chosen one of the commissioners sent to London to press on charges against Laud on account of his tyrannical conduct. Although he had now become an earnest champion of the divine right of Presbytery, and even accompanied the army

which defended the national faith in the capacity of preacher to one of the regiments, he was known as one of the most temperate of the Scotch clergy, and especially showed that he was so when he went to London in 1643 as a delegate to the Westminster Assembly of Divines. B. was one of the commissioners sent by his Church in 1649 to ask Charles II., then in Holland, to accept the Covenant and crown of Scotland. In 1642 he was appointed joint professor of divinity in Glasgow University with Mr David Dickson, and, after the Restoration, became its Principal. He died, July 1662, at the age of sixty-three. Besides writing theological works and controversial pamphlets, he left behind him, in *Letters and Journals*, an account of his public life, which is preserved in the archives of the Church of Scotland, and contains valuable material for a history of the critical period in which he played a by no means inconsiderable and an uniformly prudent part. He was a man of great learning, wrote Latin with much elegance, and, it is said, understood thirteen languages.

Baill'ie, Robert, of Jerviswoode, a celebrated Scotch patriot of the reign of Charles II., was the son of George B., of St John's Kirk, Lanarkshire, a cadet of the Lamington family, who had become proprietor of the estate of Jerviswoode in the same county. He distinguished himself from an early period by his attachment to the cause of civil and religious liberty, and his resistance to the tyranny of the Duke of Lauderdale. In 1676, having rescued his brother-in-law, a Nonconforming minister of the name of Kirkton, from illegal capture by an informer in the employ of Archbishop Sharp, named Carstairs, he was prosecuted for this interference, and an antedated warrant was furnished to Carstairs signed by nine of the Scotch councillors of the time, of whom, by his own confession to Bishop Burnet, the Marquis of Atholl was one. B. was fined 6000 merks (£318), and, on refusing to pay, was sent to prison. Such was the indignation throughout Scotland at the time, however, that at the end of four months he was released, on the payment of half the fine to Carstairs. In 1683 he engaged in the promotion of a scheme of emigration to S. Carolina as a means of escape from the tyranny at home. The same year he entered into communication with Russell, Sydney, and the other leaders of the Puritan party in England, and having gone to London, was cognisant of, if not a party to, a proposal for an insurrection as a means of obtaining reform. When the Rye-house Plot was discovered, he was arrested, and sent down to Scotland. After a long imprisonment, which completely shattered his health, he was, in the end of 1684, brought to trial before the Court of Justiciary in Edinburgh on the charge of conspiring against the life of the king, and of being hostile to monarchical government. After extraordinary and insufficient evidence, he was condemned to death, and underwent sentence 24th December 1684. Throughout all his troubles, particularly his last, he comported himself with Roman dignity and fortitude. By his contemporaries, and, apparently, with justice, he was credited with high administrative abilities, which, unfortunately, he had but little opportunity of displaying.

Bailly, Jean Sylvain, first an artist, then astronomer, was born in Paris, September 15, 1736, and devoted himself to science until the Revolution broke out. In the earlier and innocent stages of the Revolution he was conspicuous alike by his loyalty to the king and his love of liberty. Chosen President of the National Assembly, June 17, 1789, and Mayor of Paris, July 15, he laboured with incredible energy and assiduity to keep the citizens from starvation and revolt. After the flight and recapture of the king his difficulties increased. Discords showed themselves in the Assembly and throughout the nation. Finally it became his duty to order the National Guard to fire on the insurgent rabble in the Champs-de-Mars. The 'Irreconcilables' never forgave him. In November 1791 he resigned his office, and withdrew to Nantes, but when the Revolution grew more furious and hysterical, he was arrested and guillotined amidst the imprecations of delirious fanatics, November 10, 1793. His principal works are, *Sur la Théorie des Satellites de Jupiter* (1766), *L'Histoire de l'Astronomie* (1775-87, 5 vols.), a really great work, full of teeming and ingenious speculation, and written in a charming style; *Lettres sur l'Origine des Sciences* (1777), besides two posthumous works, *Essai sur l'Origine des Fables et des Religions Anciennes* (1779), and *Mémoires d'un Témoin oculaire de la Révolution* (1804, 3 vols.). See Arago's *Biographie de B.* (Par. 1852).

Bail'ment, an English law term, denoting the delivery of goods on trust for a special purpose, with a contract, expressed or implied, that they are to be returned when the special purpose is fulfilled. See **BORROWING**.

Baily, Edward Hodges, a famous English sculptor, born 1788 at Bristol; repaired to London in 1807, and studied for two years under Flaxman; gained the silver medal of the Royal Academy in 1809, and the gold medal in 1811; produced during his long lifetime an immense number of busts, portrait statues for the metropolis and the provinces, and many exquisite fanciful groups. He died 22d May 1867. Of his statues, the best-known is that of Nelson in Trafalgar Square, London. The chief of his imaginative works, which are remarkable for their originality, as well as for their simplicity and sweetness, are his 'Eve at the Fountain,' 'Eve Listening to the Voice,' 'Girl Preparing for the Bath,' and 'The Graces Seated.'

Baily, Francis, a celebrated English astronomer, was born April 28, 1774, at Newburgh, Berkshire, and died August 30, 1844, at London. Retiring from business as a stockbroker in 1825 he devoted himself wholly to science, organising the Astronomical Society, revising the *Nautical Almanac*, publishing a star catalogue, besides writing a *Life of Flamsteed* (1835). See Sir J. Herschel's *Memoir* before the Astronomical Society in 1844.

Bain, Alexander, an acute, original, and singularly lucid philosopher, was born at Aberdeen in 1818, and entered Marischal College in 1836, where he graduated in 1840. From 1841 to 1844 he acted as deputy for the Professor of Moral Philosophy, and taught the Natural Philosophy Class during the session of 1844-45. For some time he was assistant secretary to the Metropolitan Sanitary Commissioners, and afterwards to the General Board of Health. From 1857 to 1862 he was Examiner in Logic and Moral Philosophy in the University of London. Between 1858 and 1870, he was seven times Examiner in Mental Philosophy at the India Civil Service Examinations. In 1860 he was appointed by the crown Professor of Logic in the University of Aberdeen. From 1864 to 1869 he again acted as Examiner in the University of London. Professor B. commenced his literary career in 1840 as a contributor to the *Westminster Review*. His first great work was *The Senses and the Intellect* (1855), which was followed in 1859 by *The Emotions and the Will* (3d ed. 1875), completing a systematic exposition of mental phenomena. Like Hartley, he bases his psychology on physiology, but his analysis is much more accurate, subtle, and exhaustive. Later publications are, *A Manual of English Composition and Rhetoric* (1866); *Logic, Deductive and Inductive* (1870); *A Higher English Grammar* (1872); and *A Companion to the Higher English Grammar* (1874).

Baini, Giuseppe, an Italian musician and author, born at Rome in 1775. He early applied himself to musical art, and became director of the pontifical chapel in 1814. His great composition was a *Miserere*, written for the Sistine Chapel by order of Pius VII. Among his works, the *Essai sur l'Identité du Rythme Poétique et Musical* (Flor. 1820) is curious and interesting, while his *Memorie Storico-Critiche della Vita e delle Opere di G. P. da Palestrina* (2 vols. Rome, 1828) is one of the best works of its kind. B. died 10th May 1844.

Bairaktar or **Bairak-dar** (standard-bearer), the title of the grand vizier Mustapha, who was born in 1755. His valour as a soldier was early conspicuous, and in 1806, being then Pasha of Rustchuk, he opposed the Russians who had taken Bucharest. In 1807 the janizaries having revolted and deposed Selim III., B. made peace with the enemy, and marched on Constantinople. There he found that Selim had been strangled by order of Mustapha IV., who had seized upon the throne. B., deposing Mustapha (July 28, 1808), made Mahmoud II. sultan, himself becoming grand vizier. He now attempted to disband the janizaries, but they rose in arms, attacked the Seraglio (15th November 1808), and called on B. to restore Mustapha. B. defended himself valiantly till the palace was in flames, when he ordered Mustapha to be strangled, and his head thrown to the besiegers. He was found in an underground apartment, with his favourite slave and a faithful eunuch, all suffocated.

Bairam. See **BEIRAM**.

Baird, Sir David, a British general, born 6th December 1757, at Newbyth, Scotland. He joined the army in 1772; in 1779 he accompanied his regiment to India, and on the 10th of September in the following year he was captured by Hyder Ali at Perambucum, and detained as a prisoner for nearly four years in the fortress of Seringapatam. His most memorable military achievement was the capture of this fortress, 4th May 1799. At his own request he was intrusted with the command of the storming party, and his gallantry and humanity were equally admirable. For his distinguished services on this occasion he was presented with the state-sword of Tippoo Saib by the commander-in-chief, General Harris, in the name of the army. After eminent services in Egypt and India, he returned to Europe in 1803, and was knighted in June of the following year. B. was sent to Spain in 1808 with 10,000 men to assist Sir John Moore, and did distinguished service at Corunna, January 16, 1809, for which he received the thanks of Parliament for the fourth time in his life. He then retired from active service. In 1814 he was raised to the rank of a general, became governor of Kinsale in Ire. and in 1819, and of Fort-George in 1827, and died at his seat of Fern-tower in Perthshire, August 18, 1829.

Baird, a Scottish family that has acquired extraordinary wealth during the present century. The father, Alexander B. of Lockwood, Old Monkland, began the celebrated mineral enterprises of the family in 1809: a lease of Gartsherrie was taken in 1826, and the first furnace was put in blast in 1830. Coal and iron were near each other, the new railway system passed conveniently through the field, and skill, talent, and energy did the rest. The works now include Eglinton, Blair, Portland, Lugar, and Muirkirk. The father died in 1833, leaving two daughters and eight sons, William of Elie, Douglas of Closeburn, George of Strichen and Stitcheil, David and Alexander of Urie, James of Cambusdoon, Robert of Auchmedden, and John of Lockwood. James of Auchmedden and Cambusdoon was born in 1803, sat as M.P. for Falkirk from 1851 to 1857, and died at Cambusdoon, Ayr, 20th June 1876. He was the munificent founder of the *B. Trust*. Fresh force and energy were imported into the vast business of the Bairds by a nephew, Alexander Whitelaw of Gartsherrie, who was elected M.P. for Glasgow in 1874 in the Conservative interest, but died in 1879. The B. family have become extensive landowners, the total rental of their estates reaching £81,000 a year.

Baird Trust.—James B. of Auchmedden and Cambusdoon, founded, July 24, 1873, this trust, with a fund of £500,000 sterling. Its objects are to help in the work of spreading the gospel in connection with the Church of Scotland, of building churches, endowing parishes, augmenting stipends, spreading sound literature, promoting religious education, assisting divinity students, and maintaining the 'B. Lecture.' The trustees must be members of the Church of Scotland, only one to be a clergyman; and the general design of the trust is to promote the territorial work of the National Church, and to maintain the great truths of the gospel as declared in the standards of the Church of Scotland.

Bairdia, a genus of crustacea belonging to the order *Ostracoda*, and represented by living as well as by extinct species. The fossil forms occur in the silurian, carboniferous, and permian rocks, and in the mesozoic and caenozoic formations also. See also CRUSTACEA.

Baireuth, or **Bayreuth**, on the Red Main, the capital of Upper Franconia, Bavaria, and 126 miles N. of Munich. It is well built, well paved, with many objects of ornament and interest, including promenades, fountains, and groves; two palaces, the old and the new; a monument to Jean Paul Richter, Schwanthaler, &c. A grand new opera-house for the performance of Wagner's music was completed at B. in 1875. B. has manufactures of porcelain, leather, and linen, woollen and cotton stuffs. Pop. (1871) 17,841. The history of the principality of B. (originally Kulmbach) is from the earliest times blended with that of Ansbach or Anspach (q. v.). After the death (1603) of the Markgraf Georg-Friedrich of Ansbach, the Franconian principalities fell to the younger sons of Johann Georg, Elector of Brandenburg. Joachim Ernst got Ansbach, and Christian got B. The latter removed his residence from Kulmbach to the town of B., which under him and his successors attained its greatest prosperity. In 1791 both principalities were sold to Prussia, from whom Napoleon wrested them in 1806, and in 1810 they

passed to Bavaria. See Lang's *Geschichte des Fürstenthums B.* (2 vols. Gött. 1801).

Baitul', or **Beitool**, a fortified town in India, in the Saugor and Nerbudda territory, Bengal presidency, about 100 miles N. W. from Nagpore. Pop. 4466.

Baja, a town in the district of Bacs, Hungary, situated on the Danube, 25 miles N. of Zombor. It lies in a rich vine-growing region, has an increasing trade, and is the site of a great yearly swine-fair. Pop. (1869) 18,110.

Bajan. See BEJAN.

Bajazet' (Bajasid), or **Bayezid I.**, called Ilderim or the Lightning, ascended the throne of the Ottoman (Osman) empire on the death of his father Amurath (q. v.) or Murad (the founder of the janizaries), who perished in conquering the Servians at Kossova, A.D. 1389. At this time the Ottoman empire comprised, besides what was originally allotted out of the Seljuk empire, the districts known as Khorasi, Kermian and Hamid, and also large portions of modern Turkey, the capital having been successively transferred from Prusa (Broussa) to Gallipoli and Adrianople. B. renewed the treaty made by his father with John V., the Byzantine Emperor, by which the latter acknowledged himself a vassal and tributary. He also removed, by strangling, his only brother Yakub Chelibi; a crime which became customary with later Ottoman sultans, and was defended by Turkish historians by the text in the Koran that 'commotion is worse than strangling.' Philadelphia, the last independent Greek community in Asia Minor, and the Seljuk districts of Muntesha, Aidin, and Serukhan, were soon added to B.'s empire. Wishing to make his supremacy nominal as well as real, B. invested Constantinople in the reign of Manuel. The siege was raised by the advance of Sigismund of Hungary and other Christian princes, whom B. defeated at Nikopolis in Bulgaria (28th November 1396). This victory was followed by expeditions to Thrace, Thessaly, and Greece, Wallachia, and Hungary. In spite of the bravery of Marshal Boucicault and his fleet, B., now master of nearly all Asia Minor, would have reduced Constantinople, had he not been called to the defence of his Asiatic possessions by the appearance of Timur, or Timur-leng (the lame Timur), who, after reducing Mesopotamia and Syria, was now threatening the borders of Asia Minor. The armies of B. and Timur met 30th July 1402, at Angora, when, in consequence of the disparity of numbers, the former were utterly routed, B. himself being taken prisoner and dying the next year in his captor's camp. The immediate result was, that several provinces in Asia Minor revolted from the Ottoman empire, and John Palaeologus, whom B. had placed on the Byzantine throne, retired in favour of Manuel to Thessaly. B.'s sons, Suleiman, Isa, Musa, and Mohammed all claimed the empire.

Bajazet' II., born 1447, became Emperor of the Turks in 1481 on the death of his father, Mohammed the Great. After getting rid of his brother, Prince Jau or Zizim, who fled to Rhodes and afterwards to France, B. checked the advance of the Mamluk sultans of Egypt, assisted the Moors of Spain against Ferdinand of Aragon, and in a successful campaign on sea and land forced the Republic of Venice to relinquish all claim to the mainland of Greece. After this he seems to have become a voluptuary, and was forced, chiefly by the janizaries, to resign in favour of his son, Selim I., the Severe, who had previously made an unsuccessful revolt against his father. Thirty days afterwards B. died (A.D. 1512). (See Von Hammer, *Geschichte des Osmanischen Reiches*; and Finlay, *Byzantine and Greek Empires*.) Racine's play of *Bajazet*, of which Corneille said: 'These Turks are very much Frenchified,' refers to the brother of Amurath IV. and Ibrahim I., who ruled in the 17th c.

Bajimont's Roll. This is the name of a valuation of the benefices of Scotland. It was called after an Italian ecclesiastic named Baiamund di Vicci, who was sent by the Pope in the 13th c. to collect tithes in Scotland. A copy of a portion of the original roll, applying to lands S. of the Firth, is preserved at Durham; and there is a copy of the whole, as adopted in the reign of James V., in the Advocates' Library in Edinburgh, in a MS. of the 17th c. Previous to the making up of the B.R., the Scotch clergy had been assessed according to a valuation roll called the *Antiqua Taxatio*, copies of which still exist in MSS. of the 13th c. In the Durham MS. the valuation in the B.R. is nearly 50 per cent. higher than in the *Antiqua Taxatio*.

Bajmak, a town in Hungary, about 16 miles S.W. of Maria-Theresopol by railway. Pop. (1869) 5610.

Bajoc'co, a copper coin, the 100th part of a scudo (4s. 3d.), and therefore equal to about an English halfpenny. The B. was a coin of the Papal States, but a Sicilian coin, of somewhat smaller value, has the same name.

Bajus (a Latinised form of the French *De Bay*), **Michael**, a Belgian theologian, born at the village of Melin, near Ath, in the province of Hainault, in 1513. He studied at Louvain, was appointed professor of theology there by Charles V. in 1550, and represented his university at the Council of Trent in 1563-64. His views of free will, original sin, and divine grace, in which he was a follower of Augustine, being thought to have a fatalistic tendency, eighteen of his propositions were censured by the Theological Faculty of Paris in 1560. Seven years later, seventy-six propositions were condemned by a bull of Pius V., when B. submitted. He again defended his doctrines, but was again condemned, and once more retracted. The Jansenists revived his views, which were known as *Bajanism*. In 1578 he was made chancellor of his university, and later was appointed General Inquisitor of the Netherlands. His works in 2 vols. were published by Gerberon at Cologne in 1696. B. died December 16, 1589, with the reputation of great learning and worth.

Bajza, **Anton**, born at Szücsi, 31st January 1804, belongs to the group of native Hungarian authors who in the period 1830-48 contributed in the most powerful manner to the political cause of a national language. The foundations of this literature had been laid by the *Magyar Museum* of Kazinczy and by the two Kisfaludis. It was carried on by Josiha and Eötvös, and other novelists; Vörösmarty and Petöfi, romantic and political poets; and by the Academy of Sciences, founded in 1830, in science. B. was not only a lyric poet of high order, and a critic, in the *Athenæum* and elsewhere, of the native literature, but also an industrious translator and compiler of historical and dramatic collections, chiefly from the German. His *Történeti Könyvtár* (Historical Library, 6 vols.) appeared at Pesth in 1843-5. There also he for some time directed the National Theatre, and edited Kossuth's *Ujirajja*, the organ of the Independent Nationalists, from the meeting of the 'Long Parliament' in July 1848 till Windischgrätz took possession of Pesth. B. died March 3, 1858.

Baker, **Sir Richard**, a miscellaneous writer, born at Sissinghurst, Kent, about 1568; educated at Oxford; knighted in 1603; sheriff of Oxfordshire in 1620; died 18th February 1644 in the Fleet, in which he had been imprisoned for debt. His *Chronicle of the Kings of England*, the favourite reading of Addison's Sir Roger de Coverley, though destitute of historical authority, was once very popular. Sir Richard also wrote several theological treatises, and translated Malvezzi's *Discourses on Tacitus*, and Balzac's *Letters*.

Baker, **Sir Samuel White**, **K.O.B.**, **F.R.S.**, a distinguished African traveller, the son of Samuel B., Thorngrove, Worcestershire, was born in 1821. Educated as an engineer, he went to Ceylon at an early age. He soon showed himself to be fond of sport and adventure, and in 1854 and 1855 published two works, *The Rifle and Hound in Ceylon* (new ed. 1874), and *Eight Years' Wanderings in Ceylon* (new ed. 1874). In 1860 he married a young Hungarian lady, daughter of F. Von Sass, who has been the brave associate of his arduous wanderings. In 1861 he projected an expedition to Africa with the view of meeting Captains Speke and Grant at the sources of the Nile. After preliminary explorations he reached Khartûm, and then organised his expedition to the Great White Nile. Starting from Khartûm with a long train of attendants, he arrived at Gondoroko (1863), where he was joined by Speke and Grant, whom he relieved, and who informed him of the Victoria N'yanza, which they had discovered, and told him also that the natives had described to them another great lake. B. and his undaunted wife set out in search of this, and, after a number of remarkable adventures, arrived, March 14, 1864, at cliffs from which they obtained a sight of this other inland sea, which they named the Albert N'yanza, and which constitutes the chief reservoir of the Nile. B. in 1864 obtained for his relief of Speke and Grant the medal of the Geographical Society, and in November 10, 1864, was knighted. In 1869 he led an expedition of 1500 picked troops, under the auspices of the Khedive, and with the title of Pasha, to put down the White Nile slave trade, and succeeded in annexing Bari and Unyoro (within two degrees

of the equator) to Egypt. B. has written a number of works descriptive of his adventures and discoveries in Africa, of which the chief are the *Albert N'yanza* (1866); the *Nile Tributaries of Abyssinia* (1871); *Ismailia* (1874); *Cyprus as I saw it* (1879).

Bakeries, Army. Arrangements for supplying the British army with loaves instead of biscuits have only recently been made. The French and other Continental nations took a long lead of us in this respect. The Crimean war, in which British and French soldiers had excellent opportunities of learning lessons of friendly rivalry, occasioned the securing of this as well as many other comforts, and even luxuries, for our troops. In the calamitous winter of 1854 before Sebastopol, British soldiers would sometimes willingly barter for one pound of the bread served out to their French neighbours three or four pounds of biscuit. This and other similar occurrences during that war led to the great improvements which are now apparent in the B., as in all the other sanitary aspects of the British army. On the field large supplies of excellent bread are now produced, being baked in portable ovens. In the large garrison towns, and at camps—as in London, Portsmouth, Dover, Dublin, at Aldershot and the Curragh of Kildare—the system pursued in the field is, as nearly as possible, adopted. At almost all the small garrison towns of the United Kingdom, loaf bread is supplied to the troops by contractors, who are under the superintendence of the Control Department. The supply branch of the Army Service Corps, a subordinate part of the Control Department, is appointed to look after the bread and other articles of food for the troops. This corps is made up of bakers, butchers, &c., selected from the regiments, or enlisted for the sole purpose of provisioning. See **COOKERY, ARMY**.

Bake'well, an old town of Derbyshire on the Wye, near where it joins the Derwent, 25 miles N.W. of Derby, and 145 from London by rail. It lies in the heart of the fine scenery of N. Derbyshire, has chalybeate springs, and is a favourite resort of anglers. Near it are quarries of black marble, the polishing and inlaying of which is the chief local industry. The Duke of Rutland is proprietor of B., and has a seat in the neighbourhood. B. has an ancient cruciform church in various styles of architecture, which was restored in 1846 at great cost. There are also remains of a castle, built in 924 by Edward the Elder. Pop. (1871) 2283.

Bake'well, **Robert**, a famous English agriculturist, born at Dishley, Leicestershire, in 1726. He devoted himself to improving the breeding of cattle, aiming principally at producing the greatest weight of carcase with the smallest amount of feeding, and is to be regarded as the initiator of that system of scientific breeding which has made British cattle everywhere renowned. B. died October 1, 1795.

Bakhtegan', a salt lake in the province of Farsistan, Persia, which is nearly dry in summer, when the bottom becomes encrusted with a very fine salt. Circumference, according to Kinneer, 70 miles.

Baking, the process of drying and consolidating the parts of a body by exposure to heat in an oven or other closed chamber. Bread (q. v.) is baked in an oven; bricks, terra-cotta, pottery, and porcelain are in like manner hardened in a kiln; for a description of which processes see the various heads.

Bako'ny Wald, a mountain range in Hungary, stretching from the Platten See northwards to the Danube, and occupying a region 50 miles long and 20 broad. The highest point is Köröshegy, N. of Bakonybel, 2238 feet, and the average elevation is about 2000 feet. Only the central part is now covered with timber (chiefly beech and oak), the lower flats are cultivated; the hill slopes are clothed with vines and other fruit-trees, and the valleys contain numerous villages. Still vast numbers of swine are brought here annually to feed on mast, though the herdsmen are no longer the wild robbers of Hungarian song.

Bak'shish, a Persian word signifying a present, has acquired in Turkey, Egypt, and Syria a peculiar meaning in modern times. It is a fee which might be styled a compulsory gratuity. If a traveller in any of these countries receives any service, down even to the most trifling, he is not allowed to forget B., if the noisy shouting and repeating of the word can serve to remind him of it. Even when an ambassador at the Sublime Porte obtains an audience of the Sultan, or any of the high dignitaries, he has to pay B. to the menials in waiting.

Baktahi-Seral' ('the palace of the gardens'), a town of Russia, government of Taurida, Crimea, near Simferopol. Pop. (1867) 11,448, mostly Tartars. The most remarkable building, the Khan Serai, or palace of the ancient Tartar khans, has been restored by the Russian government. There are some trifling manufactures of silk and of Turkish saddles.

Baku', a fortified town of Russia, government of B., Trans-Caucasia, on the S. side of the peninsula of Apsheron, Caspian Sea. Pop. (1867) 12,383, mostly Mohammedans. B. has a trade in naphtha, with which the soil of the surrounding district is impregnated. It exports besides salt, saffron, linen and woolen goods, &c. There is considerable trade carried on through the port of B. between Russia and Persia. B. has some fine mosques and bazaars. The town was founded by the Sassanidæ in the 4th c., and has been successively conquered and possessed by Arabs, Tartars, Turks, Persians, Caucasians, and Russians.

Balaam, a prophet and poet of the Midianites, introduced in Numbers xxii. 5. He was the son of Beor, and dwelt at Pethor, a city of Mesopotamia, whence he was summoned by the messengers of Balak, King of Moab, to curse the Israelites, who were encamped in the plains of Moab. Though a Gentile, B. had a certain knowledge of the one true God, and a prophetic gift, which he seems to have exercised for gain. Whence had he this prophetic gift? It has been supposed that he was among the last of those belonging to the patriarchal age with whom God held direct communion. The miracle of the ass has been explained in various ways. Leibnitz and Hengstenberg suppose the event to have occurred in a trance; but Peter (2 Pet. ii. 16) seems to refer to it as an historical incident. B. seems to have practised divination, for in Numbers xxiv. 1 it is said that 'he went no more to seek for enchantments.' In a battle between the Israelites and Midianites, he sided with the latter, and was slain with five kings of Midian (Num. xxxi. 8).

Bala Beds, a local deposit, near Bala, N. Wales, referred to the Lower Silurian of Murchison, and composed chiefly of hard crystalline limestone, in which trilobites and cystidæ predominate as fossils.

Bala'na. See WHALE.

Balaenoptera. See KOKQUAL.

Balakla'va, a land-locked harbour in the S. W. of the Crimea, 6 miles from Sebastopol, the *Symbolon Limen* of Strabo. It is chiefly memorable for being the principal station of the English fleet during the Crimean war, 1854-55. England is not likely to forget the shameful exhibition of mismanagement and incapacity displayed by her commissariat, in consequence of which supplies of food, clothing, and medicine, stored in abundance at B., were for a time unavailable, while her soldiers perished by the hundred of needless privations. The cavalry charges of October 25, 1854, on the heights between B. and the Tchernaya, rank among the most disastrous and the most heroic achievements of the English army. Pop. (1867) 742.

Bal'ance (derivation doubtful, possibly from the middle Latin word *valentia*, denoting price or value), is an instrument for

Chemical Balance.

ascertaining the weight of any body, and is composed essentially of a rigid lever, called the *beam*, movable in a vertical plane round a central fixed point. A true B. must fulfil the following conditions: The arms of the beam must be similar and equal in size and weight, and the whole apparatus must be symmetrical with respect to the vertical axis through the point of support, and must have one, and only one, position of stable equilibrium. We thus see that the centre of gravity, or the centre of inertia of the B., must be *below* and in the same vertical line with the point of support. If one arm be

longer than the other, the B. is false; but we may obtain the true weight of a body by means of it by two methods—either by double-weighing, *i.e.*, by replacing the body, previously counterbalanced by some material in the other scale, by known weights, until the equilibrium be again restored; or by weighing the body first in the one, then in the other scale, and finding the geometric mean of the two apparent but false weights, which mean is the true weight.

An important desideratum in a delicate B., such as the common chemical B. employed universally in laboratories, is its *sensibility* to the addition of a small weight to one of the scales. This sensibility in the first place obviously depends upon the friction at the point of support of the beam and the points of suspension of the scales. Accordingly, it being desirable to lessen this friction as much as possible, the beam is poised upon a knife-edge working on an agate, and the scales are suspended in a similar manner. Again, by increasing the length of the arms, we increase the leverage at the extremity of the arm, and thus make the B. more sensible; and this same effect is also produced by raising the centre of inertia, since by decreasing the distance from the fulcrum of the point at which the weight to be moved is applied, the leverage at the other extremity is proportionately increased. There is, accordingly, in the finer balances, an arrangement for varying the sensibility, by altering the position of the centre of inertia, consisting of a vertical screw surmounting the beam at the centre, along which a weight may be moved either up or down. Generally a bar with projecting pegs is added, which is capable of raising the beam and scales, so as to leave the knife-edges free, and thus keep them in good condition.

In commercial life, however, such a B. as above described would be practically useless, on account of the long time it would take to come to rest, its *stability* being small. As the conditions for stability are nearly opposed to those for sensibility, it is obvious that one of these must be sacrificed to the other.

Of other kinds of balances, we may mention the *Roman B.*, or *steelyard*, the *Danish B.*, and the *bent-lever B.* The steelyard is a lever of unequal arms, the weight being applied at the shorter arm, and the power movable along the longer arm, which is graduated usually by experiment. The Danish B. differs from this in having the fulcrum, not the power, movable. In the bent-lever B., again, the body to be weighed is, as above, attached to the shorter arm, but the weight is shown by the distance described before a graduated arc by the longer arm, to which the power is permanently fixed.

Bal'ance, and **Bal'ance-Spring**, are those portions in the mechanism of a watch which regulate the beat and secure uniform motion. The B. is a delicately poised wheel or ring, with most of its mass accumulated in the rim, and so connected with the spiral or helicoid spring that, when displaced from its position of rest, it acquires an oscillatory motion, from the alternate contractions and expansions of the spring. With the same length of spring, the time of vibration is directly proportional to the distance of the centre of gyration (see CENTRE OF GYRATION) from the axis, and consequently varies with temperature. The *compensation B.*, however, meets this difficulty by taking advantage of the unequal expansion of two different metals. The ring is divided into two or more segments, one extremity of each of which is connected with an arm of the B., while the other extremity, which is quite free, has attached to it a weight. Each arc consists of two laminæ of different metals fused together, with the more expansible to the outside. Upon a rise of temperature, the radii of the wheel expand, but at the same time the weights at the free ends of the arcs are brought nearer the centre, since the arcs become more curved owing to the greater expansion of the outside ring. With a fall of temperature exactly the reverse takes place; and by this method very exact compensation may be obtained.

Bal'ance-Fish. A name applied to the *Zygana malleus*, or hammer-headed shark, so named from the shape of the head, the eyes being placed at the extremities of the elongated head. See SHARK.

Balance-Fish.

Bal'ance of Power, an expression much more used in diplomacy in the 18th and beginning of the 19th c. than it is now,

denotes a state of matters in which no one of a community of nations is allowed to possess such power as to interfere with the independence of the rest. The idea of such an arrangement probably existed from a remote period of antiquity, and in Greece in particular caused alliances against the paramountcy of in turn Athens, Lacedæmon, and Thebes. The idea was first, however, formally recognised in Europe as a sound one, and in its name those wars originated which humbled the power first of Spain after the time of Charles V., and of France during the reign of Louis XIV. It may be said to have been the B. of P. that wrested Europe from Napoleon I., and in 1854 waged the Crimean war, and saved Turkey from the aggressions of the Czar Nicholas. Since the Treaty of Paris (1856), however, the idea of the B. of P. seems to have to some extent lost its hold upon the European, and especially the English mind. Three wars which have taken place since that date, between Austria and Sardinia, aided by France, in 1858, between Austria and Prussia in 1866, and between France and Germany in 1870-71, have very materially altered the power of Europe, and yet the changes that were made were effected without any great consultation on the subject of the B. of P. by the five great powers. The last event suggestive of the old idea was the agreement in 1871 of the powers consenting to the Treaty of Paris, by which the clause in it prohibiting Russia from maintaining a naval power on the Black Sea was practically rescinded. Something very like the European B. of P. is at present maintained in Asia by arrangements between the two dominant powers, Britain and Russia, and the weaker states, such as Persia and Afghanistan, by which the independence of the latter is guaranteed.

Balance of Trade. The difference between the money value of the exports and imports of a country is called the 'balance of its trade,' and this balance is said to be 'in favour' of the country or 'against' it, according to the excess of either the former or the latter. The expressions quoted indicate ignorance as to the causes and sources of the wealth of nations; and seem to proceed upon the notion that trade is like a game of cards; at which, if one gains, another must lose correspondingly. The B. of T. regulates rate of exchange (see EXCHANGE), but no conclusion can be drawn from it either as to the positive gain of a country, or as to its gain relatively to that of the country with which the balance arises. If England takes the value of a million sterling of raw cotton from America, manufactures it, sends it back and sells it in America for £1,250,000, America will then owe England £250,000, but it will not follow that England is £250,000 richer by the transaction, nor that America is poorer. England may have made a bad speculation, and the quarter of a million may not pay the costs of production and transport. Were this so, it would arise from over-trading—from England having sent to America more manufactured cotton than can be disposed of at a remunerative price. Suppose, however, that the transaction is a good one for England, and that the £250,000 is a gain to us, there will then, no doubt, so far as this one transaction can be supposed to have influence, be a tendency of gold to drift from America to England; but there will be an increased demand for raw cotton, and labour in America is thereby stimulated to the production of real wealth. The debt of £250,000 of America to England will be largely utilised in paying for this by bills, and will thus never cross the Atlantic; and to the extent to which it does cross, it will be employed by manufacturing England in stimulating production in other foreign countries; which countries may again, in consequence, increase their demand for American cotton. It is thus that the creation of wealth in one country tends not to impoverish another country with which it has commerce, but to enrich that country. The more that France takes of the cottons of Manchester, and of the woollen goods of Bradford, the more of French wine will be consumed in Manchester and Bradford.

Balanophora, an order of peculiar leafless plants found growing parasitically on the roots and stems of trees, principally in tropical countries, and having a fungus-like appearance. The *Fungus Meliænsis* of Malta (*Cynomorium coccineum*) is celebrated for arresting bleeding. The famous *Rafflesia* (q. v.) of Java belongs to the order. The genus *Balanophora* is the type of the order. *Cytinus hypocistis* is a common parasite on the roots of species of *Cistus* in the S. of Europe, and contains gallic acid. Some authors make B. a sub-order of *Rhizanthæa*.

Balanus, a genus of crustaceans included in the order

Cirripedia of that class, and represented by the familiar 'sea-acorns,' which stud over the rocks at low-water mark around all our coasts. These forms are sessile or unstalked, and are fixed directly to rocks by the base of the shell. The shell of each B. is conical in form, and is developed by limy secretions formed by the first three segments of the body of the animal. The animal is situated head downward within its shell, and is attached to the flat plate or 'basis,' forming the floor of the shell. This latter structure is composed of six pieces, and opens superiorly in an aperture guarded by a movable lid, the *operculum*. The joints of the chest or thorax bear six pairs of appendages, each of which is divided into two filaments; and the twenty-four ciliated filaments, or *cirri* as they are termed, representing the limbs of other crustaceans, are capable of being protruded from and retracted within the shell. These filaments constitute the 'glass-hand' of the 'sea-acorns,' and being continually protruded from the shell, serve by the currents they create in the water to bring particles of food to the mouth. From the presence of the *cirri* the name of the order—*Cirripedia* ('cirrus-footed')—is derived. The young first appear as free-swimming, locomotive larvæ, known as *Nauplii*; which moult, and become pupæ. In these states eyes are present, as also are limb-like appendages. Finally these locomotive forms settle down, attach themselves to fixed objects, and each, developing a shell, loses the eyes, has the limbs converted into *cirri*, and becomes an adult B. *B. sulcatus* is a familiar species; as also are *B. perforatus*, *B. porcatus*, *B. crenatus*, &c. *B. tintinnabulum* and *B. pilulacus*, both large species, are eaten, the former in China, the latter in Chili. The ancients esteemed the flesh highly. (See also CIRRIPIEDIA, BARNACLES, &c.)

Balasinore, or **Balasinur**, the capital of a *jaghire* or petty Indian native state of the same name, Rewa Kanta Agency, Bombay, India, is situated on the river Sheri, about 51 miles N. of Baroda. Pop. (1872) 8836. The native ruler (the Nawab) pays a tribute of £1000 to the British Government. B. has an area of 150 sq. miles; pop. (Government Report, 1873) 41,984.

Balasore (*Daleswara*, 'young lord'), the chief town of the district of the same name in Orissa, Bengal, British India, 123 miles S.W. of Calcutta. The Portuguese, Dutch, and Danes successively had factories here, and it was not till 1846 that it passed under English rule. Pop. (1872) 18,268. The district of B. has an area of 2066 sq. miles, and a pop. (1872) of 770,232. The one crop is rice, which is largely exported to the Maldives and Laccadive Islands.

Balata Gum, the milky juice which exudes from *Sapota Müllerii*, a large tree which grows in tropical America. The juice quickly hardens on exposure to the air, and, in its solid state, in appearance, properties, and uses it is similar to gutta-percha, for which it can be used as a substitute.

Balaton Lake, in Ger. *Platten-See*, the most important lake in Hungary, and the largest in the S.E. of Europe, lies to the S.W. of Pesth. Its greatest length is 46 miles; its average breadth, 7 miles; its area, with that of the frequently inundated marshes, variously estimated at from 250 to 420 sq. miles; and its greatest depth from 36 to 39 fathoms. B. abounds with fish; and iron-sand, containing small garnets, rubies, amethysts, &c., is found in it. The hills surrounding its N. sides are clad with woods and vineyards. When frozen in winter it forms a valuable means of intercommunication. The most interesting places on the lake are the Abbey of Tihany, the town of Füred on the N. shore, and the village of Keszthely on the W. shore. B. is often mentioned in the Magyar legendary ballads of the dark ages and the later Turkish wars.

Balausta. See BERRY.

Bal'bek, or **Bal'bec**. See BAALBEK.

Bal'bi, Adriano, a celebrated geographical writer, was born at Venice, April 25, 1782. He was made professor of geography in 1808 at Murano; in 1811 was appointed professor of physics at Fermo, and received a call to the chair of statistics at Padua in 1815, which, however, he declined. In 1820 he married an actress and retired to Portugal, where he collected the varied and valuable materials given to the world in his *Essai statistique sur le Royaume de Portugal et d'Algarve, comparé aux autres États de*

l'Europe (2 vols. Par. 1822), and *Varités politiques et statistiques de la Monarchie Portugaise* (Par. 1822). In 1822 he went to Paris, where he produced his chief works, the *Atlas ethnographique du Globe, ou Classification des Peuples anciens et modernes d'après leurs Langues* (1826), and the *Abrégé de Géographie* (Par. 3d ed. 1850; Ger. translation by Arendt, 1870), which has been translated into the principal languages of Europe. B. received a grant from the French government, and in 1832 retired to Padua. He died at Venice, March 14, 1848. His son, Eugenio B., collected his *Scritti geografici* (5 vols. Turin, 1841-42).

Bal'bi, Gasparo, a Venetian jewel-merchant, who visited India (1579-88), and on his return published a singularly interesting account of his travels, under the title of *Viaggio nelle Indie Orientali* (Venice, 1590). A Latin translation of this work appeared in the *Descriptio generalis totius Indue Orientalis* by the brothers Jan Theodorus and Jan-Israel de Iby (Frankf. 1598-1628).

Balbi'us, Decimus Cælius, one of two Roman emperors elected by the senate and invested with equal power, on the death of the elder Gordian and his son, to resist Maximin advancing on Italy with the legions from Germany. But though the choice of the senate, B. and his colleague, Clodius Pupienus Maximus, were not the choice of the Prætorians, who cherished the most implacable resentment against both. While Maximus, who was a severe, but brave soldier, went to fight Maximin, B. remained at home to govern the empire, but proved himself incapable of quelling the factions of the city. On the return of the victorious Maximus, the two emperors tried hard to govern wisely and well, but military insolence and insubordination proved too much for them, and they were murdered by the Prætorians in a savage outburst of rage and disloyalty, A.D. 238.

Bal'bo, Count Cæsare, a distinguished Italian politician and author, born at Turin, 4th November 1789. When only eighteen he was appointed by Napoleon I. auditor of the Council of State in Paris. In 1812 he acted as commissioner for the Illyrian provinces that fell to France by the Peace of Vienna. On the fall of Napoleon he devoted himself to literature, his first work being a history of Italy to the time of Charlemagne. His reputation was established beyond the limits of Italy by his *Speranze d'Italia* (1843), which did much to create the monarchical Piedmontese party, in opposition to the republican party, of which Mazzini was the leading spirit. B. also wrote a compendium of Italian history, *Della Storia d'Italia dall' Origine l'ino al 1814* (11th ed. 1859), and other works of less moment. He died 3d June 1853. He was a man of pure and sterling character, who loved his native land, with its great history and its famous Church, and who had a profound dislike of the destructive spirit of Continental liberalism. See Ricotti, *Della Vita e degli Scritti del Conte Cesare Balbo* (Flor. 1856).

Balbo's, Vasco Nuñez de, the discoverer of the Pacific Ocean, and one of the famous Spanish *conquistadores*, was born of a noble but poor family, at Xeres-de-Badajoz, in 1475. He volunteered in the expedition of Bastidas to the New World in 1501, established himself shortly afterwards as a planter in St Domingo, became involved in debt, and, in order to escape the law, had himself rolled in a barrel on board a ship bound for the Gulf of Darien. B. soon rose to the command of the expedition which he had thus joined, and landing on the Isthmus of Darien, he marched into the interior, and on the 29th September 1513, having crossed the isthmus, after travelling a month, he first beheld the immense expanse of the Pacific Ocean. Davila superseded him in the rule of the newly discovered territories in 1514, and although B.'s enterprises were rewarded with success, and his services to his country were great, the new governor continued to persecute him, and at length, having subjected him to a form of trial for rebellion, had him condemned and beheaded at Castile d'Or in 1517.

Balbriggan (Ir. Gael. 'city of Breacan'), a seaport and watering-place in the county of Dublin, 22 miles N.E. of Dublin, with some manufactures of linen and cotton embroidered goods. B. society is famed. The town is a station on the Dublin and Drogheda Railway. Pop. (1871) 2332.

Balbuena, Don Bernardo de, one of the most distinguished epic poets of Spain, was born at Valdepeñas in 1568, sailed for

the New World at an early age, and completed his studies for the Church in a college of Mexico. Returning to Spain in 1608, he was soon after appointed provost of Jamaica, and in 1620 Bishop of Puerto Rico, where he died in 1627. Of his works we possess only three—*La Grandena Mexicana* (Mex. 1609; Madr. 1829), a poetical description of the Mexican capital; *El Siglo de Oro* (Madr. 1608), a pastoral novel in prose and verse; and *El Bernardo, ó la Vittoria de Roncesvalles* (Madr. 1624, best ed. 1808), an epic poem in 24 books, the great merits of which have only recently been recognised. It is full of originality of design and execution; yet amidst all its fire and fancy there is a wonderful simplicity and naturalness.

Bal'cony (It. *balcone*), a gallery thrown out from a building, and usually placed in front of windows. The B. originated from the projecting galleries on fortified buildings used for throwing boiling tar or offensive missiles on besiegers. Balconies were not applied to private houses before the 15th c.

Bal'cony, in nautical language, is a gallery outside the stern of a large ship. In three-deckers there are two—the lower connected with the admiral's state-cabin, the higher with the captain's.

Baldachin, or **Baldachi'no**, in ecclesiastical language the dome or canopy which is stretched over the high altar. It is usually a highly ornamental structure, made of marble, wood, bronze, or precious metals. In early times the B. was known as the *aborium*, and used as the receptacle for the consecrated host. The name is also to some extent used, like the English term *canopy*, to distinguish any overarching covering, and so applied to the projecting niches over doorways, windows, to

Altar with Baldachin, from St Denis.

mantelpieces, and to the tops of old tester-beds. Baldachins are also erected over tombs, and the canopies which Italian bishops place over their ecclesiastical chairs are so termed. Portable baldachins were carried over monarchs in their coronation processions; and in the East, such a canopy is a necessary adjunct to all state processions.

Bal'der, Bal'dur, or **Balldr**, a Scandinavian divinity, with whose name are associated the ideas of brightness, beauty, peace and purity. He is the son of Odin, and brother of Thor, and falls a victim to the spirit of evil contention and fraud, represented by Loki, the foster-brother of Odin. How this happens is related in the 49th chapter of the *Prose Edda*. Before the arrival of Loki in Asgard, the Aesir (q.v.) had lived in peace. B. in particular, living in Breidablið, the mansion into which nothing unclean can enter, is the subject of praise from all mankind: like those of his son Forseti, living in Glitnir (the house of justice), the judgments of B. can never be altered: rays of light issue from his person; the whiteness of plants is called *Balder's-brow* (the Swedish *Balldurstra* or *Anthemis cotula*). B. has dreams of evil. His mother Frigga exacts from all nature an oath against injuring B., but she omits the mistletoe growing on the eastern side of Valhalla. Loki, who has already shown his cunning in the recovery of Thor's hammer, discovers this, and, when the Aesir are amusing themselves in the Peacestead, by hurling darts at B. in sport, he persuades Hödur (the

strong, but blind, god) to cast a piece of mistletoe at B., whom it kills, his wife Nanna (the Maiden) dying of grief. Hermod the Nimble then rides to Hel, where all those not dying in battle go, to ask from Hela (Death), a daughter of Loki, that B. may return to Asgard. This is granted, provided all things weep for him: a proviso taken advantage of by Loki, who, disguised as Thaut, refuses to weep. In the meantime the funeral of B. takes place, the pyre being placed on board his ship. The frost-giants, as well as the gods, are present. The gods then pursue Loki, whom they finally capture and confine in a cave under torments like those of Azael and Prometheus. This will endure until the catastrophe of Ragnarök and the renovation of the world, when B. is to leave Hel and come to Ida, where Asgard formerly stood. There probably is in this legend a mixture of physical and moral allegory. See the works of Thorpe and Müller, and Blackwell's translation of the *Edda*.

Bald'ness. See ALOPÉCIA.

Bal'do, Mon'té, a mountain of Venetia, N. Italy, on the E. shore of Lake Garda, 18 miles N. of Verona. It is 7100 feet high, is notable for its petrifications, and also for its fine green-coloured sand of Verona.

Bal'drick (Fr. *baudrier*, from Low Lat. *balterarius*, deriv. of *baltus*, the 'belt' of the Roman soldier), a broad belt which in mediæval times was worn from either shoulder diagonally across the body, either as an ornament or for carrying arms, horn, or other implement. The custom is alluded to by Spenser:—

'Athwart his breast a baldrick brave he bare,
That shined like twinkling stars with stones most precious rare.'

The B., as indicated in these lines, was frequently highly ornamented, and decorated with precious metals, gems, &c. The B. is often confounded with the military belt or belt of knighthood, which, being a waist-belt only, is quite distinct.

Bal'dung, Hans, or **Hans Grun**, born at Gmünd, Swabia, in 1470, died at Strasburg in 1552, a painter and engraver of much merit. His chief works are the pictures in the nunnery of Lichtenthal, Baden (1496), and the altarpiece in the Minster of Freiburg (1516), which are splendid specimens of old German art. Other pieces by B. are to be seen at Aschaffenburg, Basel, Berlin, Karlsruhe, Ludwigsburg, Nürnberg, Vienna, &c.

Bald'win (Fr. *Baudouin*), the name borne by nine Counts of Flanders, the first of whom, Baldwin *Bras-de-Fer*, married Judith, daughter of Charles *le Chauve*, and died in 879; and the last, a contemporary of Philippe Auguste, took the cross in 1201. By far the most notable of the nine, however, was Baldwin V., surnamed of Lille, or *le Dbonnaire*, who died in 1067. He carried on a bloody strife with the German emperor, Heinrich III., made the famous canal Fosse-Neuf, which separates Artois from Flanders, was Regent of France from 1060, during the minority of the French king, Philippe, and assisted the expedition which placed the crown of England on the head of his kinsman the Duke of Normandy.

Bald'win I., Latin King of Jerusalem, was born in Flanders in 1058. He was descended from Baldwin, fifth Count of Flanders, and shared in the first crusade under his famous brother, Godfrey of Boulogne. But he was thoroughly worldly and ambitious, and having obtained the principality of Edessa, left the crusaders to conquer the Holy City. In 1100 he succeeded his brother Godfrey as King of Jerusalem, and fought with great valour and success along the Syrian coast, capturing Acre, Beirout, Sidon, and other places. He died on his march back from Egypt to Palestine, at a spot in the desert called Laris, 1118.—**B. II.**, cousin of the preceding, and eldest son of Hugues, Count of Bethel, was King of Jerusalem from 1118 to 1131. After defeating the Saracens in several engagements, he was taken captive in 1124, and was a prisoner for six months. Though not always successful in his wars, he left the kingdom of Jerusalem much enlarged at his death. During his reign the Knights of St John and Knights Templars were instituted. He died August 21, 1131, and was succeeded by his son-in-law, Foulques of Anjou.—**B. III.**, King of Jerusalem 1143–62, son of Foulques of Anjou, born 1130, was the *beau idéal* of a knight. On several occasions he fought successfully against the Sultan of Aleppo, and was popular at once with Christians and Moslems. His death, occasioned it is believed by poison, took place 1162.

His brother Amaury, who succeeded him, died in 1173.—**B. IV.**, son of Amaury, born 1166, was king from 1173 till his death in 1183. During his feeble rule Saladin made rapid progress, wresting from the Christians large portions of their territory. He was succeeded by his nephew, **B. V.**, who died in 1187 of poison, administered, it is said, by his mother Sybilla, that she might secure the throne for her second husband, Guy of Lusignan.

Bald'win I., first Latin Emperor of Constantinople, a descendant of Charlemagne, and a cousin of the French king, was the son of B., Count of Hainault, and of Marguerite, Countess of Flanders. Born at Valenciennes in 1171 A.D., he took the cross in 1200, and in 1202 assisted Alexius, son of the Emperor Isaac II., to recover Constantinople from his uncle, Alexius Angelus, who, after blinding Isaac II., had usurped the government. The crusaders dethroned the usurper, and finding Alexius unable to give them the reward agreed on, turned their arms against him. They sacked the city, and B. was crowned emperor, 9th May 1204. He received, however, only a fourth of the empire, the Venetians, and the other French and Lombardian barons, retaining the remainder. The discontented Greeks, assisted by the Bulgarian king Calo-Joannes, having made an insurrection, and massacred the Latins who were dispersed throughout Thrace, B. besieged them in Adrianople, but being defeated and taken prisoner, he died a captive in 1205. 'The manner of his death,' says Gibbon, 'is variously related by ignorance and credulity. The lovers of a tragic legend will be pleased to hear that the royal captive was tempted by the amorous queen of the Bulgarians; that his chaste refusal exposed him to the falsehood of a woman and the jealousy of a savage; that his hands and feet were severed from his body; that his bleeding trunk was cast among the carcasses of dogs and horses; and that he breathed three days before he was devoured by the birds of prey.' See *The Decline and Fall of the Roman Empire*, chap. 61.

Bald'win II. fifth and last Latin Emperor of Constantinople, was born in 1217. He was the son of Pierre de Courtenay, Count of Auxerre, the brother-in-law of B. I. Pierre was singularly unfortunate. After being crowned by the Pope as the successor of Constantine, he set out for the East, but was seized and put to death on his journey by the despot of Epirus. His second son, Robert, a pusillanimous youth, was chosen in his stead, but his reign (1221–28) was an era of calamity and disgrace. The third son, B. II., was still too young to rule, and Jean de Brienne, the hero of the Egyptian crusade, and the titular King of Jerusalem, a veteran of fourscore years, was invested with the dignity of an interim emperor. On his death in 1237, B. II. received the purple. But the foreign empire had lost its vitality, and B. was no more a hero than his brother. Of the twenty-four years of his reign, the greater part was spent abroad in mendicant visits to the European princes, on whose bounty he was glad to live. At last he was driven from his capital by Michael Palæologus (q. v.), and in July 1261 the Latin empire of Constantinople came to an end, after a duration of fifty-seven years. The remaining thirty-three years of B.'s life (he died in 1274) were spent in vain attempts to induce the Catholic powers to join in his restoration.

Bâle. See BASEL.

Bale, John, Bishop of Ossory in Ireland, was born at the village of Cove, in Suffolk, 21st November 1495. Although originally educated as a Carmelite monk, he became an extremely violent Protestant at the University of Cambridge. His language on this point is amusingly vivid. 'And that I might never more serve so execrable a beast (the wicked Antichrist) I took to wife the faithful Dorothy.' In 1540 he thought it prudent to remove to Holland, where he lived for eight years. On the accession of Edward VI. he was presented to the living of Bishopstoke in Hampshire, and in 1552 to the bishopric of Ossory. He was so much hated by the Catholics, that, on the death of King Edward, his house, he tells us, was attacked, and five of his servants killed. He again fled to the Continent, and lived for a time at Frankfurt-on-the-Main and Basel. On Elizabeth's accession he returned to England, and was appointed to a canonry in the Cathedral of Canterbury. He died in 1563. A list of his works, ninety in all, is to be found in Cooper's *Athens Cantabrigienses*. B. was probably the last Englishman

who wrote miracle-plays, which he used as an instrument in his rancorous warfare with Roman Catholics. Even the Protestant Fuller nicknames him 'Bilious B.' (*Bilius Baleus*). His most important work is a collection of British Biography, written in Latin, and entitled *Illustrium Majoris Britannia Scriptorum, hoc est, Anglia, Cambria, et Scotia, Summarium* (best ed. Basel, 1557-59). The great value of this work arises from the use B. made of the monastic libraries just before their dissolution.

Balear'ic Isles, comprising Mallorca (Majorca), Minorca, Iviza, Formentera, Cabrera, and some islets, lie in the W. part of the Mediterranean, and to the E. of Spain, in lat. 38° 4'—40° 5' N., long. 1°—5° E. They now form a Spanish province; area, 1753 sq. miles; pop. (1867) 284,398, a large number of whom are employed in the tunny, anchovy, and sardine fisheries, and in the olive culture. The coasts are rugged, but there are excellent harbours. Capital, Palma, from which to Inca, a distance of 25 miles, a railway was opened in 1874, and is being continued as far as the Port of Alcudia. The name is generally derived from the Greek *ballein*, to throw, the natives having been expert in the use of the sling; but Strabo gives it a Phœnician origin, which is substantially of the same import. Aulus Cæcilius Metellus (who took the name of *Balearius*) annexed the B. I. to Rome in 123 B.C. They subsequently passed under the rule of the Vandals (426), Visigoths, Arabs (798), and the Almohades (1208), and were finally united with the crown of Aragon in 1343. See *B. I.*, by the Tuscan Archduke Luigi-Salvatore (vol. i. 1869).

Baleen', the term applied to the horny plates attached to the palate of the *Balenida*, or whalebone whales, and which constitute the 'whalebone' of commerce. The baleen-plates are arranged in a double row on the palate, and depend into the cavity of the mouth of the whale. The length of the largest plates averages from 10 to 14 feet; whilst in number about 200 plates exist on each side of the mouth. This huge fringe acts as a kind of sieve or strainer in serving to prevent substances of large bulk from gaining access to the throat, and also in entangling the minute forms upon which the whale feeds.

Balf, Michael William, a British musician, was born in Dublin, 15th May 1808. He displayed remarkable musical talent as a boy, and when only sixteen conducted the orchestra at Drury Lane Theatre. He afterwards studied music in Italy, and devoted most of the rest of his life to composition. In 1845 he was made conductor of the Italian Opera, Covent Garden. His principal works are operas, of which he wrote a great number. The best-known are *The Bohemian Girl* (1844) and *The Rose of Castile* (1857); but neither these nor the others possess any great merit or originality. His latest productions were *Satanella*, *The Puritan's Daughter*, *Blanche de Nevers*, and *The Sleeping Queen*. B. was an ardent disciple of Paër and Rossini, an imitator of Auber, and a rival of Adolphe Adam. He died 22d October 1870. See *Memoir of B.* by C. L. Kenny (Lond. 1875).

Balfour, Sir James, Lord President of the Court of Session, and son of Sir Michael Balfour of Pittendreich, in Fifeshire, was one of the most dubious politicians of the Reformation period in Scotland. He at first took part in the conspiracy against Cardinal Beaton, and was even sent to France along with John Knox. He subsequently, however, changed his religion, and was in consequence called by Knox 'Blasphemous B.' He was an accomplice in the assassination of Darnley and a friend of Bothwell, then threw over both Bothwell and Mary, giving up certain letters to the confederate Scotch lords upon which Mary's guilt was founded. Similarly he curried favour with Morton when he was made regent, and yet he was instrumental in obtaining Morton's death by producing the deed compassing the death of Darnley. During this strange political career, B. succeeded in achieving considerable personal and professional success, attaining in the end the Lord Presidentship of the Court of Session, with a pension of £500. He received a commission from Regent Morton to make a general report of the law of Scotland, and his *Prædicts of Scots Law* is still recognised as a very able work. B. died in 1583.

Balfurush' (properly *Barfurush*, i.e., 'lading mart'), a town on the river Bahbul, province of Mazanderan, Persia, 12 miles S. of the Caspian. There is a good road from the port of

Meshhed-Ser to B., which is the great market between Russia and Persia, and has a splendid bazaar, a mile in length. The principal products of the fertile plain in which B. stands are sugar, rice, and cotton. The pop. is said to range from 150,000 to 200,000.

Bali, or **Bal'ly**, an island E. of Java, 70 miles long and 35 miles broad. The soil produces two crops annually, and supports a pop. of 450,000, among whom are many Chinese. Area, 1530 sq. miles. B. is volcanic, one of the loftiest mountains having been active as late as 1843. The island has belonged to the Dutch since 1846.

Bal'iol, Edward, son of John B. (q. v.), accompanied by a few English knights, landed at Kinghorn in 1332, during the regency of Donald, Earl of Mar, whose forces he routed with immense slaughter at Dupplin Moor in Perthshire, and was crowned at Scone on September 24th. Three months after, being surprised in his camp at Annan, he fled to England, and died at Doncaster in 1363, after an ignoble, spiritless, and unfortunate life.

Bal'iol, John, Lord of Galloway, grandson of Margaret, eldest daughter of David Earl of Huntingdon, brother of William the Lion, and one of the competitors for the Scottish crown on the death of the Maid of Norway in 1290. The arbiter, Edward I. of England, previously acknowledged by the Scottish Estates to be overlord of Scotland, decided in favour of B., who was enthroned at Scone, 30th November 1292, and did homage to Edward at Newcastle on the 26th of December. In 1295, indignant at finding himself merely a nominal king, he concluded an alliance with France. For this Edward, after a three months' campaign in Scotland, in the course of which he subdued nearly the whole country, compelled B. to surrender the crown, July 2, 1296, and imprisoned him in the Tower for three years, after which he was allowed to withdraw to Normandy, where he died in 1314.

Bal'ista, or **Ballista** (Gr. *ballin*, to throw), a military engine for propelling weighty missiles, for the working of which two men were required. The machinery consisted either of strong elastic cords, or a peculiar arrangement of levers. The statement of the ancients, that the B. could propel a weight of 360 pounds, must be received with caution. During the middle ages, and before the use of gunpowder in war, various analogous contrivances were known, as the *mangonel*, *trebuchet*, *petrary*, &c.

Bal'istes, or **File-Fish**, a genus of fishes included in the *Plectognathous* section of the order *Teleostei*, and popularly known as 'file-fishes' from their possessing strong spines in connection with the first dorsal fin, these spines bearing toothlike processes, and thus exhibiting a filelike conformation. The skin is covered by rough, hard, granular scales, the skin itself being of tough consistence. The filelike spine in some species is articulated upon a bone belonging to the head, and in such cases can be retracted at will within a special groove of the supporting bone. When erect and protruded, the spine is fixed by interlocking with a projection on the adjoining spine, whilst it is released by the depression of the interlocking and smaller spine. A second and complete dorsal fin exists. The ventral fins may be spiny. Cutting teeth exist in both jaws. The body is short and compressed, and often brilliantly coloured. *B. capricus* is found in British seas; *B. pectilligerus* and *B. geographicus*, more typical species, occur in the seas of the tropics.

Balistraria, narrow apertures in castle walls, having the lower terminations generally circular, but sometimes in the form of a shovel, through which the crossbowmen shot their arrows. They are not known to have existed earlier than the 13th c., and correspond to the loopholes subsequently used by sharpshooters. See **LOPHOLES**.

Bal'ize, or **Belize**, better known as British Honduras, a territory in the S.E. of the peninsula of Yucatan, Central America, bounded on the W. by Guatemala, with some 80 miles of coastline along the Gulf of Honduras in the Caribbean Sea. Area, 3500 sq. miles; pop. (1870) 24,710, of which 24,333 were coloured, about half the entire number belonging to the capital. It is exceedingly fertile, in part mountainous, and is watered by several rivers, the chief of which are the Balize, Rio Hondo, and Siboon. The climate is hot and humid, but is

tempered by the regular sea-breeze. The capital, B., stands at the mouth of the navigable river of the same name, and is an important depôt for goods destined for the interior. The chief exports are mahogany, sugar, logwood, coffee, and indigo. Exports (1873), £200,869; imports, £161,191. After many years' occupation of B., the English possession was formally recognised by the Spaniards in 1783.

Balkan (Arab. 'high ridge'), anciently **Hæmus** (the wintry or snowy mountains: comp. Gr. *cheima*, and Lat. *hiems*, winter; also Sansk. Himalaya, 'abode of snow'), the most eastern branch of the great alpine system of Central Europe, extends from the plain of Sophia to the Black Sea, separating Bulgaria from Rumili, and forming the watershed between the Danube and the Maritza. Tchar-dagh (9700 feet), in the western part, is its highest peak. The B. is crossed by six roads, over as many passes, the most important of which is the Porta Trajani, which forms the overland route between Vienna and Constantinople.

Balk'ash, or **Tengiz'**, called by the dwellers on its shores *Ak-Dengiz* (white sea), or *Ala-Dengiz* (speckled sea), lies on the frontiers of the W. Siberian territory of Semipalatinsk and the steppes of the Kirghis. After the Caspian, Aral, and Baikal, it is the largest lake in the Russian empire, being 150 miles long, with an extreme breadth of 75 miles, and is fed by numerous streams, of which the Ili is the most important. From November to April it is frozen. The waters are salt, and the fish few. Shipbuilding is carried on by the Russians at the mouths of the Ili, the Karatal, and the Lepsa.

Balkh (anc. Pers. *Bakhti*, 'the high town'; whence the classical Bactria), the capital of a principality of the same name in Afghan-Turkestan, 23 miles S. of the Oxus, and 6 miles N. of the hills. The ruins of the old town have a circumference of 20 miles, and are now almost entirely deserted. The new town, called *Takh-ta-pul*, founded by the Afghans as their capital, lies about 4 miles E., and has a pop. of 20,000, chiefly Afghan and Usbeg soldiers. B. rivals in historic interest Samarcand and Bokhara, having been the capital of a Græco-Bactrian and afterwards of a Buddhist kingdom, and its restoration is fondly expected. B. is known as *Am-ul-Belad*, 'the mother of cities.' Wherever irrigated the neighbouring country is prodigally fertile. The staple crop is wheat. See BACTRIA.

Ball, in military art, formerly a comprehensive name for all kinds of spherical projectiles discharged from firearms of any calibre, now only applied to a few peculiar illuminating or incendiary shells. The steady application of mechanical invention to the improvement of firearms has led to the adoption of elongated or cylindrical projectiles with elliptical or conical points, spoken of as Shot or Shell (q. v.), according as they are solid or hollow, in place of those of a spherical form. For the projectiles of portable firearms, see BULLET. The ground-light B. and Boxer's parachute-light B. are employed chiefly to illuminate the area occupied by the enemy, in order to discover his operations. The latter consists of a thin wrought-iron shell, enclosing two wrought-iron hemispheres, the lower carrying an inflammable composition, and the upper a calico parachute attached by chains to the lower hemisphere. The B. is fitted with a fuse timed to explode at its maximum elevation in the air. The explosion liberates the two hemispheres from their metal envelope, and the lower with the now ignited composition, being the heavier, falls more rapidly than the upper, causing the calico to open up; when this occurs, the whole apparatus slowly settles down over the area which it is designed to illuminate. The smoke B. is composed of a paper skin filled with combustible materials, which when ignited give off a dense and suffocating smoke, intended either to repel an enemy from mines, or to conceal the operations of the user.

Ball. As we may presume that every one knows what a B. is, we need not describe it. As an implement of amusement it is valuable alike to the infant and to the man. Many of the games played with balls are of great antiquity. The Greeks and the Romans were particularly fond of this mode of exercise. A favourite game in England two centuries ago was the French game of 'Pale Maille' (It. *palla*, Lat. *pila*, a ball; and Fr. *maille*, It. *maglia*, Lat. *malleus*, a mallet), in which the endeavour was, in as few strokes as possible, to strike with a mallet a B. through an arch of iron. This game used to be much played in the long alley near St James', London—hence the name

Pall Mall. In England, Cricket (q. v.) may be called the national game with a B., and in Scotland it is Golf (q. v.); but cricket is now much played in Scotland. Football (q. v.) is an amusement common to both countries, and, though a somewhat rough game, has greatly gained in popularity of late years. America has its particular game of Base-ball, which is played by nine persons, and resembles cricket in so far as one side bats and the other fields. It was first exhibited in England by two American 'teams' in 1874. See also POLO.

Ball, a dancing entertainment, whose nature is so generally understood that it would be superfluous to attempt any description of it. Perhaps the most charming amusement of this kind in England is the county ball: but all are popular, from the court ball of London to the subscription ball of the provinces. Fancy balls, to which those who go are expected to be in fancy or peculiar dress, are not now so common as they used to be; and masked balls or masquerades are, in England, entirely gone out of fashion. There have been one or two balls which, all undreamt of by those who gave them, have become renowned in history. There was, for instance, the Duchess of Richmond's famous gathering of beauty and chivalry at Brussels, when the 'sound of revelry by night' was suddenly hushed by the tidings that Napoleon had crossed the Sambre, quickly followed by the cannons' thunder on the field of Waterloo.

Ballachu'lish (Gael. *Baile-na-coolish*, 'the dwelling on the narrow strait'), a village and parish on the S. shore of Loch Leven, Argyshire, celebrated for its slate and marble quarries. About 10,000 tons of the blue roofing clay-slate are produced annually, the quarries employing some 200 men. Pop. of parish (1871), 944.

Ball'ad (Fr. *ballade*, It. *ballata*, a dancing song; Mid. Lat. *ballare*; comp. Gr. *ballizein*, to dance), a species of poetical composition, in which the *matter* is Epic (q. v.), or narrative, and the *form* is so far lyrical as being suitable to be chanted or sung, with or without musical accompaniment. The words *ballad* and *ball*, though now entirely distinct in meaning, are the same in derivation; and the earliest ballads, properly so called, of which there is authentic notice (though the practice of combining dancing with song was a function of the Greek chorus, and has been practised by most nations from the days of 'Miriam the prophetess, the sister of Aaron'), were the *ballistea* or 'songs accompanying dancing' of the Romans. In the *Life of the Emperor Aurelian* by Flv. Vopiscus, two specimens of these ballads are given as sung in honour of the emperor's great deeds in the Sarmatic war by a corps of boys 'skipping and dancing' (*Vopisc. Aurel.* 6). The praise of heroes continued to be the chief aim of ballad-writers; but, in the later developments of the B., the primitive, artless, and spontaneous accompaniment of dancing was superseded by the more artistic and stirring harp-accompaniments of the bards or minstrels whose office it was to sing the deeds of heroes in the palaces of their descendants, or to win a livelihood by reciting historical, pathetic, or humorous legends in verse in the castles of nobles. Ballads have been the natural medium for the transmission of national or individual history among all nations prior to the diffusion among these of learning and the arts. Mr Jamieson, in his *Illustrations of Modern Antiquities*, states in reference to the earliest ballads of which we have any knowledge, that 'the songs mentioned by Tacitus in his account of the Germans, those collected by the order of Charlemagne, and those which the Goths brought with them out of the East, are now not to be found; yet it is more than probable that much more of them is preserved (in however altered a form) than we are aware of, in the elder Northern and Teutonic romances, the Danish and Swedish, Scottish and English popular ballads, and those which are sung by old women and nurses, and hawked about in Germany.' The cultivation of B. poetry, and the patronage of the minstrels, who in many cases composed the ballads they recited, commenced in the countries of Europe at a very early period. Among our own Teutonic ancestors, and especially among all the Danish tribes, the office of the minstrel or Skald (q. v.) was held in the highest estimation, and the art of reciting or singing metrical romances to the accompaniment of a harp, the effect of which depended wholly on the skilful improvisation of the musician, rose, perhaps, to the highest eminence it ever attained. That the same art was simultaneously practised with much success in Britain

may be readily believed from the circumstance that when Alfred, the great English king, penetrated the Danish camp in 878 in the disguise of a minstrel, such was his skill in the estimation of his Danish hearers, whose competency to judge was undoubted, that he was introduced to perform before the king, and allowed to remain in the Danish camp as long as he pleased. To the effect of ballads in lighting the martial fires and fanning the patriotism of a country, no sterner testimony was ever given than in the edict of Edward I. to destroy the bards of Wales as a necessary preliminary to the conquest of that kingdom. The B. may be taken as the earliest form of poetical composition. It is probable that the two famous epics of Homer, and it is certain that those of the Spanish *Cid* and the German *Nibelungen* (see Carlyle's *Essays on German Literature*), had each its origin in a cycle of original ballads, which, moulded, connected, and extended, by one or by successive master-minstrels, assumed by a process of accretion and development the complete epic form in which they are now known to us. However ancient this kind of poetical production may be—and it doubtless dates from the time when mankind first began to live in communities and to recognise natural leaders—it was not known by the name of B. until, in the 12th c., the Italians applied that title to short, lyrical pieces, usually of the amorous sort. Since that period compositions of the B. class have been produced by every civilised nation, though the quality of these compositions has been unequal in different countries and at different epochs; for in France in the middle of the 17th c. the artificial and tasteless B. of the period had to be extinguished by the ridicule of Molière—a service which Gifford performed with equal effect for the vapid Della Cruscan (q. v.) at the close of the 18th c. In the S. of Europe, the B. has, perhaps, been most successfully cultivated in Spain. The *Spanish Ballads*, translated by J. G. Lockhart (1824), familiarised British readers with these. But the true home of the B. in its highest form is the N. of Europe. Among the most eminent modern writers in which the examples of the true B. may be found are, in German, Bürger, Schiller, Goethe, Uhland, and Heine; and in English, Scott, Coleridge, Longfellow, Poe, Browning, and Tennyson. In England, and still more in Scotland, the B. has received its richest and most various illustration. Of the English ballads, the *Lyttel Geste of Robin Hood*, *Cherry Chase*, *William of Cloudestey*, are among the best-known examples. But it was not until the appearance of Scott's *Minstrelsy of the Scottish Border* in 1802 that we were made familiar with the B. in its highest form. The Scottish ballads of *Tam Lane*, *Clerk Saunders*, *The Wife of Usher's Well*, *Helen of Kirkconnel Lea*, *Johnnie Armstrong*, *Edom o' Gordon*, &c., are unequalled in clear and vivid conception, truth, simplicity, and directness of expression, the profoundest pathos, and the charm of an art that knows not art, which place them at the head of the list of all compositions of the same class. See Percy's *Reliques of Ancient English Poetry* (1st ed. 1755; new ed. 3 vols. Lond. 1844); Motherwell's *Minstrelsy Ancient and Modern* (Glasg. 1827); Aytoun's *Ballads of Scotland* (2 vols. Edinb. 1858); Whitelaw's *Book of Scottish Ballads* (Glasg. 1845); Child's *English and Scottish Ballads* (Bost. U.S. 8 vols. 1857), &c.

Ballarat, a city and goldfield of the colony of Victoria, the former being 96½ miles W.N.W. of Melbourne. B. was the scene of one of the earliest gold discoveries in Victoria, in June 1851, and is still the principal gold-producing district of the colony. At the beginning of 1874 there were 11,388 miners in the district, employing plant of an aggregate of 9314 horse-power, and valued at £494,668. Quartz-mining is now the leading feature of the district, and auriferous reefs are remuneratively worked at a depth of 300 and 1000 feet. The town of B. consists of two distinct municipalities, B. East and B. West, with an aggregate pop. of (1871) 40,705. B. is a well-built city, containing many handsome edifices. The public buildings comprise a hospital, orphan and benevolent asylums, free public library, theatre, ten banks, and fifty-six churches, including a splendid Roman Catholic cathedral (1874). B. has also eight iron-foundries, thirteen breweries and distilleries, several flour-mills, and other factories. It is connected by railway with Melbourne, and communication will also be opened shortly between it and Ararat (56 miles) and Maryborough (45 miles). B. West is a see of the Anglican and Roman Catholic Churches.

Ballast, in engineering, is that portion of the permanent way of a railway immediately under and between the sleepers.

It usually consists of broken stone or gravel well beaten down and packed.

Ballast is the name given to any substance placed in the hold of a vessel when she is empty, or carrying only a partial cargo, in order to give her sufficient stability under sail. In ballasting a ship, both the quantity and the distribution of the B. has to be considered. If it is placed too high, it is apt to cause the ship to heel over too much under the action of the wind or water; if too low, she does not move freely enough, and is said to be *stiff*. The substances chiefly used as B. are iron, gravel, sand, and water. Of these, iron has the advantage that it has great specific gravity, and can be obtained in a form easily stowed. Water has the advantage that it does not require to be hoisted on board (as it can be admitted by merely opening a valve), and can be discharged without a crane (by a pump) at the same time that the vessel is receiving its load of cargo.

Ballater, a village in Aberdeenshire, on the Dee, 36 miles W.S.W. of Aberdeen, with a pop. (1871) of 691. It is noted for its chalybeate springs.

Balleny Islands, a group of five small volcanic islands lying in the Antarctic Ocean, lat. 66° 44' S., long. 163° 11' E., containing peaks some 12,000 feet high.

Ball'et means literally a dance, but was first applied in modern Europe to the magnificent spectacles at the courts of Turin, Ferrara, France, &c., in the 16th c. and in the end of the 15th, in which symbolical scenes, dealing with various subject-matters, were represented by actors in dumb show, assisted by music and occasional dancing. In France the B. seems to have become a favourite *danseur* by the time of Charles IX. Baltagerini, musician to Catherine of Medicis, developed the B. *comique*: there were also the B. *historique* and *heroique*. Henry III. strongly encouraged such compositions, in which there was often no very definite dramatic meaning, the actors sometimes speaking, sometimes singing, but pantomime still prevailing, and appropriate music being played for the occasional dances. Baltagerini indeed said: 'J'ai toutefois donné le premier titre et honneur à la danse'; but in the following century, when Lully wrote music for the works of Molière and Quinault, the dance is in a subordinate position, a part of a pantomime *interlude*. (See *Ballet du Roi* or *Le Mariage Forcé*, danced by Louis XIV., 29th January 1664, vol. i. of Molière's collected works.) When the modern opera arose, the B. was retained, and in some cases, as in Glück's *Iphigenia in Tauris*, used successfully to increase dramatic effect. If *Macbeth* were ever made the subject of an opera, Lock's witches' dance would be an instance of an effective *opéra-ballet*. This, however, has tended to become little better than the modern *ballet-divertissement*, an *entre-chat* or *entr'acte* of mere dancing, unconnected with the rest of the performance, and often more remarkable for muscular dexterity than grace or decency. The true modern B., as a systematic expression of the drama, was revived by Noverre in the middle of the 18th c. He was called by Garrick 'the Shakespeare of dance'; and has left in his *Lettres sur les Arts Imitateurs* (Par. 1807) an account of his system. He treated such lofty subjects as *Hamlet* and *Medæa*, and succeeded in some cases in producing a coherent and intelligible effect. That human feeling has a large field of energetic expression in muscular movements is the fact on which the ancient 'orchestic' drama and M. Noverre both proceed; but there are well-defined limits to the range of such expression, and these limits vary extensively in different nations. A *Conservatoire de B.* (training-school) is still regarded as a necessary part of the modern opera-house.

Ballina (Gael. originally *Bel-ath-an-sheadha*, pron. *Bella-han*, 'the ford-mouth of the wood'), a seaport in county Mayo, Ireland, on the Moy, five miles from its entrance into Killala Bay. It has an active trade in flax, cured provisions, and salmon, but the river is only navigable to within a mile and a half of the town. In 1798 the French landed here and took B., but were defeated at Killala. B. includes the suburb of Ardnarea (*Ard-na-riaghadh*, 'the hill of execution'), which lies on the right bank of the river, within Sligo county. Pop. (1871) 4307, of whom 3644 are Roman Catholics.

Ballinasloe (Gael. originally *Bel-atha-na-shaightheadh*, pron. *Bellanaslooa*, 'the ford-mouth of the hosts'), a thriving town of Ireland, on both banks of the Suck, in Galway and Roscommon

counties, 81 miles W. of Dublin, on the Dublin and Galway Railway. It is the headquarters of the Galway constabulary, the seat of a poor-law union, and is noted for its October wool and cattle fair, which is one of the largest in Ireland, and to which there may be some allusion in the name of the place. Pop. (1871) 5052, of whom 4307 are Roman Catholics.

Ballinrobe (originally *Baile-an-Rodhba*, pron. *Rôba*, 'the town on the Robe'), a town in county Mayo, Ireland, on the Robe, 3 miles E. of its entrance into Lough Mask, and 15 S.S.E. of Castlebar. It is the seat of the general sessions, contains a barrack, and has two annual fairs. Pop. (1871) 2048, of whom 2172 are Roman Catholics.

Balliol College, Oxford, founded between 1263 and 1268 by John de Balliol, and enriched in 1340 by Sir William Fenton and Sir Philip Somerville, has since had numerous benefactors, among others, John Snell, in 1677. The Snell Exhibitions, at present fourteen in number, and tenable each for five years, in the gift of the University of Glasgow, attract annually to B. C. the best Latinists among Scottish students. Adam Smith and Sir William Hamilton were Snell Exhibitioners. The college has the presentation to nineteen livings. The society in 1875 consisted of a master, thirteen fellows, and twenty-four scholars, including three mathematical scholars; the number of undergraduates was 179, and of members on the books, 543.

Ballistic Pendulum, an instrument invented by Robins towards the close of the 18th c. for the purpose of measuring the velocity of cannon-balls and musket-balls. The pendulum consists of a rigid rod, to the lower end of which is attached a large cubical piece of woodwork, at which the shot is aimed. The momentum of the bullet at the moment of concussion is imparted to the whole apparatus; and, from the angle through which the pendulum moves, the velocity of the bullet is easily calculable.

Ball'ium. See **BALLEY**.

Balloon (Fr. *ballon*, a large ball), consists essentially of a globular or pear-shaped integument, filled with a gas specifically lighter than air. Its object is to render possible aerial navigation; and its buoyancy depends upon the principle of Archimedes (q. v.), that a body will sink or rise in a fluid of varying density until it reaches a point at which the fluid is, bulk for bulk, of the same weight as the body. The B., as at present employed and fitted up, consists of a pear-shaped bag of silk, coated with a layer of varnish, in order to render it air-tight. A car is attached by cords to a net which covers the whole of the upper hemisphere, and sometimes extends even as far as the mouth or neck of the B. By this means the weight of the car and its occupants is distributed as uniformly as possible. Another most important apparatus is the valve, which consists of a wooden clapper fitting over an aperture in the upper surface of the B., and which is regulated by means of a rope hanging down into the interior of the car.

The first B. capable of sustaining any considerable weight was invented by the brothers Montgolfier, papermakers at Annonay, in France, towards the close of last century. The envelope was of paper, and was filled with heated air. After the success of June 1783, when a spherical B. of packcloth, covered with paper, and 35 feet in diameter, rose to a height of 1500 feet in the presence of a large concourse of people, at a place near Annonay, the Academy of Science appointed a committee to report upon the experiment. A few weeks later, Professor Charles, assisted by the brothers Robert of Paris, managed to fill a B., 12 feet in diameter, with hydrogen gas. The first persons who ventured to ascend in a free B. were the Marquis d'Arlandes and M. Pilâtre de Rozier, and this feat they performed at the Château de la Muette, near Passy, November 21, 1783, in a Montgolfière or fire-B., remaining aloft about twenty-five minutes. On December 1st of the same year, MM. Charles and Robert ascended in a hydrogen B., and after coming down, M. Charles reascended to a height of nearly two miles. After this,

Balloon.

numerous ascents were made by such men as Blanchard, Morveau, Lunardi, Jeffries, Romain, who was killed with M. de Rozier in 1785, at the very commencement of their projected journey across the Channel. In 1802, General Money narrowly escaped drowning; and in the same year Garnerin descended successfully from a B. by means of a parachute. On the 23d of August 1804, Gay-Lussac and Biot ascended to a height of 13,000 feet; and on the 15th of September, Gay-Lussac by himself reached an elevation of 22,977 feet. Hitherto hydrogen or heated air had been employed as the means for rendering balloons buoyant, but these have given place to coal-gas, which was first introduced by Mr Green. The longest journeys hitherto undertaken are the remarkable voyage of Messrs Green, Holland, and Mason, on November 7, 1836, from London to Nassau, a distance of 500 miles in 18 hours, and the still more remarkable one of the American aeronauts, Wise and La Mountain, who travelled 1150 miles in less than 20 hours.

The most celebrated of recent aeronauts is Mr Glaisher, who, on September 5, 1862, accompanied by Mr Coxwell, rose to a height of about seven miles, on which occasion he became insensible; and Mr Coxwell, having lost the power of his arms, opened the valve by pulling the rope with his teeth. Of late years, balloons have been used for strategic purposes, notably in the recent Franco-Prussian war of 1870-71. M. Gambetta escaped in one from Paris, when the city was surrounded by the Germans, and organised a further resistance of the French on the banks of the Loire; but the best services which they can render are in the interests of physical science. M. Tissandier, a Frenchman, has recently made some important meteorological observations in the higher strata of the atmosphere. In one of his most recent ascents (1875), such a height was obtained that the three occupants of the car became insensible; and when he himself regained consciousness, he found both of his companions dead, owing to the bursting of blood-vessels. Numerous but futile attempts have been made to devise some method of steering, so as not to be dependent upon the direction of the wind; and in 1872 Professor Helmholtz of Berlin gave it as his opinion that a B. could be steered if only moving at a slow rate through the air. See *Travels in the Air*, by Glaisher, Flammarion, Fonvielle, and Tissandier (Lond. 1870).

Ball'ot (Fr. *ballotte*, 'a little ball'), a mode of secret voting by means of little balls of different colours, but sometimes by tickets having some mark of assent or dissent appended to the name of the candidate. Whether secret voting be desirable is clearly a matter of expediency; for what may be expedient in the case of voting for persons wishing admission into private societies, may not be so as regards aspirants for public offices. What may be proper in the former case to preserve social harmony, may be cowardice and a public danger in the latter. In ancient Athens voting was generally by show of hands, but the B. was resorted to where secrecy was desirable, as in judicial proceedings and in the court of Areopagus. At Rome the B., confined at first to the enactment or to the repeal of laws, was by the *Lex Gabinia* (B.C. 139) employed in the election of magistrates. At Venice the B. is said to have operated beneficially. In France and America, and generally in new countries, as Australia, magisterial elections are made in this way. Secret voting in legislative assemblies, introduced into the French Chamber of Deputies in 1840, was abolished in 1845, having been found productive of abuses. The election of Louis Napoleon, first as president (1848), then as emperor (1852), and again the Plebiscite (q. v.) of approval of his policy (1870), by means of the B., are among the most striking examples of secret voting on record, and gave occasion to the adversaries of the general principle to maintain that, in the hands of a well-organised despotism, the B. was a most efficacious instrument of tyranny. No question has been more keenly discussed by politicians than the B.; one party maintaining that it was essential to the interests of electors and candidates alike, as it would annihilate the influence of threats, and remove the inducements to bribery; while the other, regarding the franchise as a trust, maintained the duty of open voting, as necessary to preserve in the voter a due sense of his responsibility to the community. The value of the B. also, in its operation in other countries, was represented in different aspects, according to the politics and prejudices of the advocates. But much of the interest attaching to the question in Britain has disappeared since the passing of the *Ballot Act*,

35 and 36 Vict. cap. 32, 18th July 1872, under which both municipal and parliamentary elections are now conducted.

Ball'ot for Militia. See MILITIA.

Ballo'ta. See HOREHOUND.

Balls, Hollow, are projectiles used in military operations for the purpose of giving light, producing a dense smoke, or emitting an intolerable odour. There are accordingly three kinds of such projectiles, known as light, smoke, and stink B., and the respective effects are produced by the ignition of the combustible material composing the ball.

Ball'y, or Bal, properly *Baile*, a Gaelic word signifying originally a place, a home, then a fort or town, and allied to the Greek *polis*. It is frequently prefixed to names of places in Ireland and Scotland, e.g., Ballyshannon, Ballymena, Ballintrae or Ballantrae, Ballycastle, Balmoral, Ballachulish. See Blackie's *Etymological Geography* (Lond. 1875), and Joyce's *Irish Names and Places* (Dub. 1869, 2d ser. 1875).

Ballycas'tle ('the town of the castle'), a seaport of Antrim county, Ireland, lies picturesquely on a fine bay, at the base of Knocklady Mountain, 88 miles N. of Belfast. It is divided into an upper and lower town, standing a quarter of a mile apart, and has considerable linen manufacture and salmon-fishery. The erection of the harbour, which is now filled with sand, and of a fine pier, cost £15,000. Near B. is the 'Grey Man's Path,' a remarkable opening in the face of a greenstone cliff. Pop. (1871) 2102. The B. of Mayo is a somewhat different name. It was originally *Baile-an-Chaisil*, the town of the cashel, or circular stone fort; but the Irish cashel is probably connected with the Lat. *castellum*.

Ballyme'na (originally *Baile-meadhonach*, 'middle town'), a town in the heart of Antrim county, Ireland, on the Braid, 18 miles N.W. of Belfast, with which it is connected by railway. It is one of the largest Irish markets for linen and flax, and its chief industry is bleaching. Pop. (1871) 7931, of whom 6197 are Protestants.

Ballyshann'on (originally *Bel-atha-Seannach*, pronounced *Bellashanny*, 'the mouth of Seanach's ford'), a seaport in the S.W. of Donegal county, Ireland, stands at the entrance of the river Erne into Donegal Bay, 26 miles N.W. of Enniskillen. It has a valuable salmon-fishery on the Erne, which is here crossed by a bridge of fourteen arches. Next to the Shannon, this river is the most voluminous in Ireland, but a bar at its mouth has hindered the trade of the town. B. is the headquarters of the county militia. Pop. (1871) 2958, of whom 2372 are Roman Catholics.

Balm of Gilead. See BALSAM.

Balmoral Castle, in Braemar, Aberdeenshire, 48 miles W. of Aberdeen, a residence of Queen Victoria, was built by the Prince-Consort, who purchased the estate in 1852 from the Earl of Fife. The castle, which is in the Scottish baronial style of architecture, is built of granite, and has a square tower 80 feet high. There is an extensive deer-forest, comprising 30,000 acres, belonging to the estate. The name B. signifies in Gael. 'the majestic dwelling.'

Balnaves', Henry, of Halhill, born at Kirkcaldy, Fifeshire, in the reign of James V. He was educated at St Andrews and at Cologne, where he adopted the principles of the Reformation, and on his return to Scotland studied law. In 1583 James V. made him a senator of his new College of Justice, and under the regency of Arran he was appointed Secretary of State, but was imprisoned in 1543 on account of his Protestantism. On the capture of the castle of St Andrews, in which he had taken refuge in 1547, he was, along with Knox, sent to France as a prisoner of war. Returning to Scotland in 1554, he was appointed one of the commissioners who in 1559-60 concluded the treaty of Berwick, which established the Reformation in Scotland, and was one of the commission appointed to revise *The Book of Discipline*. B. died in 1579.

Ballot'ra, a town in the state of Jodpore, or Marwar, Rajputana, Hindostan, is situated on the river Luni, to the W. of the Aravulli mountains, 49 miles S.W. of the city of Jodpore. Pop. 7275.

Bal'sam. This term is applied to many varieties of oleo-resinous exudations, commonly procured by incising the stem and branches of plants. When fresh, they are liquid or semi-

liquid, glutinous, aromatic, and acrid to taste; by exposure to the air, they gradually thicken, and ultimately become solid, darker in colour, and in some cases odourless. They are mixtures of resins and volatile oils; some of them, however, contain cinnamic or benzoic acid in addition, and advantage is taken of this circumstance to divide them into two groups—(1) those of purely oleo-resinous character; and (2) those in which cinnamic or benzoic acid is present together with volatile oils and resins. The first group embraces Copaiba B., Mecca B., Canada B., and other Turpentine (q. v.) of coniferous plants; and to the second group belong the balsams of Peru and Tolu, liquidambar, and storax. They dissolve in alcohol, and yield volatile oils on distillation with water.

Canada Balsam is procured from the Balm of Gilead fir, *Abies balsamea*, which grows in Canada and the United States. It is transparent, colourless, or slightly yellow, mobile, with an acrid penetrating taste and agreeable odour. It hardens in thin layers, retaining its transparency, and is employed for mounting microscopical objects, and is valued as a cement for optical instruments on account of its refractive power being nearly the same as that of crown glass.

Copaiba or Copaiva Balsam is abundantly yielded by several S. American species of *Copaifera* (*Leguminosæ*). Of the three different varieties of this B., the Brazilian is the most common. It is a light-yellow transparent liquid, possessing a peculiar aromatic odour, and a nauseous hot taste. It is used in the preparation of lac varnishes and of tracing paper; also in medicine in arresting discharges from the mucous membrane of the urethra. An unsophisticated variety of copaiba B. was a few years ago introduced into this country from the Brazils. It possesses greater mobility and more essential oil than the ordinary B., and resists a certain chemical reaction which had hitherto been regarded as positive evidence of the freedom of copaiba B. from adulteration.

Mecca Balsam, Opobalsamum, or Balm of Gilead, is said to exude from a tree of the genus *Balsamodendron*, growing in Arabia, and is also obtained by boiling the branches in water. The finest kind is extremely fragrant, and is highly esteemed by Asiatics; but it is scarce, and little of it reaches the British market.

Peru Balsam.—Three varieties are known, the produce of *Myrospermum Myroxylon Pereira*, growing sparsely in Central America, and chiefly imported into Great Britain from the B. coast of San Salvador. The *white* kind is extracted from the fruit, and when hardened by exposure becomes the *dry* Peru B. Both of these varieties are scarce. The *black* viscid variety is common in commerce, and is obtained by bruising the stems of the plants. It has an acrid bitter taste and agreeable odour, and is employed medically as an expectorant and for external application, and as a substitute for vanilla in confections and perfumery.

Tolu Balsam closely resembles the commercial Peru B., and is obtained in large quantities by incision of the stem of *Myrospermum toluiferum*, which grows on the banks of the Magdalena and other localities in Colombia. When fresh, it is soft, yellowish, translucent, has a lemon-like odour and a sweetish irritating taste; by keeping, it changes to a thick consistence of a dark-red colour, and ultimately to a dry friable condition. It is used in perfumery, and medicinally as an expectorant. Tolu lozenges, valued for troublesome coughs, owe their efficacy to the presence of this B.

Storax Balsam, the produce of a shrub, *Styrax officinale*, growing in Syria, Greece, &c., was formerly imported into Great Britain chiefly from Asiatic Turkey, in the form of reeds enveloped in leaves, *Styrax calamita*, and in compact masses with white tears, hence *Amygdaloid styrax*. It is now extremely rare, and the liquid and solid varieties of the druggist are frequently factitious compounds, of very variable composition and character.

Liquidambar Balsam is found in considerable abundance between the bark and the wood of *Liquidambar styraciflua*, which is common in Louisiana, Florida, Mexico, &c. It exudes through cracks in the bark as a clear slightly yellowish liquid, possessing a very fragrant odour. An inferior kind is procured by boiling the small branches and leaves, and skimming off the balsamic oil as it rises to the surface of the water. In France it is employed as a perfuming agent.

Under the name of *Artificial Balsams* is grouped a diversity of pharmaceutical preparations, of varied character and constitution, principally used externally.

Balsamina'ceæ, a natural order of dicotyledonous plants, including only two genera, and about 130 species. Many of them have showy flowers, but their properties are unimportant. They are herbaceous, succulent plants, chiefly found in the E. Indies. Their seed-vessels, when ripe, usually open with considerable force, and scatter the seed. *Impatiens balsamina*, the common garden balsam, and *Impatiens noli-tangere*, or Touch-me-not, a native of Britain, belong to this order.

Balsam.

Balsamoden'dron, a genus of dicotyledonous shrubby plants, belonging to the order *Amyridaceæ*. They are mostly furnished with spines, and have little foliage. They yield a fragrant balsamic substance, such as balsam or balm of Gilead, myrrh, bdellium, and elemi.

Bal'sam of Sulphur, an ointment composed of two parts of sulphur to eight of olive oil. In Germany it is made by adding one part of sulphur to three of turpentine. It is used as an application to foul ulcers.

Bal'ta, a prosperous town on the Kodima, a tributary of the Bug, government of Podolia, European Russia. Pop. (1867) 14,528.

Bal'tic Provinces (Russia), comprise the governments of Courland, Livonia, Esthonia, Petersburg, and the Grand Duchy of Finland. Area about 200,000 sq. miles; pop. (1867) 4,903,808. Courland once belonged to Poland, the others to Sweden. Their constitutions vary much, but are being gradually shaped after the Russian model. In enumerating the B. P. the last two are sometimes omitted. Baltic-Port is the name of the haven (pop. 466) in Esthonia, 25 E. of Revel, which forms the terminus of the St Petersburg Railway.

Bal'tic Sea (Ger. *Ost See*, or East Sea), a large inland sea, bordered by Denmark, Germany, Russia, and Sweden, separating central from northern Europe, and communicating with the N. Sea by the Sound and the Great and Little Belts. Its length is 900 miles, breadth 138 miles, area 156,612 sq. miles. It is throughout shallow, the average depth being from fifteen to twenty fathoms, which, combined with the sudden changes of the wind, makes sailing dangerous. The water is of a lower temperature than that of the ocean; is comparatively fresh, owing to the large influx of river-water, and to the small evaporation to which it is subjected; and the tides are scarcely noticeable. The navigation is stopped from three to five months annually by ice. Branching off from it are the Gulf of Bothnia on the N., between Sweden and Finland; the Gulf of Finland, between Finland and Esthonia; the Gulf of Riga, between Livonia and Courland, &c. More than 250 rivers run into the B. It contains numerous islands, the principal of which are Zealand, Funen, and Laaland (Danish); Gottland and Oland (Swedish); the Åland, Dagö, and Oesel (Russian); and Rügen (Prussian). There is a large commerce, the chief exports being timber, hides, tallow, and grain. The coast in the S. is flat and sandy; in the N. it is for the most part rocky and precipitous, but there are many important harbours, as Copenhagen, Kiel, Danzig, Memel, Riga, Cronstadt, and Stockholm, and trade is further facilitated by the Slesvig-Holstein Canal, near Kiel, connecting the B. with the N. Sea. There is said to be a gradual vertical subsidence of the coasts in the S. of Sweden, and further N. a gradual uprising, at the rate of three feet in a century.

Bal'timore, a city and port of entry in Maryland, U.S., on the Patapsco river, 12 miles from the Chesapeake Bay, 178 from the Atlantic, 37 from Washington, and 98 from Philadelphia by railway. The site is undulating and picturesque. The harbour is little more than 20 feet deep, but is safe and commodious. The chief articles of trade are fruits, grain, tobacco, coal, and oysters. In 1874 the vessels, native and foreign, entering from foreign ports were 1117, tonnage 558,599; clearing port, 1026 vessels, tonnage 524,847. B. is the see of the Roman Catholic primate of the United States, and has a granite cathedral, with a lofty dome, some fine paintings, gifts of the kings of

France; a new city-hall of white marble, built at a cost of three million dollars; the custom-house with a dome 115 feet high; the Peabody Institute, which received one million dollars from George Peabody, and has a library of 60,000 vols.; and the munificent Hopkins' Hospital, begun in 1873. B. was founded in 1729, and is now reputed to be the third trading city in the U.S. It is healthy, with a fine climate and sky, and is famed for the beauty of its women. It is the seat of the Maryland University, and has an excellent public school system. In the vicinity is Druid Hill Park, of 704 acres, with many noble trees. Besides shipbuilding and oyster and fruit packing, B. has manufactures of iron, machinery, leather, clothing, &c. The city is supplied with water from Jones's Fall and Gunpowder River, and its reservoirs can store 857 millions of gallons. It has a monument to General Washington, and one to the memory of those who fell in the battle of B., 1814, hence it is popularly called the 'Monumental City.' It derives its name from Cecil Calvert, second Lord Baltimore. The original B. is a small village near Skibereen, Ireland. Pop. (1870) 267,354, of whom about one-third are Germans.

Baltimore Bird, or Oriole (*Yphantès* or *Icterus Baltimore*) a genus of Perching or Insectorial birds, belonging to the Den-

trostral section of that order, and found throughout the United States. Its northernmost limit appears to be about the 55° of N. latitude. It has a straight, acute bill, a long wedge-shaped tail, and pointed wings. Its plumage is bright orange and black, and it has received the names of golden robin and 'fire-bird,' from its brilliant hues. It builds a pouch-like nest, composed of hemp and flaxen

Baltimore Bird.

strands defily interwoven, and suspended from a forked branch.

Baltistân', or Little Tibet, once an independent state, now a province of Cashmere, on the Upper Indus, is separated from Chinese-Turkestan by a range of mountains. Its inhabitants are of Tibetan origin, but profess Mohammedanism. Their number is unknown. The capital, Iskardo, or Skardo, is composed of about 150 half-ruined houses.

Baltschik', or Baldjik, a town of European Turkey, vilayet of the Danube, on the Black Sea, 18 miles N.E. of Varna, with the safest harbour on the Black Sea, and a considerable trade. Its yearly market for horses, cattle, and sheep is important. From B. and Varna the Franco-English army sailed for the Crimea in September 1854. Pop. 4000. Near it are the ruins of Tomi, to which Ovid was banished.

Baluster (corruptly *bannister*; from the Ital. *balaustra*, through the Fr. *balustré*), a small column used in railings called balustrades, which may be either employed as an ornament, or for protection on the ledges of stairs, balconies, outside of windows, or in arcades. The B. varies in form and proportions according to the purpose to which the balustrade may be devoted. The shaft is generally belly-shaped, and sometimes double belly-shaped, and the section, though generally round, is sometimes quadrangular.

Balustrade, an ornamental railing or parapet, composed of a series of balusters, surmounted by a coping. Statuary figures are frequently placed at short interval on balustrades.

Bal'zac, Jean Louis Guez de, a celebrated French *littérateur*, who contributed much to refine his native language, though, singular to say, he was equally destitute of genius and taste. He was born at Angoulême in 1794, and acquired the favour of Riche-

Balustrade.

Bau, who even flattered him. When his first work appeared in 1624, it was received at first with universal applause; but gradually a suspicion arose in the minds of some that the grandiose style of B. concealed a paucity of ideas and a puerility of taste. His critics became his enemies. One of them, Le Père Goulu, in a violent diatribe entitled *Phyllargue*, passed from animadversion to calumny. At last B., wearied of controversy, retired to his ancestral estate on the banks of the Charente, where he wrote most of his works, corresponded with kings, and died 18th February 1655. Among his once famous writings are, *Aristippe*, *Lettres Choisies*, *Lettres Familiales à Chapelain*, *Le Socrate Chrétien*, *Pensées de B.* See *Œuvres Choisies de B.*, by Malitourne (Par. 1823).

Balzac, Honoré de, a distinguished French novelist, born at Tours, 20th May 1799, commenced his studies at the college of Vendôme, and completed them at the *pension* Lepitre, Paris. He was then placed in the office of a notary, but devoting himself to literature, he had published numerous volumes under various names, among others, that of *R'hoone*, an anagram of Honoré, but with no success, before he became, in 1826, the partner of the printer Barbier. He was still unsuccessful; but, though burdened with debt, he persevered heroically, till, in 1829, *Le Dernier Chouan*, to which he put his own name, secured for him public recognition. Some of his best-known works are *Physiologie du Mariage* (2 vols. Par. 1831); *Scènes de la Vie privée* (5 vols. 1831); *Scènes de la Vie de Province* (1832); *Scènes de la Vie parisienne* (1832); *Le Médecin de Campagne* (1835). The publication of this last led to a correspondence between B. and the Countess de Hanska, whom he subsequently married. He was cut off by hypertrophy of the heart, 20th August 1850, and Victor Hugo pronounced an eloquent *éloge* over his grave. *L'Histoire intellectuelle de Louis Lambert* and *Eugénie Grandet* are the most artistically complete of his works, which, though full of interest, especially for females, are overstrained, somewhat pretentious in their analysis, and not altogether so philosophical as their imaginative author supposed. A collected edition of his works appeared under the title *La Comédie Humaine* (45 vols. Par. 1856-59). See Sainte-Beuve, *Portraits Contemporains* (vol. ii.), and Gustave Desnoiresterres, *Vie de Honoré de Balzac* (1851).

Bambarr'a, a native state of Sudan, W. Africa, bounded S. by Guinea, N. by the Sahara, W. by Senegambia, and extending E., it is supposed, to the 15th meridian. It is partly mountainous, with a hot but not unhealthy climate, and is intersected by the Niger, on whose banks are the chief towns, Sego, Bam-maku, Yamina, and Sansanding, the first of which is the capital. The rainy season is from June to November. In many parts the land yields yearly double crops of corn, rice, maize, and yams. The cotton-tree, oil-palm, date, and butter-tree are indigenous. The chief wild animals are the lion, the leopard, the elephant, and the panther; there is also a good supply of domestic animals, including excellent horses. The inhabitants, reckoned at 2,000,000, are chiefly Mandingoes, and are a warlike race, partly pagan, and partly Mohammedan. They were governed by a king of their own till 1861, when El-Hadj Omar, known by his struggles with the French in Senegal, made himself master of the country. See Vignon's *Le Royaume de Ségou et les Bambaras* in *Nouv. Annales des Voyages* (1857).

Bam'berg, a city of Bavaria, circle of Upper Franconia, on both sides of the Regnitz, near its confluence with the Main. Pop. 25,738 (1871). It is the seat of an archbishop. The most remarkable of its public structures is the cathedral, in the Byzantine style, founded by the Emperor Heinrich II. in 1002 (restored since 1827), and containing the monuments of the founder, and of Kunigunde, his wife. The library contains 60,000 volumes, and there are several scientific collections of great value. See Jäck's *Beschreibung der Bibliothek zu B.* (Nürnb. 1831-34). The educational institutions are numerous and excellent. B. has cotton mills and breweries. Horticulture is carried on extensively, and there is a large export trade in garden-seeds. On an eminence not far from B. are the ruins of the castle of Altenburg, originally the seat of the ancient Counts of Babenberg. See Jäck's *Geschichte B.* (4 vols. 1806-9).

Bambi'no, the figure of the child-Christ in swaddling clothes, frequently seen in Roman Catholic altar-pieces. A splendid specimen is to be seen at the Ara Coeli (Rome), to which many make pilgrimages at Epiphany.

Bambocciades (Ital. *bamboccio*, a diminutive of *bomba*, meaning simple or stupid), the name given by Italians to paintings in which subjects from common life, such as penny-weddings and fairs, are treated grotesquely. They are named after the Dutch painter, Pieter van Laar, whom the Italians called *Bamboccio* on account of his simple and childish character. He was not the first painter of such, but he was the first to make them popular in Italy.

Bamboo, the popular name of a genus (*Bambusa*) of plants which belong to the natural order *Graminaceae* or the Grasses, but which differ very much in appearance from the ordinary grasses of temperate climates. The bamboos attain the dimensions and appearance of trees, some of them growing to a height of 100 feet. The stems are woody, hollow, and jointed, and from the joints they shoot out numerous lateral branches. They are natives of all tropical parts of both the Old and New World, and are among the most useful of plants in the lands of their growth. The grains of *Bambusa arundinacea* and other species are like oats in appearance, and are used as food, and the tender young shoots are occasionally picked for table use. The stems of species which attain considerable diameter are used as timber in the construction of houses, for the masts and spars of vessels, and general purposes. Sections of them are used as water vessels, the septum of a joint forming the bottom, and part of the neighbouring joint being left as a handle, or when both joints are left entire, a barrel is formed. The smaller stems are used for an endless variety of purposes. Cut into proper lengths, and with the septa bored out, they form admirable telescopic fishing-rods. They are extensively used throughout the world for walking-sticks and umbrella-stalks, and the Chinese form out of lengths of one joint useful pencases or manuscript holders. Excellent, light, and durable chairs, and other articles of furniture, are made from bamboos, the frames being made of whole pieces overlaced with basket-work of strips of the same material, and the Chinese and Japanese excel in the manufacture of B. baskets. A sticeous concretion termed *tabasheer*, possessed of peculiar optical properties, and highly valued as medicine in the East, is formed in some species of oriental bamboos.

Bambouk, a hilly country of Senegambia, W. Africa, bounded on the N. by the Senegal, and extending from lat. 12° 30' to 14° N., and long. 10° to 12° 30' W. It is chiefly noted for its gold-mines, but its valleys are exceedingly fertile. The inhabitants are a savage race of Mandingoes, who are mostly pagans. Since 1857 the land has been much devastated by the 'holy war' carried on by the zealous Mohammedan El-Hadj Omar, so that both the gold-mining and the trade in ivory have seriously fallen off. B. abounds in almost all the wild animals of Africa, and its climate is unhealthy. Mungo Park and Major Houghton contributed much to our knowledge of B. in the early part of the century, and, latterly, the French. See Raffeneil, *Voyage dans l'Afrique Occidentale* (Par. 1846), and Pascal in the *Revue Algérienne et Coloniale* (Aug. 1860).

Bam'brough, or **Bam'borough** (originally *Bebbanburh*, 'the town or port of Bebbe,' the wife of the Bernician king, Ida), an ancient castle on the coast of Northumberland, perched on a perpendicular rock 150 feet above the sea-level, and accessible only on the S.E. side. B. was a fortress in the days of Penda (7th c.), the heathen king of Mercia, whose attempt to storm it was frustrated (says Bede) by the prayers of St Aidan. It passed to the crown in 1095, when the wife of the great Earl Mowbray was forced to surrender it to save her husband's life. In the 15th c. it again became private property. The castle and manor, forfeited by Thomas Forster in 1715, were purchased by Lord Crewe, Bishop of Durham, who had married Forster's niece. He bequeathed them, at his death in 1721, for charitable purposes. The charity has been since much increased, and in 1874 amounted to about £10,000 a year, devoted to various humane

B. nigras

purposes, such as keeping up lifeboats; maintaining signals to warn vessels in thick and stormy weather from the dangerous cluster of rocks known as the Farn Islands; dispensing medicine and advice to the poor gratis; educating and clothing poor children, &c. B. village, near the castle, was once a royal burgh.

Bambusa. See BAMBOO.

Bamian Valley, the only practicable pass for artillery over the Hindu Kush from Cabul to Turkestan, is 8496 feet in height. Besides being strategically important, the B. V. is remarkable for the colossal statues and ancient monuments it contains. Ghulghula, a hill in the valley, 35 miles N.W. of Cabul, is carved so as to form statues in alto-relievo of a male and female figure, the former 160 and the latter 140 feet high. In the interior of each of these great statues is a stair winding upwards to the head of the figure. In the hill also a series of cells, ranged in irregular tiers and covered with carving, have been excavated. The ruins of tombs, mosques, and buildings, at an early period consecrated to the Buddhist religion, which is supposed to have had one of its chief centres in the B. V., abound in the vicinity.

Bampton ('tree-town,' the first part of the word being the Eng. *beam*, comp. Ger. *baum*), in the N.E. of Devonshire, 22 miles N. of Exeter, has manufactures of serge and of pottery, and valuable limestone quarries. Pop. (1871) 1111.

Bampton-in-the-Bush, a village in Oxfordshire, with a pop. (1871) of 764. There is here an old cruciform church with a Norman tower. As a specimen of pointed Gothic it is almost unique.

Bampton Lectures, founded by the Rev. John Bampton, Canon of Salisbury. These lectures, eight in number, are delivered annually at Great St Mary's, Oxford, the foundation being vested in the University of Oxford. The subjects of the lectures are mainly connected with the Christian evidences, and the preacher must be an M.A. of Oxford or Cambridge. From 1780, when the first course was delivered, up till the present time, there has been no interruption of the annual delivery, with the exception of the years 1834, 1835, and 1841. Some of the series have excited much attention, and caused much controversy. Dr White's lectures on Christianity and Mohammedanism, delivered in 1784, were said to owe much of their value to the assistance of Dr Parr and Dr Badcock (De Quincey's *Essay on Dr Parr*, vol. v. of his works, Edinb. 1863). Among the lecturers have been Heber (1815); Whately (1822); Millman (1827); and Dr Hampden (1832). Dr Hampden's lectures, of which the subject was *The Scholastic Philosophy considered in its Relation to Christian Theology*, were attacked by the Oxford Tractarians, and the author charged with Rationalism and Socinianism. Great but unavailing opposition was made to his appointment as Regius Professor of Divinity in 1836; and on his elevation to the see of Hereford in 1847, thirteen bishops protested against the appointment. Mansel's series on *The Limits of Religious Thought*, delivered in 1858, gave rise to much interesting discussion; and so did Rawlinson's *Historical Evidences of the Truth of the Scripture Records Stated Anew* (1859). Canon Liddon's lectures on our Lord's divinity (1866) form a valuable contribution to theological literature. The lecturer for 1875 was the Rev. William Jackson, M.A., of Worcester College. The original endowment, £120, now produces £200, and the lectures are published at the expense of the estate, within two months of their delivery.

Bampu'ra, or **Bawampura**, a town of India, in the native state of Holkar, 170 miles E.S.E. of Baroda. Its palace and fort were begun by Jeswant Row Holkar, whose fine marble statue adorns the former. Pop. about 10,000.

Ban, or **Banus** (a Slavonic word signifying 'lord'), was the name originally applied to the governors who were appointed to districts on the S. and E. frontiers of Hungary for purposes of national defence, and was therefore equivalent to the *Markgraf* or Border Earl of the old German empire. The government of the Bans was really military, a regular civil establishment being impossible during the Turkish wars. The districts were consolidated towards the end of the 16th c., the Sultan Selim undertaking to recognise the imperial power in Dalmatia, Croatia, and Slavonia, in consideration of the recognition by the Emperor of the Turkish *vaiwodes* in Transylvania, Moldavia, and Wallachia. The B. of Croatia and Dalmatia speedily became an important figure in Hungarian history,

race-jealousy sometimes inclining him to adopt the imperial against the national cause. In 1723 the B. became directly subordinate to the Hungarian palatine, holding a place in the council, while the territories were represented in the national diet. In 1849, on the erection of the vassal lands into crown-lands, the B. ceased to have political connection with Hungary. Zriny and Erdody in the 17th c., and Jellachich in the 19th, are among the best-known of the Bans. In the insurrection of the Herzegovina (1875), the B. appears in the Dalmatian Assembly as the mere mouthpiece of the imperial cabinet.

Banana, a tall herbaceous endogen belonging to the natural order *Musacea*, which, amid the luxuriant vegetation of tropical countries, is much admired for its elegance and the beauty of its flowers and foliage. The *Musa sapientum* of botanists, it is now generally considered to be only a variety of the Plantain (q. v.). Both of these trees administer in many ways to the comfort of the natives of hot climates, but chiefly from the abundant nutriment afforded by their fruits, which are produced in enormous quantities. The B. fruit is from four to eight inches long, and of a pale yellow colour; before maturity it contains a lacteous starchy liquid, which with maturity acquires a saccharine character, and forms a delicious refreshing beverage. The fruit has been preserved for years by drying it in the sun, when it becomes coated with a preservative efflorescence of sugar; the skin is usually stripped off before the efflorescence appears, as it gives the fruit a disagreeable flavour. The blades of the large oblong B. leaves are employed in thatching, and the petioles, being formed of tenacious fibres, yield material for textiles.

Banana.

Banana Bird (*Icterus xanthornis*), a genus of *Icterina* or American starlings, occurring in the W. Indies and tropical America, and allied to the Baltimore Bird (q. v.). The plumage is a darkish brown, the wings being striped with white. It is readily tamed, and builds pendulous nests like others of its group.

Ban-Arrière. The heer-ban or hériban (summons or proclamation of the army) was first defined by the capitularies of Charlemagne of 807 and 812. All benefices were held on condition of military service in public and private war (*Wehr* and *Friede*). Ban was, therefore, applied to the levy of the barons proper, or peers of the court, who were the immediate vassals of the crown, and carried their own banners to the field; B.-A. to the secondary levy of vavassors, chatelains, &c., who were sub-tenants. This B.-A. must be distinguished from the service of allodial proprietors (*heerman arimanni*), who were also bound by the capitulary of 813 to furnish soldiers according to the extent of their lands. These probably served under the counts of their neighbourhood. There were complete feudal levies at Bovines under Philippe Auguste, and at Courtrai under Philippe the Fair. Permanent troops on pay were not established in France till 1444. See Meyer, *Esprit, Origine, et Progrès des Instituts Judic.* (1818 et seq. 5 vols.).

Banas, or **Bu'nas**, the name of three rivers in India. The largest rises in the Aravulli mountains, Rajputana, flows N.E. and E. to the Chumbul, and so to the Jumna and Ganges. Another rises in the same range, and flows S.W. to the Runt of Cutch. The third, in Bundelcund, flows N.W. to the Sone, an affluent of the Ganges.

Banat', a frontier province in the S. of Hungary, consisting of the counties of Temesvár, Krasso, and Torontál, with an area of 8648 sq. miles, and a pop. (1869) of 1,028,263. It is one of the richest portions of the Austro-Hungarian monarchy, yielding various grains, tobacco and millet, and wine equal to the best produce of Burgundy. There are also mines of iron, copper,

coal, gold, silver, and zinc. Besides steamboat communication on the Danube, B. has now the advantage of several lines of railway. The capital is Temesvár (q. v.). Originally a Hungarian territory, B. formed an Austrian crown-land from 1849 till 1860, when it was restored to Hungary. The B. derives its name from having been originally governed by a *Ban* (q. v.).

Banawaram, an ancient town in Mysore, India, 81 miles N.W. of Mysore. Hyder Ali removed a great number of the inhabitants to the neighbouring town of Nagapuri; but owing to the unhealthiness of the latter place, they were allowed to return to their former homes. Pop. about 10,000.

Ban'bridge, a town of Down county, Ulster, Ireland, on the left bank of the Bann, 76 miles N. of Dublin, with an important manufacture of linen. There are also large thread factories and chemical works. B. is connected by railway with Belfast and Dublin. Pop. (1871) 5600.

Ban'bury, an old town of Oxfordshire, on the right bank of the Cherwell, 21 miles N. of Oxford, and 38 S.E. of Birmingham, and a station on the Birmingham and Oxford Railway. It lies in the fertile 'red land' of Oxford county, and has manufactures of implements of husbandry, plush and girth webbing, cheese, and the celebrated 'B. cakes.' In the beginning of the 12th c. a strong castle was built here by Alexander de Blois, Bishop of Lincoln, which sustained several sieges, and was finally dismantled by the parliamentary forces in 1646. In 1469 the Yorkists were defeated at the battle of B., fought on the neighbouring plain of Danesmore. B. returns one member to Parliament. Pop. (1871) 4122; of parliamentary borough, 11,726.

Banco is an Italian word meaning a seat or bench. The expression 'sitting in B.,' or in *banco*, as applied to the law-courts, means the sitting of the judges in their respective courts, according to statute.

Ban'ca, an island in the E. Indian archipelago, belonging to the Dutch, lies E. of Sumatra, in lat. $1^{\circ} 30' - 3^{\circ} 5' S.$, and long. $105^{\circ} 10' - 106^{\circ} 53' E.$ Its products are gold, iron ore, silver, tin, and amber. In 1872 the exports amounted to £533,137. The capital is Minto. Area, 6883 sq. miles; pop. (1872) 62,216, the natives and Chinese numbering about 62,000.

Ban'co a commercial term, denoting the standard money in which a bank keeps its accounts, as distinguished from local currency.

Ban'croft, George, a leading American historian, was born 3d October 1800, near Worcester, Massachusetts, being the son of Dr Aaron B., a Unitarian minister, and author of a *Life of George Washington, Sermons on the Doctrines of the Gospel*, &c. Young B. studied at Harvard College; went from thence to Göttingen and Berlin, coming in contact with Hegel, Goethe, Varnhagen von Ense, Schleiermacher, Von Humboldt, and others. On returning to America, he threw himself into historical literature and politics, declaring himself a keen democrat; filling, under President Polk, the offices of Secretary to the Navy, and Ambassador Extraordinary and Plenipotentiary to England. He wrote several historical works, which, in the end, he incorporated in his *History of America* (10th vol. 1869), one of the best written, and, at the same time, most substantial and accurate historical works of the present time. It has been translated into several continental languages. In 1855, his contributions to the *North American Review* were published under the title of *Miscellaneous Essays and Reviews*. From 1867 to 1871 B. was Minister Plenipotentiary to the Court at Berlin. Another American author of this name, **Hubert Howe B.**, has written a history of *The Native Races of the Pacific States of N. America*, of which 3 vols. have already (1875) appeared.

Ban'croft, Richard, Archbishop of Canterbury during a critical period of the history of the Church of England, was born at Farnworth, Lancashire, in September 1541; his father, John B., being a gentleman of the place, and his mother the niece of Hugh Curwyn, Archbishop of Dublin. B. was educated at Christ's College, Cambridge, and after a distinguished career as a clergyman, was consecrated Bishop of London May 8, 1597, and in that capacity attended Queen Elizabeth on her death-bed. Although of high repute as a man, a scholar, and even

as a statesman, he was a very fierce opponent of the Puritans; and in the Hampton Court Conference under James I. was foremost in the discussions that took place on the side of the Church of England. In October 1604 he succeeded Whitgift as Archbishop of Canterbury; next year he was sworn one of his majesty's (James I.) privy council; and in 1608 he became Chancellor of the University of Oxford. He died November 2, 1610, leaving his library to the see of Canterbury for ever. His literary work consists of a sermon and two tracts against the Puritans, and an unpublished letter on pluralities. The tracts are, *A Survey of the Pretended Holy Discipline* (1593), and *Dangerous Positions and Proceedings, published and practised within this Island of Britain, under Pretence of Reformation, and for the Presbyteriall Discipline* (1593).

Band, Military, is a body of musicians attached to a regiment of soldiers. The members of the B. are selected mainly from the ranks, but the bandmaster is commonly a civilian. The regulation number of instruments is very small, including only fife, bugles, trumpets, and drums; but it has long been the invariable custom that the officers of a regiment should, principally at their own expense, render the B. more effective by the introduction of other instruments, the chief of which are clarionets, oboes, flutes, bassoons, and a great variety of brass instruments. Modern improvements in the mechanism of the instruments, and the growing taste for music, have wonderfully increased the strength and efficiency of military bands. Those of Austria especially, the finest in the world, play as perfectly as an orchestra (the clarionets representing the violins), and often number seventy or eighty performers. Among our British military bands, those of the Grenadiers, Coldstreams, and Scots Fusiliers are the most distinguished.

Ban'da Isles, a group of ten volcanic islets, belonging to the Dutch, lying between the Moluccas and the smaller Sunda islands in the Indian archipelago, with a mean lat. of $4^{\circ} 30' S.$, and long. of $129^{\circ} 50' E.$ The chief trade is in nutmeg, the yearly export of which is about 60,000 lbs. Banda-Neira is the chief of the group, and the residence of the Dutch governor. Total area, 170 sq. miles; pop. (1872) 5600.

Ban'da Ori'ntal, S. America. See URUGUAY.

Ban'dages are used by surgeons for the twofold purpose of applying compression and keeping a part in position. We have an example of the former when a pad and bandage are applied to a bleeding part to arrest the hæmorrhage, and of the latter when a bandage is applied to keep a broken limb in position. B. are generally made of cotton, linen, flannel, or carbolie gauze, but any kind of cloth may be used. The cloth is cut up into strips of variable breadth, from a fraction of an inch to a foot or more, according to the purpose for which the bandage is required. They are generally wound up like a roller, which enables them to be more easily applied. Very narrow B. are required for the fingers and toes, broader for the limbs, and the broadest of all when the whole body is to be encircled in a bandage, as in the case of a fractured rib, when a flannel bandage is wrapt round the chest. Special B. are required for special purposes, and for particular parts of the body. In applying B., care must be taken to have them so applied that they will maintain sufficient pressure without unduly interfering with the vitality of the part. When applied too tightly, B. are apt to cause death of the parts. In bandaging the limbs, it is well to begin at the extremities, and bandage upwards. By so doing, the risk of interfering with the venous circulation is avoided.

Bandage across foot.

Bandajan, a Himalayan pass, on the S. boundary of Kuna-war, at a height of 14,000 feet, is covered with perpetual snow.

Banda'na, a variety of printed cotton goods originally made to suit the taste of oriental nations, where cloth with the same kind of patterns had long been manufactured by native artisans. The B. style consists in discharging the colour from a Turkey-red ground by the action of a strong solution of chlorine, brought to bear on the particular portions to be discharged, by specially

constructed machinery. The pattern on the oriental cloth which the European B. has supplanted was produced by tightly tying up the portions of the cloth before dyeing, by which the constricted parts were kept free from the dyeing agent when the piece was immersed in the dye-vat.

Bande Noire (black band), a title of reproach given to those who bought the property of the Church and of the emigrants during the first French Revolution, after it had been confiscated by the dominant party in the state. They unquestionably destroyed many objects of historical interest; but it is affirmed that the subdivision of the large estates into small holdings has produced a large class of peasant-proprietors, a thrifty and industrious race, forming an important element of the national strength of France.

Ban'del, Joseph Ernst von, German sculptor, born at Ansbach, Bavaria, 17th May 1800. He studied at the Academy of Munich, and resided in that city for fourteen years. His *Mars Reposing*, an ed. work, won him a high reputation. His statue of *Charity*, upon which he worked for ten years, is one of the most beautiful pieces of modern German sculpture. His greatest work, however, is the colossal statue of *Hermann*, the ancient national hero, situated on a hill overlooking Detmold, in Lippe, unveiled in 1875. This statue, in copper, is 80 feet high. B.'s statues are distinguished for their nobility of style and ease and command in execution. His busts are full of expression and movement. B. died at Donauwerth in 1876.

Bandello, Matteo, an Italian writer of fiction, born at Castelnuovo, Piedmont, about 1480. Abandoning his early profession of a monk, he devoted himself in Rome and Naples to study. After the battle of Pavia (1525) he followed François I. to France, and in 1550 Henri II. appointed him to the bishopric of Agen, but he devolved his episcopal duties on the Bishop of Grasse, that he might have leisure to complete his *Novelle* in his native language, which were published at Lucca in 3 vols. in 1554. B. died in 1562. A posthumous volume was added in 1573. There were numerous editions of the *Novelle* in the 18th c. The latest is that of Turin (1853). B.'s tales, like those of the Decameron, are unaffectedly simple, and pure in style, but the morality is not of a lofty tone. Other writings of B.'s are *Canti delle Lodi della S. Lucrezia Gonzaga*, and *Rime* (Tur. 1816).

Ban'derole, a small streamer or banner on a crozier, a military weapon, or the mast of a vessel. Also, in architecture, an inscribed band on Renaissance buildings, similar to those now used for mottoes on coats-of-arms.

Ban'dicoot, a genus of the order *Marsupialia* or 'pouched' mammals, forming the type of the family *Peramelidae* of that order, and found in Australia. These forms are of small size, and are included in the *Entomophagous* (or insect-eating) division of the order. They represent in Australia the moles, hedgehogs, and small insectivora of the Old World generally. The hind-limbs in the bandicoots are longer than the fore-limbs, the latter members possessing five toes each; of which, however, the outer and inner digits are rudimentary, only the three central ones being fully developed. They are nocturnal in habits, and burrow with great ease. They progress by a series of running leaps, in consequence of the greater length of the hind-limbs. Six incisor teeth exist in the lower, and eight or ten in the upper jaw; large canines exist; the premolars number six, and the molars eight in each jaw. The total number of teeth is about forty-six or forty-eight. The marsupial pouch in the B. opens backwards in some species, instead of forwards as in other marsupials. These forms are represented by the *Perameles lagotis*, or native 'rabbit' of Australia, so named from the size of the ears. *P. nasuta* and *P. gunnii* are other species of the typical genus. The allied genus *Charopus* wants the two outer toes of the fore-feet.

Bandicoot Rat, or **Great Indian Rat** (*Mus giganteus*), not to be confused with the marsupial bandicoots described in the article *Bandicoot*, is a true rodent, included in the rat and mice family (*Muridae*). This form is the largest of the rats, averaging 2 feet in length including the tail, and weighing 2 or 3 lbs. This rat occurs in India and Ceylon, and inhabits dry places, burrowing to great depths. It is very destructive to plants and fruits, and is also said to attack poultry. It is coloured black in the upper, and grey on the under parts.

Bandiera, Attilio and Emilio, two brothers, descended from an aristocratic Venetian family, who were among the earliest victims to the cause of Italian liberty. In 1842, while lieutenants in the Austrian navy, they began a correspondence with Mazzini, and in the following year made an effort to stir up revolt, which proved abortive. After seeking refuge for some time in Corfu, they were seized in Calabria, tried in secret, and, along with seven companions, shot in the public square of Cosenza, July 25, 1844. See Ricciardi, *Storia dei Fratelli B. e Consorti* (Flor. 1863).

Bandinelli, Baccio, an Italian sculptor, born at Florence 1487, died there 1559-60. Unfortunate in his proud and jealous temperament, he was also unfortunate in his contemporaries, Michael Angelo and Benvenuto Cellini, whom it was his vain ambition to rival. He is best known for his *bassi-relievi* of the prophets, apostles, virtues, &c., in the cathedral of Florence; and his figure of Christ at the tomb, in the church of the Annunziata, Florence—which figure he is said to have completed for his own tomb shortly before his death—is a work of very rare excellence.

Ban'dit (Ital. *banditto*, comes from the Teutonic *ban*, a proclamation, which, though it generally conveys the idea of outlawry, as in the phrases 'ban of the Empire,' 'ban of the Church,' yet does not necessarily do so, as we see from the still more familiar phrase 'banns of marriage'). The name B. is given in Italy to an outlawed robber. The Italian banditti formed communities or corporations, and submitted themselves to be regulated by stringent laws. They were long the scourge of Italy, but in 1820 the Papal troops succeeded in partly breaking up their haunts. They are still to be found on the frontiers of Naples, where they combine the occupations of husbandman and brigand. In 1812 the Neapolitan government was under the necessity of concluding a treaty with 'Peter the Calabrian,' a formidable B. chief; and sometimes the banditti were so numerous and daring that it was necessary to send regular troops against them. Sicily is still infested with robber bands, and at one time they were so powerful there that it was deemed politic to treat them with confidence. The disturbed state of Italian society in 1848-49 swelled the ranks of the banditti with refugees and desperate men of all kinds; and under the command of Beltramo, whose death occurred in 1851, they were strong enough to engage the Austrian troops of the army of occupation. The Italian banditti, though by no means so formidable as they were, still occasionally succeed in procuring large sums for the ransom of rich captives.

Bandoleer, or **Bandaleer**, was a belt worn by musketeers two centuries ago over the left shoulder, and having attached to it twelve small boxes, each of which contained sufficient gunpowder for one charge.

Ban'doline, a preparation made by hairdressers for stiffening and fixing stray hairs in toilet operations. It is said to be prepared from Iceland moss, which it sometimes may be, but more commonly it is made from gum tragacanth, perfumed with some essential oil.—A B. is also an obsolete form of a musical instrument.

Ban'don (Gael. 'the brown lea-field'), a town in the county of Cork, Ireland, on a river of the same name, 19 miles S.W. of Cork city, with manufactures of linens, camlets, coarse woollens, and leather. There are also distilleries, dye-works, flour-mills, and bleaching-fields. B. returns one member to Parliament. Pop. (1871) 6131, of whom 4186 are Roman Catholics. The river B. rises in the Carbery mountains, and enters the sea at Kinsale, after a course of 40 miles. This is Spenser's 'pleasant Bandon, crowned by many a wood.'

Bands, a portion of clerical dress in the Presbyterian Church, are a relic of the ancient *Amice*, which was derived from the Jewish *Ephod*, and in primitive use was nearly a counterpart of the modern white neckcloth, but falling down so as to cover the neck and shoulders.

Baneberry. See *ACTÆA*.

Banff, the capital of Banffshire, a royal burgh (since 1372) and seaport at the mouth of the *Doveran*, on the *Moray Firth*, 45 miles N.N.W. of Aberdeen, connected by a bridge of seven arches with the town of Macduff. The harbour is occasionally

silted up with sand. B. exports cattle, corn, salmon, and herrings. It is one of the Elgin burghs (the others are Elgin, Cullen, Inverury, Kintore, and Peterhead) which return a member to Parliament. Pop. (1871) 7439. B. is the birthplace of the notable Archbishop Sharpe.

Banffshire, a north-eastern Scottish county, bounded N. by the Moray Firth; E. and S. by Aberdeen; and W. by Elgin and Inverness. Area, 686 sq. miles. It has a seaboard of about 30 miles, the surface bordering on which, for several miles inland, is for the most part level. In the S. and S.E. the surface is mountainous, but has numerous fertile valleys. Ben-Muic-Dhui, 4296 feet, once thought to be the loftiest mountain in Scotland, is partly in B. The highest peak in B. is North Cairngorm, 4090 feet. The chief rivers are the Spey and the Doveran, the former the most rapid of British rivers. Both granite and the old red sandstone abound, and the 'Portsoy marble,' a richly variegated species of serpentine, has long been celebrated. The metallic treasures are small, though lead and iron are found, as well as small quantities of antimony and plumbago. Agriculture is in an advanced state, and about a third of the soil is cropped. Large quantities of cattle are bred; weaving, tanning, and distilling are important branches of industry, and herring and salmon fishing support a large proportion of the inhabitants. The principal towns and villages are Banff, Macduff, Portsoy, Keith, and Cullen. B. returns one member to Parliament. Into the walls of the old church of Gamrie, which was discontinued as a place of worship only in 1830, the bones of the Norsemen slain at Bloody Potts were built, hence its popular name, 'the Kirk of Skulls.' Pop. (1871) 62,023.

Bangalore, a fortified town of Mysore, India, and the chief military station of the country, 180 miles W. of Madras, with which it is connected by railway. It stands 3000 feet above the sea-level, and has an excellent climate, with an abundant supply of good water. In 1791 it was stormed, and taken by the British under Lord Cornwallis. B. was founded by Hyder Ali, and one of its finest buildings is the palace of Tipoo Saib. The neighbourhood is exceedingly fertile, and there are important manufactures of cotton and silk. Pop. (1872) 142,513. The executive district of B. has an area of 2914 sq. miles, and a pop. (1872) of 828,354.

Bangkok, capital of the kingdom of Siam, on the Meinam, and 20 miles from its mouth. Pop. 500,000, half of whom, forming the commercial community, are Chinese, who, for the right to trade, pay three dollars each on entering the kingdom, and are taxed to the same amount triennially. The tax is not onerous when the extent of the commerce is regarded. In 1874, 484 vessels of 131,676 tons entered the port—103 vessels being British. In the same year the exports from B. amounted in value to £1,225,864, the chief articles being rice, sugar, pepper, teak planks, tin, teel-seed, rosewood, and cardamums; while the imports amounted to £964,128, the chief articles being cotton, linen, woollen, and silk manufactured goods and opium, of which alone the imports amounted to £90,089. The situation of the town is picturesque, and its environs are beautiful, its appearance having gained for it the name of the 'Venice of the East.' Many of the houses are afloat on rafts on the river or the canals, and the land houses are raised six or eight feet from the ground on piles, and are reached by ladders. There are few streets, and traffic is carried on by the numerous canals. B. is the residence of the two kings of Siam, the palace of the first being about a mile in circumference, and containing the hall of the sacred white elephant. There are numerous temples. See Bowring's *Kingdom and People of Siam*.

Ban'gor (Cymr. *Ban-choir*, 'the high choir'), a burgh and seaport, Carnarvonshire, and an episcopal see, dating, it is said, from 550, is on the Menai Strait, and about 60 miles W. of Chester. The scenery in the neighbourhood is singularly beautiful, and B. is in consequence much resorted to. It has also been greatly benefited by the opening of the Chester and Holyhead Railway. The principal industry is slate-quarrying, the slates of Llandegai being sent everywhere. Along with Carnarvon, Conway, Criccieth, Nevin, and Pwllheli, B. sends one member to Parliament. B. cathedral contains the tombs of a few Welsh princes, and several eminent ecclesiastics. Pop. (1871) 9859.

Ban'gor (originally *Bannchar* in Gael., 'the pointed hill,' 266

named probably from a hill near the town), a seaport of Down county, Ireland, on the S. side of Belfast Lough, 12 miles E.N.E. of Belfast, with manufactures of linen, cotton, and muslin embroidery. It also exports cattle and provisions. B. is connected by rail with Belfast. Pop. (1871) 2560. There still exist the ruins of the great abbey of B., founded in 555 by St Cungall.

Bangor, a flourishing city of Maine, U.S., on the right bank of the Penobscot river, 230 miles N.E. of Boston, with which it is connected by railway. It lies 60 miles from the mouth of the river, at the head of the tidal water, and is accessible to vessels of 1400 tons burthen, with full cargoes. B. has a larger timber trade than any other city of New England, this single article of export amounting in 1874 to £45,000. There are many fine public buildings, including the custom-house and post-office, a theological seminary, and a large orphanage erected in 1872. B. has two daily and four weekly newspapers. Pop. (1870) 18,290.

Bangor Iscoed ('Bangor below the wood'), a village on the Dec, on the borders of Flint and Denbigh shires, N. Wales. It was the seat of a monastery said to have contained 2400 monks in the 6th c., but no traces of the building now exist. Pop. (1871) 554.

Bangorian Controversy, the name given to a once famous controversy provoked by a sermon of Dr Hoadley, Bishop of Bangor, on the text, 'My kingdom is not of this world,' which gave much offence to the defenders of ecclesiastical authority. See HOADLEY.

Bangweolo, or **Bemba**, one of the largest lakes of Central Africa, lies about 200 miles S.W. of Lake Tanganyika, in lat. 11°—12° S., and long. 28° 20'—30° 35' W. It is of somewhat oval shape, and extends in an E. and W. direction, being 150 miles long and 80 broad. Many rivers enter it on the N. and E., the chief of which are the Chambeze (q. v.), Lopopussi, Lucla, and Lolotikira. It is also fed by innumerable smaller streams, and by the waters which in the rainy season flood the surrounding country to a distance of 40 miles. This margin of morass or 'sponge' is inhabited by numerous small tribes, and covered by aquatic vegetation, including the papyrus, arum, lotus, rushes, &c. ferns. The lake is 3688 feet above the sea-level, and abounds in fish, while its waters are sweet, and of a dark sea-green colour, probably due to the reflection of light by the fine white sand forming the bottom. It is drained by the great Luapula or W-bb's River (q. v.). B. was discovered in 1868 by Dr Livingstone, who revisited it for the purpose of further exploration, and died on its S. shore at Chitambo's village, May 1, 1873.

Ban'ian, or **Banian** (Hindustani, *banij*, a merchant, from a Sansk. root, *ban*, to sell), a term applied to the merchants in the W. of the Indian peninsula, particularly those in the seaports Bombay, Surat, Cambay, &c., who, in the way of business, penetrate Asia as far as the borders of China and Russia, and visit Africa as far S. as Mozambique. They form a division of the caste Vaisya, wear a peculiar cloak, also called B., observe fasts rigorously, and abstain from eating flesh, though a sect of them—the Bhattias—are, on the other hand, notorious for 'having reduced philosophical epicureanism to practice in forms more hideous and degrading than almost any which the Hindu Pantheon could furnish.' See Sir Bartle Frere's article on the Banians in *Macmillan's Magazine*, October 1875.

Banian Days, a nautical phrase denoting the days on which no flesh-meat is allowed to a ship's crew. The term is derived from the usage of the Hindu Banian.

Ba'nim, John, an Irish novelist, born at Kilkenny, April 3, 1800, commenced life as a portrait-painter, but subsequently betook himself to literature. His earliest production, his *Tales of the O'Hara Family* (Lond. 1825), was followed by *Boyne Water* (1826), *The Croppy* (1828), *The Denounced* (1830), *The Smuggler* (1831), *The Mayor of Windgap* and *Father Connell* (1842). Having been attacked by an incurable disease, a pension from the civil list of £150 was awarded him. He died at Windgap Cottage, near Kilkenny, 1st August 1842. B. has never been excelled as a depicter of the peculiarities of the Irish peasant, and it can hardly be said with justice that imitation of Scott has to any serious extent compromised his reputation for originality. See Murray's *Life and Correspondence of B.* (Lond. 1857).

Banish'ment, the punishment of legal exile from one's country. It is a penalty which has partly been abolished by statute, and, in so far as this has not been done, it has fallen into desuetude. Transportation also, by which was legally understood B. accompanied by the other penalties of felony, is also now abolished, with the substitution of PENAL SERVITUDE (q. v.).

Banister, a corruption of BALUSTER (q. v.).

Banjalu'ka, a strongly fortified town of Bosnia, Turkey, on the left bank of the Verbas, a branch of the Danube, in the N.W. angle of the kingdom. It has a gunpowder factory, several hot springs, and many Roman remains. Pop. 15,000.

Banjermassin', a Dutch residency in the extreme S.E. of Borneo (q. v.). It is in great part a flat country, but is intersected by a lofty mountain range, and is watered by the Banjer, Nagara, and other large rivers. The chief exports are gold-dust, diamonds, coal, ratans, gutta-percha, cotton, edible nests, and benzoin. There are several weapon factories, where highly ornamented arms are produced. Area, 5880 sq. miles; pop. (1871) 326 Europeans and 847,846 natives. The capital, B., is situated on the Banjer, 15 miles from its mouth, and is almost entirely built on piles. There is considerable trade, the chief imports being sugar, rice, silks, and gunpowder. Pop. (1871) 35,000.

Banjoemas', a port-town of Java, 22 miles inland from the S. coast, the residence of a Dutch governor, and the capital of a rich and productive province of the same name. Pop. 9000.

Bank, Banking. In the wide meaning of the word, any place where a money-dealer, or a company or corporation of money-dealers carry on their business, is a B. In this sense alone was the word understood when it first came into use. It is derived from the Italian word *banco*, a bench; the early money-dealers of Italy having been in the habit of sitting on benches in the market-places of the chief towns. The B. of Venice was established in 1171, the B. of Amsterdam in 1609. The latter was simply what we call a B. of *deposit*; that is, it took charge of money and valuables for the public, but did not lend. To receive money on deposit and to lend it have for long been the radical functions of a B.; and in England we should hardly speak of any institution or company by this name which did not receive money and lend it. A *public* B. in Great Britain is constituted by Act of Parliament or by royal charter. Its constitution, amount of capital, and the rights of its partners, depend on the laws and powers so conferred on it. A *private* B., again, is under the laws which regulate private trading companies. See JOINT-STOCK COMPANIES.

In considering how a B. conducts its business, this distinction between a *public* and a *private* B. need not be kept in view. For this purpose, we must keep in view the distinction between a B. of *deposit* and *loan* only, and one which is also a B. of *issue*. Under each of these divisions, the first requisite of success is public confidence. The B. must borrow before it can lend, and before the public will intrust its money, it must feel confidence that this money will be at once repaid when required. This confidence can only be gained by those answerable to the public for the solvency of the B. having a reputation for wealth and commercial prudence. Having more or less gained this confidence, the B. has its subscribed capital, that is, the money which its shareholders have paid on their respective shares, and its deposits with which to work for profit. For deposits some banks give interest, others do not; but none give a rate of interest to depositors nearly so high as they charge to those who borrow from them. Plainly no B. could afford to do this. The profit of the B. will now plainly depend upon the interest which it receives upon its working capital, diminished by the interest, if any, which it pays to its depositors, by the expenses of management, and by bad debts. Upon economy of management, therefore, and upon the avoidance of bad debts, will mainly depend the success of the B. The latter is in a mercantile community, even in fairly good commercial times, a matter of great difficulty. The manager of a B. and his directors—that is, a body chosen by the shareholders to counsel and assist him—must be thoroughly versed in mercantile affairs, cautious even in the best times, as knowing that seed then sown may bring forth its fruit in evil times. Above all, must they be firm; and the successful banker must have commercially neither friend nor foe. The chief point of the business of our bankers consists in the discount of bills. See BILL OF EXCHANGE. But loans are frequently made

on other securities, such as mines and manufactories. These securities, however, are seldom taken from free choice. When taken, it is generally because when the bills fall due, either they have not been paid, there has been visible difficulty in paying them, or the banker has had reason to suppose they have been paid by means of discounting Accommodation Bills (q. v. under BILL OF EXCHANGE). The banker has then but had the choice of two courses—either to make a bad debt, by making the defaulter bankrupt, or that of taking such security as the trader has to give, which may be that of a mine, manufactory, or something equally hazardous. If he take the latter course, the banker is plainly going out of his legitimate path of business, by becoming himself a mining master or manufacturer. There have doubtless been many cases in which, by taking this course, a B. has not only retrieved a debt which would otherwise have been bad, but has made immense profits by so doing; nevertheless it is a course severely to be reprobated. The most cautious banker must run some risk, and he must consequently occasionally make bad debts, nevertheless, cautious banking in the United Kingdom is on the whole safe as well as lucrative; and the failures of the last twenty years have all been the result of infatuation which might seem incredible, were it not for the fact of universal application, that the first fatal step once taken, the road to ruin is easy.

The second class of B. has a source of profit besides those of its subscribed capital and deposits—that is, on what is called its *issue*. This is its Promissory Notes (q. v. under BILL OF EXCHANGE); that which we call a bank-note being simply a promissory note by the B. which issues it to pay the bearer on demand the sum written in it. Now, if any one discounting a bill with a B., or otherwise taking a loan from it, agrees to take the loan in the B.'s promissory notes instead of in coin, it is plain that, so long as it is not required to give coin for these notes, the interest paid to the B. on account of the loan is almost wholly profit. A trifling deduction must be made for the expenses of making and maintaining the note circulation and general cost of the establishment; but this is all.

The interest, then, which a B. gets on its note circulation may be said to be virtually clear profit. Suppose, then, a B. to make a loan for a fixed period, in its own notes, does it necessarily make a clear profit of the interest agreed to be paid for the period? It lends say £100 in its own notes for a year, agreeing to take £5 of interest for the year's loan, does it make £5 of profit? It may do so in one transaction, but there are limits to the possibility of its doing so. There is a natural limit, and our legislature has imposed an artificial one, we suppose from the belief that the natural force was insufficient. The natural limit to a B. issuing notes is simply that the public, not requiring them, will not keep them. Every householder keeps a certain amount of money for daily requirements in his desk, and if he keeps this in B. notes, this is so much profit to the B. But whenever he gets a sum in excess of this requirement, he pays it into the B. with which he keeps an account, from which it is returned for gold to the B. whose promise to pay it bears; banks periodically exchanging notes, drafts, cheques, &c., and paying in gold the balance that arises on the account. Thus the £5 will be diminished by the interest paid to the depositor on so much gold. In London, the exchanges are effected through the Clearing House (q. v.), and there are similar establishments in some of the provincial towns.

The legislative check upon the issue of banks imposes on them the necessity of keeping in their vaults an equivalent in gold for every note issued beyond a certain amount, which amount is called the B.'s 'fixed issue.' This limitation proceeds on the theory that an unlimited right of issue would be followed by an increase of issue, which, by augmenting the quantity of money in circulation, would artificially raise the prices of commodities in general. At least, it was a general belief that the banks were by their issues causing this effect which led to the restrictive B. Acts of 1844 and 1845.

The author of these acts, however, Sir Robert Peel, according to Mr Gladstone, who was then a member of his cabinet, was largely influenced by his faith in another principle—namely, that the whole business of B. issue ought to be in the hands of the state. 'Sir Robert Peel,' says Mr Gladstone, in his speech on Mr Goschen's Bankers' Act Amendment Bill (17th March 1875), 'proceeded steadily on the principle, that where the law imposed restrictions on issuing banks, these restrictions ought to be maintained; and, moreover, Sir Robert Peel did that with reference to

a wider principle still—namely, the principle that the state ought to get into its hands the whole business of issue.

It would lead us quite beyond the necessary limits of this article to discuss these questions. An issue in the hands of the state would presumably give the public the profits of the B. issue of the country, which at present goes into the pockets of private bankers and of the joint-stock B. shareholders; but may not the same be said of the state taking to itself any other lucrative field of business, which it has hitherto been considered wise to leave open to British commercial enterprise? Then, as to the wisdom of legal restriction on issue, seeing that there is a natural law of restriction, may it not be, as has hitherto been found in all connected with trade, that the unfettered operation of the natural law is best?

Giving all due weight to the authority of Sir Robert Peel, we may fairly recall to mind the fact that, at the date of his B. Acts, he had but newly awakened to belief in the principles of free trade; and it is not unreasonable to suppose that he may not then have been fully awake to the whole detail of these principles. Issue is not free now, and some banks in the United Kingdom are under different laws as regards restrictions from others; the result being, what is sure to happen under so anomalous and unnatural an arrangement, that there is general discontent.

The Bank of England.—This, the largest banking establishment in the world, was projected by William Paterson, a Scotchman. It received its charter of incorporation on 27th July 1694. Its original capital was £1,200,000, which it lent at interest to the government of William and Mary. Its original charter has from time to time been renewed, the last renewal being under the Act and charter of 1844. Under these, the B. is divided into two compartments, the *Issue* and the *Banking*.

Previous to the Act of 1844, the government debt to the B. was £11,015,100. This was, by the Act, declared to be a debt due to the issue department, which was accordingly allowed to put in circulation notes to that value, without holding any gold. By 1844 the value so authorised to be issued had, in consideration of certain securities, been raised to £14,000,000. An additional million of issue was authorised by the Act, on account of the lapsing of the right of issue of some country banks. Thus, the total authorised issue, without holding gold, was by the Act £15,000,000, which is the present authorised value. The B. must pay to government the profit which it makes on the extra million. And the profit of the issue department is the interest at 3 per cent. on the £14,000,000 of government debt, which is £420,000, less £180,000 paid for stamp duties, and £160,000 of expenses; the deductions together amounting to £340,000, leaving a net profit of £80,000. Bullion and foreign coin are a source of profit to the B. Being worth £3, 17s. 10½d. per ounce, the B. buys them for notes at £3, 17s. 9d. Holders can have them coined free of charge at the mint, but the delay causes a loss of 1½d. per ounce.

In its banking department, the B. of England differs only from other banks in its having the custody and management of the funds of the state. For managing the public debt, the B. receives about £247,000, against which there is about £124,000 of expenses. The other profits of the B. are derived from employment of its deposits, on which it allows no interest, and of its capital. The following is a copy of the weekly account of the B. of England, on 17th February 1875:—

ISSUE DEPARTMENT.—February 17, 1875.

Dr.		Cr.	
Notes issued, . . .	£35,023,450	Government debt, . . .	£11,015,100
		Other securities, . . .	3,984,000
		Gold coin and bullion, . . .	20,023,450
		Silver bullion,
	£35,023,450		£35,023,450

BANKING DEPARTMENT

Dr.		Cr.	
Proprietors' capital, . . .	£14,553,000	Government securities, . . .	£13,595,034
Reserve, . . .	3,424,835	Other securities, . . .	18,800,241
Public deposits, . . .	6,196,080	Notes, . . .	9,360,330
Other deposits, . . .	18,065,308	Gold and silver coin, . . .	839,578
Seven day and other bills, . . .	355,924		
	£44,395,147		£44,395,147

The issue account is credited with the *fixed* securities, together £15,000,000, and debited with their constant equivalent, the 'notes issued.' These notes, it will be seen, are to the extent of £9,360,330 in the banking department. This is called the 'note reserve.' The remainder of the £35,023,450, that is, £25,663,120, is in the hands of the public, and is called the 'active circulation.' The banking department is debited with the fixed capital, £14,553,000, with the 'rest' or surplus, £3,424,835, with public deposits, and with 'other' deposits, being those of individuals, firms, London bankers, &c. On the credit side are government securities, a safe and readily convertible investment; 'other' securities, composed of bills discounted, bonds on which advances have been made, &c.; and the reserve of notes and coin immediately available for advances. The figures (£9,360,330) denoting the notes in the banking department are simply an arithmetical expression for the bullion in the issue department available for the banking department. The 'reserve,' then, of the B., by the above account, was £9,360,330 + £839,542 = £10,199,872. Since 1844, the reserve stood highest—£17,861,747—on June 21, 1871, when the private securities were £16,816,887, and the discount rate 2½ per cent. It stood lowest—£1,552,686—on November 18, 1857, when the private securities were £26,113,453, and the discount rate 10 per cent.

Generally, gold tends to leave the B., and reduce the reserve, when the short exchange of London or Paris falls to 25s. 10c., while an opposite effect is produced by the exchange rising to 25s. 33c. It is when this all-important reserve is seriously diminished that commercial panic is prone to arise. Till it does arise, restriction of issue is unnecessary, and then the restriction can no longer be maintained. Thrice since the Act of 1844—during commercial panics in 1847, 1857, and 1866—the government of the day has taken the responsibility of authorising an extra issue of notes.

Joint-stock and Private Banks in England and Wales.—There are at present 114 private and fifty-four joint-stock banks in England and Wales.

The total fixed issue of the private banks is, . . . £3,845,594
The total fixed issue of the joint-stock banks is, . . . 2,652,993

Total fixed issue of private and joint-stock banks of England and Wales, . . . } £6,498,587

Banks in Scotland.—The earliest established B. was the B. of Scotland, instituted by charter of incorporation from the Scotch Parliament in 1695. It gave the first impetus to Scotch industry, which has since had such an immense development. It was followed by the Royal B. in 1727, and the British Linen Company in 1746. The object of this institution was specially to encourage the linen manufacture of Scotland, but it gradually fell into the course of common business. The failure of the Western B. in 1857 has been the greatest Scotch commercial disaster of this century. It is, however, to be observed, that the company was not properly speaking insolvent, for it paid its creditors—that is, its depositors and note-holders—in full. Since then, the prosperity of Scotland has been unexampled, owing greatly to the excellence of its banking system and management. 'I know,' says Mr Gilbert (*Banker's Magazine* for March 1875), 'of no better illustration of the beneficial action of banking in promoting the development of natural resources than the present advanced condition of Scotland.'

The total authorised circulation of the Scotch banks is £2,749,271. On January 23, 1875, their total actual circulation was—

Of £5 and upwards, £1,996,453
Under £5, 3,865,759
Total, £5,862,212

At the same date the Scotch banks held, in round figures, seventy-seven millions of deposits, while their total working capital, exclusive of note circulation, was fully ninety millions. These facts, we think, show that in any question of right or power of competition, the right of issue exercised by Scotch banks is not extremely important. It is the force of the ninety millions, not of the £2,749,271, which the advocates of protection in the banking trade have to dread, though no doubt the issue helps to collect the deposits. Over the United Kingdom, there can be no doubt that the important part which banks play

is not by their issue, but as the recipients of deposits and makers of advances. At the same time, to deprive the Scotch banks of the right of issue would be an unquestionable injury to them, and to the commerce and general prosperity of Scotland, which they have done so much to promote.

Irish Banks.—The authorised circulation of these is £6,354,494. The actual circulation on January 23, 1875, was £6,882,942. The B. of Ireland is a national B., lending £2,630,769 of its capital to government. It was established in 1783. Its capital is £2,769,230, and its rest £1,077,000. It allows no interest on deposits.

Bank-Note Circulation of the United Kingdom.—For the week ending January 23, 1875, this was—

Bank of England (20th January), . . .	£26,313,715
Private banks of England, . . .	2,612,932
Joint-stock banks of England, . . .	2,328,482

Scotch banks, . . .	£31,255,129
Irish banks, . . .	5,862,212
	6,882,942

£44,000,283

Bank-Notes, Manufacture of. The chief object in this manufacture is to make forgery as difficult as possible. Peculiar paper and ink, and intricacy of design, have all been brought to bear on this end by men who have made it their special study. But the ingenuity of the forger has sometimes been not less industriously exerted. Of recent years, however, there has been no extensive forgery of bank-notes. Since 1855 the notes of the Bank of England have been produced by the electrotype.

Bankruptcy, in law, and in its general meaning, is the condition of one who is unable to meet the legal demand of a creditor, and who has by his act or omission (see ACT OF B.) given legal proof of his inability. The condition of inability to meet a legal demand, previous to legal proof of the inability, is called *Insolvency*; and from insolvency there is, of course, the possibility of recovery without B. In Scotland, the condition of one who has committed an act of B. is called *Notour B.*

Of late years the B. laws of England and of Scotland have been the subject of endless discussion, especially in England, by parliament, chambers of commerce, and other societies interested in trade, and by the corporations of our trading cities. So long ago as 1825, the great mass of English statutes on this subject were consolidated, and several new and salutary provisions introduced; amongst others, those which allowed an offer of composition, and permitted a trader publicly to declare his insolvency, and equitable measures to follow the declaration. The Act of 1831 established a Court of B., and the office of official assignee, corresponding to the office in Scotland of *Trustee* under B. But still the B. law of England proved wholly inadequate to deal with this most difficult subject. By secret transfers, concealment of property, and the enormous expense of the B. Court and the other machinery required for winding up, and by endless delay, prospective dividends continued to grow smaller, until not unfrequently they altogether vanished. The Act of 1849 for the first time introduced 'arrangement clauses,' under which the bankrupt, with the necessary consent of creditors, was able to clear himself of debt *without the stigma of B.* This was an improvement, no doubt; still, as it was difficult to get sufficient value of creditors to consent, the great proportion of estates continued to be liquidated as formerly.

In Scotland, during the same period, from the expansion of its trade, and consequently growing importance of the subject, discontent with the existing B. laws had continued to increase. Yet some difficulty was felt in discovering where or in what the error practically lay. Lawyers and mercantile men read the Scotch statute, and its provisions, with a few exceptions, really seemed good. Its machinery was simple, the creditors from first to last keeping the management of the B. estate virtually in their own hands. They appointed their own trustee, who was superintended by a committee of their body called 'commissioners.' Trustees were, under the statute, called on to render an annual account to the Sheriff, showing exhaustively the past transactions, present position, and prospects of the estate. Yet, for some reason, results in Scotland were *nearly*, but probably not quite, as unsatisfactory as in England; dividends which originally seemed almost at hand and substantial, growing with the lapse of time more and more distant and visionary.

Such was the position of matters in both countries in 1854, when it occurred to Lord Brougham that it was highly desirable that the B. law of England and Scotland should be made the same, and that this end should be carried out by the repeal of the Scotch statute, and the substitution of the English Act of 1849. His lordship grounded his view on the general principle of its being most desirable that the mercantile law of the two countries should be the same. While the general principle was universally granted in Scotland, the special application was all but universally objected to by the legal and mercantile community, on several grounds. In the first place, the English were still in a state of chronic discontent with their own law. Then the machinery of a B. court was held to be cumbrous, and out of harmony with the legal institutions of Scotland; while the English system was statistically proved to be considerably more expensive than the Scotch.

An indignation storm from the London press, whose fury was directed against 'Scotch provincialism,' then burst over Scotland. It was productive of good, however, stimulating inquiry in Scotland, till the fact came to light that, while the provisions of the Scotch Act were generally excellent in the care which they took of the interest of creditors, these provisions were almost wholly ignored by trustees and all concerned in the management and supervision of the B. estate. Accounts of the trustees' *Intromissions* (see INTROMISSIONS), instead of being made up at statutory periods, were often hardly made up at all. Commissioners signed without auditing; returns to sheriffs were never made; dividends were indefinitely postponed pending petty law-suits, which only ended when there was nothing left to divide. The results of the whole controversy were, first, the Scotch B. Amendment Act of 1856, which continued the main provisions of the law as it previously existed, but made them efficient by the appointment of an Accountant in B., an officer whose business it is to see that trustees in B. make annual returns, in prescribed form, showing the funds of the estate realised and outstanding, the dividend paid, the legal and other expenses incurred, and the position and prospects of the estate generally. Of the returns so made, the Accountant must keep a register, open to all concerned. Besides this, it is his duty to exercise a strict supervision over the conduct of trustees, commissioners, and bankrupts, and he is bound to report any neglect or misconduct to the Court of Session, or to the Lord Advocate, either of whom may censure, remove from office, or prosecute criminally. The second result of the controversy above alluded to was the assimilation of the English B. law to the Scotch, by the passing of the English Act of 1869. Under it, the office of official assignee is abolished, and that of a trustee appointed by the creditors put in place of it.

Both English and Scotch Acts contain *Arrangement Clauses*; the former Act allowing a majority in number, and three-fourths in value, of the creditors to carry a composition without B., while the Scotch Act does not allow any majority to carry a composition previous to examination under B. The Comptroller in B. in England and the committee of inspection discharge the duties of the commissioners and Accountant in Scotland. By the Scotch Act of 1856, the judgment of the Sheriff is made final in competitions for the office of trustee. By a B. Amendment Act in 1860, power is given to the Scotch courts to recall a sequestration until three months after its date, on being shown that the procedure ought to be in England or in Ireland. This provision remedies the evil which formerly existed of English and Irish debtors coming to Scotland for the purpose of sequestration, and so getting quit of their debts without due notice of procedure to their creditors.

In a country whose commercial circumstances are ever varying, as are those of Great Britain, frequent repair and modification of B. law will doubtless be found necessary; meanwhile the law as it at present stands in England and Scotland is on the whole, we believe, found to work satisfactorily and efficiently.

Banks' Land, a large island in the Arctic Ocean, 70 miles S.W. of Melville's Island, and 100 from the N. coast of British America, extending in lat. 74° N. and long 116° W.

Banks' Peninsula is situated in the province of Canterbury, on the E. coast of the Middle Island of New Zealand, between 43° 37' and 43° 55' S. lat., and 172° 40' and 173° 9' E. long. Its area is estimated at 250,000 acres. B. P. is deeply indented with bays, the chief of which is the splendid inlet of Akaroa, on the S. The surface of B. P. consists of sharply

defined mountain ranges and peaks, containing abundant evidence of volcanic action, and covered with forests. These ranges end abruptly on the W. in the great Canterbury Plains, and the curious Lake Ellesmere (q. v.).

Banks, Savings'. See SAVINGS' BANKS.

Banks, Sir Joseph, was born at London, 4th January 1743 (O.S.), of an ancient family, having possessions in Lincolnshire. He began his botanical studies while at Eton, by reading Gerard's *Herbal*. At Oxford, Sibthorp, the professor of botany, did not lecture, and B. had to hire a lecturer on that subject. He succeeded to his father's estates in 1764, and was elected to the Royal Society in 1766. The same year he accompanied Sir Thomas Adams to Newfoundland on a botanical expedition. In 1768 he and his friend, Dr Solander (botanist), joined the scientific expedition sent out to Otaheite by Lords Bute and Sandwich, to observe the transit of Venus of 3d June 1769. They sailed in the *Endeavour* (Captain Cook), and on the return voyage visited the Society Islands, New Zealand, New South Wales, and New Guinea. In 1772, with Solander and a staff of assistants, B. sailed to Iceland, and examined its flora, fauna, and physical geography. He made a collection of Icelandic books and manuscripts, which he presented to the British Museum. In 1778, B. was elected President of the Royal Society, in 1780 he obtained a baronetcy, and in 1795 the Order of the Bath. In 1802 he was elected member of the Institute of France, and died 19th June 1820. B. wrote two tracts on *Corn Blight* (1803) and *Merino Sheep* (1809), and several papers in the *Transactions of the Horticultural Society*. His most important achievement was the introduction of the banana from Otaheite to the W. Indies. He left his botanical library and collection, which were of great extent, to the British Museum. The library was catalogued by Dryander; the collections have been made use of by Gärtner, Brown, Broussonet, and others.

Banks, Thomas, born at Lambeth, 22d December 1735, was trained as an architect, but devoted himself to sculpture in early manhood, and in 1770 carried off the gold medal of the Royal Academy. He was sent, at the expense of the Royal Academy, to Rome, and there produced his *Caractacus Pleading before Claudius*, a noble work, and his *Psyche with the Butterfly*, which in grace, symmetry, and classical elegance is held to rival the works of the ancient masters. He went to Russia on the invitation of the Empress Catherine, who purchased his *Psyche*, and commissioned him to carve a group of the *Armed Neutrality* in stone. After two years he returned to England, where he continued to practise his art till his death, 2d February 1805. Of his later works, the *Nymphs Consoling Achilles*, an oval alto-relievo, in which Thetis and her nymphs are seen rising from the sea, is not surpassed in the buoyancy and spontaneous movement

of the figures by any work in ancient or modern art.

Bank'sia, a genus of plants of the natural order *Proteacea* (q. v.), named after Sir Joseph Banks, and peculiar to Australia and Tasmania. Only two of the fifty species of which the genus is composed are tropical. *B. grandis* has been known to reach a height of 50 feet, but excepting some six other arborescent species, the genus consists of shrubs, some of which attain a height of from 15 to 26 feet. The flowers of the *B. integrifolia* contain a large quantity of honey, whence it is called the honey-

Bank'sia.

suckle by the colonists. Various species of B. are commonly grown in greenhouses in Britain for the sake of their flowers.

Bank'sian Cockatoo' (*Calyptorhynchus Bankisi*), a species of cockatoo, occurring in Australia, the plumage being black or brown, variegated with spots of red or orange, with which colours the tail-feathers are also banded.

Bann (Upper and Lower), two rivers in the N.E. of Ireland. The first, rising in the Mourne mountains, passes Banbridge, Gilford, and Portadown, and falls into Lough Neagh; the latter, issuing from Lough Neagh, flows through Lough Beg, divides Antrim and Londonderry, and falls into the Atlantic near Portrush. A mile above Coleraine, where the B. falls over a ledge of rock 13 feet high, there is a valuable salmon-fishery. Here the Irish Board of Works have erected a lock and piers, to regulate the water-flow.

Bannatyne Club, instituted in Edinburgh in 1823 by Sir Walter Scott, for the purpose of printing scarce works bearing on Scottish history and literature, is named after George Bannatyne (a Scottish merchant, born 22d February 1545, died before 1608), the transcriber of the famous Bannatyne MS., preserved in the Advocates' Library. The works were to be printed uniformly and handsomely, the club, or, as often happened, some individual member, defraying the expense. The number of members, at first 31, was raised to 100, the annual contribution being five guineas. Its first president was Sir Walter Scott, and its first and only secretary David Laing. The annual meetings of the club, which were highly convivial, were held in December. They were, however, ultimately discontinued, and the club itself was dissolved 27th February 1861. Its publications, 116 in number, bring high prices at sales. In December 1874 a complete set was bought for the Glasgow Public Library, at the sale of the library of the Rev. Dr Stevenson, late Professor of Ecclesiastical History in the University of Edinburgh, for £204, 15s.

Bann'er. By this word we generally mean to indicate a flag or similar device used for ornament on important occasions, or to denote nationality or fraternity. Among all people there is a veneration for the national flag, which promotes the virtues of heroism and patriotism. Chiefly is this found in nations which have long been great, and whose colours have become the nucleus round which historical and traditional glory has gathered. From the earliest times we find that banners have been used in war, for the purpose above indicated, and for directing the movements of troops. The Roman standard was in the earlier days of Rome a spear with a bundle of straws. This was succeeded by the haughtier emblem of the eagle—since adopted by the Bonaparte dynasty, and by the American Republic.

Banner.

The ensign of the United Kingdom, or Union Jack, is formed by a combination of the three national emblems—the crosses of St George, St Andrew, and St Patrick. As a specimen of heraldry it is not considered to be very successful; nevertheless, *per mare, per terram*, 'the meteor flag' has well sustained the honour of the British name. In the navy the ensign is displayed on flags of various colours—most commonly red, yellow, white, blue, or black.

Internationally, the white flag is the token of peace or surrender; a red flag, of defiance. The black flag is the emblem of piracy.

Bann'eret, a knight who, for some deed of valour performed on the field, was entitled to bear a banner instead of a pennon. The act of elevating any one to this dignity consisted in cutting or tearing off the ends of the pennon. According to Froissart, Edward I. introduced this grade of knighthood; and the last knight-B. was John Smith, who received the honour from Charles I. after the battle of Edgehill.

Bann'ock (Cael. *bonnach*, a cake), a thick round cake common in the rural districts of Scotland and the N. of England.

The Scottish B. is made by kneading barleymeal or a mixture of barleymeal and pease meal with water, only to a softer consistence than is requisite for the oat-cake, and firing on a girdle or circular plate of cast-iron. Oatmeal forms the principal constituent of the B. of the N. of England.

Bannockburn, a celebrated village in the county of Stirling, three miles S.S.E. of the town of that name, so called from the rivulet of the Bannock, which falls into the Forth. It derives its fame from the battle fought 24th June 1314, between the Scots under Robert Bruce, and the English under Edward II., in which the former, although in numbers not more than a third of their opponents, were completely victorious. In the vicinity of B. at Sauchie Burn, James III. was defeated in 1488 by his subjects, who had rebelled against him in the name of his son, and later in the day was assassinated. B. is otherwise chiefly noted as a seat of the woollen manufactures.

Banns of Marriage. Marriage according to the rites and ceremonies of the Church of England requires one of three preliminary forms—*License, Publication of B., or Registrar's Certificate.* The publication of B. must, under statutes, be made audibly in church according to the rubric of the marriage service of the Church of England. It is to be made on three successive Sundays previous to the marriage, in prescribed form. Marriage without B., unless by license or certificate, is void by statute. If either of those intending marriage is resident in Scotland, certificate of publication of B. in Scotland by the session-clerk of the parish in which it has been made is valid in England. In Scotland the publication of B. in church is required to constitute a regular marriage. It is directed to be done 'in an audible voice'; a direction, however, which is not always attended to. Marriage in Scotland is, according to the essential principle of the law of that country, necessarily valid without publication of B., but the witnesses and celebrator are liable to heavy penalties. Strictly, the proclamation in Scotland ought to be made on three successive Sundays; but it is now allowed to make the three proclamations on one Sunday for a higher fee than usual. The object of the publication of B. is to inform the public of the intended marriage, so that if any one knows of any legal impediment, he may have opportunity to state it. Keeping this as the object in view, the law does not hold proclamation vitiated by an error in name, provided it appears that the name used was one by which the person proclaimed was known in the district in which he or she lived. A clergyman who celebrates a marriage, to which legal objection has been intimated to him, incurs penalties under ecclesiastical law. But if he refuse to celebrate without sufficient cause, he may be found liable in a civil action. (See MARRIAGE, SPECIAL LICENSE, REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES.)

Banquette (Fr.), in fortification, is a raised bank or ledge running along inside of the parapet, and thus enabling the soldier to fire over the rampart without too much exposure to the fire of the enemy.

Banshie. See BENSHEE.

Banswara, the capital of a protected state of the same name, in the Mewar Agency, Rajputana, India, is 200 miles S. of Ajmir. Pop. about 7000. The state, between Malwa and Gujerat, has an area of 1500 sq. miles, and an estimated population of 150,000. It became tributary December 25, 1818, agreeing to pay a sum not exceeding three-eighths of the revenue, which is about £30,000.

Bantam, the earliest Dutch residency in Java (1602), occupying the western portion of the island, with 607,400 inhabitants. The trade here has greatly declined. The seaport and capital, also called B., situated 40 miles W. of Batavia, is now an insignificant village.

Bantam Fowl, a variety of the common fowl (*Gallus domesticus*), so named from its being supposed to have been originally brought from B. in Java. This variety is of small size. The legs are generally more or less completely feathered. Several distinct varieties of B. have been described. They are all distinguished for their courage and vigorous disposition.

Banteng (*Bos somidaicus*), a species of ox inhabiting Java and Borneo, coloured black with white legs, and unprovided with a dewlap. The muzzle is pointed, and the back is highly arched

behind the neck. The Gaur-ox of India somewhat resembles this species, concerning the exact nature of which considerable doubt still exists.

Ban'try (named from the *Branntraighe*, descendants of Beann, King of Ulster, who settled in the S. of Ireland), a seaport town of Ireland, county Cork, at the head of the bay of the same name, 44 miles W. by S. of Cork. There is some fishing carried on, but the principal trade consists in exporting agricultural produce. Pop. (1871) 2421.

Bantry Bay, a deep inlet on the S.W. coast of Ireland, between Crow Point on the N., and Sheep's Head Point on the S., Cork county, one of the safest and most capacious roadsteads in Europe, though but little shipping resorts to it. At the head of the bay are two harbours, B. harbour, completely landlocked, being within Whiddy Island, and Glengarriff harbour, also sheltered by an island, but small, and used chiefly by coasters. The coast around the bay abounds in picturesque scenery, and the magnificent cataract of Hungry Hill lies 17 miles W. of the town of B. Admiral Herbert with the British fleet engaged the French fleet that brought James II. to Ireland in 1689 at the mouth of the bay; and some vessels of the fleet that carried the force intended for the invasion of Ireland anchored here, 22d December 1796.

Ban'ring (*Tupaia*), a genus of *Insectivorous* mammals, inhabiting the Indian Archipelago, and adapted for an arboreal life. The tail is longer than the body, and fringed. The feet are plantigrade, and possess five toes each. The claws are curved. The snout is prolonged and slender, and the eyes are large. The best-known species are the *T. ferruginea*, *T. novima*, and *T. javanica*.

Ban'ya-Nagy ('great mine'), in Ger. Neustadt ('new town'), a town in the E. of Hungary, county of Szathmar, near the borders of Transylvania, 85 miles E. of Debreczin. It has a royal mint, and is noted for its gold and silver mines, from which it takes its Hungarian name. Pop. 9082.

Ban'yan, an Indian tree (*Ficus Indica*) belonging to the natural order Moraceæ. It sends down roots from its branches, which, in their turn, become stems, and send forth similar branches and roots, and in this remarkable manner the tree

Banyan.

extends to a great distance, and often covers a large area with its leafy arcades. The fruits are about the size of cherries, scarlet, and produced in pairs.

Banyuls-sur-Mer, a town in the department of the Pyrénées Orientales, France, situated in the district where the Grenache and Rancio wines are produced. It was the scene of many fierce engagements at the end of the 18th c., between the Spaniards and the French republicans. Near it are four ancient towers, one of which marks the line of boundary between France and Spain. Pop. (1872) 2227.

Banyuwan'gy, the chief town of a Dutch province of the same name, Java, and a thriving seaport. Pop. 45,000.

Ba'obab, the common name for *Adansonia* (q. v.).

Bapaume, a fortified town in the department of Pas-de-Calais, France, with manufactures of laces, and woollen and cotton goods. The French army of the north was defeated here by the Germans under Von Göben, January 2 and 3, 1871. Pop. (1872) 2864.

Baph'omet, a symbol in use among the Knights Templars,

the meaning of which has not been satisfactorily explained. It is a small human figure in stone with two heads—one male, the other female—and the rest of the body being female. It is surrounded with serpents and astronomical signs, and furnished with inscriptions mostly in Arabic. One explanation of it is, that the name is a corruption of the word Mahomet, to whose faith the Templars were said to be secretly addicted. Another is that which derives the word from Gr. *baphé*, baptism, and *metis*, council or wisdom. According to this view, the Templars borrowed their symbol from one of the corrupt Gnostic sects, who were still to be found in the East, whose baptism of fire was regarded as a mode of spiritual illumination. For a full exposition of the latter view, see Hammer's *Fundgruben des Orients*. Specimens of the B. are to be seen in the archæological collections of Vienna and Weimar.

Baptism (Gr. *baptizo*, *bapto*, to dip, &c.). Washing the body with water, representing the removal of impurity and pollution in connection with religion, was much in vogue among ancient nations. In the ceremonial laws of Moses, as well as of Menu, elaborate directions are given for purifying from various kinds of defilement or uncleanness. B. also symbolised purification of the heart and life; and accordingly John the Baptist administered the rite of B. or ablation to those who, on hearing his preaching, professed repentance and promised amendment. B. was adopted as an initiatory rite by the Christian Church, and exalted into one of her sacraments. The chief points of importance connected with the sacrament are included under the heads of *the subjects for it*,—its *efficacy*,—and *the mode of administering it*, &c.

1. The first subjects for Christian B., as a matter of course, were adults. The converts from heathenism who professed their faith in Christ and willingness to live a holy life were immersed in water in the name of the Father, the Son, and the Holy Spirit. The practice of baptizing the infants of believers was soon introduced, however; by the 5th c. it was fully established in the Church, and has prevailed ever since, although it has been opposed by certain sects since the middle ages. 2. Regarding the efficacy of B., the Church of Rome in her canons (Co. of Trent) anathematizes those who teach that B. is a matter of indifference and not necessary to salvation, and who deny the propriety, necessity, or efficacy of infant B. She also holds that B. avails not only for the remission and removal of all sin, but also for the inward sanctification of the soul. The Reformed doctrine denies—(1) that B. conveys grace 'ex opere operato' (see SACRAMENTS); (2) that the co-operation of the Spirit always attends its administration; (3) that B. is the ordinary channel of conveying the benefits of salvation, so that those benefits cannot be obtained without it. On the other hand, it affirms that B. is—(1) a divine ordinance; (2) a means of grace to believers; (3) a sign and seal of the covenant of grace; (4) was intended to be of perpetual obligation; and (5) that the benefits signified by the sacrament will be conferred on all who receive it in faith, and on all infants who, on arriving at maturity, remain faithful to the vows made in their name. (See REGENERATION.) 3. There has been considerable controversy during the whole time of the Church's history regarding the proper mode of administering the sacrament, whether it ought to be by sprinkling or by immersion. It was one of the points on which the Eastern and Western Churches were divided; the E. holding to immersion, the W. to sprinkling. The modern practice of the Church of Rome is affusion or sprinkling. As a rule, those who oppose infant B. also hold sprinkling to be insufficient, the chief arguments brought forward in favour of this view being—(1) the classic usage of the word *baptizo*, and the usage of the prepositions *en* and *eis* in construction with it in the New Testament, together with the use of such expressions as 'buried with Christ in B.', alluding to a typical burying in water; (2) that immersion was the practice in New Testament times, as is indicated by such passages as Matt. iii. 16, Acts viii. 38. The arguments on the other side are—(1) an *a priori* one that the idea of purification is as clearly and frequently signified by affusion as by immersion; (2) that the usage of the word *baptizo* in the classics, the LXX., the Apocrypha, the New Testament, and the fathers, is by no means confined to immersion; (3) that the gospel is designed for all classes of persons and all parts of the earth—not merely for the strong and robust, but for the weak, the sick, and the dying. At any rate, the ordinary mode of administering the

sacrament in the early Church was by immersion, the sick only being sprinkled.

Besides immersion with the ordinary formula, various other ceremonies were formerly connected with the administration of the sacrament. The rite was regularly administered only twice a year, namely at Easter and Whitsuntide. Candidates made a public profession of their faith and renunciation of the flesh and the devil. After a course of fasting and prayer, the exorcist in a solemn formula declared them free from the bondage of Satan. Before and after the B. they were anointed with oil as wrestlers against spiritual enemies; after, they were signed with the cross, in token of being soldiers of Christ; tasted salt, milk, and honey, in token of receiving spiritual gifts and graces; had their ears and nostrils touched with spittle, to signify they would always listen to the truth and smell the odour of virtue. They returned home decorated with a crown and white robe, the one to signify their victory over the flesh and the devil, and the other their freedom and innocence.

As to the persons by whom B. was to be administered, considerable laxity prevailed at first, but as the hierarchy came to be established, the administration was confined to ordained clergy. High views regarding the necessity of B. for salvation tended, however, to counteract this exclusiveness, and in cases of emergency a lay person could administer B. to an infant, as is allowed yet in the Church of Rome.

Baptism, Infant. The difficulty in the question of I. B. is, that infants cannot make the profession of faith by which Christ is to be confessed before men, and hence cannot be members of his Church in the same sense as adults. The justification of the practice, therefore, must be based on an idea of the Church which includes the children of believers. The argument in favour of it is as follows:—1. The visible Church is a divine institution. 2. The visible Church does not consist exclusively of the regenerate. 3. The commonwealth of Israel was the Church. 4. The Church, under the new dispensation, is identical with that under the old. 5. The terms for admission into the Jewish Church were the same as are required for admission into the Christian Church. 6. Infants were members of the Jewish Church. 7. There is nothing in the New Testament to show that the children of believers should not also be members of the Christian Church. 8. Children need, and are capable of, receiving the benefits of redemption. For the other side of the question, see BAPTISTS.

Baptistery (Gr. *baptisterion*, a vessel used in baths, a bathing-place). As soon as the Christian Church began to be organised and established, for the more convenient administration of baptism, fonts were erected in the porches, or other convenient part of the churches. Then buildings called baptisteries were erected adjacent to the churches, in which the catechumens were instructed, and where were cisterns into which water was let at the time of baptism, and in which the candidates were baptized by immersion. They were generally circular or polygonal; and the B. still forms an important architectural feature of some of the finer churches in Italy and elsewhere.

Baptists generically hold the opinion—(1) that none ought to be baptized but adults who can make an intelligent profession of their faith; and, as a rule, (2) that the rite is not valid unless administered by immersion. Their chief arguments in favour of the first point are—(1) that repentance and faith are prescribed in the New Testament as conditions of baptism; (2) that the apostles did not baptize any till they were satisfied on this point; (3) that infants are thus excluded (*a*) by their inability to comply with the required terms, and (*b*) by their baptism not being enjoined in the New Testament; (4) that infant baptism was unknown in the early Church. Infant baptism was repudiated by the fanatical Anabaptist sects of the 16th c., as well as by the more moderate Mennonites; but the B., as the name is generally understood, are an offshoot from the English Independents. The first congregation was formed under John Spilsbury, in London, in 1633. Another was formed in 1639; and the 'new baptism' was effected by communication with the Mennonites of Holland. In 1643 the sect was so far organised and established as to draw up a Confession of Faith. In 1646 they had forty-six congregations in London and neighbourhood, while they were also gaining a footing in the American colonies. In 1647, for the help

they had given in the Civil War, they received from Parliament a declaration of toleration, which, however, was reversed next year by Presbyterian influence. They acquired influence again under Cromwell, and thirty-five of their clergy were among the first Nonconformists.

The original body of the sect have always held the Calvinistic doctrine of 'particular redemption,' and hence, as a distinctive title, receive the name of 'Particular B.' There are, however, two parties of them, though not two separate sects; the 'Free Communions,' who admit to the Lord's Supper those who have been baptized only in infancy, as well as adult B.; and the 'Close Communions,' who admit none but those who have been baptized as adults.

Bar is the name given to any lengthened piece of wood, metal, or other solid substance. See **IRON MANUFACTURE**.

Bar, or **Barr**, in heraldry, is the principal diminutive of the *honourable ordinary*—the Fess (q. v.), which is a horizontal band in the middle of the shield, occupying one-third of it. The B. occupies a fifth part, and may be borne on several parts of the shield, while the fess is confined to the centre.

Bar, in hydrography, is a deposit of mud and sand at the mouth of a river, preventing the passage of a vessel of any considerable burden except at high water.

Bar, in law, means the enclosed space in courts from which lawyers address the judge or jury. It also means the enclosed space where those accused of felony are placed during trial. In Scotland, the Lord-Advocate and the Solicitor-General have a right to sit within the B.; the former by statute, the latter by direction of the crown. A *Trial at B.*, in England, is one held before all the judges at the B. of the court in which the action is brought.

Bar, in music, is a line drawn perpendicularly across the stave to indicate a certain quantity of time or a certain number of beats.

Bar, Pleas in. In the law of England, a special P. in B. is a plea stating some ground on which the indictment should not be gone on with; such as that the accused had been already tried or pardoned for the alleged offence.

Bar, Toll. The original erection of toll-gates for the purpose of levying a tax for the maintenance of roads excited violent opposition in England, and their continuance has led to serious riots in many parts of the country. While none deny that roads must be kept in repair, and consequently that funds must be raised for doing so—how to raise the funds, and who ought to contribute, have long been and continue to be vexed questions in England and in Scotland. Strange to say, Ireland seems to have taken the lead in an amicable solution of the problem. The system was abolished in Ireland in 1858, and a land assessment substituted for support of the roads. It may be held that nothing can be more fair than that he who uses a road should contribute to its support; but, on the other hand, the T. B. system is attended with immense expense. Besides the cost of erecting houses and gates, there is the cost of maintaining collectors, of whom it has been calculated that there are over 6000 employed in England and Scotland. Again, the opponents of the system, in support of their view, point to the fact that it has been eminently unsuccessful, there being over four millions of debt on the turnpike trusts of England, and two millions and a half on those of Scotland. In Scotland, the following counties have obtained abolition Acts—Dumfries, Haddington, Kirkcudbright, Wigton, Peebles, Aberdeen, Banff, Caithness, Cromarty, Elgin, Ross and Nairn. Orkney and Shetland, Sutherland, Argyll and Bute never had the T. B. system, having all along maintained their roads either by assessment or by state assistance. The other counties continue the T. B. and Statute-labour system. In England, under the Act of 1864, the turnpike roads are placed under the management and direction of certain bodies of trustees, who are usually named and appointed by the respective Acts of Parliament which are occasionally passed regarding the making and sustaining the particular roads specified in them. But various Acts of general application have been passed for the regulation of turnpike trusts throughout the kingdom. Under these Acts the following are exempt from toll—horses employed in husbandry, persons going to and from church on Sun-

day, clergymen engaged on parochial duty, officers conveying criminals, officers of the army, or soldiers or volunteers on duty, persons going and returning from Parliamentary elections. Any one claiming an exemption to which he is not entitled is liable to a penalty of £5. Toll-collectors refusing to give their name, or obstructing or injuring any passenger, or using scurrilous or abusive language, are liable to a penalty of £5. A table of tolls, in large and conspicuous characters, must be put up by the trustees. Mile-stone and direction-posts must also be erected. Any one defacing the same is liable to a penalty of £10.

Bar, Trial at. See **BAR**.

Baraba', a steppe of Asiatic Russia, between the rivers Obi and Irtysh, nearly 200,000 sq. miles in extent. In spring it is partly under vegetation, but in summer and winter it is covered with snow and salt lakes. It is sparsely inhabited by a nomadic race (the *Barabinsen*), descended from the Tartars of Turkestan. See Middendorf, *Die Baraba* (1870).

Baraco'a, a seaport on the N.E. coast of Cuba, in the vicinity of which is a singular mountain, called the Anvil of Baracoa.

Baraguay d'Hilliers, Louis, a distinguished French general of Napoleon I., was born at Paris, August 13, 1764. He served with distinction in the days of the republic, and in Italy with Bonaparte. He accompanied his great leader to Egypt, and, after much distinguished service, he accompanied him in 1812 to Russia. B. died at Berlin shortly after the retreat, December 1812.

Baraguay d'Hilliers, Achille, son of the above, was born at Paris, September 6, 1795. In 1832, after having served duly in the inferior military ranks, he was made governor in the military school of St Cyr, where he showed good practical capacity. He served for several campaigns in Algeria. After the revolution of 1848 he was chosen a member of the National Assembly. Adhering to Napoleon III., he was appointed to command the army of Paris in 1851. He distinguished himself both in the Crimean War and in the war with Austria in 1859. Previous to the latter he had been made a marshal of France. At the close of the Franco-Prussian war (1871) he was made president of the commission appointed to inquire into the causes of the disgraceful capitulations, particularly that of Bazaine at Metz, and in 1872 he was also president of the special council of war which tried General Cremer. He died 7th June 1878.

Barante, Amable Guillaume Prosper Brugiere, Baron de, a French statesman and author, born at Riom, in Auvergne, 10th June 1782, entered the service of the state in 1802, was a prefect under Napoleon, opposed the reactionary policy of the restoration, and zealously supported the government of Louis Philippe. He was French ambassador at Turin and at St Petersburg, but withdrew from public life after the revolution of 1848, and died in Paris, 23d November 1866. His chief literary performance, *Histoire des Ducs de Bourgogne de la Maison de Valois* (1824-26, 8th ed. 1858), is a learned and pictorial, but not very critical work. Other writings of B.'s are *Histoire de la Convention Nationale* (1851-53); *Histoire du Directoire de la République Française* (1855); *Le Parlement et la Fronde* (1859). He also translated Schiller's dramas into French.

Barb, a variety or breed of horses originally bred by the Moors of Barbary, and noted for their endurance, speed, and docility. The breed, introduced into Spain, has declined of late years.

Barbace'na, a city of Brazil, in a productive district of the province of Minas Geraes, about 150 miles N.W. of Rio. It stands at the height of 3500 feet above the sea, on the Sierra Martiquivera, and has a delightful climate. Pop. about 12,000, engaged in gold-mining and in the export of coffee and cotton to the capital.

Barba'does (Port. 'island of pines'), the most easterly of the Windward Islands, and next to Jamaica the richest of the British W. Indian possessions, in lat. 13° 4' N., long. 59° 37' W. It was discovered by the Spanish in the 15th c., and taken by the English in 1624. B. is the residence of the governor-general of the group, and the see of a bishop. It is cultivated

almost to the utmost limit of its resources, and the impossibility of greatly extending its productiveness has given rise to fears for the future provision of its rapidly increasing population. Sugar is the staple product, but there is also much cotton, wheat, and arrowroot. The climate is good; but there are frequent earthquakes, severe thunderstorms, and hurricanes of unusual violence. The island is of coral formation, and is nearly surrounded by reefs, there being no harbours. Bridgetown is the capital. The exports in 1872 amounted to £1,021,444; imports, £1,125,032. Area, 166 sq. miles; pop. (1871) 162,042, of whom 105,904 are black and 39,578 coloured. See Schomburgk's *History of B.* (Lond. 1848).

Barba'does Cherry, the common name in the W. Indies for the fruit of *Malpighia urens*, which is eaten. See MALPIGHIACEÆ.

Barba'does Gooseberry, the popular name in the W. Indies for *Pereskia aculea*, a plant of the order *Cactaceæ*, which yields a pleasant fruit used for making preserves.

Barba'does Leg, a name given to a disease which consists essentially of induration and thickening of the true skin, especially of the leg. The disease is met with occasionally in this country, but is common in the W. Indies, Barbadoes, China, Africa, &c., &c. It is a non-contagious disease, is not hereditary, and attacks rich and poor indiscriminately. Frequently the limb is swollen to double its natural size, so that the shape of the foot is quite obliterated, producing marked deformity, causing the limb to resemble the leg of an elephant; hence the disease is often called Elephantiasis of the Arabians. There is no very satisfactory treatment for this malady; when only one leg is implicated amputation has been practised sometimes with advantage. Benefit has also been derived from tying the main artery which supplies the lower limb, with the view of diminishing the nutrition of the leg. In the early stage, rest, elevation of the limb, and bandaging should be tried. This disease frequently attacks the scrotum and parts in that region, and cases are on record where the skin of the scrotum has so enlarged that when removed by the knife it weighed upwards of 50 lbs. The patient often does well after this operation.

Barbara, St., suffered martyrdom at Nicomedia in Bithynia under the Emperor Maximinus I., about A.D. 236, or according to others, at Heliopolis in 306. The legend of her life represents her as a lady of good family; and her education was carefully attended to by her father Dioscorus, who had a tower built for her in which she might pursue her studies undisturbed. She embraced Christianity, through the influence, it is said, of Origen. Her father was enraged at this, and handed her over to Martianus, the Roman governor, to deal with her according to law. Torture proving unavailing, Dioscorus offered to strike off his daughter's head. He did so, and was instantly struck with lightning. Hence St B. is prayed to in storms, and is the patron saint of artillery. Her image used to be placed on arsenals, powder-magazines, &c. The powder-room in a French ship of war is still called Sainte-Barbe. Her day in the Roman calendar is the 4th of December.

Barbaræa, a genus of Cruciferous plants. See CRESS.

Barbarelli, Giorgio. See GIORGIONE.

Barbarian (Gr. *barbaros*), originally one who could not speak Greek; then used especially of the Medes and Persians. Plato divided mankind into Hellenes and Barbarians. The origin of the word probably is, that the Greeks in imitating the language of a foreigner said *bar-bar*, meaning thereby that it was an unintelligible jingle. The secondary and contemptuous sense of *uncivilised, brutal, rude*, now in use, arose after the Persian war. The Romans were called barbarians till the Greek language was cultivated among them, and then the term was confined to the Teutonic and Scythian races. See Roth, *Über Sinn und Gebrauch des Namens Barbar* (1814).

Barbarossa. See FRIEDRICH I.

Barbarossa, the name given to two brothers, **Aruj** or **Haruj**, and **Khair Eddin**, sons of a renegade Greek, who were born in Mitylene towards the close of the 15th c., joined the Turkish corsairs, and soon became the scourge of the Mediterranean. Haruj, by treachery, made himself sultan of Algiers

in 1516, and was slain by the Spaniards in 1518. His brother succeeded him, and surrendered the sovereignty to the Porte in 1519. In 1532, becoming master of Tunis, he gave this up also to the Turks; but Tunis was retaken by the Emperor Charles V. in 1535, and was not incorporated with the Ottoman empire till 1575. Khair Eddin died at Constantinople in 1547.

Barbaroux, Charles Jean Marie, was born at Marseilles 6th March 1767. An advocate by profession, he represented Marseilles in the Constituent Assembly. At Paris he became attached to Brissot and Vergniaud, discussed with the minister Roland the scheme of a Southern Republic, and brought the Federates to Paris. In the Convention he boldly denounced the Septembriseurs, opposed the forced loan and the grain-tax, and supported the appeal to the people in the sentence passed on the king. The leader of the Girondists, he was proscribed 31st May 1793, and after wandering through France for a year, was captured at Bordeaux, and guillotined 25th June 1794. B.'s character stands high among the more moderate republicans: he was a bold and skilful speaker. Besides a memoir on extinct volcanoes at Toulon, he has left an essay on the influence of maritime war on commerce. Madame Roland mentions B.'s singular beauty. See *Mémoires de Ch. B. avec une Notice sur sa Vie*, by his son, M. Ogé B., and *Eclaircissements Historiques* by MM. Berville and Barrière (Par. 1822).

Barbary, the northern part of Africa, extending along the shores of the Mediterranean from the Atlantic to Egypt, and as far inland as the Desert of Sahara, or between 10° W. and 25° E. long., and 25° to 37° N. lat. It comprises Barca, Tripoli, Fezzan, Tunis, Algeria, and Morocco, with their dependencies, each of which is separately treated. The Atlas Mountains (q. v.) traverse a great part of B. in an irregular and double line, from Cape Geer on the Atlantic, to the coast of Tunis; while an offset, stretching northward, terminates at Ceuta. B. is naturally fertile, and in ancient times supported great and flourishing colonies, and furnished supplies for large conquering armies. In fact, Mauretania was once the granary of the world, and might still be so under proper rule.

The populations, exclusive of Europeans, are the Berbers (q. v.), called in Algeria, Kabyles, from whom B. takes its name; the Moors, Arabs, Jews, Turks, Kuluglis, and Negroes. Of these, the Moors are the residents in the towns; the Negroes are slaves, chiefly from Sudan; the Berbers inhabit the mountains and valleys of the Atlas; the Arabs are nomadic; the Kuluglis are children of Turks by native mothers. The Turks are dominant in Tunis and Tripoli; and the Jews prosecute lucrative callings in the towns. Pop. exclusive of Jews and Christians, estimated at over 11,000,000, all Mohammedan, with the exception of the Negroes, who are Pagans.

In Morocco, which is independent of Turkey, Arabic is the prevailing tongue, but Turkish is the official language in the regencies subject to the Porte. The *lingua communis* of commerce is Arabic.

The history of B. is of engrossing interest. Leaving out of view the narrative of Herodotus, with the exception of his notice of the Phœnician colonies, we know that after the third Punic War, when Carthage was sacked, the Romans gradually extended their dominion over the whole of Northern Africa. Numidia became theirs after the defeat of Jugurtha, and Mauretania after the defeat of Juba; while Cyrenaica, bequeathed to them by its King Apion at his death, B.C. 96, though at first declared free, was within thirty years also appropriated. Thus the Roman possessions in the N. of Africa, coextensive with the present B., received the benefits of Roman law and Roman civilisation. The remains are still numerous of the towns they built, while a natural consequence of Roman possession was the construction of aqueducts, amphitheatres, and other works for use or ornament.

Nowhere was Christianity promulgated with greater success than in Roman Africa, in which there were more than 160 dioceses. The decline of Roman power under Honorius, and the temptations to disturbance and revolt inseparable from a weak rule at such a distance from the central power, operated banefully on the African provinces. The Vandals, under Genserich, landed in Africa, A.D. 429, and their sway was a series of atrocities, till it was terminated by Belisarius in 533. In 647 the Arabs found the country an easy prey; before the close of the century they had annihilated what remained of the dominion

of the empires Eastern and Western; and with their usual policy proselytised the tribes by means of the sword. Dynasty succeeded dynasty with perplexing rapidity till near the close of the 13th c., when independent states began to arise. The expulsion of the Moors from Spain, not completely carried out till 1609, now began to be partially effected. Those expelled resorted to piracy, and formed settlements in the N. of Africa. Thence arose fierce contests between them and the Christian powers, especially Spain and Portugal, the greatest sufferers by their ravages. Marocco and Fez form an independent empire under the Sultan Muley Hassan; Algeria has been a French province since 1830; Tunis and Tripoli are nominally subject to the Porte, and Barca is claimed by Egypt.

Barbary Ape or Magot (*Macacus inuus*), a species of Macaque monkeys, included in the *Catarkine* ('oblique-nosed') section of the order *Quadrumana*, and which inhabits the N. of Africa. This species is also found on the Rock of Gibraltar, and thus represents the only monkey found in Europe in a wild state at the present time. The tail in the B. A. is rudimentary; the muzzle slightly elongated; the facial angle is much higher than in the baboons, to which the B. A. is evidently allied; the face is destitute of hairs; the ears are prominent, and the eyes large. Cheek-pouches are present, and natal callosities are developed. These monkeys generally inhabit rocky places, and are gregarious in habits. They feed on fruits, but also appear to devour eggs and animal matter. They rarely assume the semierect posture, and progress chiefly on all-fours. They are intelligent, and can be taught tricks, if trained when young.

Bar, Bastard, the bar in heraldry is formed by two horizontal lines passing over the shield. The mark of bastardy is generally spoken of as the bar-sinister; but incorrectly so. A bend-sinister is also sometimes confounded with the B.-B., from which, however, it essentially differs. The real B.-B. is half of the scarp, which again is half of the bend-sinister. In England the B.-B. is called the baton-sinister. In the heraldry of our time it is not generally fully insisted on.

Barbastelle. See BAT.

Barbas'tro, a walled town in the province of Huesca, Spain, on the Vero, with a cathedral containing some of Antonio Gaceran's paintings. Pop. 6500.

Bar'bauld, Anna Letitia, a delightful writer for children, the daughter of the Rev. John Aiken, F.D., was born at Kibworth-Marcourt, Leicestershire, 20th June 1743. Studious in her habits, she early acquired considerable skill in Latin and Greek, and attained facility in writing English prose and verse. She produced a volume of poems in 1773, and in the same year published, in conjunction with her brother, a volume of *Miscellaneous Pieces in Prose*. In 1774 she married the Rev. Rochemont Barbauld, who shortly after opened a boarding-school for boys, in the superintendence of which he was ably assisted by his wife. Mrs B.'s *Hymns in Prose for Children, Early Lessons, &c.*, were written about this time in the interest, in the first instance, of her own pupils. She edited Akenside's *Pleasures of Imagination* in 1795, and in 1804 a selection from the *Spectator, Guardian, Tatler, &c.* She is also the editor of a *Collection of the British Novelists*. She died 9th March 1825. Her collected works, with Life by Lucy Aiken, were published Lond. 1825.

Barbed, in heraldry, pointed, as an arrow. The term is also applied to a heraldic rose with small green leaves, or barbs, surrounding it. *B. and crested* indicates that the comb and gills of a cock are tintured differently from the body. *Wattled and combed* is the old English phrase for the same thing.

Bar'bel (*Barbus vulgaris*), a genus of Teleostean fishes included in the *Malacopterus* division of the order, and belonging to the *Cyprinidae* or Carp family. This fish is one of the most familiar and most esteemed of fresh-water fishes. Its average length is two and a half or three feet, and it may attain a weight of 16 or 18 lbs. The name B. is derived from the filaments, known as *barbules*, which fringe the mouth, and which are supposed to subserve the sense of touch. These tentacles, possessed by other Cyprinoids also, are of great length in the Barbels, and are four in number. The upper jaw is longer than the lower jaw. The dorsal and anal fins are short; and the chief

ray in the dorsal fin is strong, and serrated or toothed. The flesh of the B., though coarser than that of the Carp, is still esteemed. It inhabits the deeper fresh-water rivers, and appears to feed on worms, crustaceans, and other small animals, which it obtains by groping in the mud of the bottom. Its general colour is a greenish-brown on the upper portion, and a yellowish-green on the sides; whilst the belly is white, and the tail purplish. The common B. is the only British species; the Binny or Nile B. (*B. Niloticus*) being a second species inhabiting the Nile, and attaining a weight of 60 or 70 lbs.

Barber. The business of a B. is of great antiquity; and in oriental countries it still flourishes. In England and France, again, private shaving has almost extinguished it, at least in cities, though in villages and country towns we still occasionally see swaying from the end of a pole in front of some little shop the brass basin with semicircular gap, indicating that the once-honoured profession is not wholly extinct, and recalling to us the deeds of the famous Don. In Spain the B.—like everything else in that queer fossilised country—is in nearly the same position that he was in three centuries ago. His premises are thronged morning and evening with customers, who, for the smallest possible consideration, enjoy the luxury of being shaved or trimmed under the soothing influence of the cigarette.

Barber Surgeon. In former times, in all countries, the business of a B. and that of a surgeon appear to have been regarded as having a natural affinity. In England, in the reign of Henry VIII., the surgeons and the barbers were incorporated into one company; but, strange to say, the very Act of Parliament which does this, draws a very sharp line between the functions which each is to discharge, and they are strictly prohibited from encroaching on each other's province. Barbers are not to draw teeth—surgeons are not to 'exercise the feat or craft of barbery or shaving.' Two centuries later, it was discovered that the functions in general of barbery and surgery were as independent of each other as the art of tooth-drawing is of that of shaving. Accordingly, on the preamble that the business of a B. was 'foreign to and independent of the practice of surgery,' an Act was passed in the 18th year of George II., dissolving the connection between the two bodies. In London, the barbers still possess the hall which they had in common with the surgeons before the disunion. It is in Monkwell Street, in the City.

Barberi'ni, a princely Roman family, originally called Tafari, but which took the name of B. from the Tuscan village from which it sprang. The noted poet and philosopher **Francesco da B.**, who wrote in the first half of the fourteenth century *Documenti d'Amore*, is supposed to have belonged to this family, which at an early period removed to Florence. **Antonio B.** (died at Florence 1577) had three sons, **Carlo**, **Ma'neo** (born 1568), who became pope under the title of Urban VIII., and **Antonio** (born 1569, died 1646), cardinal-librarian of the Church. The greatness and splendour of the house of B. dates from the time of Urban, who during his long pontificate of twenty-one years lost no opportunity of advancing the interests of his kinsmen. Of the three sons of his brother Carlo, the eldest, **Francesco** (born 1597), was elected a cardinal in 1623, possessed great influence with his uncle, and died, 1679, dean of the Sacred College. The second, **Taddeo**, married Anna Colonna of Paliano, great-granddaughter of the hero of Lepanto, and purchased from the elder Roman line of the Colonna the principality of Palestrina (anc. Præneste), along with other possessions of the Colonna family. The growing power and influence of the B. excited the jealousy of the Medici, Este, and Farnese families, and during the pontificate of Urban's successor, Innocent X., Taddeo and his brothers were forced to seek refuge in France, where the former died in 1647. **Antonio**, the third son (born 1608), was a restless character, fond of tournaments and display, but at the same time a patron of Latin and Italian poetry. In 1631 he too was made a cardinal, and after his retreat to France received from Louis XIII. the bishopric of Poitiers, and in 1657 the archbishopric of Rheims. Subsequently he was reconciled to the Pope, and returned to Italy, where he died at Remi in 1671. Through him the property of the Frangipani family came to the B. About a century after the death of Urban VIII., the male line of the B. became extinct. **Cornelia**, the grand-daughter of Taddeo and Anna, married in 1728 Giulio Cesare Colonna, Prince of Carbo-nano and Duke of Bassanello (died 1787), the grandson of that

Colonna who had sold Palestrina to the B.; and in this way the whole estates and wealth of the latter house once more reverted to the Colonna; but Giulio Cesare was compelled to add the name of B. to his own, and to leave unaltered the arms of the family. Of the sons of this marriage, the elder, **Urban** (born 1733), Prince of Carhognano, became the founder of the house of Colonna di Sciarna, represented at the present day by Prince Maffeo, born in 1850; the younger, **Carlo**, obtained the B. and Colonna property, and died in 1819. He is represented by his grandson, **Don Enrico B.**, Prince of Palestrina, who has married into the famous family of the Orsini.

Barberino di Mugello, a town in the province of Florence, N. Italy, on the Sieve, a branch of the Arno, 15 miles N. of Florence, with a large manufacture of straw-hats. Near it is the royal villa Cafaggiola, the ancient residence of the Medicis. Pop. 9000.

Barberino di Val d'Elsa, a picturesque village about 14 miles from Florence, which has given name to the Barberini family (q. v.), who have here a palace.

Barberry, the English name for the *Berberis vulgaris*, a genus from which the natural order *Berberidaceæ* is named. It has bright green spiny leaves, yellow pendant clusters of flowers, and in autumn is adorned with racemes of bright scarlet berries. The bark, wood, and roots furnish a yellow dye; the fruit makes an agreeable preserve, but are much too acid for use when raw. The leaves are also acid. The popular idea that there is a connection between the red rust (*Æcidium Berberidis*) that affects the leaves of the B. and that which affects corn is correct, and farmers are therefore right in removing the B. from the vicinity of corn-fields. The species of B. are natives of the N. and S. temperate regions, and are much planted in shrubberies and gardens.

Barberry.

Barbet, a genus of Scansorial or Climbing birds, forming the sub-family Capitoninæ, included in the family of the Woodpeckers (*Picidae*). The bill in the barbets is stout, conical in shape, and more or less expanded at the sides. The base of the bill is provided with bristle-like filaments—from the presence of which the name B. has been derived. The tail is short and even, and the wings are also small. The species of the typical genus, *Capito*, inhabit South America. The *Bucconina*, or puff-birds, allied to the *Insesorial* kingfishers, and possessing the same arrangement of the toes—namely, two in front and two behind—as seen in Scansorial birds, are by some authors included under the designation of barbets. This latter family includes the genera monasa (*Barbacous*), Barbicans (*Pogonias*), and puff-birds (*Tomatia*). The first and last genera are found in South America; the barbicans occurring in India and Africa. The name puff-bird has been applied to this genus from the distended appearance of their plumage. They are solitary in habits.

Barbette (Fr.), in fortification, is a raised platform inside the parapet, of such a height that guns placed on it may be able to fire over the parapet, instead of through the embrasures.

Barbican, a watch-tower projecting before or rising above the gate of a castle or fortified town, from the Italian *barbaccine*, regarded by Wedgwood (*Dictionary of English Etymology*) as a corruption of the Persian *bâla khaneh*, an upper chamber. The best examples of the B. are to be seen in the town of Carcassonne; but Alnwick and Warwick in England also possess very perfect ones. The name is also applied to apertures in the wall of a fortress from which to fire upon the enemy.

Barbou, the name of a French family of printers, famous for the elegance and correctness of the works issued from their press. **Jean B.**

published at Lyon, in 1539, a valuable edition of Clement Marot. In 1580, his son, **Hugues B.**, published at Limoges, in *Italics*, a beautiful edition of Cicero's *Letters to Atticus*. **Joseph Gerard B.**, of the same family, commenced at Paris, in 1755, a 12mo issue of Latin classics, in continuation of a series begun in 1743 by Coustelier. In all, 76 volumes were published. In 1809, the stock and business of the Barbous were purchased by Auguste Delalain from the heirs of Hugues B., who had succeeded his uncle, Joseph Gerard, in 1789.

Barbican.

Barbour, or **Barber**, John, the earliest Scottish poet who used the English language, a contemporary of Chaucer, though somewhat older, was born probably a few years after the battle of Bannockburn, but first emerges into the light of history in 1357, when Edward III., King of England, grants a safe conduct to John B., Archdeacon of Aberdeen, with three scholars in his company, going to study at the University of Oxford (*Rotuli Scotiae* i. h. 808). The same authority affirms that, in 1364, he was permitted to pass through England to study at Oxford, or elsewhere as he may 'be proper'; and in 1365 and 1368, he again obtained permission to pass through England to pursue his studies in France. B. was a member of the national council that, in 1357, secured the release of David II. from an English prison; was thrice an auditor of exchequer, viz., in 1372, 1382, and 1384, and received from Robert II., by a charter dated 5th December 1388, a grant of ten pounds sterling yearly for life, payable out of the customs of Aberdeen. The cessation of these payments enables us to fix the date of his death in 1395—probably the 13th of March, as on that day his memory was religiously celebrated in the cathedral of Aberdeen down to the Reformation.

The work that has given him an enduring place in Scottish literature is his poem entitled the *Brus*, a metrical chronicle in octosyllabic verse, narrating the career of the great Scottish king, from the murder of Cumyn in Dumfries to the death of Douglas in Spain on his way to Jerusalem with the heart of his master in a silver casket. From the first it was regarded as a history, not as a romance; and is the only record of the hero of Bannockburn that we possess. Both Wyntoun and Bower, the continuator of Fordun, plead the sufficiency of the *Brus* as a reason for passing over the story of the 'Seven Years War' of independence (1307-14). When the character and position of the author are considered, it will not be found difficult to believe that the poem is in the main a veracious account of Bruce's life from the unexpected disaster in Methven Wood to the brilliant day of Bannockburn. The style is simple and unaffected, but a fine patriotism and a chivalrous spirit animate the unrhymed verse. The dialect is the Lowland Scotch form of northern English, and the language is considerably purer than that of the *Canterbury Tales*. The best edition of the work is that edited by Cosmo Innes for the Spalding Club (1856). If we may trust Wyntoun, B. wrote another national poem on 'the Stewartis orygenale,' which has unfortunately perished.

Barbuda (Port. 'the island of the bearded men'), one of the Leeward Caribbees, 30 miles N. of Antigua. The castle is in 17° 33' N. lat., and 61° 43' W. long. Area, 75 sq. miles; and pop. (1871) 813. B. was taken possession of by Sir Thomas Warner in 1628, and in 1680 was given by the crown to the

Codrington family, to whom it still belongs. The agricultural operations are on a very limited scale; but stock is bred, and some corn, cotton, and tobacco are grown.

Barby, a town of Prussian Saxony, on the left bank of the Elbe, 15 miles S.E. of Magdeburg, with woollen and linen manufactures. It was formerly the seat of a large Hernnhuter colony, whose 'pädagogium' has been removed to Niesky, in Silesia. Pop. (1871) 5212, of whom 200 are Hernnhuters.

Bar'ca, a country of N. Africa, the eastern division of the regency of Tripoli, between the Gulf of Sidra and Egypt, lat. 26° to 33° N., and long. 20° to 25° E. Though much of it is barren, in the N. and E. is excellent pasturage, on which a superior breed of horses is fed, and in the vicinity of the streams the land is extremely fertile, producing in abundance rice, dates, figs, olives, palms, and saffron. The name B. was anciently applied only to a town, but under the Greek empire it was transferred to the provinces, and superseded the classical Cyrenaica (q. v.), with whose limits the country of B. nearly corresponds. The inhabitants are Arabs and Berbers, whose numbers are estimated at from 300,000 to 1,000,000.

Barcello'na Po'zzo di Got'to, a haven in the province of Messina, Sicily, 23 miles W.S.W. of Messina. It is divided by a small stream into two parts, and has a trade in corn, wine, oil, and fruit. Pop. of commune, 20,246.

Barcelo'na (Lat. *Barcino*), a strongly fortified city, and capital of a province of the same name, Spain, situated in a beautiful amphitheatre on the Mediterranean, midway between the rivers Llobregat and Besos, and distant from each about 4 miles. It is the chief trading and manufacturing city in Spain, the see of a bishop, and the seat of a university, with a splendid cathedral (1298), large public libraries, a fine stock-exchange, an arsenal, and a cannon-foundry. The town is composed of an old and new portion, separated by a picturesque old river-bed (the *Rambla*), now a garden and promenade. There is also a maritime suburb (*Barceloneta*), the *corso* of the famous B. carnival, with 10,000 inhabitants. It has a large harbour, and is defended by a citadel, and by the fortress of Montjuich or Mont-juy, and carries on a large import trade, chiefly in raw cotton, coal, cod-fish, coffee, cocoa, sugar, rum, hides, iron, timber, and petroleum. The principal manufactures are cottons, woollens, fancy silks, lace, and firearms. In 1875 the harbour was extended, and its entrance improved. For several years return cargoes have been difficult to obtain at the port, and trade has suffered generally from the Carlist war. The imports amounted in 1874 to £1,943,310, and the exports to some £300,000. Pop. (1878) 256,195. B. owes its origin to the Carthaginians, perhaps to Hamilcar *Barcas*, father of Hannibal, from whom the name *Barcino*, by which it was known to the Romans, is thought to be derived. In the 4th c. the modern form of the name first appears; but by the Arabs it was called *Barsanana*. Ecclesiastical councils were held here in 504, 599, 906, and 1064. During the dark ages B. frequently changed its rulers, and suffered severely from the devastations of the Arabs; but under a dynasty of hereditary counts it grew and flourished in the 11th and 12th centuries. At this time it was the 'lord and terror of the Mediterranean,' sharing with Italy the rich trade of the East, and occupying a foremost place as a centre of learning, art, and luxury. By the marriage of Count Raymond Berengar IV. with the daughter of Ramiro II., King of Aragon, in 1137, B., together with the whole of Catalonia, was joined to the crown of Aragon. In 1493 Ferdinand and Isabella here welcomed Columbus on his return from the New World. B. threw itself into the arms of France in 1640, to escape the taxes and tyranny of Philip IV., but again, in the War of Succession, it espoused the Austrian cause, and was taken by Lord Peterborough in 1705. It was again captured in 1714 by the Duke of Berwick, after a murderous siege, and in 1808, through a treacherous trick by Napoleon, who declared that it 'could not be taken in fair war with less than 80,000 men.' The Treaty of Paris restored it to Spain in 1814, and of late years it has displayed an occasionally zealous interest in the Carlist war. The province of B. is a modern division of Old Catalonia, the most cultivated, fertile, and populous part of España. Area, 19,824 sq. miles; pop. (1870) 762,555.

Barcelo'na, earlier *Naveva Barcelona*, a seaport of Venezuela, at the mouth of the Aragua, on an open bay of the

Caribbean Sea, 165 miles E. of Caracas. It has considerable trade, chiefly in maize, coffee, and indigo. Pop. (1873) 7674. B. was founded in 1671, thirty-three years after the establishment of the first town of this name at the foot of the Cerro-Santo mountains, and first rose into importance about the close of the 18th c., through a smuggling trade carried on with the W. Indies.

Barclay, Alexander, was born (probably in Scotland) in 1476, studied at one of the English universities, became successively a priest at St Mary Ottery's, Devonshire, a Benedictine monk at Ely, the vicar of Great Baddow (Essex) and Wokey (Somerset), and died in 1552. He was patronised by the Duke of Norfolk, and was possibly a friend of Dean Colet. His chief work is *The Shyp of Follys* (Pynson, 1509), adapted and translated from the *Narrenschiff* of Sebastian Brandt, of Basel, the most popular satire of society in Germany, Switzerland, and France at the end of the 15th c. B.'s version is remarkable (though directly translated from Latin and French) for the simplicity of its English, and the absence of Latin forms, and is a valuable illustration of English manners and morals, *temp.* Henry VII. and VIII. B.'s *Egloges* are partly a translation of the *Miseries of Courtiers* by Aeneas Silvius (Pope Pius II.). Besides some prose lives of saints, a translation of Sallust's *Jugurthine War* entitled *Cronycle compiled by Salust*, and an *Introductory to Write and Pronounce Frenche* (a work important to philologists, as one of the signs that English pronunciation of Latin was moulded on the French), B. wrote *The Myrrour of Good Manners*, a translation from the Latin elegiac of Mancinus on the four cardinal virtues. B. is distinguished among early satirists for the purity of his thoughts. Though a good Catholic, he lashes the vices of the Church, and is especially severe upon the court. The woodcuts published with *The Shyp of Follys* from the German original are of great interest (see edition by Jamieson, Paterson, Edinb. 1874). Those of the fools 'that *cras* singeth with the crow,' 'that will build before he count the cost,' 'that weigheth in one balance the heaven and earth, to know the heaviest,' are among the best. The satire on Predestination is singularly bold.

Bardclay, John, M.D., anatomist and physiologist, born December 10, 1758, at Cairn, in Perthshire, studied theology at St Andrews, but after receiving licence as a preacher, commenced the study of medicine at the University of Edinburgh, from which he obtained the degree of M.D. in 1796. He gave private lectures in Edinburgh on anatomy; wrote the article *Physiology* for the third edition of the *Encyclopædia Britannica*; published in 1803 *A New Anatomical Nomenclature*, followed in 1812 by a description of the *Arteries of the Human Body*, and in 1825 by an *An Inquiry into the Opinions, Ancient and Modern, concerning Life and Organisation*. He died, August 21, 1826, bequeathing to the Edinburgh College of Surgeons his valuable collection of specimens in comparative anatomy.

Barclay, John, the son of William B., a Scottish professor of civil law at Pont-à-Mousson and Angers, was born in the former place, 28th January 1582. Educated in the Jesuit College, he with difficulty escaped being pressed into the service of the order. Going with his father to London, he produced in 1603 and 1606 two parts of his *Euphormionis Satyricon*, dedicated to James I. and Lord Salisbury. This attacks the Jesuits, and gives curious details about England. In 1612 he defended against Bellarmine the orthodoxy of his father, which was thought to have been compromised by a work on *Regia Potestas*. In 1614 appeared the *Icon Animorum* (translated into English by Thomas May), which analyses the genius and manners of European nations, giving a high place to the Scotch. Leaving England in 1615, he settled the following year in Rome, where he composed his romance of *Argenis*, which has been translated into most European languages (into English by Le Grets and May). It describes under fictitious names the secret politics of the time, the monarchs of England, France, and Spain, the Guises, Pope Urban, and John Calvin being mentioned. B. died at Rome, 12th August 1621.

Bardclay, Robert, son of Colonel David B. of Urie, a volunteer under Gustavus Adolphus, and Katherine Gordon, was born at Gordonstown, Morayshire, 23d December 1648. Sent for education to his uncle Robert, the Catholic rector of the Scots College, Paris, he returned to Scotland in 1664, and soon after both he and his father and Jaffray joined the Society of Friends. In 1670 he married Christian Molleson, and in the

same year published at Aberdeen *Truth Cleared of Calumnies*, in reply to Mitchell's *Dialogue between a Quaker and a Stable Christian*, which was followed by *William Mitchell Unmasked*. In 1673 appeared his *Catechism and Confession of Faith*, followed by the *Theses Theologicae*, in support of the fifteen propositions of the Friends. For some time he had been exposed to persecution by the authorities of Aberdeen, his marriage having been declared unlawful, and the absurd Acts against conventicles being enforced. B. startled Aberdeen by walking through its streets in sackcloth and ashes. This he was commanded to do by the Lord. In 1675 he finished his famous *Apology for the True Christian Divinity*, dedicated to Charles II., whom he exhorts by the remembrance of his own exile to protect Quakers. It was published in Latin and English, and is an eloquent and learned statement of the Quaker position. Like the *Institution* of Calvin, it is read and quoted to the present day. His *Anarchy of the Ranters* (1676), republished as *Treatise on Christian Discipline* (1771), deals with the outward ceremonies of the sect. B. accompanied Penn and Fox to Holland, and was a good deal in London. In 1679 Charles II. granted him a barony charter of Urie, and in 1682 he was offered the governorship of E. Jersey (New England). He died at Ury, 30th October 1690. Modern Quakers think that B.'s works 'lead to Rationalism.' It is not the dogmatic contents, but the spiritual religion, of the *Apology* which makes it so powerful. Even the bigoted Brown of Wamphray admits that 'the serpentine venom' of B. is 'sugared over with fair speeches.' This, however, only makes Brown the more angry with the 'hellish neopaganism' of this 'devil in Samuel's mantle.' The collected folio edition of B.'s works (1692) is known as *Truth Triumphant through the Spiritual Warfare, &c., of that able and faithful servant of Jesus Christ, Robert B.* A 13th edition of the *Apology* was published at Manchester in 1869. Particulars of B.'s life will be found in the *Diary of Provost Jaffray of Aberdeen*, and in the unpublished *Reliquia Barclaiana*, lithographed by Walter & Bailey, Lond. 1870.

Barclay de Tolly, Michael, Prince, a celebrated Russian general of the 18th and early part of the 19th c., was a descendant of the Scotch family to which B. the poet and B. the Quaker champion both belonged, and two of the branches of which had settled in Mecklenburg and Livonia respectively. Born in Livonia in 1759, he was trained to arms by his uncle and by Brigadier Van Vermoulen, a veteran of the Seven Years' War, and fought with great bravery in the Russian ranks against Turkey in 1788 and 1789, against Sweden in 1790, and against Poland in 1792 and 1794. He played an important part in the wars against Napoleon, in spite of the hatred felt towards him by the Russian national party, who called him a German; he commanded the advanced guard of Benningsen's army at Pultusk; lost an arm at Eylau, and was minister to the Emperor Alexander 1810-13. Losing the battle of Smolensk in 1812, he had to give up the chief command of the army to Kutusow; but, on the death of the latter, resumed it, holding it at the battles of Bautzen, Dresden, Culm, and Leipzig. Although on Napoleon's return from Elba he was not able to take an active part in the hostilities which ensued, he acted as commander-in-chief of the Russian armies in France, and was made a prince, receiving also from Louis XVIII. the cross of Commander of the Order of St Louis. He died at Insternburg in Prussia, April 25, 1818, while on his way, for the benefit of his health, to the Bohemian baths. He has the reputation of being at once one of the bravest, the most skillful, and the most humane commanders of his time.

Barclay and Perkins' Brewery, one of the most extensive industrial establishments in Great Britain, and, after that of Messrs Truman, Hanbury, Buxton, & Co., the largest brewery in London or the world, is situated in Park Street, Southwark, covers an area of eleven acres, and consumes in brewing 600 quarters of malt daily. One of the numerous vats contains 3500 barrels of porter, which at selling price would yield £9000. The water used in brewing is taken from the Thames at Ditton, and costs £2000. About 200 horses, splendid specimens, chiefly of the Flanders breed, are employed in carting the beer. The work was founded by Mr Thrale, the friend of Dr Johnson, and on his death it was sold by Johnson and another executor on behalf of Mrs Thrale to Messrs B. & P. for £135,000. On the occasion Johnson said characteristically—'We are not here to

sell a parcel of boilers and vats, but the potentiality of growing rich beyond the dreams of avarice!'

Bar-Coch'ba, Simon, the leader of the Jews in their revolt against the Romans under Hadrian, which broke out soon after the Emperor's second return from Syria. Simon applying to himself the prophecy of Balaam, 'There shall come a star out of Jacob' (Num. xxiv. 17), assumed the name of Bar-Coch'ba (son of the star), and about 132 A.D. took Jerusalem from the Romans, and had coins struck in his own name. The Jews soon possessed 50 towns and nearly 1000 villages; but Julius Severus, Hadrian's general, arriving from Britain, retook Jerusalem, and the last stronghold of the Jews, Bethar, was stormed in August 135 A.D. On this day B. fell, and his head was carried to the Roman camp. This was the last great struggle of the Jews, and from it dates their final dispersion over the earth.

Bard, the name given by various Celtic peoples to a class of literary men or public singers, having a defined status with certain duties and privileges. Their precise relation to the priest class on the one hand and to the judges on the other is doubtful, at least in the archaic times, but there is no doubt that they were gradually formed into a separate class, whose function was to recite on great occasions in peace and in war, religious and secular, and which long survived the decay of the Celtic religions with which they were connected by origin. Feasts, battles, treaties, funerals, popular assemblies, these were the times at which the B. spoke and sang; and, if they were the depositaries of the national music and verse, they must also have been intrusted with the great mass of oral tradition. A very large collection of Welsh bardic fragments from manuscripts chiefly of uncertain date has been made in the *Myvyrian Archaeology of Wales* (2d edit. 1870). These are divided into the earlier poetry before the beginning of the 14th c., when the change of political conditions, through the annexation of 1282, took away the ancient patronage of the B., and the poetry of the 14th, 15th, and 16th c. Prominent among the former are the *Gododin*, or battle of Cattraeth, by Aneurin (510-560), the historical, mystical, satirical pieces and odes and elegies of Taliesin (520-570), the moral triplets of Llywarch Hen (550-640), and the *Oracles* by Myrddin (530-600). In the 12th c. Gwalchmai, Cynddelw, and Llyward ab Llywelyn, composing panegyrics and odes to historical persons and on historical events, are the principal figures. In the 13th c. the elegies of Bledydd Vardd, Prydydd Bychan, and Gruffydd ab Maredudd (who also treats a number of Christian subjects) are important. In what is called the Venedotian or N. Wales code of the laws of Howel Dda, which is assigned to the 11th c., in the book treating of the laws of the court, the position of the king's bard (Teulwr) is very clearly defined, although he has sunk in dignity beneath, not the priest and judge merely, but even the chief falconer and groom. At the feast he is to sing first of God, then of the king; at the division of spoil he is to sing of the British monarchy. His 'saraad' (or hurt-money) and 'worth' (death-money) are much the same as those of the higher officers. Among the prose remains of the B. may be mentioned the moral aphorisms of Catoc the Wise, the didactics of Bardd Gläs o'r Gadair, the Blue Bard of the Chair, a contemporary of Alfred, and the triads and institutes of the B. on various subjects. The very interesting relics of ancient music of Wales (said to have been settled by a congress of B. before Gruffydd ab Cynan in 1040), are said to show, from there being no fundamental notes added to the bass chords, and from such technical terms as 'the thumb choke,' 'the trill of the thumb,' 'the shake of the little finger,' that the music was meant for the crwth, a sort of flat violin of six strings, which might be tuned as low as the modern violoncello, and might be used as a bass to the harp. The Welsh kings presided at the Eisteddvod where the B. competed for the silver harp, and the rules of harmony were discussed. After the annexation the Eisteddvod was permitted by royal commission: it is now supported by the Metropolitan Cambrian Institution. As regards Ireland, we know from the Brehon laws that judicature and poetry were the most honourable professions, to which certain privileges were attached. Their close connection is seen in the fact that Dubthach, royal poet of the 5th c., is said to have given the award which forms the connecting link between pre-Christian and post-Christian law. The Irish B., who were pro-

bably hereditary, were like the Welsh historians and heralds: they are spoken of in the *Leabhar na Ccirt* as giving legal advice and instruction in science. The common division is into (1) the *Filí*, who sang of religion and war (*Ros Catha*), &c.; (2) the *Breitheamhinn*, or Brehons, who recited the laws; (3) the *Seanachaidhe*, who kept annals and genealogies. Fergus Fionbell, the sweet-voiced, and Torna Eigeas, the learned, are noted among heathen B.: Amergin, Adamnan, Maolmore, and Flann among the later Christian B. The sacred odes and hymns of Donogh O'Daly, abbot of Boyle in the 13th c., and the crop of political B. during the oppression of Elizabeth, should be noticed. Carolan, a miscellaneous poet, who died in 1737, has been called the last of the B. Amatory sentiment marks the later Irish B. The English government felt the power of these B., and the statute of Kilkenny (1327) was intended to destroy it. The B. used the harp and the cruit, the most common type of ancient verse being a quatrain with seven syllables to the line. The 'Duans' of Scotland were probably sung by a class of B. attached to the clans. It should be added that, although the existence of the four great Welsh B. of the 6th c. has been established, there is still controversy as to the genuineness of many pieces ascribed to them, the four oldest collections of manuscript, viz., the black book of Carmarthen, the book of Aneurin, the book of Taliessin, and the red book of Hergerst, being all later than 1150. Mr Skene, the editor of selections from these books, observes that a large proportion of the historical poems belongs to Cymry, e.g., the *Cyvoesi Myrddin*, an historical dialogue between Myrddin and his sister Gwenydd, composed partly in the reign of Cadwallader, the son of Cadwallawn. Under these monarchs (in the end of the 6th and the first half of the 7th c.) a consolidation of bardic tradition took place, and when the kingdom of y Gogledd (the north) was destroyed by the Angles, the history of Nennius (circa 738) was carried to Wales, and with the introduction of the Armorican legends led to the composition of the *Bruts*. Mr Skene also calls attention to the revival of bardism on the return to Wales of the lawful prince Rhys ap Tewdwr and Prydydd Mawr at the end of the 11th c. (*The Four Ancient Books of Wales*, vol. i. 1870). So late as the end of last c., Mr Edward Williams, calling himself Iolo Morganwg, claimed the honours and titles of the Glamorgan bard's chair, one of four chairs which were said to have existed at one time. We may add the classification of B. adopted in Toland's *History of the Druids*: 1. *Privardh*, or prince of learning; 2. *Posvardh*, or Prydyddion, registrar and teacher of learning; 3. *Arrayvardh*, ensign, genealogist, or herald. The Bardh I'elyn was the doctor of players on the harp. Poets were divided into *Pruddudh*, who treated of nations, princes, and nobles; *Tevlwyr*, who dealt in jests and pastimes; *Clerwyr*, who recited caricatures among the lower orders. The last may perhaps be the '*vates*' mentioned by Strabo, and the '*cubages*' mentioned by Ammianus Marcellinus. The Ollamh was a graduate in poetry. A tradition exists of a parliament at Drumcat, in Derry, which (A.D. 597) ordained every king and lord of a cantred to keep a poet free, and to give him land.

Bardessanes (Bar-Deisan), born in Edessa 154 A.D., founded, towards the close of the 2d c., a sect of Gnostics known as Bardesanists. He first embraced the doctrines of Valentinus the Egyptian, which he afterwards abjured, though ultimately he was partially reconciled to them. His *Gnosis* differed considerably from the old Syrian Gnosticism, for he regarded evil as arising from matter acting temporarily on spirit. He held further that Christ had no material body, but only the semblance of one, there being no resurrection of the body. Like some modern Christian sectaries, he disseminated his views by means of hymns, of which he is reckoned the first Syriac writer. His adherents were always, though somewhat loosely, in connection with the orthodox Church. Hahn's *B. Gnosticus Lyrorum Primus Hymnologus* (Leips. 1819); Marx's *B. von Edessa* (1864); and Hülgenfeld (1865).

Bar'di, a small town in the province of Piacenza, Italy, situated on the Ceno, 31 miles W.S.W. from Parma. A castle, erected in the 9th c., upon a neighbouring hill, commands the town. B. was also formerly the name of a duchy. Pop. some 3000.

Barefooted (Lat. *discalceati*, shoeless), applied to certain

monks and nuns who go with their feet uncovered, either constantly, like the Alcantarines, or for a fixed portion of the year, like the nuns of our Lady of Calvary. Other *discalceati* wear sandals instead of shoes. They are not a separate order, but are to be found among most of the orders, as ascetics of grades more or less austere. The most probable account of the motive of their origin is that which attributes it to Christ's command to the disciples (Matt. x. 10; Luke x. 4).

Barèges (Fr. *crêpe de Barèges*), a mixture of silk and worsted, or worsted and cotton, used for women's dresses. It is a slight fabric for summer wear, of various colours. The best is produced in France, not at the place of the same name, but at *Bagnères de Bigorre*, about 16 miles distant.

Barèges-les-Bains, a celebrated watering-place of the Hautes Pyrénées, France, in the Bastan valley, with eight alkaline and sulphurous springs, from 100° to 133° F., of great efficacy in the cure of rheumatism, wounds, and stiffness of joints, and scrofulous complaints. It is much visited during summer, being one of the best points from which to explore the Pyrénées, but is almost entirely deserted in winter. B. is in the commune of Betponey, which in 1872 had a pop. of 586.

Bareilly (*Bareilly*), the chief town in the district of the same name, and capital of Rohilkund, N.W. provinces, British India, on the Rangunga river, 788 miles by rail N.W. of Calcutta, and 152 E. of Delhi. It has extensive cantonments, and a considerable trade in grain, cotton, and sugar. The chief buildings are the recently erected fort, two mosques, the Government college, and an English church. At the Mutiny all the European inhabitants of B. were put to death (31st May 1857), except the ladies and children, who had been previously conveyed to Nynee Tal. Pop. (1872) 105,649. The district of B. has an area of 2982 sq. miles, and pop. (1872) 1,506,801.

Barère de Vieuzac, Bertrand, one of the chief orators during the worst excesses of the French Revolution, was born at Tarbes, 10th September 1755, and trained to the profession of an advocate. He became, however, first a member of the National Assembly, and subsequently of the National Convention, in 1792. Originally a Girondin, he seceded to the Mountain; and although naturally of a by no means cruel nature, the moment he tasted blood he craved for more. He was President of the Convention when sentence of death was passed on Louis XVI., and his florid harangues did almost as much as Robespierre's fanaticism to supply the guillotine with victims. Although he was far-seeing and cunning enough to desert Robespierre before his fall, he was one of those condemned to transportation after that event. He shared, however, in the amnesty of the 18th Brumaire, and was even employed as a writer of reports and pamphlets, chiefly against Great Britain, by the First Napoleon. During the Hundred Days of 1815, he was a deputy to the Chamber, but was banished after the Bourbon restoration, returning, however, to his country in 1832, and acting as a member of the administration of the Department of Hautes-Pyrénées till 1840. His death took place January 14, 1841. Besides his political pamphlets, B. translated a good deal of prose and poetry from English and Italian. His *Mémoires* were published in 4 vols., 1842, under the editorship of M. Hippolyte Carnot. B. has been severely branded by English historians and critics of the Revolutionary period, especially by Carlyle and Macaulay; the latter, in one of his essays, saying that 'B. approached nearer than any person mentioned in history or fiction, whether man or devil, to the idea of consummate and universal depravity.' Although Macaulay's criticism may be too trenchant, there can be no doubt that B. was one of the most mendacious, cowardly, and sensual of the Terrorists.

Baretti, Joseph, known chiefly as the friend of Samuel Johnson, and tutor in the family of Mr Thrale, was born in Turin, 1716. He became a teacher of languages in England in 1750, and at that time was introduced to those persons, his acquaintance with whom has gained him a certain immortality in the pages of Boswell. B. was an industrious writer, publishing, among other works, an Italian dictionary, and *Travels through France, Spain, Portugal, and Italy* (4 vols.). In 1780 he visited Italy, and published a journal at Venice called the *Frusta Litteraria* ('Literary Scourge'), which involved him in some trouble with the authorities. Having stabbed a man with a penknife in a street brawl in London, he was tried for murder,

but acquitted through the interposition of his influential literary friends. He died in London, 5th May 1789.

Barfleur ('the summit on the channel'; *Bar* = summit or stronghold, and *fleur*, a French corruption of the Low Ger. *vlier* or *vliet*, a run or flush of water), is the name of a French fishing village, department of La Manche, 15 miles E. of Cherbourg. It has two lighthouses. About the period of the Norman conquest B. was a great seaport, and was the chief port of communication between Normandy and England. Here Duke William prepared his armament for the invasion of the latter country. It was from B. that the ship sailed which carried the son and daughter of Henry I. of England, and by whose shipwreck, 25th November 1120, there perished, besides the prince and princess, upwards of 140 members of the noblest houses of England and Normandy. In 1342, at the beginning of the Hundred Years' War, Edward III. landed at La Hogue with an army of 30,000 men, and captured B. among other places.

Barga, a town of Italy, province of Lucca, 25 miles N.E. of Pisa, on the river Serchio. It is noted for the manufacture of gunpowder. Pop. 7215.

Bargain, in law, usually signifies a contract which may be completed without writing, such as a sale of goods. In mercantile affairs, a B. of great importance may be proved by letters of correspondence, or even by less formal writings.

Bargain and Sale, in English law an instrument by which lands and tenements are transferred. To be valid, the transfer must purport to be for adequate value; but it seems to be unnecessary that this provision should be given any effect to.

Barge, an old town in the province of Coni, N. Italy, on the head-waters of the Po, 30 miles S.W. of Turin, with some trade in firearms and roofing-slates. Pop. 9191.

Barge (Low Lat. *barga*), is the general name applied to certain flat bottomed craft, employed on rivers and canals; also to boats of pleasure or state, such as those used by the Commissioners and Corporation of London on ceremonial occasions. Besides these, the name is also given to one of the larger boats of a man-of-war, usually between 30 and 40 feet long, without sails, and intended solely for the use of the officers. In France, the name is applied to certain boats with square sails employed on the Loire.

Barge-board, in Gothic architecture, is an inclined board placed at the gable of a building to hide the horizontal timbers of the roof. The phrase seems to be a corruption of *verge-board*. The barge-boards, especially in the 14th and 15th centuries, were often richly ornamented.

Bar'i, or **Bari delle Puglie**, the capital of a maritime province of the same name, S. Italy, on the Adriatic coast, 140 miles E. of Naples, and 73 N.W. of Brindisi. It is the ancient *Barium*, a place, as appears from its coins, of some consideration as early as the 3d c. B.C., but of whose origin there is no record. It did not rise to importance till the 10th c., when it was held by the Greek emperors, who made it the residence of the governor of Apulia and capital of the province. The only vestiges of antiquity are a few Roman inscriptions, and some coins and painted vases of a Greek character. B. is now the see of an archbishop; is strongly fortified, and is further defended by a massive old Norman castle. The finest building is the priory of St Nicholas, founded in 1087, and in which Urban II. held a council (1098) for the purpose of reconciling the Greek and Latin Churches. The chief manufactures are cotton, silk, linen, and soap, and there is a large export of corn, oil, and fruit. Pop. (1872) 50,524. The province of B. has an area of 2282 sq. miles, and a pop. (1872) of 604,540.

Barigaz'zo, a small town in the province of Modena, Italy, notable for the flames which issue from the ground in the vicinity, burning continuously for several days.

Barilla (Span. *barrilla*), an alkaline product obtained by burning plants such as *Salsola soda*, cultivated on the coasts of Spain, France, Italy, &c. That prepared at Brittany is called *varre*. B. was formerly the principal source of carbonate of sodium, which is extensively employed in glass and soap making and other industrial arts, and formed an important article of commerce, but its manufacture has greatly declined owing to the stupendous development in the preparation of sodium carbonate from common salt.

Baring. The founders of the firm of B. Brothers were Francis and John B., sons of a German named John B., who settled in England in the first half of the 18th c. The now celebrated house was established in 1770. Francis B., who was a strong adherent of William Pitt, was made a baronet by that minister in 1793. He was succeeded by his eldest son, Sir Thomas B. Sir Francis' second son, Alexander, was in 1835 created Lord Ashburton (q. v.). Sir Thomas died in 1848, and was succeeded by his son Sir Francis Thornhill B., who was M.P. for Portsmouth from 1826 to 1865. Under successive Whig governments he held the offices of Lord of the Treasury, Secretary to the Treasury, Chancellor of the Exchequer, and First Lord of the Admiralty. In January 1866 he was created Baron Northbrook. He died in the following September. He was succeeded by his son, the present Lord Northbrook. Thomas B., M.P. (born 1800), uncle of the present Lord, devoted himself to commerce, and was universally known for many years as the leading partner in the great mercantile firm of B. Brothers. He died 18th November 1873.

Baritone, or **Baryton**, the male voice whose compass lies between that of the tenor and the bass, and has generally the limits A to F. The B. voice has a rich quality of its own, especially in the high chest-notes.

Witherite. Carbon. Baryta. Carbonic oxide.

It is a grey powder, having a sharp alkaline taste, and a great affinity for water and carbonic acid—in both respects resembling unslaked lime—with which indeed it is perfectly analogous. It combines with water with so much energy that the mass may become red-hot; the resulting compound is the hydrate of B. or caustic baryta, BaH_2O_2 , a crystalline substance soluble in cold, but more readily in hot water. Its solution has an alkaline taste and reaction, and is of great use to the chemist as a test for carbonic acid; the smallest trace of that substance causing a milky precipitate of carbonate of B. It is also useful in preparing other bases from their sulphates.

The soluble salts of B. are extremely hurtful to the economy, acting as cumulative poisons. In the arts, sulphate of baryta is used to adulterate white paints (*permanent white*), and the carbonate is employed as a pigment, and in the manufacture of certain kinds of glass. All the soluble salts of B. are precipitated by sulphuric acid and solutions of sulphates, insoluble sulphate of B. being formed.

Bark. See BARQUE.

Bark (*cortex*) surrounds the whole axis of plants, and is most distinctly seen in trees and shrubs, in which it attains a considerable thickness. In early life it is entirely cellular, but later in life the innermost layer (or *liber*) becomes fibrous and vascular. From within outwards the bark is composed of four layers—viz., (1) The *liber*, *bast layer*, or *endophloeum*, composed of layers of branching fibres which frequently separate from each, owing to the interposition of layers of cellular tissue. On the inner side of it are usually developed some milk (*lactiferous*) vessels. In an exogenous stem one layer of the endophloeum is developed for every year's growth of the tree. The *liber* of the lime-tree (*Tilia Europaea*) forms Russia matting, that of the sack-tree of Coorg (*Antiaris saccidora*) is used to form bags, mats, &c. Cuba bast is the *liber* of *Paritium datum*, while flax is the *liber* of *Linum usitatissimum*, that of *Cannibis sativa*, hemp, &c. (2) The *mesophloeum*, or green layer; it is made up of superimposed layers of thin-walled globular or polyhedral cells, filled with Chlorophyll (q. v.), and has usually a number of interspaces formed by the loose union of the cells. It sometimes contains vessel-shaped lacunæ containing resin—e.g., in pines, junipers, and various other coniferæ. (3) The *epiphloeum*, or corky layer, which has no chlorophyll in the cellulose tissue composing it. The cells are thin-walled, and are rectangular and elongated in a horizontal direction, being by these characters distinguished from those of the mesophloeum. It is also distinguished by remaining alive for a short time only, in wanting sap, and in its cells containing air. Unlike cellulose, it does not turn blue under the action of iodine and sulphuric acid. The *suberous* or corky layer is largely developed in the B. of some trees, and notably in the cork-oak (*Quercus suber*), from which it is stripped to supply the Cork of commerce (q. v.). (4) Lastly, there is the general integument of the plant, or *Epidermis* (q. v.). In annual dicotyledons the B. is more simple in structure, and varies in some slight particulars. In the stems of monocotyledons (*endogenous* Stems—q. v.), the B. is composed of (1) an epidermis; (2) cellular tissue; (3) bundles of fibrous vessels, which are sometimes wanting, but never forming, as in the *liber* of dicotyledons, leaf-like layers (hence the name *liber*, from the Latin for a book). The B. in endogenous stems is firmly attached to the wood by means of the woody bundles which arch outwards from the interior of the stem. The B. of the root of dicotyledons has all the anatomical elements arranged in the same order as in the stem. It differs, however, in the size of the fibres of the *liber*, in the 'greater development which the cellular envelope often attains in the root, particularly of herbaceous plants, and in the stem possessing a much greater development of the suberous layers of the B.' (Brown). There is no chlorophyll in the bark except in that of aerial roots.

Bark, in medicine. From the bark of trees many valuable medicines are obtained. These are used as powders, infusions, and tinctures. They are chiefly used as bitter tonics. Many of them will be found under separate headings. The most important are Cinchona B., sometimes called Peruvian or

Jesuits' B.; Cusparia B., called Angostura B.; Strychnos or Nux vomica B., called false Angostura B.; Cascarella B., Winter's B., &c. Some are used chiefly for aromatic properties as Cinamon and Cassia B., others for their astringency alone, as Oak B. Many of them owe their activity to the alkaloids contained in them. The most important B. is Cinchona B., from which quinine is obtained.

Bark, Tanning. The barks of a great variety of trees yield tannin in sufficient proportion to make them available for the use of tanners, but a few only are of such importance as to render them objects of international commerce and general staples of the tanning industry. The bark of various species of oak is specially rich in tannin, and the common oak, *Quercus robur*, is the chief source of native British T. B. Oak bark is also imported in large quantities from various Continental countries for use in tanning, and the inner bark of the cork oak, *Quercus suber*, is brought for the same purpose from the S. of Europe. Quercitron bark, *Quercus tinctoria*, is a valuable tanning and dyeing bark, imported from N. America, from whence also comes the bark of the hemlock spruce, *Abies Canadensis*, now one of the most extensively used tanning barks. Under the name of mimosa bark or wattle bark, the Australian Colonies export for tanners the barks of several species of *Acacia*, chiefly *A. melanoxylon*. The bark of the common larch, *Larix Europæa*, is also largely employed in tanning, and among others less generally employed, there may be noted mangrove bark, *Rhizophora mangle*, from the E. and W. Indies, and the bark of the sweet or Spanish chestnut, *Castanea vesca*. The imports of tanning barks into Great Britain during 1873 amounted to 467,515 tons, of a value of £176,997, but much of this is used by dyers as well as by tanners.

Bark Beetle, or **Bark Chafer**, the popular name applied to various species of *Coleoptera* or beetles, which have the habit of eating and eroding wood. Thus the members of the tribe *Xylophagi* ('wood-eaters'), represented by the *Tomicus typographus*, the *Hylurgus piniperda*, &c., are notable as destroying wood; the larvæ, as well as the perfect forms of these species, boring into the trees of the German pine-forests, and causing vast destruction therein. In 1783, these insects thus destroyed one and a half millions of trees in the Hartz Forest; and prayers are offered up by the clergy for the limitation of their ravages. The *Scolytus destructor* of Britain similarly destroys elm-trees.

Bark Stove is a stove in which there is a bed of tanner's bark, or some such substance, for the purpose of producing by fermentation a moist heat, which is necessary for the successful cultivation of tropical plants. In many instances, however, the B. S. has been superseded by pipes or tanks filled with hot water, and laid beneath the bed in which the plants are placed.

Barkal, or **Jeb'el Barkal**, the name given to an isolated sandstone rock, 400 feet high, and about two miles in circumference, situated near the right bank of the Nile, in Nubia, lat. 18° 31' N., long 31° 46' E. Near B. are the remains of several splendid temples, and the supposed site of the ancient city of Napata. In 1832 Lord Prudhoe brought hence the two red granite lions now in the Egyptian Room of the British Museum.

Barker, Edmund Henry, a philologist of some note, was born at Holmyn vicarage, in Yorkshire, December 22, 1788, and was a student at Trinity College, Cambridge. He made numerous contributions to philological journals, translated some works of German philologists, edited several Latin classics, and published his *Classical Recreations* (1 vol. 1812). In 1816, he undertook for Valpy a revision of Stephens's *Thesaurus Lingua Græca*, which was completed in 13 vols. (1816–28). The work was severely criticised by Bishop Blomfield in the *Quarterly Review* (No. 44), and this called forth B.'s *Aristarchus Anti-Blomfieldianus*. His *Parriana* (2 vols.) consists of ill-arranged but interesting notices of the opinions, controversies, and peculiarities of his friend Dr Parr, contributed from many sources. B. died in London, 21st March 1839. Porson's remark gives B. the chance of a painful immortality: 'Sir, you have read a great deal, you have thought very little, and you know nothing.'

Barker's Mill is a kind of water-wheel, invented towards the close of the 17th c. by Dr Barker, the action of which depends upon the law that, when a fluid is issuing from a vessel,

a pressure is applied to the internal side of the vessel opposite the opening proportional to the velocity of emission, thus tending to push the whole vessel backwards. In its simplest form B. M. consists of a J-shaped tube, the cross-piece being below. The lower extremity turns on a pivot, the upper is fixed to a wheel, which is capable of setting in motion other wheels, shanks, &c. If the tube were filled with water, it would be in equilibrium, provided there were no outlet. If, however, two openings are made, looking in opposite directions, one at each extremity of the cross-piece, the momentum of the issuing water, which depends upon the height of the column of water in the vertical portion of the tube, reacts upon the cross-tube, and pushes the whole round in the opposite direction. There is found experimentally to be considerable loss of energy due to the sudden change in direction of the water. This is to a certain extent obviated by making the arms curved instead of straight.

Bar'king, a market-town in Essex, five miles N. E. of Greenwich, on the left bank of the Roding, a little above its junction with the Thames. It has a trade in potatoes and vegetables, coal and timber. Pop. (1871) 5766. The place is famous for the ruins of a formerly large and rich abbey and nunnery, the abbess of which was a baroness in virtue of her office. It was built in 677 A.D. by St Erkenwald, Bishop of London; burned by the Danes in 870; and rebuilt by King Edgar in the middle of the 10th c.

Bark, or **Barque**, a nautical term meaning strictly a three-

Barque.

masted vessel without mizzen topsail, or whose mizzen sails are fore-and-aft instead of being square. But the term is sometimes applied simply to a small ship, at other times, to a broad-sterned vessel without a figure-head.

Barleam and Josaphat, a religious romance which had its origin in the Eastern Church, but which attained its greatest popularity in the W. of Europe,

where it appeared in a Latin version early in the middle ages. It professes to be a history of the conversion of an Indian prince, Josaphat, by an Asiatic anchorite, Barlaam, and is obviously composed in the interest of Christianity. No one doubted that it was an original invention until Liebrecht (in the *Fahrbuch für Romanische Literatur*, 1862) made the interesting discovery that the groundwork of the romance is derived from Buddhist sources, and that the history of the imaginary Josaphat and his equally imaginary father Abenner is simply a Christianised, but otherwise very accurate, picture of the life and spiritual transformation of Siddhartha (son of Suddhodana, king of Kapilavastu), who subsequently, under the name of Buddha, became the founder of the religious system which bears his name. The author of the Greek original is not known. It has been erroneously attributed to Joannes Damascenus and to Anastasius Bibliothecarius, but is more probably the work of an Ethiopian Christian. Although the Greek text is the original, it was first published by Boissonade in his *Anecdota* (Par. 1832), and has only once been translated—viz., into German by Liebrecht (Münst. 1847). The Latin version, on the other hand, has been the mother of a numerous progeny. Besides being itself frequently printed towards the close of the 15th c., it gave birth to three French metrical translations still unprinted, one by the Anglo-Norman trouvère, Chardry (13th c.), another by Gui de Cambrai, and a third by Herbert, as also to several independent prose versions which were published at Paris in the 16th c. From a Northern French or Provençal version came the Italian *Storia de S. Barlaam*, about the beginning of the 14th c. In Germany, again, the Latin originated three native works in verse, that of Rudolf of Ems

(first printed at Königsberg by Köppke in 1818, and again at Leipzig by Pfeiffer in 1845); one by an unknown author, fragments of which have been printed by Pfeiffer in his *Forschung und Kritik auf dem Gebiet des Deutschen Alterthums* (B. 1. Vien. 1863); and a third, of which a complete MS. exists in the Solms-Laubach library. There is also a German prose translation extant in an undated Augsburg imprint, and supposed to belong to the last decade of the 15th c. From the Latin have also come a Spanish version (Madr. 1608), a Bohemian (composed about 1470, printed at Prague in 1593), and a Polish (Cracow, 1688). The German is the source of the Icelandic *Barlaam's Saga*, and the Swedish *Barlaam och Josaphat*. No version of the romance exists in English.

Bar-le-Duc ('the duke's citadel'), or **Bar-sur-Ornain**, the chief town of the department of Meuse, France, on the Ornain, 125 miles by rail E. of Paris. It was founded in the 10th c., was once capital of the Duchy of Bar (whence its name), contains a communal college and public library, and has manufactures of cotton, calicoes, and comfits. Near it are large smelting furnaces. Pop. (1872) 14,664.

Barlett's, a seaport on the Adriatic, in the province of Bari, S. Italy, trading principally with Greece, the Ionian Islands, and the Adriatic ports. B. is a clean, well-built town, with a cathedral, a college, and a very strong fortress. The harbour is approached by a magnificent gateway. Exports, wine, oil, salt, skins, corn, &c. Pop. (1872) 28,163.

Barley (*Hordcum*), a genus of *Gramineæ* or grasses, of which the two-rowed B. (*H. distichum*) is the species most commonly cultivated; the *H. vulgare* (bigg), or four-rowed B., and *H. hexastichum*, or six-rowed B., being found in higher districts, and but rarely cultivated in Britain. The inflorescence or arrangement of the flowers and their parts in B. is *spicate* or *spiked*. The one-flowered spikelets are arranged in threes on each joint (or *rachis*) of the inflorescence. In two-rowed B. the single floret or flower of the central spikelet is alone fertile, the florets of the two lateral spikelets being barren. In six-rowed B. each of the three spikelets contains a fertile floret. Two outer glumes or scaly bracts exist, and one flowering glume. There is one *pa'* or innermost glume. Two lodicules or minute scales exist, and represent a *perianth*, or outer flower envelope. The stamens number three, and the styles or terminal points of the *carpels* (*pistils*) number two. B. forms one of the cereals most extensively cultivated, from its being used in many forms in the industrial processes of civilised life. It is regarded as the first cereal brought under cultivation. It was grown in Egypt and Palestine of old, and is mentioned in Homer's works. It is remarked frequently in the Old Testament; beer being made from it by the ancient Greeks, Egyptians, and Germans. B. probably originally came from Central Asia. It is cultivated generally as an annual crop, although some varieties bear sowing in autumn, and grow through the succeeding winter. It equally bears cold, temperate, and warm climates, and is the favourite cereal of northern nations. Its general use in Britain is for making Malt (q. v.), used in the manufacture of beer (see BREWING); but B., with the husks or paleæ simply taken off, is used as food, under the name of pot or Scotch B. With the seed further uncovered, it becomes the finer pearl B. Other species and varieties of B., besides the principal ones already mentioned:—Siberian B. (*H. celeste*) is cultivated in Europe for its larger straws. In this and in the Nepaul or Himalayan B. (*H. trifurcatum*) the seeds are naked—that is, the paleæ separate readily from the seeds. The *Chevalier*, early English B., and Italian B. are the best-known varieties of the common two-rowed species. The battledore or sprat species, or German rice (*H. searriton*), is two-rowed, and possesses prominent grains, with the awns spreading widely. Other uncultivated species of the B. genus are the *H. murinum*; the *H. jubatum*, or squirrel-tail grass of N. America; the meadow-grass (*H. pratense*); and *H. bulbosum* of S. Europe.

In Europe, B. is chiefly cultivated for export purposes in Denmark and Silesia; and in America, in Mexico, the United States, and Canada. Britain affords soils very favourable to the growth of B.; and Suffolk and Norfolk are the two chief English B. counties. Throughout Scotland generally B. is widely grown. B. crops generally follow root-crops consumed by sheep on the land. Some take B. after wheat, to ensure a moderately rich state of the ground only, as B. does

not produce well in overly rich soils. The condition of his sheepfold is, in fact, the leading thought in the barley-grower's mind. The ground is ploughed as early as possible, to obtain frost, and to a depth of about 3 inches; a fine top with a firm bottom being the best conditions for sowing, and one which prevents weeds springing up, and the soil thus lies open through winter. B. may be sown from the middle of February till the end of May. Early sowing, however, is preferable. The seed runs about 2½ to 3 bushels per acre. Rolling the ground is all that is required after sowing B. If required for malting, B. is allowed to ripen more fully than wheat; great care is required in its harvesting, and it requires also to be 'hummelled,' or deprived of its 'awns' after it has been thrashed—a process accomplished by means of a special apparatus attached to the thrashing-machine. From 46 to 60 bushels of B. may be got from each acre sown on good soils. The chief B. manures are the sheep-droppings, guano, rape-cake, &c. From 2 to 4 cwt. guano per acre, is the proportion employed in Scotland. About 10,000,000 qrs. of B. are grown annually in Britain. In 1873, the number of acres under B. in Britain was 2,574,529; in France (1872), 2,669,489; in the United States (1872), 1,397,082.

Barleycorn, an old measure of length, equal to about the third of an inch.—**John B.**, a jocular personification of the spirit of barley—i.e., malt-liquor.

'Inspiring, bold John Barleycorn,
What dangers thou canst make us scorn!'—BURNS.

Barlow, Joel, an American poet, politician, and pamphleteer, who was born at Reading, in Connecticut, 24th May 1755, and served as a military chaplain in the War of Independence, obtained considerable reputation in 1787 by the publication of a poem called *The Vision of Columbus* (republished in 1805 under the title of *The Columbiad*), which, although very unequal, contains some fine passages. Other of his works are *The Conspiracy of the Kings* (1791), and a comic epos, *Hasty Pudding* (1805). B. filled several political posts. In 1811 he was appointed ambassador of the United States to the Emperor Napoleon, and died December 22, 1812, at Zarnawicz, when on his way to a conference with the Emperor at Wilna.

Barm (a corruption of *beer ream*, beer cream, still 'ream' in Lowland Sc.), the name given in Scotland to YEAST (q. v.).

Barmecides, or **Barmekides**, an illustrious Persian family belonging to the province of Khorasan. Barmek, the founder of the family, left a son Khaled, vizier to Abul Abbas Al-Saffah, the first Abbasside calif, and ultimately tutor to the famous Harun Al-Raschid. When Harun succeeded to the califate in 786 A.D., he chose for his vizier Yahya, the son of Khaled, whose administrative abilities, civil and military, gave stability and splendour to the reign. Harun, at length becoming jealous of the popularity of Yahya's son Jarfar, had him beheaded; all the other B. were imprisoned, and their goods confiscated; and the very mention of their name was forbidden on pain of death.

Barmecide's Feast, a phrase become proverbial for a feast on imaginary dainties, and originating in the story of the barber's sixth brother, in the *Arabian Nights*, an abridgment of which, in the 162d number of the *Guardian*, was long a favourite extract for English school-books. The gist of the story is this: Poor Shacabac, distressed by a two days' fast, visited a wealthy but eccentric Barmecide, in the hope of being welcomed to good cheer. Being presented with an empty plate, on which were supplied several courses of imaginary dainties, Shacabac, entering into the humour of his host, praised them highly. When wine, however, was presented, of course equally imaginary, he excused himself from indulging in it on account of his quarrelsome humour over his cups. Being pressed, he soon feigned unwonted exhilaration, and gave his host a box on the ear. The Barmecide, pleased with the spirit and humour of his guest, had the reality of a banquet served up, and Shacabac now feasted himself to his heart's content.

Bar'men, a town of Düsseldorf, Prussia, near Elberfeld, 25 miles N.E. of Cologne, with which it is connected by railway. It extends for about 5 miles in the valley of the Wupper, and in reality consists of five distinct villages, which together form a manufacturing town of the first rank. B. contains 361 factories, producing chiefly cotton, silk, linen, ribbons, thread, and buttons, to the annual value of about £571,500. It is the seat of the Rhine Mission Society. Pop. (1872) 74,449.

Barnabas, St (Heb. 'son of prophecy'), a surname given to Joses (Acts iv. 36), who was a Levite of Cyprus, and along with Paul was recognised as an apostle of the uncircumcision (Acts xv.). In the New Testament there is no further notice of him after he sailed for Cyprus the second time; according to one tradition he suffered martyrdom in Cyprus at that time; according to others, he preached at Rome and Alexandria, became first Bishop of Milan, &c.

Barnabas, Epistle of, a work long ascribed by tradition to B., and according to Jerome read along with the Apocrypha, resembles, in its style and matter, the Epistle to the Hebrews, and was intended to convince the Judaizing Christians of the time that the old covenant was only an imperfect type of the new. By the best critics it is now regarded as spurious, and assigned to the first half of the second century. One of the old arguments against its authenticity, that the first five chapters only existed in Latin, cannot now hold good, since the whole of the original Greek was discovered by Tischendorf in the Codex Sinaiticus.

Barnabites, a monastic order founded at Milan in 1530, and sanctioned by Popes Clement VII. and Paul III., obtained their name from the Church of St Barnabas in that city. They undertook to visit the sick, preach, instruct the young, and take charge of souls. They were speedily regarded with favour in Italy, France, Austria, and Spain. Theology was taught by them in the schools of Milan and Pavia. To the three customary evangelical vows—poverty, chastity, obedience—the B. added a fourth, not to sue for church preferments. They have still some twenty houses or colleges in Italy and Austria, the chief of which is at Rome.

Barnacle (*Lepas*). A genus of *Cirripedia* (q. v.) (Crustaceans), forming the type of the family Lepadidæ, and distinguished by the possession of a muscular flexible stalk or *peduncle*, by means of which these forms attach themselves to fixed or floating objects. The *capitulum* or head-like part of the animal, borne on this stalk, consists of a body enclosed within a case formed by a number of calcareous or shelly plates. The peduncle represents the anterior or front portion of the body. The shelly case is composed of five pieces, two pairs forming the sides, whilst the fifth piece closes the back of the structure. From within this shelly covering, the limbs, converted as in the Balanidæ (see *BALANUS*), or 'sea-acorns,' into filamentous organs, are continually being protruded in search of food; whilst a complicated body-structure is also to be discerned. The barnacles undergo a metamorphosis on passing from the young to the adult state; the embryo being at first free-swimming, and finally attaching itself, and developing the fixed form. Most of the barnacles are hermaphrodite. They attach themselves sometimes in immense numbers to floating timber, and the progress of ships through the water is occasionally impeded by the thick coating of barnacles attached to their sides. The common species is the *Lepas anatifera*. Other species are the *L. pectinata*; *L. fascicularis*.

Barnacle or **Bernicle Goose** (*Anser bernicla* or *leucopsis*), a species of *Anseridæ* or geese, deriving their popular name from a superstition that they originated from Barnacles (q. v.). Gerarde, in his 'Herball,' dating 1633, gravely states that 'in the north part of Scotland, and in the islands adjacent called Orchades' (Orkneys), there are found 'certaine trees whereon doe growe certain shell-fishes of a white colour tending

Barnacle.

Barnacle Goose.

to russet, wherein are contained little living creatures; which shels in time of maturitie doe open, and out of them grow those little living foules, whom we call barnakles, in the North of England brant geese, and in Lancashire tree geese; but the other that do fall upon the land perish and come to nothing.' The B. G. is of smaller size than the wild goose. It averages 2 feet in length, and 5 lbs. in weight. The forehead, cheeks, and throat are white; the bill is black, as also are the crown of the head, neck, and breast. The rest of the upper plumage is greyish, the lower portions being white. A black strip extends from the base of the bill to the eye. It inhabits the W. coasts of Britain and Ireland in winter; whilst in spring and summer it is found on the coasts of Norway northwards to the Arctic Ocean.

The brent goose (*Anser brenta* or *torquata*) is different from the previous form, and is a distinct species. It averages 21 inches in length, and the plumage is generally darker. The upper parts are black, the sides of the neck being marked with white; the lower parts are white and slaty-grey in colour. It breeds in the arctic regions, but is common in Britain, Europe, and N. America in winter. Hutchins' B. (*A. Hutchinsii*) possesses a triangular patch of white on each side of the neck, and is found in Hudson's Bay and on the northern coasts of America.

Barnacles, an instrument used for breaking horses, and resembling what are now called twitchers, is a frequent heraldic charge.

Barnard Castle, a town in Durham, on an eminence on the Tees, 40 miles from its mouth, with manufactures of hats, carpets, and stockings. A magnificent museum (1869-78), with picture and sculpture galleries, erected at the cost (£100,000) of the Countess of Montalto. It takes its name from the castle founded there about 1180 by Barnard Baliol, one of the followers of William the Conqueror, and an ancestor of John Baliol, king of Scotland. Pop. (1871) 4276.

Barnaul', a town in the government of Tomsk, W. Siberia, at the juncture of the B. and Obi, with a mining school, museum, and a magnetic and meteorological observatory. It is the seat of the government Altai smelting-works, and in the vicinity are gold and silver mines. Pop. (1867) 12,928.

Barnave, Antoine-Pierre-Joseph-Marie, born October 22, 1761, at Grenoble, lawyer and politician, and member of the States-General in 1789. His ideas were advanced, and it was owing much to him that the Jews were then emancipated and the slaves liberated. In opposition to Mirabeau, he maintained the right of the National Assembly to proclaim peace or war. The violence of the revolutionary party induced him to retire to Grenoble when the National Assembly was dissolved; but being convicted of corresponding with the court, he was guillotined, 29th November 1793.

Barnes, Rev. William, poet and philologist, born at Rush-bay, Bagber, Dorsetshire, in 1810, wrote three collections of poems in the Dorsetshire dialect, entitled respectively *Poems of Rural Life in the Dorset Dialect, with a Dissertation and Glossary* (Lond. 1844); *Humely Rhymes, &c.* (Lond. 1859); and *Poems of Rural Life, &c.* (Lond. 1862). In November 1859 a writer in the *North British Review* bestowed on Mr B. the rather extravagant praise of being the best rustic eclogue-writer since Theocritus; adding that his poetry combined the merits of Wordsworth and Burns, but with no trace of imitation. This eulogium is to a certain extent merited by the freshness and truth of his descriptions of local scenery, by his sincere love of nature, and by his genuine and unaffected sympathy with the persons, passions, and fortunes of the subjects of his rhymes. B., who was for several years master of the grammar school at Dorchester, was ordained in 1847, and in 1862 was appointed rector of Winterbourn-Came, Dorset. He is B.D., St John's College, Cambridge. Among his philological works may be mentioned, *An Investigation of the Latins of Case in Language* (Lond. 1840); *The Elements of English Grammar* (Lond. 1842); *An Anglo-Saxon Delectus* (Lond. 1849); *The Song of Solomon in the Dorset Dialect, from the Authorised English Version* (Lond. 1859)—Prince Louis Lucien Bonaparte defrayed the expense of printing this; *Two, or a View of the Roots and Stems of the English as a Teutonic Tongue* (Lond. 1862). His *Outline of English Speechcraft* (1878) is a quaint but unavailing effort to annul the linguistic results of the Norman Conquest.

Bar'net, Chipping, an old town of Hertfordshire, 11 miles N.N.W. of London by rail, formerly a place of importance on

the great northern coach-road. Here, April 14, 1471, the Yorkists gained a victory over the Lancastrians, which placed Edward IV. on the throne. An obelisk commemorative of the battle was erected in 1740. B. has large horse and cattle fairs. Pop. (1871) 3720.

Barneveld, Jan Van (of the knightly house of Oldenbarneveldt), born in 1547 at Amersfoort, after studying in the universities of Holland, France, Germany, and Italy (where he became distinguished as a civilian), and serving at Haarlem and Leyden in the Dutch war of independence, attained through successful practice in the Dutch courts the position of Chief Pensionary of Rotterdam in 1576. On the death of William the Silent, B., as ambassador to England and France, offered these governments the Protectorship of the Confederated States; on their refusal, carried through the successive elections of Maurice of Nassau as Stadholder of five provinces, and in 1586, although a native of Utrecht, became Advocate of the leading province, Holland. In this post he had to oppose the imperious Leicester, who held a place in the Council of State, and to adjust the claims of State and Church to the ownership of ecclesiastical property and the control of education by the establishment of a mixed lay and clerical board. In 1598 the Treaty of Vervins called B. to France, where he obtained from Henry a large promise of pecuniary help: in the same year he arranged with Elizabeth the public debt and securities which England then held from the Republic. In 1603, during the famous siege of Ostend, B. again appeared at the English court and secured an alliance with James, to which Sully, as representing France, was a party. The next diplomatic feat of B. was the treaty of peace for twelve years between Spain and the Republic, dated 9th April 1609, which, although the foundation of Dutch political independence and equality, not only exposed him to the suspicion of the clerical bigots, but estranged from him Maurice the Stadholder. The struggle of Arminians and Gomarists was already raging, and B. had defended the cause of toleration. The appointment of Vorstius to a chair at Leyden and the royal marriages of France and Spain gave B. very great trouble. Prince Maurice, taking the side of the democratic Contra-Remonstrant party, opposed the party of aristocratic Federalists and Arminians, with whom B. was connected. The latter seems to have been the first among Protestant statesmen to foresee the designs of the Catholic League, and the magnitude of the impending Thirty Years' War, which was precipitated by the apathy of James I. At this time Carlton was the British ambassador at the Hague, and Caron the Dutch ambassador at London. In 1616 (the year of Coke's dismissal) B. prevailed on James to compound the large debt due by the States, and to free the cautionary towns, Flushing, Brieke, and Rammekeens. He also assisted Savoy against Spain. The rebellion in France against the Concinis further estranged B. and Maurice. The opposition of the former to the new W. India Company procured him enemies among the Amsterdam merchants, and strengthened the unjust suspicion of his connection with Spain. Then came the question of the National Synod, or of the right of the States-General to enforce Calvinism on the seven republics by means of an ecclesiastical synod; the enlisting of Waastgelders in the state of Utrecht; the occupation of Overijssel and Guelderland by the Prince. In 1618, after struggling to the last to avert civil war and to uphold the union of 1579, B. was illegally arrested, along with Grotius (then Pensionary of Rotterdam) and Hoogerbeets, by a secret order which was afterwards adopted by the States-General, in spite of the protest of the States of Holland. On 7th March 1619 (during the sittings of the Synod of Dortrecht) he was brought to an illegal and oppressive trial by twenty-four commissioners from the States; found guilty, asserting the right of provinces to settle each its own religion; and in spite of the intercession of the French ambassador, Maurier, he was executed in the Binnenhof at the Hague 13th May 1619. See Deventer's *Gedenksrukken van Olden Barneveldt en zijn Tijd.* (3 vols. Haag, 1862-65), and Motley's *Life of B.* (2 vols. Lond. 1874). For what may be called the Orange Calvinistic view of the question, see M. Groen van Prinsterer's *Maurice et Barneveldt, Etude historique* (Utrecht, Ker. ally B. is crops con-

Barnsley, a flourishing town in the W. Riding of Yorkshire, 16 miles N. of Sheffield, on the right bank of the Don, as B. does

in a rich coal and iron mining centre. It formerly produced the finest ironware in England, and is now noted for its linen cloth, damasks, drills, and diapers. There are also extensive iron-foundries, glassworks, and bleaching-grounds. Four railways pass through B., which is also connected with the Don and Calder by two canals. New public baths were opened in 1874, and the Locke public park in 1877. Pop. (1871) 23,021.

Barn'stapse (lit. 'a barn for merchandise'), a seaport of Devonshire, beautifully situated on the Taw, 6 miles from the fine Bay of B., in the Bristol Channel, and 34 miles N. W. of Exeter. It was an important place of trade in early English times, and in 1588 three vessels were equipped here to oppose the Armada. Its shipping has suffered from the silting up of the harbour; but it still carries on an active trade, and has manufactures of pottery and lace. A new fishmarket was opened in 1871. B. returns two members to Parliament. Pop. (1871) 11,813.

Bar'num, Phineas Taylor, the great American showman and 'prince of humbugs'—a title which he accepts with no small gratification—was born at Bethel, Connecticut, U.S., July 5, 1810. He tried journalism and the stage at an early period, but entered on his true career when, in 1835, he bought Joice Heth, an old negro woman, who was represented to have been the nurse of General Washington, and to be 160 years of age. Upon this venerable negress, the nurse of the patriot, B. based his fortune. Thousands of visitors from every city in America flocked to see the early guardian of the great Liberator. B. subsequently 'took up' Tom Thumb, established his famous museum in New York, and became 'the apostle of total abstinence'; but his most profitable speculation as an *entrepreneur* was his engagement of Jenny Lind for a series of concerts in the United States, Canada, and Cuba, by which he made 350,000 dollars. This engagement terminated in June 1851, after which date B. was elected president of a bank, commenced farming, and speculated in real estate. But he was out of his element in dealing with anything but shams, and the result was that he lost his fortune and became bankrupt. In 1855 he published his *Autobiography*, and in 1857-58 he lectured in London, again filling his pockets by explaining the *ruses* he had formerly practised for emptying the pockets of others. After a vain attempt to succeed in politics, he recommenced showman in 1871 with a circus and menagerie.

Baroach', or Broach (supposed to be the *Barygaya* of Arrian), the chief town of an executive division of the same name, in the N. of Bombay presidency, India, and situated on the Nerbudda, about 25 miles from its mouth. It belonged formerly to the kingdom of Gujerat, but, after a few changes, was taken by the British in 1772, ceded to Scindiah in 1783, and retaken by British troops in 1803. Estimated pop. (including the suburbs) about 30,000. It carries on a considerable and growing trade in cotton, grain, and seeds with Bombay and Surat. Area of division, 1318 sq. miles; pop. (1872) 298,889.

Baroche', Pierre Jules, born at Paris, 8th November 1802, joined the bar in 1827, distinguished himself in the case of Colombar, and in 1847 was elected deputy for Charente and Bâtonnier of the bar. The post of Bâtonnier resembles that of Dean of Faculty in Scotland. He acted with Barrot against Guizot. A member of the Legislative Assembly of 1849, B. became Procureur-Général, and occupied the posts of Minister of the Interior and of Foreign Affairs under the Republic. After the *coup d'état*, he became Vice-President, and then President of the Council of State, which, after the death of Billault, he represented in the Chamber. Although once a republican, he embraced the Emperor's policy of despotic centralisation supported by espionage. He was appointed Minister of Foreign Affairs in 1860, Minister of Justice and Public Worship in 1863, and in 1867 received the Grand Cross of the Legion of Honour. He died in the island of Jersey, November 2, 1870.

Baro'da, the most important of the Gujerat native states, Bombay, India, has an area of 4399 sq. miles, and a pop. (1872) of 2,000,225. It is intersected by the western spur of the Vindhya mountains, but is well watered, and fertile. Rice, wheat, millets, cotton, sugar cane, tobacco, and opium, are the chief products. Several of the late Gaekwars of B. have been notorious for their criminal misrule. In 1873 a commission was appointed to examine into the condition of the country, and a result of its report was, that the Gaekwar was allowed a probationary period of eighteen months to reform his administration. After being

tried on a charge of attempting to poison Colonel Phayre, the British resident at his court, he was deposed by the British Government. Gopal Rao, the eldest son of the previous Gaekwar, was appointed in his stead, June 1875. B., the capital, is situated on the Vishwamitri river, near the Gulf of Cambay, 235 miles N. of Bombay by rail. Pop. (1872) 112,057. B. is crowded with palaces and temples; its streets swarm with mendicant Brahmins and irregular soldiers. There are also menageries of wild animals, and athletes are trained for the arena. Much wealth is displayed by the sirdars, the bankers, and the jewellers.

Bar of Dower, a widow's right to Dower (q. v.) may be barred or defeated by certain delinquencies on her own part, or substitution of jointure. In Scotch law the corresponding term to dower is Terce (q. v.). It may be similarly barred or excluded.

Baro'meter (Gr. *baros*, weight; *metron*, a measure) is an instrument for measuring the weight or pressure of the atmosphere. That the air has weight was first proved by Otto de Guericke in 1650, who showed that a vessel, when exhausted of its contained air, weighed less than when full; and weight implies, of course, a downward pressure, which lessens as the height increases. Torricelli in 1643 made an experiment which proved conclusively the presence of such a pressure, and at the same time gave a convenient method of measuring its intensity with considerable accuracy. Take a tube, about one yard in length, and one-third inch in diameter, fill it entirely with mercury, and after having closed the open extremity with your finger, invert it into a trough containing this metal. Upon withdrawing the finger, the mercury in the tube will be observed to fall, till it reach a height which, in ordinary circumstances, is about 30 inches above the surface of the liquid in the trough. The conclusion, therefore, is, that any given surface experiences, on account of the air, a normal pressure which is equal to the weight of a column of mercury with this surface as base, and with a height of 30 inches. If an analogous experiment be made with water, which is 13.59 times less dense than mercury, a column about 32 feet high will be required to balance the pressure of the atmosphere; and in this lies the explanation, that a pump cannot raise water from a depth greater than 32 feet. It must be noticed that the Torricellian vacuum, that portion of the tube above the column of mercury, is not a true vacuum, but is filled with a certain quantity of vapour of mercury.

When a graduated scale is placed alongside the tube, the variation of the pressure of the atmosphere may be shown by the corresponding effect produced upon the height of the mercuric column. We must, however, correct for the change of level which the surface exposed to the atmospheric pressure also necessarily undergoes, for change of temperature, and for capillarity. Besides the cistern B., which is simply a straight tube with its open end immersed in a trough of mercury, as in the Torricellian experiment, we have the syphon B., in which the tube is bent round at the lower end like the letter U, and the cistern is merely an expansion of the tube.

It is to the latter form that the majority of those in common use belong. Of such may be mentioned the wheel B., in which a hand is moved before a dial, by means of a toothed wheel and rack, which is fastened to a plug resting upon the exposed surface of the mercury; Fortin's B. (improved by Negretti and Zambra), surrounded by a brass tube and enclosed in a cylindrical wooden case, the lower portion of which is made up of three distinct pieces, which, working on hinges, are capable of an outward and upward rotation, thereby forming a tripod stand, and enabling observations to be made much more conveniently; and Gay-Lussac's B. (see fig.), peculiar in having the lower portion of the tube bent, so that the shorter leg is in the same straight line with the upper portion of the longer one, thus presenting greater facilities for measuring the true height of the mercuric column.

The B. is applied to many and important uses, of which we may enumerate the following:—Its indications form an essential element in the determination of atmospheric refraction. It is extensively employed in the measurement of altitudes, and in the

Baro-meter.

chemical analysis of gases, and is one of the most characteristic instruments employed in navigation and meteorology. No certain rules can as yet be laid down for the prognostication of the weather by its means; but considering the great value which it reached in the hands of Admiral Fitzroy, there is a strong probability that ere long, supplemented by other meteorological observations, the B. will afford pretty certain means of predicting an approaching atmospheric change. As a general rule, a falling B. indicates wet, and a rising, fair weather. A rapid fall portends a short but violent storm,—a slow and steady fall, a continued rain with a moderate wind. A sudden fall in hot weather indicates thunder, with a succeeding cool air. Unsteady fluctuations are usually attended by broken weather; and serene weather can be expected only with a steady or slowly rising mercury. A wind veering round in the direction from W. to E. by S. is usually attended with a fall; when it moves round in the opposite direction (with the sun), a rise is commonly observed. During an E. wind, the B. is generally high (30 inches or upwards); and a steady and considerable fall during its prevalence generally indicates a change of wind to the south, with subsequent heavy rains. It is to be noted, in conclusion, that the greater fluctuations in the mercuric column are produced when there are several differently directed strata of air, a high pressure being usually prevalent when the upper current is N., and a low pressure when it is from the S. and S.W.

Barometz, or **Tarta'rian** or **Soyth'ian Lamb**, a term applied to the rhizome or prostrate stem of the *Cibotium barometz*, a species of fern found near the Caspian Sea. It derives its name from the shaggy appearance which the silky scales on the rhizome give to it, causing it to resemble a lamb lying down in the pasture. In early times ridiculous stories of this plant being half lamb, half fern, and sharing the habits and qualities of both, prevailed. It is also called *baránez* (diminutive of *barán*, a sheep) by the people of the country. Erman (*Travels in Siberia*, vol. I. p. 112) considers that mixed up with the fables concerning it were some vague ideas in regard to the use to which cotton was applied.

Baron. This term is used historically to denote any member of the peerage of England or of Scotland. Thus, when we read of 'the barons,' we understand the term as equivalent to that of 'the peers' in our own time. B. is now the title of the lowest order of the peerage of England, Scotland, and Ireland, and of the United Kingdom. In the reign of Henry III. in England, the burgesses of London were styled barons, and so were persons holding lands of the king. The order was then divided into *greater* and *lesser* barons, a distinction which seems to have prevailed in most of the countries of Western Europe. The greater barons were the king's chief tenants, holding their lands directly from the crown; the lesser barons again held from the greater by the tenure of military service. A B. may now hold his title—(1) by prescription, 'for that he and his ancestors have immemorially sat in the House of Lords'; (2) by patent, bearing to be to the heirs of him who is created; (3) by tenure, holding the title as annexed to a grant of lands. This is the title by which the bishops sit in the Upper House, though Mr Hallam considers that they hold their legislative places in virtue of their ecclesiastical office, this being according to the custom of Europe. According to Blackstone, 'creation by writ is the more ancient way; but a man is not ennobled thereby, unless he actually takes his seat in the House of Lords; and some are of opinion that there must be at least two writs of summons and a sitting in two distinct parliaments to evidence an hereditary barony.' Creation by writ is, however, now almost obsolete. It has been held by the House of Lords, in the Wensleydale case, that when creation is by patent, the patent must be in favour of heirs, otherwise that the grantee is not entitled to sit in the House of Lords.

In the House of Peers there are at present (1875) 242 barons. In the peerage of Ireland there are 70. In that of Scotland, by the Union Roll, there were 49; five have subsequently been enrolled, many have since become extinct, attainted, dormant, or have merged in higher titles.

In writing to a B. the proper address is 'The Right Honourable Lord —'. The children of a B. are addressed as 'The Honourable —', with Christian name and surname. The eldest son of a B. in Scotland has the courtesy title of 'Master of —' (whatever be the title of his father).

Baron and Feme, or **Femme**, are two words used in English lawbooks to denote husband and wife. They are Norman-French. In heraldry, B. and F. denotes the bearing of the arms of husband and wife on the same shield.

Baron of Beef, a double sirloin (q. v.), weighing from 50 to 100 lbs. These two sides of the back of an ox, when served at certain great English festivals, are prominently placed, and ceremoniously carved. Baron is probably a fanciful allusion to the lesser rank of 'sir' in the single loin of beef.

Baronet. This is the lowest hereditary title in the United Kingdom. A B. is a commoner, ranking immediately after the younger son of a baron. The wife of a B.—who is entitled to be addressed as 'Lady'—ranks immediately after the wife of the younger son of a baron. See PRECEDENCE. The order was instituted by King James I. of England in order to raise money, the fees of patent being upwards of £1000. When we consider the value of money in those days relatively to its value now, and the difference between the real wealth of England then and now, it is curious evidence of the general love of imaginary distinction that some 200 people availed themselves of the royal offer. In Scotland, the order of baronetcy, though projected by James, was not instituted till the succession of Charles I. in 1625. The Scotch order is 'B. of Scotland and Nova Scotia.' The creation ceased at the union with England in 1707. Irish baronets were also created till the union with Great Britain in 1800, when the Irish creation ceased. Subsequent to 1707 all creations of baronetcy are either 'of Great Britain' or 'of Ireland.' Subsequent to 1800, they are all 'of the United Kingdom.' The creation of a B. may either be by writ or patent. The order of the descent of the dignity is variable. It cannot be held by a woman, but it may pass to the husband of an heir-female.

Baro'ninus, Cæsar, a Roman Catholic historian, born 30th August 1538, at Sora, and educated at Naples, entered the discipline of the Congregation of the Oratory at Rome, where he succeeded St Philip Neri as superior (1593). Clement VIII. made him successively papal confessor, cardinal, and librarian of the Vatican. B. belonged to the French party at Rome, which elected bc. Leo XI. and Paul V. (1605); he might have secured the chair, if his book *De Monarchia Sicilia* (suppressed by the Regent Ponte at Naples) had not specially incensed the Spanish party. From 1588 to 1607 B. wrote his great work *Annales Ecclesiastici* (continued by Rinaldi to 1571), to exhibit the unity of the Church during the first twelve centuries. It was intended as the Catholic reply to the *Centuriators* of Magdeburg; and was criticised in a hostile spirit by Isaac Casaubon and Samuel Basnage. In spite of its faults, it is a work of vast and rare erudition, and a knowledge of its contents is indispensable to the student of ecclesiastical history. B. belongs to the period of Tasso, Caracci, Palestrina, and Bellarmine. He died 30th June 1607. Of the *Annales*, the best edition (with Pagi's critical examination and Raynaldi's continuation) is that of Mansi Lucca (43 vols. 1738–59). At present, Aug. Theiner, a priest of the Oratory, and coadjutor-prefect of the secret archives of the Vatican, is issuing a new edition and a continuation of B.'s great work, of which 18 vols. had appeared between 1863 and 1873. A life of B. by Lefevre was published at Douay in 1668, and another by M. La Croze.

Barons of Exchequer. The judges of the Court of Exchequer in England are called B. of E. They are the Lord Chief Baron and four *puisne* Barons. See COMMON LAW, COURTS OF; COURT OF JUDICATURE, SUPREME ACT.

Barony means in law the manorial and hereditary right belonging to the possession of land. In former times it involved a criminal as well as a civil jurisdiction; but by modern legislation, little now remains of either. The *Court Baron* was a court composed of the tenants of the lord of the manor. It had jurisdiction in petty personal cases.

Baro'sma. See BUCKU.

Barque. See BARK.

Barquesime'to, the capital of a province of the same name, Venezuela, on the Cojeda, a branch of the Apuré, 163 miles W.S.W. of Caracas, and 75 S.W. of Valencia. It was founded in 1522 by Juan de Villegas for the sake of the gold-mines supposed to exist in its vicinity, and was named by him New Segovia. B. was long a flourishing place of trade, but was

destroyed by the terrible earthquake of 1812. It has now, however, more than recovered its former importance, and has a pop. (1873) of 25,664. The maritime province of B. has an area of 9305 sq. miles, and a pop. of some 113,000.

Barr, a town of Alsace-Lorraine, Germany, 18 miles S.W. of Strasburg, at the foot of the Vosges, and at the entrance of the picturesque valley of Ulricht. It carries on a trade in wine, brandy, timber, cattle, and iron, and has some woollen and cotton manufactures. B. is much resorted to on account of the beauty of its neighbourhood. Over the town rises the Odilienberg to a height of 2450 feet, with its once famous cloister, built, it is said, by a Saint Odilia, daughter of a Duke of Alsace, in the latter part of the 7th c. Pop. (1873) 5655, with the suburb La Vallée.

Barr, or **Barra**, a small Mandingo kingdom at the mouth of the Gambia, W. Africa, well cultivated, fertile, but somewhat marshy. Area estimated at 250 sq. leagues; pop., according to Goldberry, 200,000, who are superior in physique and intelligence to the neighbouring peoples, and strict Mohammedans in religion. They trade with the interior in salt, and receive in turn maize, ivory, gold-dust, and cotton.

Barra, a picturesque town some 3 miles E. of Naples, consisting chiefly of beautiful villas. Pop. 12,000.

Barra do Rio Negro, capital of the province of Amazonas, Brazil, on the river Amazon, not far from the mouth of the Rio Negro, is a flourishing place of trade, with a pop. of 6000.

Barra Islands, the most southerly group of the Outer Hebrides, consisting of some seventeen islands, forming a parish of Inverness, and lying about 40 miles W. of Ardnamurchan Point. By far the largest of the islands gives its name to the cluster, is 8 miles long and from 3 to 4 broad, and has considerable fisheries and a good harbour. Some black cattle and sheep are pastured on the hills, but the soil is wretched. Area, 348 sq. miles; pop. (1871) 1753. On Bernera, the southernmost of the islands, stands the lighthouse of Barrahead, at the great elevation of 680 feet, and visible from a distance of 33 miles.

Barra Man'sa, a town of 6000 inhabitants, on the Parahiba, 70 miles N.W. from Rio Janeiro, in the province of the same name, Brazil.

Barracks (Span. *barracas*, tents, huts), brick or stone buildings for soldiers stationed in towns or permanent camps. The term used to be confined to temporary constructions for cavalry—those for infantry being called *huts*, but it is now used in the general sense given. During the earlier years of the 18th c. strong opposition was made in Great Britain to the introduction of this arrangement for the convenience of the army. On the one hand, it was argued that B. would favour the inauguration of a military caste, so separated from their fellow-countrymen as to be too much under the control of government; and, on the other, that the danger to which the morals of civilians were exposed by the older system of billeting soldiers at private houses was more to be feared than the centralising advantage given to the ruling power by the barrack system. The year 1792 was an era in this movement. It was then that Parliament consented to the founding of several new buildings of the kind, and to the creation of the office of B.-master-general. Another era originated from the disasters which befell British soldiers in the Crimea, owing to defective arrangements for their household accommodation. Returns were ordered by Parliament in 1857 of all the B. in the United Kingdom, and 252 were enumerated, with details of their condition. It was reported that of these only 20 had separate sleeping-places for married people; that sanitary arrangements were very defective in all of them; and that there were no adequate means for the employment or amusement of soldiers. These reports brought about great improvements. According to the Army Regulations published in 1873, the commanding officer, in conjunction with officers of the engineering and control departments, has, on the arrival of troops in B., to ascertain the state of the buildings, to see that it is satisfactory, and then to hand them over to the new occupants, who are to be held responsible for them. Particular attention to the airing of bedrooms is required; and a medical officer is ordered to inspect every apartment once a week. The troops in occupation must sweep and roll the yards and parades. Special attention is given in these regulations to the moral condition of B. Commanding officers are to prohibit the indis-

criminate admission of strangers; and are to take means to prevent any but persons of respectable character from gaining access. The ventilation of stables is carefully attended to; commanding officers being required to see that this arrangement is not counteracted by the men in charge of horses. The use of fireworks within the enclosures of B. is strictly prohibited; and to encourage soldiers in industrial pursuits, allotments of ground for gardens have been made by the War Department. If a soldier marries, he must procure the consent of his commanding officer before he has a chance of being allowed to take his wife to live with him in B.; married women in the proportion of 6 in a company of 100 soldiers being allowed so to live. An extra 2d. a day is allowed to the married soldier who sleeps outside. Aldershot Camp (q. v.) possesses the finest B. in England, if not in Europe; the Curragh Camp is famous in Ireland; and the combined cavalry and infantry B. which is (1875) being built at Maryhill, Glasgow, will be an honour to Scotland. The expenses for works, buildings, and repairs connected with the British army at home and abroad for the year 1873-74 amounted to £778,000. To superintend these constructions and repairs is the duty of the Barracks-master-general; but there are local barrack-masters, mostly retired military officers, who act under his orders.

Barrackpore, a town in the District of the Twenty-four Pargunnahs, Bengal, British India, on the E. bank of the Hoogly, 15 miles above Calcutta. Troops were first stationed here in 1772, whence the town derives its name. It still contains the garrison of Calcutta. S. of these lies the Park, containing the country residence of the Viceroy and the tomb of Lady Canning. It has also gardens, an aviary, and a menagerie. B. is notable for two mutinous outbreaks: one in 1824 of a native regiment that refused to sail for Burmah, and the second in 1857, the first overt act of the Sepoy war. Pop. (1872) 9591.

Barra'da, or **Bura'da**, a river of Syria, which N.W. of Damascus divides into two branches, one of them irrigating the gardens of the city, while the other passes on its N. side. They are conjectured to be the scriptural *Pharpar* and *Abana*. After uniting, they flow in an easterly direction, and fall into Lake Bahr-el-Merj.

Barrafranca, a town in the Italian province of Caltanissetta, Sicily, on a branch of the Salso, 35 miles N.E. of Girgenti, near which are sulphur mines. Pop. 6000.

Barramun'da, the native name of the *Ceralodus Fosteri*, a curious fish which occurs in the rivers of Queensland in Australia, and which appears to be most nearly related to the singular mud-fishes or *Lepidosirens* of American and African rivers. It varies from 3 to 6 feet in length, and possesses a covering of cycloid scales. The skeleton is cartilaginous. The operculum or gill-cover is well developed. The tail is homocercal. The heart consists of a single auricle and ventricle, with a contractile *arterial bulb*. The intestine has a spiral valve. No pyloric cæca are developed. The swimming-bladder communicates with the mouth by a pneumatic duct and glottis, and is of cellular or lung-like structure internally. The B. is the 'native salmon' of the Queensland rivers. It appears to be a slowly-moving fish, and feeds on the decaying vegetation of rivers.

Barras, **Paul-Jean-François-Nicolas, Comte de**, a leading figure in the first French Revolution, was born 30th June 1755 at Eohempoux, in the department of the Var, his family being reputed to be 'as old as the rocks of Provence.' After a creditable career as a soldier in India, he returned to Paris, and succeeded in spending his patrimony on its pleasures. He then became a champion of the Revolution, and aided both in dethroning the king (1792) and overthrowing the Girondins (1793). At the same time he was not a Jacobin, but, on the contrary, aided materially in hastening the fall of Robespierre (1794). After that event, he became (November 1795) one of the five members of the Directory which governed France, and for two years he was virtually Dictator. Having entered, as is alleged, into negotiations with the Bourbons, he was, after the 18th Brumaire, displaced by Bonaparte, whose promotion in his early years he had materially aided, and retired to Brussels, thence to Marseille, from which he was banished to Rome, and afterwards kept in surveillance at Montpellier. B. returned to France after the restoration, and lived on his estate of Chaillot, in the neighbourhood of Paris. He died 29th January 1829. Napoleon, in his *Mémoires de Sainte Hélène*, criticises his former

colleague with merciless severity. B.'s *Mémoires* were seized by government, and are still unpublished.

Bar'atry, or **Barretty Common**, in the law of England, is the offence of exciting disputes and lawsuits among the people. It is punishable with fine and imprisonment; and any one after conviction practising as solicitor or agent is liable to transportation for seven years. Related to this offence, and of equal gravity, is that of suing another in the name of a fictitious plaintiff, or of a plaintiff who has not consented to the suit. This offence, if committed in any of the superior courts, is one of 'contempt,' and so punishable at the discretion of the judges. In the inferior courts, the punishment is six months' imprisonment, with treble damages. Officious intermeddling with a suit is also punishable. See **CHAMPERTY**, **MAINTINANCE**. In Scotch law, B. is the crime committed by a judge who accepts a bribe.

Bar'atry of mariners is a fraud by the master or mariners of a ship against the owner or underwriter, punishable criminally by the law of all European states.

Bar'el (Fr. *baril*; It. *barile*; Span. *barrila*), a measure of capacity in different countries of Europe and America, varying greatly, however, according to the locality and the nature of the liquid. Thus, the French standard B., the *barrigue* or cask of Bordeaux, contains 50 English gallons, while the Italian varies from 7 to 31 English gallons. In the old English measures, a B. contained 31½ gallons of wine, 32 of ale, and 36 of beer. Formerly, and to this day, in America, the B. expressed a certain weight of an article: thus a B. of flour contained 196 lbs.; of beef, 200 lbs.; of soap, 256 lbs.

Bar'el, in military art, the essential part of portable firearms. Inferior barrels are forged from soft, tenacious iron: those of fowling-pieces and the better class of small-arms from steeled iron, known as *stub*, *stub-twist*, *Damascus-twist*, *wire-twist*, &c. Stub-iron is formed from old horse-shoe nails, called stubs, with the addition of a small and varying proportion of steel-clippings of the same size as the stubs. Damascus-twist, admired for its ribbon-like markings, is produced by fagotting alternate layers of steel and iron, welding and drawing them into a rod, which is cut into lengths, and each length shortened to one-half by twisting it. In the manufacture of the Martini-Henry rifle, milled steel-scrap, as cuttings of saws, waste from steel-pen and tool making, old coach-springs, &c., are collected and cut into pieces of equal size, placed in a revolving drum, and polished bright by the friction of the parts, and then melted on the hearth of an air-furnace. The bloom thus formed is welded under a three-ton hammer into a large square block: this is reheated and drawn out into bars under a tilt hammer, and the bars are reduced to rods of the required size by being passed through rollers. The cylindrical shape is given to the rods by beating them while hot round a steel core, and finally hammering in a groove of the anvil. The boring is accomplished by pressing the barrel forward upon a rapidly-revolving *bit*, the heat generated by the friction being neutralised by water constantly trickling over the barrel. The exterior of the barrel is smoothed upon grinding-stones, and polished by two clamps faced with leather. See **PROOF** and **RIFLING**. Good fowling-pieces are twisted into form from stub or Damascus iron, which is forged into fillets or ribbons half an inch in width, and of varying thickness, being thinner in the middle than at the ends. The white-hot fillets are then wound in a close spiral round a rod; the spiral is next raised to a welding heat, held vertically with the muzzle downwards, and struck forcibly upon the anvil to cause the seams to unite, and the welding is finally completed by hammering all over. Wire-twist barrels are made of narrower slips than the preceding.

Barrel-Organ, a small portable organ used by street-players. Its sound is produced by a revolving cylinder set round with pins, which, as it moves, open valves admitting wind to the pipes.

Barreto de Resende, Pedro, a Portuguese historian, born towards the close of the 16th c., died at Lisbon in 1651. He has left a splendid work on India, which has never been published, and of which the *Bibliothèque Republicaine* of Paris contains what is probably the original MS. The work gives coloured plans of all the Portuguese fortresses in India and Africa, with portraits of all the governors and viceroys, from Vasco de Gama to Linhares.

288

Bar'head' (the first syllable is Celtic, the second English, and both have the same meaning), a town in the E. of Renfrewshire, with cotton-mills, printworks, and bleaching-fields. It is a station on the new Union Railway between Glasgow and Kilmarnock. Pop. (1871) 6209.

Bar'ricades (from the Ital. *barricidia*, introduced into French in the 16th c.), a military term denoting a hastily constructed work in some narrow place, as in a street, a hollow way, or on a bridge, for the purpose of defence, or of obstructing the progress of an enemy. Waggon, beams, chains, *chavaux-de-frise*, paving-stones, and, as the name imports, barrels or casks—in short, whatever comes to hand—are all made use of in their construction. They are principally effective against cavalry attacks, and as a protection against these, even ammunition and baggage waggons are hastily upset. They have been the favourite defences of insurgents in street-riots since the middle ages. Especially in Paris, which may be called the cradle of barricade-struggles, have they been resorted to. In 1358 the streets of the French capital were barricaded against the Dauphin, afterwards Charles V.; in 1436 another bloody struggle was made in the same fashion against the foreign rule of the English; and again on May 12, 1588, against 4000 Swiss soldiers introduced into Paris by Henry III. to intimidate the Council of Sixteen. During the troubles of the Fronde, on the 26th of August 1648 and the following days, 100,000 armed Parisians, it is said, ranged themselves behind 2000 B. The three days' revolution of July 1830 witnessed the erection of thousands of B.; and in 1848, in the insurrection against Louis Philippe there were also struggles at the B. On the night of 23d June 1848 occurred the most sanguinary of all barricade struggles, when General Cavaignac, in defence of the Provisional Government, stormed the B., and 16,000 of the Parisian 'Irreconcilables' were either killed or wounded. B. also played a bloody part in the revolutionary risings of 1848 and 1849 in Milan and Naples, Vienna and Berlin. By widening and asphaltting the streets of Paris, Napoleon III. did much to render such occurrences so difficult as to be almost impossible. In recent times B. have been successfully carried by breaking through the houses of neighbouring streets, and attacking the insurgents in the rear; while street-struggle may be effectually checked by planting cannon on churches and other public buildings, and playing on the combatants from all sides.

Bar'rier Act is the name of an Act of the General Assembly of the Church of Scotland, passed (8th January 1697) with the view of preventing hasty legislation. It provides that no fundamental law of the Church can be changed until the alteration has been submitted, by the General Assembly approving of it, to the consideration of all the presbyteries. The proposed change must then be approved of by a majority of the presbyteries; after which it falls to be considered by the next General Assembly, which may approve or reject. If it approves, the proposed measure becomes law. Similar regulations have been adopted by the Free Church and the other Presbyterian Churches of Scotland.

Bar'rier Reef, the name applied by Mr Darwin to those coral reefs which stand out at a greater or less distance to sea from the land, and thus enclose a strip of water between the reef and the mainland, known as the *inner channel* or *passage*. Such a reef—exemplifying the second stage in the formation of coral islands, and which is produced by the sinking of the original land—is seen on the N.E. coast of Australia, and extends along that coast for 1300 miles; and is distant from 10 to 100 miles from the mainland. On the W. coast of New Caledonia a B. R. runs for 400 miles. The depth in the outer surface of barrier reefs is always considerable. See also **CORAL-REEFS**, &c.

Bar'ring Out, a school custom, described as old in the year 1558, and of which genuine instances occur at the beginning of the present century. It is found in all three kingdoms, sometimes connected with Christmas and Fasten's Even (Lent), sometimes also with Easter and Whitsunday. The pupils took possession of the school-building, and if they could hold it against the 'flogging parson' for three days, the latter, along with two bondsmen, was bound to subscribe certain written 'orders' or rules as to holidays, work, &c., which were then binding for the ensuing session. On the other hand, if an entry was forced before three days' siege, the master acquired a right of unlimited flogging. As the custom has been recognised in

school statutes, dated in 1558 (*Carlisle's Endowed Gram. Schools*, 1), and was enforced at the Edinburgh High School in 1595, to the extent of killing a patron magistrate who was forcing an entry, it would seem that the custom was not an amusement, but a social institution, like flogging, probably not without its uses, when schools were 'places of weeping and flagellation.' See Brand's *Pop. Antig.* by Ellis (3 vols. Lond. 1849).

Barringtonia, *ceae*, a small order of plants allied to *Myrsineae*, and by some authors considered a subdivision of it. They are tropical plants, having large leaves and clusters of fine flowers, with beautiful and numerous stamens. The fruit is fleshy, and the contained kernels have medicinal properties.

Barrister is the name given to the pleaders at the English and Irish bar. In Scotland the corresponding body are called Advocates (q. v.). The general rules of qualification to entitle a man to be called to the bar in all the Inns of Court (q. v.) are—that he must be at least twenty-one years of age, have passed an examination in Roman and civil law, the law of real and personal property, and common law and equity, and have been for five years at least a member of the society. If he be a Master or Bachelor of Arts of either English university or of Dublin University, it is sufficient if he has kept twelve terms, and has been three years a member of the Inn by which he desires to be called to the bar. Serjeants-at-law (*Serviens ad legem*) are barristers so created by the crown. Formerly the common-law judges were exclusively taken from the serjeants; but this custom has been abolished by the Judicature Act of 1873. *Pre-audience*, or right to be first heard by the court, is held so important by members of the bar, that we here give the order of precedence, as settled by royal mandate—1. Queen's Advocate; 2. Queen's Attorney-General; 3. Lord Advocate of Scotland; 4. Queen's Solicitor-General; 5. Queen's Premier Serjeant; 6. Queen's Ancient Serjeant; 7. Queen's Serjeants; 8. Queen's Counsel, and counsel having patent of precedence prior to 24th April 1834; 9. Serjeants-at-law; 10. Recorder of London; 11. Common Serjeant of London; 12. Advocates of the civil law; 13. Barristers generally, according to date of call to the bar.

A B. can maintain no action for his fees, these being held to be given gratuitously. See *FEEs*, *PROFESSIONAL*. In forensic pleading a B. may state anything communicated to him in his professional capacity, if pertinent to the matter at issue, without examining whether it be true or false. But the observation must be strictly relevant to the point at issue; and a client's presumed ignorance of what is or is not relevant may excuse him in an error before the court which would not be excused to the B., owing to his presumed superior legal knowledge.

The bar of Ireland is subject to nearly the same rules, and is on much the same footing, as the English bar. Before Parliament, the House of Lords, and the Privy Council, barristers and advocates rank alike, and have the same rights and privileges. Before the House of Lords, all cases, from whatever tribunal the appeal may come, may be advocated by members of the English, Scotch, or Irish bar. The rank of Queen's Counsel has recently (1868) been introduced into the Scotch bar.

Barrister, Revising. See *REVISING BARRISTER*.

Barros, João de, a Portuguese historian, formerly spoken of as the *Portuguese Livy*, born at Viseu, in 1496, was appointed page to King Emanuel while still a child, and afterwards became the companion of Dom João, heir to the throne. His romance of chivalry, *Cronica do Emperador Clarimundo* (Coimbra, 1520; and again in 1791), written at the age of twenty, is remarkable for its beauties of style. His great work is the *Asia Portuguesa*, a history of the conquest of the Indies by the Portuguese (3 vols. Lisb. 1552-63), continued by Diego do Couto (Lisb. 1602-45). The latest edition is that of 1778-88; but there is an abridged translation in German by Soltau (Bruns. 5 vols. 1821). B. also wrote the first Portuguese Grammar (Lisb. 1540; new ed. 1785). He died at Alitem, near Villa-do-Pombal, 20th October 1570.

Barro'sa, or **Baross'a**, a village in the province of Cadiz, Spain, 4 miles N. of Algeciras, where Major-General Sir Thomas Graham gained a splendid victory over the French under Marshal Victor, March 5, 1811. Nearly 3000 French were killed and 300 prisoners taken, with 6 pieces of cannon and an eagle.

Barrot, Camille Hyacinthe Odilon, born at Villefort (Lozère), 10th July 1791, educated at Saint-Cyr and the Lycée Napoléon, joined the bar in 1814, and distinguished himself in

the case of the Protestants du Midi. In the Chamber of Deputies he was a foremost Liberal, and though not a Doctrinaire, belonged to the Aide-toi Society. In 1830, along with Maison and De Schonen, B. presented the ultimatum to Charles X. at Maintenon. After holding office for a short time under Lafayette, he became the leader of the moderate 'left' opposed to Casimir Périer, voting for the abolition of the hereditary peerage. He joined the coalition against Molé, supported Thiers, and opposed Guizot. On the eve of the revolution of 1848, B. attempted with Thiers to form a ministry which would have accepted the Count of Paris and a regency. As president of Louis Napoleon's first ministry B. was succeeded by Baroche, and shortly afterwards withdrew from public life. He recognised the value of the right of discussion on home and foreign affairs conceded to the Chambers in 1860, and pointed out that the right of censure implied a responsible ministry. In 1861 he published an important work on centralisation and its effects. In June 1872 he was chosen a member of the Council of State by the National Assembly, and vice-president of the Council on the 27th of July. He died August 6, 1873, and a volume of memoirs appeared in 1875.—**Victorin Ferdinand B.**, brother of the foregoing (born 1806), has also had a political career, but not a conspicuous one. He accepted the Empire, and after serving as ambassador at Turin, became a senator in 1853, and was made secretary of senate in 1865.

Barrow, the *Birgos* of Ptolemy, a river in the S.E. of Ireland, after the Shannon the most important in the island. It rises in the Slievebloom mountains, in the N. of Queen's county, and after an easterly course of 15 miles, and a southerly course of 85 miles, it falls into the estuary of Waterford harbour. It is navigable for large ships up to New Ross, and for barges up to Athy, fully 60 miles from the sea. It has several tributaries, the most important of which are the Nore and the Suir, which with the B. are named the Three Sisters. The Grand Canal connects the B. with the Liffey at Dublin.

Barrow, Isaac, D.D., a celebrated mathematician and divine, was born at London in October 1630. In 1645 he entered Trinity College, Cambridge, where he obtained a fellowship in 1649, and graduated as M.A. in 1652. Though recommended by the retiring professor for the Greek chair, he lost the election on account of his suspected Arminian views. This professorship, however, he obtained in 1660, a few months after his return from the Continent, where he had travelled for four years. He occupied in succession the Gresham chair for geometry and the Lucasian mathematical professorship, which latter he relinquished in 1669, in favour of his pupil Isaac Newton. In 1672 he became the master of Trinity College, and in 1675 vice-chancellor. B. died at London, May 4, 1677. His sermons are remarkable for their vigour, lucidity, eloquence, and length. On one occasion at least, a congregation, after listening for three and a half hours, had recourse in despair to an organ, and 'blowed him down.' B.'s theological works have been edited by Tillotson (3 vols. Lond. 1683; new ed. 1741). There is also a Cambridge edition in 6 vols. (1818), a New York one in 3 vols. (1845), and another by Napier in 9 vols. (1859). His best mathematical works are his *Lectiones Geometricæ*, translated by Stone (1735), and *Lectiones Opticæ*, by Kirby (1734). The latest edition is that of Whewell (Lond. 1861).

Barrow, Sir John, born at Dragleybeck, Lancashire, June 19, 1764, was first engaged as clerk in an iron-foundry Liverpool, made a voyage in a Greenland whaler in 1780, became mathematical tutor to the son of Sir George Staunton, through whose influence he was appointed private secretary to Lord Macartney in his embassy to China, and afterwards in the governorship of the Cape of Good Hope. He was appointed secretary to the Admiralty in 1804, held the appointment for forty years, and during the whole of that time laboured with enthusiasm and with much success in the interests of geography. To him it is mainly due that the spirit of arctic enterprise was kept in activity during these years, and the earlier polar expeditions of this century owed much to his superintendence. The idea of the foundation of the Geographical Society (1830) originated with him, and he remained its vice-president till his death, 23d November 1848. He was a voluminous writer of travels, voyages, and the memoirs of naval heroes. His books are accurate and agreeable in style. He is chiefly remembered now for his *Chronological History of Arctic Voyages* (Lond. 1818). His *Autobiographical Memoir* was published in 1847.

Barrow-in-Furness, a thriving seaport and manufacturing town in N. Lancashire, on the S.W. shore of the peninsula of Lower Furness, and 18 miles W.N.W. of Lancaster. It is a station on the Furness Railway, and is thus connected with the London and North-Western and the Midland Railway systems. Its charter of incorporation dates from 1867. B. furnishes the most striking instance of rapid growth of any European town of recent times. In 1847 the population was 325; in 1864 it had increased to 10,608; in 1871 to 18,245; and in 1875 to 40,689. The borough is one of the largest in the country, containing no less than 9720 acres. This extraordinary prosperity is due to the abundance in its neighbourhood of rich hematite ore, yielding an average of 57 per cent. of iron, and which has converted a fishing hamlet into one of the most important centres of the iron manufacture in the world. The ore, being almost free from phosphorus, is well suited for the manufacture of steel, which is here produced by the Barrow Hematite Steel Company at the rate of 1000 tons weekly. The process employed is the Bessemer (q. v.). Nearly 500,000 tons of ore are annually required for the blast-furnaces, which, to the number of fourteen, are ranged along the shore. About 20,000 tons of slate, obtained near B., are annually exported. Iron shipbuilding is now carried on to a great extent on Barrow Island. The principal proprietors are the Dukes of Devonshire and Buccleuch, who have formed a harbour and docks at a large expense. There are now four docks—the Devonshire, the Buccleuch, the Ramsden, and the New Ramsden Docks opened in 1878, and covering $7\frac{1}{2}$ acres. In 1876, 1285 vessels entered of 276,105 tons, and 1531 cleared of 338,072 tons. The steam-packets from the Isle of Man and Belfast arrive and depart from Piel Harbour, 2 miles S. of B. The most prominent structures are the steel-works (the largest in the kingdom) and the new jute-works. A handsome bronze statue was erected by public subscription in Ramsden Square in 1872, in honour of Sir James Ramsden, first mayor of the borough, and managing director of the Furness Railway.

Barrow-on-Soar, a village on the navigable river Soar, in the county of Leicester, 10 miles N. of Leicester, and a station on the Midland Railway. A fine blue lime found in the district is converted into a valuable subaqueous cement. The inhabitants manufacture lace and hosiery in their own homes. B. has considerable charitable endowments, two free schools, and an extensive union workhouse. Pop. of township (1871) 1963.

Barrow Point and **Strait**, the former considered the most northerly point of continental N. America, in lat. $71^{\circ} 23' N.$, lat. $156^{\circ} 31' W.$ (see BELLOT STRAITS); the latter being the continuation westward of the passage called Lancaster Sound, S. of the island of N. Devon, and crossing the northern outlet of Regent Inlet, have both been named in honour of Sir John Barrow (q. v.).

Barrow etymologically, is the modern form of the old English *beorh*, first a mound for defence, then a heap or cairn for whatever purpose. The word is not derived, as commonly said, from *byrian*, to bury, but *byrian* is derived from it. B. is now exclusively used to denote a mound of earth or stones raised over the remains of the dead. Though this form of sepulture was specially characteristic of the prehistoric periods, it continued in many parts of Europe down to the introduction of Christianity. In countries that have been long under cultivation, the smaller barrows have mostly disappeared. Yet the number existing in the Orkneys has been estimated by Captain Thomas at about a thousand. In Scotland and Ireland they occur in groups, of which Clava, near Inverness, and Moytura, near Sligo, are examples. The Moytura group consists of upwards of sixty barrows, many of them chambered. Scandinavia and N. Germany are studded with these grave-mounds. Upwards of 100,000 have been enumerated in France. They are numerous in Spain and Portugal. The magnificent chambered B. of Antequera, near Malaga, Andalusia, is one of the most remarkable in Europe. The mound exceeds 100 feet in diameter, its chamber measures 80 feet in length by 20 feet in width, and 10 feet in height. Ten stones on each side form the walls. The end is a single stone, and the roof is covered by five stones, the largest of which is 25 feet long, and 21 feet broad. When the chamber is not of this megalithic construction, the upper portion of the side-walls is built so that each stone projects a little further inward than that below it, thus forming a rude dome-shaped roof.

These dome-roofed chambers are always provided with a passage leading to the exterior of the mound. The great chambered B. of New Grange, on the banks of the Boyne, is the best-known example of this type. It is over 300 feet in diameter, and 70 feet in height. The central chamber is upwards of 20 feet in height, and is approached by a passage 70 feet in length. In Denmark the oblong barrows called 'giants' graves' are most common. They contain chambers of the first-mentioned form, without passages, while the round barrows usually have passages leading into them, but they never have domed roofs like those of Britain. The long barrows of England and Denmark are characteristic of the Stone Age, but the circular form was retained in the succeeding periods, and some of the largest chambered barrows of this form in Scandinavia belong to the latest times of Paganism. It is from the character of the sepulchral deposits, therefore, and not from the external form, or internal construction, that the age of a B. is to be determined. In those of the Stone Age the deposits are usually of unburnt bodies, accompanied with rude, hand-made pottery—the remains of food-vessels or drinking-cups—axes of polished stone, spear and arrow heads of chipped flint, and rude implements and ornaments of bone or stone. Cremation, however, began in the Stone Age, and is found contemporaneously with the deposit of unburnt bodies, sometimes even in the same B. The cinerary urns which accompany interments after cremation are often larger vessels, and usually of coarser make than those found with unburnt bodies. Special forms, however, are peculiar to the two styles of interment, so that the nature of the sepulchral pottery is to a certain extent an index to the form of burial. The barrows of the Bronze Age (in which cremation had largely superseded unburnt interment) are seldom chambered, and the deposit is usually contained in small cists of slabs. The pottery is of finer texture, and exhibits a greater variety of form and ornament than that of the preceding period. Sometimes the urn is found simply inverted over the deposit of burnt bones, without any protecting cist, at other times it is placed upright in a cavity among the stones of the B. The deposits accompanying interments of the Bronze Age are weapons and implements of bronze, and ornaments of bronze and gold, often of exquisite workmanship. Towards the close of the Bronze Age in Central Europe, the size of the B. was greatly reduced, and a custom prevailed of burying in vast cemeteries like that of Hallsstadt (containing upwards of 1000 graves), in which interments of burnt, unburnt, and partially burnt bodies are accompanied by weapons and implements of bronze as well as of iron, in which the forms peculiar to the Bronze Age were for a time reproduced. The barrows of the Iron Age are most numerous in Scandinavia. The Kongs-hol at Upsala in Sweden, and the grave-hills of King Gorm and his wife Thyre at Jellinge in Jutland, are well-known illustrations of the enormous size of the barrows of this period. In the Viking time, the sea-king was placed in his B., seated in his ship, with his arms and accoutrements around him. Sometimes the B. itself was made in the form of a ship, with great stones set for the prow and stern. The *Njal Saga* and the old English poem of *Beowulf* describe instances of B.-burial, and the funeral obsequies performed at the rearing of the barrows of the Homeric period are detailed in the *Iliad* and *Odyssey*. Consult Bate-man's *Vestiges of the Antiquities of Derbyshire* (Lond. 1848); Worsaae's *Primeval Antiquities of Denmark* (Lond. 1849); Macpherson's *Antiquities of Kerloch* (Lond. 1857); Kemble's *House of Ferales* (Lond. 1863); Stuart's Preface to *The Sculptured Stones of Scotland* (Spalding Club, 1867); Thurnam's *Ancient British Barrows*, in *Archæologia*, vol. xliii. (1872); Fergusson's *Rude Stone Monuments*, London, 1872; and Greenwell and Rolleston's *British Barrows* (Oxf. Clar. Press, 1877), a most careful and valuable work.

Barraulet, in heraldry, a diminutive of the bar (q. v.), occupies on the shield the fourth part of the width of the bar, and half that of a Closet (q. v.), the other diminutive.

Bar-sur-Aube ('the stronghold on the Aube'), an ancient town in the department of Aube (Champagne), France, and a station on the railway from Paris to Mulhouse, with considerable trade in wine, corn, hemp, wood, and wool, and some manufacture of calicoes, brandy, paper, tablecovers, and vinegar. It stands on the right bank of the Aube, here crossed by a bridge, from which, at a spot now marked by a chapel, the Bastard of Bourbon was thrown into the river (1440) by order of Charles

VII. On the 25th February 1815, the Allied Powers met at B., and fixed the plan of the war which resulted in the first overthrow of the Empire; and two days later Schwarzenberg gained a decisive victory here over the French under Oudinot and Macdonald. Pop. (1872) 4356.

Bar-sur-Seine ('the stronghold on the Seine'), a town in the department of Aube, France, on the left bank of the Seine, 15 miles S.W. of Troyes, with an extensive wine trade. The Allies, commanded by the Prince of Württemberg, defeated the French here, March 1814. Pop. (1872) 2443.

Barry, Marie Jeanne Gomar de Vaubernier, Comtesse du, the central figure for a time in the licentious court of Louis XV. of France, was born at Vaucouleurs, the birthplace of Joan of Arc, 19th August 1746. Her father was an excise-man of the name of Vaubernier, her mother a dressmaker, named Bécu or Cantigny, who survived till 1788. On the death of her father she went to Paris. There, as a nun, as a servant, and as a milliner, under the name of Mademoiselle Lange, she lived a chequered and disreputable life. At last she became the mistress of the Comte Jean du Barry-Ceres, commonly known as Le Réné, and one of the rakes of the period. Introduced by him to Lebel, the valet of Louis XV., and by Lebel to the king, her youth, beauty, and somewhat coarse wit, fascinated the sexagenarian voluptuary. She became his favourite, and having gone through the ceremony of marriage with Count Guillaume du Barry, brother to Count Jean, she was in 1769 introduced to the court as Comtesse du Barry. Till the death of the king in 1774 she ruled France, and never was its court so corrupt and shamelessly immoral as under her rule. Although a woman of no refinement or taste in any sense of these words, she yet patronised artists and men of letters, because she feared them. After the death of Louis XV. B. was dismissed the court, and sent to the convent of Port-aux-Dames, near Meaux; and although she was subsequently allowed to live on a pension at the mansion of Luciennes, which the old king had built for her, she never attempted to take part in public life. During the frenzy of the revolutionary period, she was, on the orders of Robespierre, arrested, tried on the charge of conspiring against the republic, condemned, and guillotined 7th December 1793. Of all the female victims of the Revolution, B. alone showed a want of courage at the last, shedding tears on her way to the place of execution, and imploring her life of the mob. See Lacretelle's *Histoire de France pendant le dix-huitième Siècle*; Moutte d'Angerville's *La Vie Privée de Louis XV.* (Lond. 1781); and above all, MM. de Goncourt's *La Du Barry* (Par. 1878), a work of minute and persevering research, to which all sorts of pamphlets, caricatures, vaudevilles, prints, newspapers, and satires have been made to contribute. The so-called *Mémoires de Mme. la Comtesse du B.* (Par. 1829-30; new ed. 1843) are believed to be the fabrication of Paul Jacroix and La Mothe-Langon.

Barry, Sir Charles, a celebrated English architect, born in London in 1795, studied his art in England under Messrs Middleton and Bailey, and afterwards travelled over the Continent and part of Egypt to improve and liberalise his knowledge. His first important work of a public character was the Church of St Peter at Brighton, which made so favourable an impression that his design was chosen by the Church Building Commissioners for their seal. Another fine work of B.'s was the Manchester Athenæum, in the Greek style; and a still finer was King Edward VI.'s Grammar School at Birmingham, a Gothic structure. The College of Surgeons, Travellers' Club, and the Reform Club were also constructed from his designs, but the most splendid and enduring monument of his genius is the New Houses of Parliament—'a dream in stone,' according to the happy phrase of the Russian Emperor Nicholas. B. received the honour of knighthood (1842) on the opening of the Victoria Tower, and died at Clapham, 12th May 1860. He was buried in Westminster Abbey.

Barry, James, a painter, born at Cork, October 11, 1741, displayed at a very early age a taste for drawing, and, before he was twenty-two years old, gained the patronage of Edmund Burke, who supplied him with the means of studying art in Ireland. He went to England, and obtained a high reputation by his historical paintings, which were characterised by power if not by delicacy of finish, and of which the *Victors at Olympia* was the chief. B. was made professor of painting at the Royal Academy in 1786, but being a quarrelsome eccentric man, he was removed from the post in 1799, and died in comparative

poverty, February 22, 1806. A writer on art subjects as well as a painter, his collected works with a memoir prefixed appeared in 2 vols. 1809.

Barry, Martin, M.D., F.R.S., an eminent physician and physiologist, was born at Fratton, Hampshire, in 1802, and died at Beccles, Suffolk, 27th April 1855. His *Researches in Embryology* are published in the *Philosophical Transactions* of the Royal Society of London for 1838, 1839, and 1840.

Barry Cornwall. See PROCTER, BRYAN WALLER.

Bars-Gemelles (Fr. *jumeau, jumelle*, a twin, from the Lat. *gemellus*, a diminutive of *geminus*), in heraldry, twin barrulets—that is, barrulets disposed in couples, or borne in pairs.

Bartan', a town of Anatolia, at the mouth of the Chati-su, or Bartan-su (the ancient *Parthenius*), whose name still survives in that of the town. B. has a good trade with Constantinople. Pop. estimated at 10,000.

Bartas, Guillaume de Salluste du, a Gascon poet, born at Montfort, Armagnac, in 1544. His reputation, brilliant during his lifetime, dimmed shortly after, and now extinct, was based on a long poem on the creation and early history of the world, a work of which thirty editions passed through the press in six years, and which is thought by some critics to have influenced Milton considerably in writing *Paradise Lost*. *La Première Semaine* or *La Création* is considered the best part of the work, while *La Seconde Semaine*, an enumeration of the deeds of primeval heroes, is admitted to be about the worst. B. wrote *L'Uranie* in early youth, in praise of poetry. *Judith*, *La Bataille d'Ivry*, and some pieces addressed to the Queen of Navarre and to King James VI. of Scotland, were quite ephemeral. B. in his poetry indulged largely in the use of compound words, and this led Sylvester (q. v.), his translator, to compound English words, and thus to reduce the expressiveness of the English language. B. was also a soldier and a diplomatist, and died in 1590 of wounds received at the battle of Ivry. The most complete edition of his works is that of 1611.

Barter is the exchange of a commodity for anything except money, the exchange for money being called Sale (q. v.). As civilisation advances, exchange of commodities increases. Each one finds it more profitable to have some fixed employment, and to exchange the produce of his labour for the produce of the labour of others, than to endeavour to make everything for himself. Then the effecting of exchanges becomes itself a business. This business ultimately splits, and we have the wholesale and the retail dealer. While the price of the article is thus increased to the consumer, it is less than he could get it for without the intermediate dealer. Yet in reality B. is not extinguished by this process. The exporter, instead of getting a remittance of money for the goods exported, probably imports a cargo of some other goods, with at least a part of the proceeds of the export; that is, he exchanges on B. It used to be maintained that for the merchant to deal in this way was not conducive to national wealth, and that a cash remittance for the whole value exported was the proper thing. For an exposition of the fallacy of this view, see BALANCE OF TRADE. The simple commercial law is now happily generally understood, in England at least—that *what is best for the merchant is best for the community*.

Bartfeld, an old royal free town on the frontiers of Galicia, in the county of Saros, N. Hungary, on the Tepla, 95 miles N. of Debreczin, noted for its chalybeate springs. It was once an important centre of trade between Galicia and Hungary, and its archives are very rich in historical documents. Even yet it has some trade in wine, brandy, and linen, and many thousands of bottles of mineral water are annually sent to all parts of the country. Pop. 4222.

Barth, Heinrich, a celebrated African explorer, was born at Hamburg, February 16, 1821. He studied at the University of Berlin, specially devoting himself to archaeology and philology, and in 1844 took his degree and crossed to London, there to learn the English and Arabic languages. In 1845 he set out on his first great African journey; explored the entire N. coast of the continent, travelled through Arabia, Palestine, Asia Minor, and Greece, and returned in 1848 to Berlin, where he gave a series of lectures on ancient geography, and published his *Wanderungen durch die Küstenländer des Mittelmeers in den Jahren 1845-47* (vol. i. Berl. 1849). The influence of the

Chevalier Bunsen procured leave for B. and Dr Overweg to accompany the British political and commercial expedition to Central Africa, headed by Mr James Richardson. In 1850 they started from Tripoli, to which B. returned in 1855, after having explored 24 degrees of latitude and 20 of longitude, over 12,000 miles, most part of which had been untrodden ground. He crossed the Great Desert, visited for the first time many native states in the Fellatah country, traced the course of the Niger for several hundred miles, and resided at Timbuctu for seven months. These results are given fully in his *Reise und Entdeckungen in Nord und Centralafrika* (5 vols. Gotha, 1855-58, English translation in 1857-58), a work displaying true German solidity, excelling in a clear perception of things physical, historical, and ethnological. In 1863 B. was made Professor of Geography in the University of Berlin, and President of the Geographical Society. His other works are *Reise von Trapezunt durch die nördl. Hälfte Kleinasiens nach Skutari* (Gotha, 1860); *Reise durch das Innere der Europ. Türkei* (Berl. 1864); and an unfinished *Sammlung und Bearbeitung Centralafrik. Vocabularien* (Gotha, 1862-64). B. died at Berlin, November 25, 1865. See *Life* by Koner in the *Zeitschrift der Gesellschaft für Erdkunde zu Berlin* (vol. i. part 1, Berl. 1866).

Barth, or **Bart**, **Jean**, the favourite naval hero of France, son of a fisherman, was born at Dunkirk in 1651. He first served in the Dutch navy, was next captain of a privateer, and was then commissioned to cruise the Mediterranean by Louis XIV., who shortly afterwards appointed him lieutenant of a man-of-war. Being made prisoner by a superior English force, he escaped from Plymouth, and reached France after a voyage of nearly 200 miles in an open fishing-boat. For this exploit he was made captain. Eluding the English fleet, which was blockading the French ports, he inflicted much damage on the Dutch; and for this he was appointed to the command of a squadron in 1697. His bluntness, as much as his undoubted skill and courage, made him a favourite with the king. The peace of Ryswick deprived him of further opportunity of signalising himself, and he retired to Dunkirk, where he died, 27th April 1702. See Richer's *Vie de Jean Bart* (Par. 1780), Poirier's *Eloge Historique de Jean Bart*, &c. (1807), and Vanderest's *Histoire de Jean Bart* (Par. 1841).

Barthélemy, **Auguste-Marseille**, born at Marseilles in 1796, studied at the College of Juilly, and early devoted himself to the composition of political satire in verse. Going to Paris (1822), he produced, along with his fellow-townsmen M. Méry, several powerful pieces, such as *Les Sidiennes* (1825), *La Villiade* (1826), *Les Jésuites* (1826), all directed against the Conservative Legitimists, and suggesting regret for the Empire. *Le Fils de l'Homme* (i.e., Napoleon II., King of Rome and Duke of Reichstadt), brought upon B. three months' imprisonment and a fine, just on the eve of the revolution of July, which he and Méry celebrated in *L'Insurrection*, and the sentence itself in *La Bourse et la Prison*. A pension from the Louis Philippe government (speedily withdrawn) did not alter B.'s political principles, or silence his active pen. The fifty-two satires known collectively as *Némésis* and *Nouvelle Némésis* (1834), did not spare the successive ministers who tried to make a good constitution out of a bad charter. Even the comparatively liberal Guizot was scandalised. B.'s latest poem was *Les Deux Marseilles* (1858). He supported the Second Empire, and died librarian of Marseilles, 23d August 1867. His brilliant verses depend chiefly on contemporaneous politics for their interest; but such sayings as '*L'homme absurde est celui qui ne change jamais*,' are more likely to live. B. translated the *Æneid* into French (4 vols. 1835-38).

Barthélemy, **Jean Jacques**, known as Abbé B., was born at Cassis, 20th January 1716. Educated for the Church, he devoted himself to the study of oriental antiquities, especially numismatics. Appointed in 1745 assistant to De Boze in the cabinet of medals, he classified an immense number of these antiquities, including those of the Petterin Collection. The Palmyran alphabet and the mosaic of Palestre were special subjects of research. In 1788 he produced his celebrated work *Voyage du jeune Anacharsis*, in which, in the form of a narrative of travel through Greece in the 4th c. before Christ, he recorded his immense stock of erudition relating to the ancient world. The best edition of the *Anacharsis* (which was translated into English in 1794, and into German by Fischer and Haupt 1836) is that published by Didot (Par. 7 vols. 1799). See

Villeneuve's *Notice sur les Œuvres de Jean J. Barthélemy* (Par. 1821), with a valuable atlas. B. died at Paris, 30th April 1795.

Barthélemy-Saint-Hilaire, **Jules**, member of the Institute, was born at Paris, 19th August 1805. Before and after the revolution of 1830 he supported democratic principles in *Le Globe* and *Le Bon Sens*. In 1834 he became a tutor of French literature at the École Polytechnique, and in 1838 Professor of Greek and Latin Philosophy in the Collège de France. B. appeared in the Constituent Assembly of 1848, at first supporting Barrot and the candidature of Napoleon. On the *coup d'état* he refused the oath to the new government, and resigned his chair, to which he was not reappointed till 1862. He was a member of the Corps Législatif in 1869, and was elected in 1871 to the Assembly, where he supported Thiers. Between 1837 and 1846 he translated the *Politics, Logic, and Psychology* of Aristotle into French. He has also written on the Alexandrian School of Philosophy, on the Vedas, on Mohammedanism, and on Buddhism. See his works: *Le Bouddhisme* (1855), *Des Vedas* (1854), *Boudha et sa Religion* (1859, 3d ed. 1862), and *Mahomet et le Coran* (1865).

Barthès, or **Barthès**, **Paul Joseph**, a celebrated French physician, born at Montpellier, 11th December 1734. After serving in the army, he was, in 1759, appointed to a professorship at Montpellier, which soon became one of the most famous medical schools in Europe. In 1781, in consequence of disputes with his colleagues, he removed to Paris, where he was named consulting physician to the king. The revolution deprived him of his places and emoluments, and he left Paris; but he was recalled by Napoleon, who loaded him with wealth and honours. B. died 15th October 1806. Of his works, which are numerous, and on a variety of subjects, the best known are his *Nouvelle Mécanique des Mouvements de l'Homme et des Animaux* (Carcassonne, 1798), and his *Nouveaux Éléments de la Science de l'Homme* (Montpellier, 1778; 2d ed., much enlarged, Par. 1806). See Lordat's *Exposition de la Doctrine Médicale de P. J. B.*, et *Mémoires sur la Vie de ce Médecin* (Par. 1818).

Bartholin, the name of a Danish family, the members of which have distinguished themselves in medical science and literature.—**Kaspar**, born at Malmö, 12th February 1585, studied medicine at Padua, was made Doctor of Medicine at Basel in 1610, became Rector of the University of Copenhagen in 1618, and Professor of Theology in 1624. He died 13th July 1630. Of his forty-nine publications, the most important is his *Institutiones Anatomica* (Wittenb. 1611). He left six sons, all distinguished by their writings. Of these, the best celebrated was **Thomas B.**, born 20th October 1616; became Professor of Anatomy at Copenhagen, 1648; Physician in Ordinary to the king, Christian V., in 1670; Councillor of State, 1675; and died 4th December 1680. Besides his works on purely medical subjects, he wrote valuable treatises on antiquities, and on natural philosophy. He was an ardent defender of Harvey's doctrine of the circulation of the blood. Among his works on biblical antiquities are his treatises *De Morbis Bibliis* (Copenhag. 1672), and his *Disquisitio Medica de Sanguine Vetito* (Frankf. 1673). His sons, **Kaspar B.** (born 1654, died 1704), and **Thomas B.** (born 1649, died 1690), were also distinguished—the one as an anatomist, and the other as an antiquarian.

Bartholomew Fair, formerly an important market, associated in various ways with the literature and history of England, was first held at West Smithfield, London, in 1133, under charter granted by Henry I. to a monk named Rayer or Rahere, at one time a court fool, but subsequently the founder of St Bartholomew's Church and Priory, and also of the famous Hospital of the same name. The fair continued to be held annually on the 24th of August, the festival-day of St Bartholomew, and in addition to the usual buying and selling, soon became remarkable for the miracle-plays, mysteries, and the later moralities performed by the monks of the adjoining priory, for athletic sports and popular games, and for the public disputations and rhyming contests of the scholars from the various London schools. In the 14th and 15th c. it was one of the most flourishing fairs in England, chiefly for cattle, cloth-stuffs, leather, and pewter, and was a great place for theatrical booths, shows, exhibitions, mountebanks, acrobats, &c. The priory was abolished on the suppression of religious houses by Henry VIII. in 1546, and the hospital, along with the charter, was transferred to the London corporation. The fair now began to decline as a

place of traffic, and towards the end of the 16th c. a street of houses was built on the site of the Cloth Fair, a name which the street still retains. Ben Jonson's play of *Bartholomew Fair*, which was produced in 1614, gives a vivid picture of the junketings of the old gathering. In 1593, the year of the great plague, for the first time the fair was not held, and for various reasons it was also postponed in 1603, in 1625, in 1630, in 1665, and in 1666. Hitherto it had usually lasted only three days, but after the restoration of Charles II. it was prolonged to a fortnight. So much, however, had it lost its character for trade, that it was found necessary to restrict it to three days in 1691, and also, its duration having again increased, in 1700. It had been already represented as a nuisance in 1701, and the traffic now rapidly declining, it soon became a yearly spectacle of riotous amusement and debauchery. The fair was removed to Islington in 1840, where it feebly struggled for existence, till it was finally abolished in 1855. See Henry Morley's *Memoirs of B. F.* (Lond. 1859, new ed. 1874).

Bartholomew, St., one of the W. India islands, lies among the most northerly of the Lesser Antilles, about 25 miles S. of the British island of Anguilla. It exports sugar, tobacco, cotton, and cocoa, and is the only colonial possession of Sweden, to which country it was ceded by the French in 1784. Chief town, Gustavia. Area, 80 sq. miles; pop. (1875) 2394.

Bartholomew, St. (Heb. 'son of Talmai'), one of the twelve apostles, is conjectured to have been Nathaniel, because the latter seems to be ranked as an apostle in John xxi. 2; he was brought to Jesus by Philip (John i. 45-50); and in the catalogues given by the evangelists B. and Philip are always put together. Of his subsequent history there are nothing but vague traditions. In the Latin Church his festival is held on the 24th of August; in the Greek Church, on the 11th of June. A spurious gospel with his name was among the Apocryphal books condemned by Pope Gelasius. See APOCRYPHA.

Bartholomew's, St. Day (called by the French *La St. Barthelemy*), is the day which has given name to the massacre of the Huguenots at Paris on 24th and 25th August 1572, and following days. A great number of Huguenot noblemen and their followers had come to Paris to celebrate the marriage of Henry of Navarre (a Protestant leader) with Margaret, youngest sister of Charles IX., which took place on 18th August. On the 22d an attempt was made to murder the Admiral Coligny. This may have caused disturbance among the Huguenots (the despatches to the Protestant princes of Germany alleged this as an excuse for the massacre), but, from whatever cause, the King was, on the 23d, persuaded by Catherine of Medici, his mother, the Duke of Anjou (afterwards Henry III.), his brother, Tavanne, De Retz, Birague, and Nevers, to consent to a general massacre. The instructions were given to the French and Swiss guards, and to the civic authorities, by Guise, whose father had been murdered by Huguenots. Besides Coligny, Rochefoucault, Teligni, Ramus the philosopher, and De la Place the jurist, all the leading Huguenots, and all those in Paris, were murdered. The massacre was repeated at Meaux, Orleans, Lyons, and elsewhere, on a smaller scale. In six weeks 50,000 Huguenots are supposed to have been killed. On the 26th the King stated to the Parliament that he was responsible for what had been done. Philip II. warmly approved of, and offered to assist, the process of extermination. Pope Gregory XIII. (following the traditions of Pius V., who had opposed the Jesuits to the Huguenots), went in solemn thanksgiving to the Church of San Luigi, and had a medal struck in commemoration of the event. It was thought at one time that the massacre had been planned by Catherine (the queen-mother) and Alva, at a meeting which took place at Bayonne in 1564, shortly after the edict of Amboise; and that Charles, in signing the Edict of Pacification of St Germain-en-Laye (1570), and in receiving Coligny at Paris, was acting a part. The true view seems to be that a liberal Catholic party had been formed, consisting of L'Hopital, Montmorency, &c., who, along with Coligny, desired to break with Spain and assist William of Orange. It was Montmorency who arranged the pacification. Charles, impatient of his mother's restraint, at first sided with this party, made a treaty with England, and sent Genlis to Flanders. Latterly he became jealous of the influence of his brother Henry with the old Catholic party, and veered round at the last moment, in the hope of making his own position more secure. As regards the extent and ferocity of the

massacre, it must be remembered that a long civil war, marked by atrocious cruelty on both sides, had just been raging all over France. It is impossible not to connect it partly with the rapidly-growing influence of the Jesuits, of whom Augier and Maldonet had just become famous in Lyons and Paris. See Audin, *Histoire de la Saint Barthélemy d'après les Chroniques et les Manuscrits du 16^{me} Siècle* (Par. 1829); Soldan, *Hist. of Protestantism in France to Death of Chas. IX.* (1855); and Ranke, *Civil Wars and Monarchy in France in 16th and 17th Centuries*, translation by Garvey, 2 vols. Lond. 1854.

Bartholomew's, St. Hospital, Smithfield, London, originally part of a priory for black canons, founded in 1102 by Rahere, a jester at the court of Henry I., was established for a master, eight brethren, and four sisters, who were to take charge of those who needed its benefits. Henry VIII. granted it a new charter, and the endowment was enlarged by Edward VI. There are now over 600 beds, and 70,000 patients are relieved annually. The medical school attached to it is deservedly famous.

Bar'tizan, a small, overhanging turret projecting above doorways, as well as from the angles and other parts of mediæval buildings.

Bartlett, William Henry, artist and author, born in London, 29th March 1809, became a pupil of the architectural antiquary Mr John Britton, and after a time was employed to make finished drawings from nature for the *Cathedral Antiquities*, and the *Picturesque Antiquities of English Cities*, which have made the name of Britton famous. B. supplied the illustrations from nature of a work on Switzerland, to which Dr Beattie, his friend, and the companion of his travels, contributed letterpress. Similar works, the result of the same copartnery, were subsequently published with great success, the subjects being the Waldenses, Scotland, Ireland, Holland, Turkey, America, &c. Later, B. wrote his own descriptive matter for his pictures, the chief of his works which he thus illustrated with both pen and pencil being *Walks about Jerusalem*, *Forty Days in the Desert*, *The Overland Route*, *Footsteps of our Lord*, *Pictures of Sicily*, and *The Pilgrim Fathers*. He died 12th September 1854, on his passage by steamer from Malta to Marseilles.

Bartolini, Lorenzo, an Italian sculptor, born at Vernio, Tuscany, in 1777, studied in Paris, and at the beginning of the present century carried off the second Academy prize by his basso-relievo *Cleobis and Biton*, which in ideal purity and simplicity is said to be unsurpassed by Canova. This work established his reputation, and Napoleon, Denon, and others, gave him commissions. Among the works executed by him in France were the colossal bust of Napoleon now in the Louvre, and a magnificent statue of the Emperor, never delivered to government owing to the affairs of 1815, and now in America. On the fall of the Empire, he returned to Florence, where he executed numerous busts, and the groups of *Charity*, *Hercules and Lycus*, &c. In 1845 he produced the *Nymph and Scorpion*, a delightful picture in marble, proving in its beauty that age had not dulled his genius. B. died 20th January 1850.

Bartolomeo, San, a town in the province of Benevento, S. Italy, on a branch of the Fortore, about 50 miles N.E. of Naples. It stands in a hilly region, and has a pop. of 5400.

Bartolozzi, Francesco, an Italian engraver, born at Florence in 1730, came to London in 1764, and was invited in 1806 to Portugal, where he obtained an appointment and a pension from the King, and died April 1813. Of great taste, invention, and talent, the fame of B. at one time eclipsed that of almost all rivals. His engravings are very numerous (over 2000); but among the best known are his *Dion*, after Cipriani; *Silence*, *Birth of Pyrrhus*, &c., after Carracci; *Massacre of Innocents*, after Guido; and *The Death of Chatham*, after Copley.

Barton Beds. See BAGSHOT BEDS.

Barton, Bernard, an English Quaker poet, born in London, 31st January 1784, became a clerk in Woodbridge Bank in 1810, and continued in this employment till within two years of his death, 19th February 1849. His *Metrical Effusions* (1812), *Poems by an Amateur* (1818), *Poems* (1820), and *Napoleon and other Poems* (1822), gained for him considerable reputation, and the friendship of Southey, Lamb, and Byron. Later works are *The Reliquary* (1836) and *Household Verses* (1845). There is a sweet and gentle purity in B.'s verse which wins respect, but his genius, though true, is not strong. *Selations*

from the *Poems and Letters of Bernard Barton* were published by his daughter in 1849. See Gurney's *Memorial of Bernard Barton* (Lond. 1847).

Barton, Elizabeth, or the Holy Maid of Kent, was in the year 1525 a barmaid at Adlington, and subject to epileptic fits. A priest named Master persuaded her that she had divine visions. She joined a nunnery, where Fisher, More, and others, saw her and believed. In 1533 she announced a divine message that, unless Henry VIII. forbore from his divorce from Catherine and marriage with Anne Boleyn, 'he should not be king one day, and should die a villain's death.' On arrest, B. confessed her imposture, and was beheaded (21st April 1534), with five priests, her accomplices. She was probably as much sinned against as sinning. For opposite views, see Burnet's and Lingard's Histories.

Barton-on-Humber, an ancient market-town in Lincolnshire, 6 miles S.W. of Hull. Its ferry, referred to in Domesday Book, had its tolls fixed in the reign of Edward III., but the altered conditions of locomotion have caused it to be disused, and another to be established 6 miles farther down the river. B. has a trade in corn and malt; manufactures of bricks, tiles, pottery, ropes, sacking, and sailcloth; and quarries of oolite and chalk. The tower of St Peter's Church was built, it is thought, before the close of the 11th c. St Mary's is a large and beautiful structure of the 14th c. Pop. (1871) 4332.

Baru, a woolly substance found at the base of the leaves of *Saguerus saccharifer*, one of the sago-palms of the Malay Archipelago. It is used to caulk ships, stuff cushions, &c.

Baruch (Heb. 'blessed'), the friend and amanuensis of Jeremiah (Jer. xxxii. and xxxvi.), was thrown into prison along with that prophet, where they remained till the capture of Jerusalem by the Chaldeans, B.C. 586. On their release, he first resided with Jeremiah at Mizpah (*Jer. Ant. x. ix. 1*), and then accompanied him to Egypt (Jer. xliii. 6, 7). According to one tradition, he died there; according to another, in Babylon.

Baruch, Book of, one of the Apocryphal books, professing to have been written by B., the friend of Jeremiah, in Babylon, about B.C. 581, although it contradicts this itself (cf. B. i. 2, and Jer. xliii. 6, 7). It divides itself into two parts: the first (i.—iii. 8), from its style, seems to be a Greek translation of an original Hebrew text; the second is in good Alexandrian Greek. The book as it now exists probably dates from about B.C. 160. At the end of B. in the Vulgate (6th chap. in English version) there stands a pretended letter of Jeremiah to the exiles in Babylon against idolatry, which may probably be assigned to the 1st c. In old MSS. of the LXX it stands after Lamentations.

Barwood, or **Camwood**, the wood of *Baphia nitida*, a large Leguminous tree growing on the tropical coasts of W. Africa. The wood is very dense, and of a deep-red colour. It is imported in considerable quantities from Sierra Leone as a dye-wood, yielding a bright, but rather fugitive red.

Baryta. See **BARIIUM**.

Baryton (Ital. *viol di Bardoni*), an obsolete musical instrument. It had a finger-board, and seven strings played on by a bow, and under the neck were other strings which could be sounded by the fingers.

Bas, or **Batz**, one of many small French islands in the English Channel, lies 3 miles N. of Roscoff, department of Finistère. It is 3 miles long and 2 broad. B. has a lighthouse standing 223 feet above the sea, and is strongly fortified.

Basalt, a variety of igneous or volcanic rock of a dense compact texture, dark-green or black colour, composed of very minute crystals of augite, Labradorite, and magnetic iron, with frequently crystals of olivine. The composition of basalts, however, vary considerably, and the name is given to rocks more according to their external characteristics than on account of their intimate structure. To any compact, dark-coloured, igneous rock of recent or Tertiary origin, the name B. is frequently applied, and rocks of similar appearance and structure of more ancient date are known as Melaphyre. Dolerite and anamesite are also rocks which differ only from B. in the size of the crystals of which they are composed. Basaltic rocks occur either in the form of intrusive dykes or narrow sheets shot up through pre-existing deposits, of tabular sheets intruded horizontally between beds already formed, or of contemporaneous sheets poured out over the surface of the ground. It is only in the latter case

that the rock affords direct evidence of its age, as it must have been formed later than underlying and previous to superimposed strata. Basaltic rocks are especially characterised by their tendency to assume a columnar form, magnificent examples of which are afforded by the Giant's Causeway in Ireland, Fingal's Cave, off the west coast of Scotland, and Samson's Ribs, in the neighbourhood of Edinburgh. The columns are sometimes easily separable, and divided by transverse joints, as in the case of the Giant's Causeway; at other times they are firmly embedded in a rocky matrix. In chemical composition the B. of Fingal's Cave contains per cent. 47.80 of silica, 14.80 of alumina, 13.08 of oxide of iron, 12.89 of lime, 6.84 of magnesia, and small proportions of potash, soda, and manganese. Owing to its hardness and power of resistance, B. is well suited for street paving and road metal, but it is not in any favour as a building material. Some ancient Egyptian statues carved out of B. exist. Messrs Chance of Birmingham at one time made a dark-coloured glass by melting the Rowley Rag B.

Bas'cinet. See **HELMET**.

Base, in architecture, one of the three parts of a column, which consists of B., shaft, and capital. It is divided into the plinth and mouldings, the chief of the latter being the torus. The Grecian Doric is the only one of the classical orders which has no B. The proportion of the height of the B. to the lower diameter of the shaft varies considerably, but it is most frequently about the half of that diameter.

Base, in chemistry. See **BASES**.

Base, in heraldry, the lower part of a shield or escutcheon, technically distinguished from the *side* and the *chief*. It is divided into the dexter or right, the middle, and the sinister or left B.—the right and left being those of the wearer of the shield, not of the spectator. A charge placed on any part of the B. is said to be *in B.* See **SHIELD**.

Base, in surveying, is a line very carefully measured, the length of which is used as a starting-point in the calculation of the lengths of the other lines in the survey by means of measured angles. The original B. for the Ordnance Survey of Great Britain was measured upon Hounslow Heath. Other bases have also been measured upon Salisbury Plain, at Belhelvie Links, Lough Foyle, &c.

Base-Court (Fr. *basse-cour*), an outer yard or court of a feudal mansion for stables and the accommodation of servants. It was distinct from the chief quadrangle in front.

Base of Operations, a military term denoting a port, a stretch of sea-coast, a river, or mountain range, on which the general of an army can rely as a magazine for supply of food, forage, and ammunition; a place for retreat after disaster, and to which the sick and wounded may be sent; the end of a line of open communication to which fresh troops may be sent, and from which they can safely advance through a hostile country, or any other similar necessity to an invading army.

Bas'edow, Johann Bernhard, properly **Johann Berend B.**, was born at Hamburg, 8th September 1723, studied philosophy and theology at Leipsic (1744-46), was first a private tutor in Holstein in 1753, became a teacher in a *Ritterschule* at Saröe, and in 1761 was transferred to the gymnasium at Altona. The reading of Rousseau's *Emile* (published 1762) inspired him with a desire to revolutionise the methods of instruction followed in the schools of Germany, and he issued the prospectus of an *Elementar-Werk*, which excited much enthusiasm. The work was published, with pictorial illustrations, in 1774. Called to Dessau (1771), he established there (1774) a *Philanthropin*, or boarding-school, the pupils of which were to be disciplined in all studies—physical, intellectual, and moral, while the textbooks were to be 'free from those theological peculiarities which separate Christians from Jews, Mohammedans, deists, and dissidents, or, as they are called in some places, heretics.' In 1778 he withdrew from the institution. The remainder of his life was devoted to the propagation of his educational ideas through numerous writings. He died at Magdeburg, 25th July 1790. It is difficult merely to praise so one-sided a man as B.; yet such was his intellectual ardour that he often threw out ideas and suggestions the value of which has since been recognised. The deeper study of the mother-tongue, the introduction of modern languages, and the extension of realistic instruction, can be

partly traced to this pedagogic Ishmaelite. B.'s idea that education should be something real and living, something more than the meagre fare of the old classicists, has been enforced anew in the present day, with more genius and learning, by his great-grandson Professor Max Müller. See Rathmann, *Beiträge zur Lebensgeschichte B.'s aus seinen Schriften und andern echten Quellen* (Magdeb. 1791); and Meyer, *Charakter und Schriften B.'s* (2 vols. Hamb. 1791-92).

Basel (Fr. *Basle*, or *Bâle*), a canton and city of Switzerland. The canton, bounded by Aargau, Solothurn, and Bern, by France and by the Rhine, has an area of 177 sq. miles, and was divided in 1833 into two half-cantons, *Basel-stadt* or *Basle-ville* (Basel-city), and *Basel-landschaft*, or *Basle-campagne* (Basel-country), the respective populations of which in 1870 were 47,760, and 54,127. B.-city consists of the city and two small districts N. of the Rhine, with a strip adjoining the city walls on the S., while the rest of the canton forms B.-country. The canton, stretching on the N. slopes of the Jura, here called Hauenstein, is, in the main, hilly; the district in the neighbourhood of the city is fertile in corn and wine, and much of the remainder is rich in pasture-land. The inhabitants are employed in agriculture, the breeding of cattle, and in fishing; ribbons are largely manufactured, and there are besides manufactures of woollens, linens, paper, and leather.

The city of B. had its origin in the fortress *Basilia* (first mentioned 372 A.D.), about 4 miles from Augusta Rauracorum, whose name still survives in the two villages *Kaiser-Augst* and *Basel-Augst*. In 406 B. came under the power of the Alemanni, in 500 under that of the Franks, and at the division of the Frankish empire in 843 it fell to Ludwig the German. It was rebuilt by the Emperor Heinrich I., after its destruction by the Magyars in 917; next belonged to Burgundy for a time, and in 1032 again formed part of the German empire. The burghesses gradually restricting the power of the bishops and the nobles, and conquering or purchasing adjoining districts, raised B. to the rank of a free city. In consequence of continual feuds with the house of Hapsburg, it terminated its connection with the empire, and joined the Swiss Confederacy in 1501. In 1527 it adopted the reformed doctrine, and after some years the bishop and chapter left the city, and the convents were suppressed. The burghes element was now triumphant, and such of the nobles as did not emigrate, had no privileges over the simplest citizen. Occasional disturbances, caused by the undue assumption of authority by the magistrates, alone varied the orderly and industrious citizen-life. The city governed the whole canton, with little regard to the wishes and interests of the country district, the natives of which saw themselves systematically excluded from all the higher offices, while proper educational appliances were denied them. Hence there was continual, though abortive, rebellion, and in 1831 a civil war broke out, the result of which was the separation of the city and country districts into sovereign half-cantons in 1833, as stated above. The capital of B.-country is Liestal. By the federal constitution, proclaimed 29th May 1874, B.-city sends two, and B.-country three, members to the National Council. B.-city has 34,457 Protestants, 12,301 Roman Catholics, 496 belonging to other Christian denominations, and 506 Jews. B.-country has 43,523 Protestants, 10,245 Roman Catholics, 228 belonging to other Christian denominations, and 131 Jews. The Protestant and Roman Catholic clergy are alike paid by the state. The population of B. has gradually diminished, one of the causes assigned being the difficulty experienced by a stranger in becoming a burgher, and liberty to carry on trade being restricted to burghers. B. is divided by the Rhine into Great and Little B. The cathedral, built in 1019, contains the tomb of Erasmus, and there is a bridge over the Rhine built in 1226. The University of B. (founded 1459) has a valuable library, and numerous paintings by Holbein. There is also a public library containing 70,000 volumes. Euler, and the three Bernouillis, were natives of B. See Ochs, *Geschichte der Stadt und Landschaft B.* (8 vols. Bas. 1796-1822).

Basel, Council of, called by Pope Eugenius IV., in accordance with the 'caput Frequens' of the Council of Constance, met 7th December 1431, the Pope being represented by the Cardinal Julian. (It had been originally called by Martin V., avowedly for the reconciliation of the Hussites and of the Pope with the Emperor.) In April 1432, Eugenius dissolved the Council, and called another at Bonn, on the ground that the

union with the Greek Church (then under negotiation with John Paleologus) could be more conveniently treated there. The Council, which had previously renewed the declarations of Constance as to the necessity of frequent councils, and asserted its supremacy in questions of faith, extirpation of heresy, and reformation of the Church (even of its head), now passed their 'caput Considerans,' declaring the dissolution null, which, like most of their proceedings, was immediately notified to the Emperor Sigismund, Charles VII. of France, &c. In succeeding sessions they prohibited Eugenius from making or publishing cardinals or promoting to cathedrals, directed him to recall his denunciations of Sigismund (who had threatened to refuse papal coronation), and declared that, in the event of a vacancy, the election of a new Pope would take place in the Council. They further summoned Eugenius and all cardinals to B., pronounced them contumacious on non-appearance, and finally, by the famous caput 'Sancte Catholica, nisi intra 60 dies,' they suspended the Pope from office, and advocated all ecclesiastical causes to themselves. Owing chiefly to the intervention of Sigismund, Eugenius at last (1433) issued his bull, 'Dudum Sacrum,' recalling his dissolution, and confirming the acts of the Council. This had been preceded by a 'Formula of Adhesion.' In the meantime the Council had granted the use of the cup to the Calixtine Hussites, and now proceeded to abolish the right of *annates*, and the right of presentation to non-Roman benefices, and to pass a number of reforming measures affecting the elections and the internal administration at Rome. A strange rivalry then arose between Pope and Council, each striving to conduct the Greek union affair. The Greeks naturally wished a meeting in Italy, and Eugenius accordingly translated the Council from B. to Ferrara, where, and at Florence, he proceeded to transact business, declaring all subsequent edicts at B. to be worthless, and especially attacking that by which the C. of B. had pronounced their independence of the Pope as regards translation or prorogation to be 'fidei catholica.' Several articles of union were arranged with the Greeks, the difficulties being the power claimed by Eugenius of holding councils in the absence of emperors and patriarchs, and the appeals to Rome. The C. at B. now formally deposed Eugenius as guilty of simony (this was the specified penalty of his refusing to recognise the abolition of *annates*), and elected Amadeus VIII. of Savoy, a feeble recluse, who assumed the name of Felix V. He was recognised by France, Arragon, and Milan, and several of the great universities, but not by the Nürnberg Diet. Cardinal Julian went back to Italy, and Cardinal Allemand took his place. On the death of Sigismund, the new emperor, Friedrich III., exerted himself against the Council, which held its last session 16th May 1443 at Lausanne. Eugenius died in 1447, and chiefly by the intervention of Charles VII., the few remaining fathers were in 1449 reconciled to the new Pope, Nicolas V., Felix immediately resigning. The decrees of this Council, subsequent to the 'translation,' were afterwards condemned by Pius II.; the earlier, or reforming decrees, though not accepted by the Church universal, have been much deferred to in France and elsewhere, Bossuet maintaining their necessary connection with the decrees of Constance in his *Defence of the Gallican Declaration of 1682*. See Messenberg, *Die Allgemeinen Concilien des 15 und 16 Jahrh.* (Const. 1840); and Voigt, *Enca Silvio, als Papst, Pius II. und sein Zeitalter* (Berl. 1856).

Basel, Treaties of, two, concluded at Basel, 5th April and 22d July 1795: the first between the King of Prussia and the French Republic, by which Prussia withdrew from the coalition against France, and ceded to France her trans-Rhenane possessions; and the second between France and Spain, by which Spain ceded to France her portion of St Domingo.

Basell's, a genus of tropical climbing-plants allied to the natural order *Chenopodiaceæ*. One species yields a purple dye, another furnishes an edible root, while others are used as pot-herbs. They are often grown as ornaments in greenhouses.

Basement Story. See STORY.

Bases are substances which combine with *acids* to form *salts*. The aqueous solution of soluble bases, as a rule, restore the blue colour to litmus reddened by acids, change purple cabbage infusion green, and yellow turmeric solution brown. Some bases combine directly with acids to form salts. This is the case with ammonia, strychnine, brucine, quinine, &c. Thus—

Others in combining with acids give rise to the formation of water in addition to the salt. Potash, lime, baryta, and most metallic hydrates belong to this class.

Caustic potash. Nitric acid. Nitrate of potash. Water.

Ba'han was part of ancient Palestine, to the E. of the Jordan, and was famous for the excellence of its pastures. It stretched from the brook Jabbok—the 'border of Gilead'—on the S., to Mount Hermon on the N. The Jordan was its western boundary, and its eastern the Syrian plateau. Ashtaroth and Edrei were the chief cities of B. under the Amorites, whose last king, Og, with all his sons, was slain near the latter city by the invading Israelites. The half-tribe of Manasseh settled in this fertile country. In the Greco-Syrian period it was divided into four provinces, Gaulanitis, Auranitis, Trachonitis, *Batanæa*—the name of the latter province, which belonged to the tetrarchy of Philip, and afterwards to that of Agrippa II., being a Græcised form of B.

Bashaw, a Turkish corruption of the Persian *Pasha* (q. v.).

Bashi-Bazouks, irregular troops in the service of the Sultan of Turkey, drawn principally from Asia. They formed a contingent during the Russian War, 1853-56, but though making excellent light cavalry, their predatory habits made them as formidable to their friends as to their enemies. In 1855 General Beatson undertook to collect and discipline a corps of B.-B., but peace being soon after concluded, their military capacity was not tested. Dr William II. Russell describes them as 'picturesque-looking scoundrels.'

Bashi' Islands, some eight in number, form the most northerly group of the Philippines, in the E. Indian Archipelago, and lie 120 miles S. of Formosa. Dampier discovered them in 1687, and named them from an intoxicating drink (*bashi*) used by the natives. Since 1783 they have belonged to Spain. The exports are sugar, hemp, and tobacco. Pop. about 8000.

Basidoh, an important British shipping station on the island of Kishm (q. v.), at the entrance to the Persian Gulf.

Basien'to, a river of S. Italy, which rises in the Apennines, flows in a southerly direction, and, after a course of 85 miles, enters the Gulf of Taranto, near the ruins of ancient *Metapontum*, and 25 miles W.S.W. of the town of Taranto.

Bas'il, the common name for *Ocimum Basilicum*, a dwarf plant belonging to the natural order Labiatae. It is generally cultivated as an aromatic pot-herb, and is used for flavouring dishes.

Bas'il I., founder of the Macedonian dynasty of Byzantine emperors, was born in 813 or 826. Gibbon narrates with incredulity the story of his descent from the Persian Arsacidae (q. v.). What is certain is that B.'s father was a small farmer near Adrianople, and that B. himself was carried off in infancy during an irruption of the Bulgarians, and was brought up as a slave in a foreign land. While still a youth he escaped with other Roman captives, and repaired to Constantinople, where in 854 he became chief chamberlain to the Emperor Michael III., whose concubine he married. He was created Augustus about 866, and having discovered that the Emperor had resolved on his destruction, B. caused him to be murdered, 24th September 867, and thenceforth ruled alone. His career as a sovereign is incomparably nobler than his life as a courtier. Gibbon (*Decline and Fall of the Roman Empire*, chap. xlviii.) finely expresses the difference: 'His aspiring genius stooped to the arts of a slave: he dissembled his ambition and even his virtues, and grasped with the bloody hand of an assassin the empire which he ruled with the wisdom and tenderness of a parent.' To terminate religious disturbances, he removed Photius from the patriarchal throne, and put Ignatius in his place. He reconquered Asia Minor from the Arabs, expelled their co-religionists from Italy, and displayed the greatest skill in the civil administration of the finances and of the laws. In February 886 B. died of wounds received while hunting the stag. There have been several editions of his *Capitula Exhortationum*, in sixty-six short chapters, addressed to his son Leo.

Bas'il, St., surnamed the Great, Bishop of Cæsarea, was born at Cæsarea in Cappadocia in 329, and was one of the most eloquent and spiritual of the Christian fathers. After studying at Antioch and Constantinople, he went to Athens, where he formed a friendship with Gregory Nazianzen. He was at one with the latter in his opposition to the Arians, for which he was for a time persecuted by the Emperor Valens. He founded a system of monasticism, by the austerities of which he probably shortened his life. B. succeeded Eusebius as Bishop of Cæsarea in 370, and died 1st January 379. So universally was he beloved that pagans and Jews vied with Christians in the expressions of grief; and in truth, the whole patristic age does not show a finer nature, one in which wisdom, tact, tenderness, toleration, and piety were more exquisitely blended. The first edition of his works, in Greek, appeared in 1532. Subsequent editions are those of Bale (1551), Paris (both in Greek and Latin, 1618), the *Benedictine* (Par. 1721), of which a new and fine edition was published by the MM. Gaume (Par. 1839). A complete translation of B.'s works into French by M. Roustau was published at Paris in 12 vols. in 1847.

Basil'ica, from the Greek *basilikê*, a royal residence, although there is no account of any 'royal residence' in Greece specially known by that name. The building in Athens called the *Basileios Stoa*, or Royal Portico, seems to have been, as to the purposes for which it was used, very much like a Roman B. This edifice contained the court of the Archon Basileus, and the Areopagus occasionally held its sittings there. The Romans, among whom the B. gained that prominence which has rendered it an object of historical importance, gave the name to public buildings with spacious halls, often surrounded with wide porticos, many of which were built at different times in the various forums of Rome, and which, in addition to their original uses as courts of justice, became market-places and mercantile exchanges. They were usually named after the person who caused them to be built, as the B. *Æmiliana*: the B. *Porcia*, mentioned under date B.C. 182, is the earliest on record. The principal feature of the B. was a large roofed building, supported on columns. The roof, or *testudo*, rose high above the other parts of the structure, which consisted of two galleries, placed one above the other, and round the internal sides of the central building. Each gallery, or *porticus*, was covered with a lean-to roof, the upper part of which commenced below the capitals of the columns which supported the *testudo*. The earliest basilicas were open, end and side, to the air; hence an instruction of Vitruvius that the B. ought to be built 'on the warmest side of the forum, that those whose affairs called them there might confer

Basilica of St. Agnese at Rome.

together without being incommoded by the weather.' Latterly a wall, with the columns externally enclosed in it, surrounded the building. Internally, a raised platform at the end of the central part of the building—that portion of it which was covered by the

testudo—served as the magistrate's tribunal. The light was admitted between the spaces formed by the under line of the architrave of the *testudo*, the upper line of the lean-to roof of the *porticus*, and the perpendicular lines of the columns. The B. of Trajan is the only one in Rome of which any considerable remains are left. The most perfect B. of antiquity exists in Pompeii; it is built on the S.W., the warmest side of the forum. The early Christian churches were constructed after the model of these familiar buildings. The space under the *testudo* became the nave, the lateral galleries, or *porticus*, became the side-aisles, and the magistrate's tribunal the Apse (q. v.). There are several churches in Rome each still named a B., the oldest of which, that of S. Pietro, is said to have been built by Constantine on the site of the circus of Nero. Throughout Italy, also, many of the principal churches retain in the name an evidence of the original model after which they were built. The Roman B. is, in fact, the form from which all Christian church-building arose. See Lübke's *Geschichte der Kirchen Baukunst des Mittelalters* (Leips. 1865), translated into English by Wheatley, with appendix and 184 engravings; 2d ed., Thos. C. Jack, Edinb. 1873.

Basil'ica, a digest in Greek of the Latin *Corpus Juris* of Justinian, made under the superintendence of three of the Greek emperors at Constantinople—Basil I., after whom it is supposed to have been named; his son, Leo VI., the Philosopher; and Constantine VII., Porphyrogenitus, who reduced it to its present form in the early part of the 10th c. From that time the B. was used as a code of jurisprudence in the Grecian empire. Fabrot's edition (Par. 1674) and Heimbach's (Leips. 1833-50) are the best; but the latter contains various readings obtained by the collation of several MSS. not examined by Fabrot.

Basilica'ta, a province in S. Italy, extends N. from the Gulf of Taranto, and is traversed by the Apennines. It is well watered, and abounds in fertile valleys, but the roads are bad, and earthquakes are frequent. The chief products are corn, wine, tobacco, hemp, and liquorice. Area 4122 sq. miles; pop. (1872) 508,880. Potenza (q. v.) is the capital.

Basil'icon Do'ron (Gr. 'royal gift'), a prose work of James VI., containing instructions to his son, Prince Henry, first printed in 1599; reprinted in London in 1603; translated into Latin verse by Henry Peacham, 1604; paraphrased in English and Latin verse by William Wilymat; and translated into French by Villiers Hotman. It is divided into three books; the first treating of a king's duty towards God; the second, of his duty in his office; and the third of his behaviour in things indifferent. The Synod of St Andrews censured the B. D. on account of the doctrines it contained on church government.

Basil'icon Oint'ment, is a popular name for the official ointment of resin. Its constituents vary in different countries. The chief ingredients are resin, wax, lard, and almond oil. It is employed as a stimulating application to foul and indolent ulcers.

Basil'idēs, one of the earliest Egyptian Gnostics, flourished at Alexandria in the first half of the 2d c. His system of doctrine, by which he sought to account for the origin of evil, was compounded of materials borrowed from the Pythagorean philosophy, oriental tradition, and the Jewish and Christian religions. The Supreme Being he did not venture to call by any name, but indicated by a mysterious symbol, which represented the number 365 (in Greek numerals this was the letters *abraxas*). From the Supreme were created subordinate intelligences, of whom the angels, in 365 orders, were the lowest. Each of these orders made a separate heaven, and by the lowest, the chief of whom was the God of the Jews, the world was created. This chief wanted to subject all the nations to his 'chosen people,' but the other angels of the order leagued themselves against him, and the only result was strife, hatred of the Jews, and the loss of the true religion. To restore this, the Supreme sent the First of the Intelligences (Christ) to earth; but he only took the appearance of a man under the figure of Simon of Cyrene, who was crucified, while he returned to heaven. His followers maintained themselves till the 4th c., when they became extinct. Only fragments of his writings re-

main. See Miller's *Philosophumena* (Oxf. 1851), and Hoofstede de Groot, *Basilides* (Ger. transl. 1868).

Basilisk (*Basiliscus*), a genus of lizards belonging to the family *Iguanida*, and inhabiting tropical America. It wants the comb-like back ridge of the true iguanas, but is provided with a broad dorsal membrane, which is continued to form a broader fold on the tail, and is supported by the spines of the dorsal and caudal vertebrae. The 'dewlap' of the iguanas is also absent, and the pores on the inner surfaces of the thighs, seen in the iguanas, are also wanting. The top of the head is provided with a membranous sac, which can be dilated by the admission of air. In habits, the basilisks are adapted for swimming, and for an arboreal life. The teeth are attached to the inner surface of the jawbone. The common B. (*B. Americanus*) is a familiar species, and attains an average length of 2½ feet.

Basilisk.

Basilisk, from the Greek *basiliskos*, diminutive of *basileus*, a king, was a fabulous creature of whom ancient and mediæval writers relate many wonders. It was found in the deserts of Africa. Pliny describes it as a serpent, and says that all other serpents fled at its approach; hence its name, rendered in the Vulgate *regulus*, while in the authorised version of the Old Testament the original *tsiphoni* is translated sometimes *adder* and sometimes *cockatrice*. Its breath scorched up all vegetation, and broke stones in pieces; at its touch the flesh fell from the bones of animals, and its glance destroyed life. Many species had marks on the head which were supposed to resemble a crown. If a man on horseback killed one of them with a spear, the poison would run up the weapon, and kill not only the rider, but the horse. In the middle ages it was generally represented as a lizard with eight feet. It is identified by many with the cockatrice, which was believed to be produced from an egg laid by an old cock, and hatched by a toad.

Bas'in, in geology, the depressed surfaces seen in rock strata, which may be produced by subterranean movements, by the solution and removal of underlying rocks, or by the action of glacier ice. Basins may be occupied by lakes, or may be filled up by formations of a more recent date—as in the London B., which is occupied by clays and sands.—B. is also a term used in geography to denote the entire region drained by a river and its tributaries, or the space between two watersheds. Thus the B. of the Ganges is the area between the Himalayas on the N. and the Vindhya range on the S. We also speak of the B. of a lake or sea. Thus the B. of the Mediterranean includes all the regions in Europe, Africa, and Asia, the waters of which flow into that sea.

Bas'ingstoke, an old market-town of Hampshire, 27 miles N.E. of Southampton, and 46 W.S.W. of London by road, and 48 by railway. It stands at the junction of four railways, and of five important roads, is also connected with London by two canals, and has an active trade in corn, coal, malt, and timber. In 1645 Cromwell stormed and burned to the ground Basing House, the castle of the Marquis of Winchester, after a defence of over two years. Near B. is an ancient camp, in the form of an embankment 1100 yards in circuit. B. is the election-town for the N. division of the county. Pop. (1871) 5574.

Bask'erville, John, well known for his services to typography, was born at Wolverly, Worcestershire, in 1706. In 1745 he engaged in japanning, into which art he introduced improvements that became to him a source of considerable wealth; later, he turned his inventive talents to printing, and succeeded, by cutting improved type, &c., in raising the art to higher perfection than it had ever attained in this country. His editions of a number of the classics, Bible, &c., are now very valuable as specimens of typography. B. was employed to print by the universities of Oxford and Cambridge. He died at Birmingham, January 8, 1775.

Basket, a kind of domestic utensil made of interwoven osiers or willows, rushes, twigs, grasses, or other flexible materials. The art of B.-making was probably one of the earliest arts

practised by man, and at all times in the world's history uncivilised nations have excelled in the art. Fragments of interwoven mats or other articles have been recovered from the prehistoric Swiss lake-dwellings; classical authors tell us that the B.-work of the ancient Britons was esteemed by the Romans; and natives of S. America at the present day construct vessels so closely woven as to hold water. The split-bamboo work of the Japanese displays great taste and elegance of design, and the minute wicker-work which occasionally encases their eggshell porcelain is unique. The most common materials for B.-making are osiers, which are extensively cultivated in the fenny districts, and along the river-banks of England. Those of the Thames and the Cam are most valued. B.-work is a coarse kind of weaving, in which the warp is represented by the stout osiers, designed as main-ribs for the structure, and the woof by the interwoven or wattled part. From the simplicity of the operations, the art is easily acquired, and is therefore well adapted as an employment for the industrious blind.

Basnage, the name of a French Protestant family, several members of which reached distinction in law, divinity, and general literature.—1. **Benjamin B.** (born 1580, died 1652), a theologian, whose treatise *De l'Eglise* (1612) was valued by his contemporaries.—2. **Henri B. du Franquesnay**, juriconsult, youngest son of Benjamin (born 1615, died 1695), was one of the most eloquent and able advocates in the Parliament of Normandy, and, like his brother, was held in great esteem both by Catholics and Protestants. Among his writings are *Costumes du Pays et Duché de Normandie* (1678, 1681, 1694), and *Traité des Hypothèques* (1687, 1724).—3. **Jacques B. de Beauval**, eldest son of the foregoing, and the most brilliant and accomplished of the family, was born at Rouen, 8th August 1653, studied theology at Saumur, Geneva, and Sedan, and was ordained to the ministry at his native town in 1676. In 1685, on the revocation of the Edict of Nantes, he left France and settled in Holland, first at Rotterdam, and afterwards at the Hague, where he became minister of the Walloon Church. He also took an active part in state affairs, and gave himself to the cultivation of literature. He was largely instrumental in promoting the alliance between England, France, and the States-General in 1717. He died 22d December 1723. Of his numerous writings, we can only mention *La Communion Sainte* (Rotterd. 1688), admired by Catholics as well as by Protestants; *Histoire de l'Eglise* (Rotterd. 1699); *Histoire des Juifs* (Rotterd. 1706); *Dissertation historique sur les Duels et les Ordres de Chevalerie* (Amsterd. 1720), a work full of curious erudition.—4. **Henri B. de Beauval**, brother of Jacques, born at Rouen, 7th August 1656, was practising as an advocate there when the revocation of the Edict of Nantes forced him also to seek an asylum in Holland, where he died, 19th March 1710. He is the author of *Tolerance des Religions* (1684), *Histoire des Ouvrages des Savants* (1687), and *Dictionnaire Universel* (1701).—5. **Samuel B. de Flottemanville**, grandson of Benjamin (born 1638, died at Zutphen, 1721), wrote, among other works, *Annales politico-ecclesiastici Annorum 645 a Casare Augusto usque ad Phocam* (Rotterd. 1706), and *De Eibus sacris et ecclesiasticis Exercitationes historico-critice*.

Basoches (a corruption of *Basilica*, the palace of the king), a corporation of law-clerks connected with the procureurs who attended the Parliament of Paris after it had ceased to be the King's Council. Created by Philip the Fair about 1303, the B. had many privileges: a king, wearing a cap like that of the French king, a blue and yellow standard, many officers, a legal jurisdiction in disputes of members, a right to issue currency, the curious right of 'plantation d'arbre,' &c. Every July they held a grand review, followed by a dramatic representation. This last was a species of morality, farce, or *sofie*, half-way between the *Religious Mysteries* (played by the Brotherhood of the Passion), and the *Fests of Fools*, and the modern drama. The B. began with abstract moralities, in which the characters had names, such as *Honte-de-dire-ses-Péchés*, *Espérance-de-longue-vie*, &c. They soon introduced allusions to passing events, and being found politically troublesome in the early disputes of the 15th c., these farces or satires were suppressed till the reign of Louis XII., who licensed their performance in the grand saloon of the Palais. They were again suppressed in 1540, but it is said the B. received about the same time a royal grant of the *Préaux-clercs*. *L'avocat Patelin*, although sometimes described as

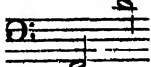

a *sofie* of the *Enfants sans Souci*, was probably a favourite farce of the B. The B. undoubtedly represent an original and fertile tendency of the French mind, which did not get fair play under the Renaissance.

Basque Provinces (Span. *Las Provincias Vascongadas*; Basque, *Euscaleria*), the name generally given to the united provinces of Alva, Biscay, and Guipuzcoa, in Spain, situated at the S.W. corner of the Pyrenees, and stretching W. along the Bay of Biscay. Total area, some 3000 sq. miles; pop. (1870) 471,989. The country is generally mountainous, but is intersected by many small rivers, and has numerous well-cultivated plains and valleys. It presents a highly picturesque mingling of the pastoral and the highland, a look of verdurous wealth being given to the landscape by the oak, beech, and chestnut forests which clothe the elevated slopes. Agriculture is still in a primitive state, and the soil is not rich. All the farms are small—the proprietor, his wife, and family being frequently the only labourers. Among the products are wheat, barley, maize, flax, hemp, fruit, and a miserable wine called 'chacoli' (Arab. *chacale*, weakness), of which the Basques alone are fond. Corn only ripens in the more favourable regions. The hills are rich in iron, copper, and tin, and also in marble, porphyry, and jasper. Besides farming, the chief occupations are commerce, fishing, iron-working of a rude kind, and smuggling. The Basques, or *Euscaldunac*, as they call themselves, make bad regular soldiers, but are celebrated for their obstinate valour in guerilla warfare. They form the backbone of the Carlist party, and it is amidst their rugged fastnesses that the civil war which has long distracted Spain still (1875) lingers on. Long independent, they voluntarily submitted to the kings of Castile in the 13th c., but reserved many rights (*fueros*), privileges, and immunities, which they retain to the present day; as exemption from the salt and tobacco monopolies, from conscription, &c.

The B. P. represent the *Cantabria* of the ancients, and, like our Wales, form a corner of the land from which no power has been able to dislodge the aboriginal inhabitants, who still preserve the marks of a distinct nationality in their government, language, manners, and costume. Their origin is still a disputed question, but scholars generally favour the opinion that they are the descendants of the old *Iberi*, who occupied the whole of the peninsula before the immigration of the Celts, and that they belong to a stock or family of nations who peopled Europe before the advent of the Aryan races. (See *ARYAN*.) Their language (*Euscara* or *Eguera*) shows no trace of connection with any Aryan tongue, and is probably Turanian. Four dialects are in use, but their literature is unimportant, consisting chiefly of proverbs, songs, and popular plays on political and historical subjects. See the *Grammars of the Basque Language* by Blani (1854) and Lardizabal (1856), the *Lexikon* by Chaho (1856), Humboldt's *Untersuchungen über die Urbewohner Hispaniens* (1821), Mahn's *Denkmäler der Bask Sprache* (1857), and the works of Michel (1857), Bladé (1869), and Garat (1869).

Bas-Relief (Ital. *basso-rilievo*, low relief). Figures which project only in a slight degree from the ground on which they are sculptured receive this appellation, in contradistinction to those of middle and high relief. See *ALTO-RILIEVO*.

Bass, or **Base**, in music, is, whether played or sung, the lowest 'part'—the one which forms the foundation of the harmony. Among stringed instruments the B. part is taken by the violoncelli and double basses; among reeds, by the bassoons and contra-bassoons; among brass instruments, by the ophicleide, bass trombone, bombardon, &c. Among voices, that which sings the B. part is called the B.: it is the lowest male voice, and its compass is in

ordinary cases  all these notes being chest notes.

Bass'a, Great, a port of the Liberian Republic, Upper Guinea, Africa, with a considerable export trade in pepper, coffee, cotton, and cocoa. The vicinity is rich in tropical fruits, such as lemons, bananas, and oranges. Pop. about 5000.—**Little B.**, 20 miles N.W., is a maritime village of some size.

Bassano, a town in the province of Vicenza, N. Italy, on the Brenta, 40 miles N.W. of Venice, with large silk and straw-hat manufactures, and a trade in wine, olives, and leather. It was

the scene of a victory of Bonaparte over the Austrians, under Wurmser, September 8, 1796; and near it other battles took place, 6th November 1796, 11th November 1801, 5th November 1805, and 31st October 1813. The French statesman Maret was made Duc de Bassano in 1811. Pop. 12,207.

Bassano, Giacomo da Ponte, an Italian painter, born at Bassano, 1510, pursued his art in Venice, inspired by the masterpieces of Titian, Parmegiano, and Tintoretto; retired to Bassano on the death of his father, and died there in 1592. His *Samson Destroying the Philistines* is, in parts, said to be not unworthy of Michael Angelo; and his *Nativity* and *Flight into Egypt*, in the style of Titian, compare not unfavourably with that master. After retiring from Venice, B. took to painting landscape, with animals and figures, and achieved great success in that department of art. He also painted many portraits of famous contemporaries—among them Tasso and Ariosto. His two eldest sons, Francesco (born 1541, died 1591), and Leandro (born 1560, died 1623), were also original artists of merit; the two younger, Giambattista (died 1613) and Girolamo (died 1622), were chiefly noted for their skill as copyists.

Basse, or **Sea-Dace** (*Labrax*), a genus of Teleostean fishes included in the Perch family (*Percidae*). The genus is represented by the B. or sea-perch (*L. lupus*), which is found chiefly on the southern coasts of Britain and in the Mediterranean. Allied species—such as the striped B. of the United States (*L. lineatus*)—occur in American waters, and also in the Mediterranean Sea. The body of the common B. is elongated and perch-like, and measures usually from 12 to 18 inches in length; but may greatly exceed these dimensions, and may weigh 15 or 16 lbs. There are two dorsal fins. Teeth are borne upon the jaws, vomer, palate, and tongue. The gill-cover terminates in two spines. This fish is valued as an article of food. The stone B. (*Polyprion cernium*) occurs in the S. Atlantic, in the Mediterranean Sea, and on the coasts of America, but is rare on the British coasts. The dorsal fin is single, its front half being spinous. This latter species feeds upon naupliques and other crustacea.

Bassein, the chief town of the district of the same name, province of Pegu, British Burmah, on the left bank of the river B., 75 miles from its mouth, with a pop. (1876) 22,417. Identified with the *Beynga* of the geographer Ptolemy. It was an important place under a succession of native rulers. On the right bank of the river are the shipping warehouses and steam mills for husking rice. The neighbouring plain is strewed with ruins of pagodas, monasteries, and colossal images of Buddha. In 1876-77 the exports were valued at £503,000; the imports at £44,000. The B. district has an area of 6517 sq. miles; pop. (1876) 302,858. Rice is the principal product of the district, which comprises most of the lower delta of the Irrawaddy. Another B., in the presidency of Bombay, 28 miles N. of Bombay, and 5 miles from the station of the same name on the Bombay and Baroda Railway, was once an important city and fortress. A treaty was signed at B., December 31, 1802, by which the *Peishwa*, the head of the Mahratta power, received an English force into his dominions, and prepared the way for his subsequent overthrow. Pop. (1872) 4063.

Basses, two groups of rocky islets, known as the **Great** and the **Little B.**, S.E. of Ceylon; the former in lat. 6° 8' N., long. 81° 30' E.; and the latter in lat. 6° 20' N., long. 80° 59' E., with a large granite lighthouse, erected in 1875.

Basse-Terre (Fr. 'lowland'), the capital of the English island of St Kitt's in the W. Indies, was founded in 1623, and has a good trade. The district was named B.-T. by the French, from its being the lower portion of the island, the portion occupied by the French till 1713. Pop. of town 7000.—**B.-T.** is also the name of the capital of Guadeloupe, on the S.E. coast of the island. It is a handsome town, with a pop. of 15,000.

Basset Horn (*corno di bassetto*), an old reed instrument very similar to the clarinet in quality and compass.

Bassia, a genus of tropical trees of the order *Sapotacea*. They have pulpy fruits, which enclose three or four seeds containing a fatty oil. The shea butter-tree mentioned by Mungo Park has been referred, as *B. Parkii*, by some authors to this

genus. The Indian butter-tree (*B. butyracea*) yields a useful lardaceous oil, which keeps sweet for a great length of time. Some species are important timber-trees, and others yield, in addition to their valuable oil, alcohol and medicinal products.

Bassompierre, François de, a French marshal, diplomatist, and author, was born at the château of Harouel, in Lorraine, 12th April 1579. A favourite at the court of Henry IV., he was appointed by the queen-mother (Marie de Médicis) Col.-Gen. of the Swiss Guards, and fought bravely in the early Huguenot wars of Louis XIII. Luynes sent him on embassies to Spain and Switzerland; and Richelieu sent him to England to adjust the dispute about the dismissal of Queen Henrietta's household. B., who had become a marshal of France in 1622, was present at the siege of Rochelle; but in consequence of his attachment to the Guises, Richelieu, in 1631, threw him into the Bastille, where he remained for twelve years writing his *Mémoires* (Cologne, 2 vols. 1665; Amst. 4 vols. 1723), which are valuable pieces of history for the period, 1598-1631. B. died 12th October 1646. He also wrote an account of his embassies (Cologne, 1661). His *Notes*, written in prison on a copy of the *Lives* of Henry IV. and Louis XIII., are bold and bitter. They were published at Paris in 1665. See M. de Puymaigre's *Vie de B.* (1848). B. was brave and witty, but also licentious, and a fop.

Bassoon (Ital. *fagotto*), is a reed instrument, the bass instrument of the Oboe (q. v.) family. It is made of wood, and furnished with holes and keys in the usual way. A small S-shaped brass tube is fitted to its narrowest end, and to the end of this wooden reed is fixed, which is held in the performer's mouth. The compass of the B. is about three octaves down from middle-line B \flat . Its natural key, as commonly used, is B \flat , but several varieties of the instrument are in existence, chiefly used in military bands.

Bassora, or **Bas'ra** now **Bussorah** (Semitic, 'fortress'), also in old writers, **Balsorah**, a town and river-port in the viçayet of Bagdad, Asiatic Turkey, on the W. bank of the Shat-el-Arab, formed by the junction of the Tigris and the Euphrates, and about 70 miles from the Persian Gulf. It is a filthy and unhealthy town, and most of the houses are built of sun-dried clay, in some instances faced with burnt bricks. In the middle of the 18th c. B. had a pop. of 150,000, which in 1824 had fallen to 60,000 after the pestilence and inundations of 1831, to 30,000 after the pestilence of 1838, to 12,000; and (according to Schlegel's 1862 est.) under 5000, chiefly Arabs and Persians. The neighbourhood is naturally one of the most fertile regions in the world, and with a little cultivation would yield abundance of the most various fruits; but the misrule of the Turk is ruinous to the land, and the date-palm is almost the only product of the region which is exported. 'The date-groves' (Consular Report, 1874) 'are of great extent and value; they form an almost unbroken line, from 1 to 3 miles in depth, along both banks of the Euphrates and Shat-el-Arab, from Medinah to the sea (i.e., for more than 140 miles).' In 1873 the yield amounted to 35,754 tons. The fruit is sent to the ports of the Indian seas, and thence transhipped to Europe. There is also a considerable trade with India in horses, and caravans ply between B. and the interior of Asiatic Turkey. At the time of the date-harvest, when all sorts of craft from the coasts of Arabia and Persia come to B., there is a short stir of life about the town. In 1862 the English Tigris and Euphrates Steam Navigation Company put on a steamer to run regularly between B. and Bombay, and in 1864 a telegraph wire connected B. with Kurachi in India. According to the Consular Reports of 1874, the British and British-Indian shipping entered at the B. custom-house (for 1873) was 118 ships of 35,208 tons. The chief imports are coals and piece-goods from England, tobacco from Persia, and coffee, sugar, pepper, and wood from India.

B. was founded in 636 by the Calif Omar to cut off the Persians from the sea, and to obtain the command of the Euphrates and Tigris, and rose into great importance as the emporium of Indian and Arabic wares for the califate of Bagdad, and as a seat of early Moslem poetry and scholarship. In the 10th c. Ibn-Risaa instituted here one of the first learned academies of the middle ages, and in the 12th c. it contained 7000 mosques. Next to Bagdad it plays the most important part in the *Arabian Nights' Entertainments*. In 1638 it fell into the hands of the Turks, and though it has frequently changed masters since, it has finally remained in their possession. A great wall, 94 miles

in length, has been built on the side nearest the desert, to guard the town against the incursions of Arab robbers.

Bass'o-Rilie'vo. See **BAS-RELIEF**.

Bass Rock, a singular islet, some 2 miles off the Haddingtonshire coast, near the entrance to the Firth of Forth. It is precipitous and nearly circular, being about a mile in circumference, and 350 feet high on the N.E. side, shelving down to the water on the S.W., where alone it is accessible, and where it was fortified at some uncertain date. The rock is of fine granular greenstone, is traversed from N.W. to S.E. by an immense cavern, visible at low tide, and is the resort of vast numbers of aquatic birds, including annually, it is estimated, some 15,000 solan geese. The Bass now belongs to the descendants of Sir Hew Dalrymple, and is rented by a keeper, so called. According to vague tradition, it was tenanted by St. Baldred in the 7th c.; but the first authentic incident in its history seems to be that it was the refuge of the son of Robert III., afterwards James I. of Scotland, prior to his English captivity of nineteen years. It was visited by James VI. in 1581, on which occasion 'Lauder of the Bass' stoutly refused to give up his property to the state. In 1651 the Church of Scotland Registers were deposited here in dread of Cromwell, to whom, however, they were surrendered in the following year. Charles II. acquired the Bass for £4,000 in 1671, and it was subsequently used as a prison during the persecution of the Covenanters. It was afterwards seized by a chivalrous band of twenty-four Jacobites, who defended it with courage and pertinacity (1691-94) as the last stronghold in Britain of the Stuart cause. Its fortifications were razed by order of William III. in 1701. See *B. R.*, &c., by Hugh Miller, Dr. Thomas M'Crie, Rev. James Anderson, and Professors Balfour and Fleming (Edinb. 1848).

Bass Strait separates Tasmania from Australia. It runs E. and W., and is about 200 miles wide. Its centre may be said to be at the intersection of the parallel of 40° S. and meridian of 146° E. It contains many islands, the chief being King, Flinders, Cape Barren, and Clarke islands. The strait bears the name of its discoverer, Mr. Bass, surgeon of H.M.S. *Reliance*. After an unsuccessful attempt to reach it in a whaleboat from Sydney, Bass obtained a sloop of 25 tons from Governor King of New South Wales, and in this vessel he not only discovered the strait (1798), but circumnavigated Tasmania. He was accompanied in this voyage by Flinders, but to Bass himself the credit of discovering the strait entirely belongs. Bass Strait is now an important ocean thoroughfare.

Bast, the fibrous inner bark or liber of plants. Although, strictly speaking, many of the most important fibres of commerce, such as flax and jute, are the products of B. or liber, the term is generally restricted to a few substances which retain much of their original bark structure in their industrial employment. Russian B., which is very largely employed by gardeners and for packing furniture, &c., is prepared from the bark of the lime-tree (*Tilia Europæa*), the B. being torn into strips and very coarsely woven. The 'tapa' cloth of the South Sea Islands is the B. of a tree (*Broussonetia papyrifera*), and this forms the chief paper-making material of the Chinese and Japanese. From the B. of the sabb-tree (*Antraris saccidora*) the Hindoos and Singalese prepare useful bags by beating the bark till it is loosened from a portion of the stem, which is then cut out, and a plug of wood attached to the bark is left at the lower extremity to form the bottom. In the W. Indies children's caps and small articles of dress are made from the inner bark of *Lagetta lintearia*, the fibres of which interlace so closely that the material has a very lace-like aspect. In Brazil the papery inner bark of the huge monkey-pot tree (*Lecythis ollaria*) is used for wrapping up cigarettes; and under the name of Cuba B., the same part of *Paritium elatum* is employed for tying up cigars. So-called B. brushes are made from the fibre of the leaf-stalk of the Piacaba palm (*Attalea excelsa*).

Bastard and Bastardy. By the law of England a child is a B. who is not born in wedlock or within natural time after its determination. But if the child be begotten while the parents are single, and they marry before its birth, the child is legitimate. Again, though the usual course of gestation is nine months, the law is not strict on this point. See **PREGNANCY**; **GESTATION**, **LAW REGARDING**.

The legitimacy or illegitimacy of the child of a married woman living in adultery is a question of evidence for a jury to determine. Legitimacy is generally presumed unless it be shown to be physically impossible that the husband of the woman can be the father of the child. But *access* of the husband is not conclusive of legitimacy; and in the Banbury case, though access was clearly proved, the House of Lords decided that concealment of birth of the child by the mother from her husband was enough to prove an adulterous issue. See **FILIATION**.

A B. has no rights but what he acquires; being in the eye of the law the son of nobody, he cannot be heir to any one, nor have heirs but of his own body. The law of England is especially harsh as regards bastards. Not only does it not allow a child born out of wedlock to be made legitimate by the subsequent marriage of its parents, but it has even been decided that when a child is so born in a foreign country, and so made legitimate according to the law of that country, it is still illegitimate in England, and subject to all the disabilities of illegitimacy. A B. may make an effective will, but if he die intestate, his succession falls to the crown. It is usual, however, for the crown to transfer its right to the nearest relative or relatives of the deceased B. In Scotland the law allows the legitimation of a B. by the marriage of its parents at any time. In both countries the widow of a B. is entitled to the same legal rights as if her husband had been legitimate. See **LEGITIMATION**.

Bastard Eigné, in English law, is an eldest son, illegitimate, whose father and mother have been married subsequent to his birth, and have had other children.

Bastardy, Declarator of, in the law of Scotland, is the legal procedure by which the crown's *donatory* or *donee* asks to have it declared that the lands or effects of a deceased bastard belong to him, in virtue of a gift from the crown. The defender called in the action is the person who, had the bastard been a lawful child, would have succeeded to him. A D. of B. seems also to be competent during the life of a bastard to any one who has a good title and interest to prove the bastardy. (See under **ACTION**, *Action of Declarator*.) In England, the same objects may now be effected under the Legitimacy Declaration Act, 1858.

Bastardy, Gift of. In Scotland the G. of B. conveys power to institute a Declarator of Bastardy (q. v.), which is necessary to entitle the *donee* to the crown to the gift.

Bastia, a fortress and seaport in the N.E. of Corsica, once the capital of the island, and still more important than the present capital, Ajaccio. A singular rock, resembling a lion couchant, and called by the natives 'Il Leone,' lies at the mouth of the harbour, which is defended by a mole. The chief Corsican courts sit at B. There are manufactures of leather and soap, and wine, oil, and figs are exported. B. has regular steamboat communication with Ajaccio and Marseille. The town was founded by the Genoese Lomellino in 1380. The language spoken is Italian, but French is generally understood, Corsica having come into the possession of the French in 1768. Pop. about 20,000.

Bastiat, Frédéric, one of the most brilliant, if not most profound, of political economists, was born at Bayonne, 29th June 1801. He became, like his father and uncles, a merchant, and in his leisure hours studied political economy. An article of his on English and French tariffs, in the *Journal des Economistes*, showed him to be opposed to protection in trade. He subsequently became the friend and ally of Cobden and the English free-traders, whose speeches he translated into French. At the same time he opposed Prudhon and the Socialists. He died of pulmonary disease at Rome, 24th December, 1850. B.'s works, one of which, the *Harmonies Economiques*, has been translated into English (Lonc. Murray, 1860) by D. P. J. Stirling, are written in an epigrammatic and sarcastic style, and are eminently readable. The best-known besides the one mentioned are *Sophismes économiques* (1846); *Propriété et Loi, Justice et Fraternité* (1848); *Protectionisme et Communisme* (1849); *Paix et Liberté, ou le Budget Republicain* (1849). The second edition of his *Œuvres Complètes*, in 7 vols., appeared in 1865.

Bastide, Jules, a French publicist, was born at Paris, November 22, 1800. He was one of the first members of the

French Carbonari, and fought gallantly in the revolution of July 1830, after which he became conspicuous as a writer against the Orleans dynasty. In 1832 he obtained the command of a legion of artillery, took part in the insurrection of June 5th, for which he was condemned to death, but managed to escape to London, whence he returned pardoned in eighteen months. He afterwards established the *National* and the *Revue Nationale*, special organs of republicanism, and at the revolution of 1848, held the office of Foreign Minister from May to December of that year. He contributed to M. Buchez's *L'Histoire parlementaire de la Révolution Française* (5 vols. 1845-47), and has published *L'Éducation publique en France* (1847), *L'Histoire de l'Assemblée Législative* (1st vol. 1847), *La République Française et l'Italie en 1848* (Brus. 1858), *Guerres de Religion en France* (2 vols. 1859, 3d ed. 1868). He has been one of the editors of the *Revue de Paris*.

Bastille, also **Bastide** (Old Fr. *bastir*, to build). In the 13th, 14th, and 15th centuries this word was used to denote a camp surrounded by an enclosure of some kind, which gave it the character of a fortified work, having some resemblance to a redoubt. The name was also given to any strong castle constructed in masonry, and has acquired historical celebrity in connection with the work built during the reigns of Charles V. and VI. for the defence of Paris. Before their time the approach to the city, on the site now occupied by the Faubourg Saint-Antoine, was defended only by two isolated towers. Hugues Aubriot, provost of the merchants, conceived the idea of erecting a fortress at this point. The works, begun in 1369, were finished in 1383, but additions were made at a later period. During the civil wars in France, the contending parties often strove for the possession of a stronghold that commanded the capital. From the first the B. was used as a state-prison. It is even said that Aubriot himself was its first inmate. In its later form it had eight towers of five stories each, the rooms in which had no fireplaces. Larger apartments with fireplaces were constructed in the walls connecting the towers, and were assigned to prisoners of importance. The prisoners were first conducted to the governor, to whom the police delivered the *lettre de cachet* authorising their imprisonment. There was accommodation for about eighty prisoners. The capture of the B. by the Parisian mob, 14th July, was the beginning of the French Revolution. Even the courtiers of the king recognised this. When the news was brought to Louis, he said, 'Mais c'est une revolt.' 'Sire,' answered the Duke of Liancourt, 'c'est une revolution.' Its demolition was decreed on the 16th, and with the materials the bridge of Louis XVI. was constructed. Not a vestige of the B. exists, but its site is marked by a column in the Place de la B. It has, however, occasioned a good deal of more or less interesting literature. See Linguet's *Mémoires sur la B.* (Lond. 1873); *Remarques historiques et anecdotes sur le Château de la B.* (Par. 1789); *La B. dévoilée* (Par. 1789); Bojanowski's *Einstimmung der B.* (1865); and Ravaissou's *Archives de la B.* (7 vols. 1866-75).

Bastina'do (from the Sp. *bastonado*, the same as the *bastonnade*, from *baston*, now *bâton*, a cudgel or stick), a Turkish and Chinese mode of punishment, in which the culprit is beaten on the soles of the feet with a baton or cudgel.

Bas'tion (Old Fr. *bastir*, to build), in fortification, is a part of the main enclosure or defensive works of a fortified town or other position to be defended. It is a species of low, broad tower, and the rampart by which it is formed is disposed on four sides of a pentagon, two of which, technically called the *faces*, are the outermost, and meet in an angle, while the other two, termed the *flanks*, connect the opposite extremities of the faces with the *curtain*, which is that plain-wall portion of the rampart, usually a polygon, which is run round the fortified place. The fifth side of the pentagonal B. is generally unoccupied by the rampart, opens towards the interior, and is called the *gorge*. The B. is mainly a mound of earth, capable of supporting heavy ordnance, and resisting the fire of the assailant; but it is faced and strengthened, where the military engineer thinks needful, with stone or brick. When the interior of a B. is filled to the top with earth, rubble, or other materials, it is technically called *solid*: it is a *hollow B.* when its floor is level with the town. The detached B., or *lanette*, was devised by Vauban to enable the besieged to hold out after the main bastions were taken.

Basuto Land. See KAFFRARIA.

Bat, the name given to the members of the Mammalian order *Cheiroptera* ('hand-winged'), the distinguishing characters

of which group consist in the elongation of the fore-limbs, and in the development of the digits of those limbs, which, with the exception of the thumb, are remarkably long, and serve to support a patagium, or flying-membrane. This membrane, besides stretching between the greatly elongated fingers, extends also along the

Bat.

sides of the body, between the fore and hind limbs, and in many instances between the hind-limbs and tail. The other characters which distinguish the *Cheiroptera* are included in the possession of one or two pairs of mammary glands borne on the breast. The third, fourth, and fifth fingers are destitute of nails, the second digit generally wanting a nail also. The thumbs are always provided with hooked, claw-like nails, by means of which these creatures suspend themselves from the walls of their habitations. The bats are most active in flight, the patagium serving as wing-like organs, aided by the extension of the fore-limbs. They progress awkwardly on the ground. When on the ground, the thigh-bones, from their position, are twisted backwards and upwards, the knee having the same position, and the toes being disposed outwards and slightly backwards; the fingers are also bent upon the palms of the hands, the wing-membrane being folded upon the sides of the body, the thumbs alone being extended. As thus placed on the ground, the bats move with a shuffling, interrupted gait, by pushing themselves from behind with the hind-limbs, and pulling themselves forward with the thumb-claws. Besides suspending themselves by the thumbs, the bats also attach themselves by the claws or nails of the feet, and thus hang head-downwards, with the wing-membrane folded over the front portion of the body. The hind-feet usually possess five toes, which are all of proportional length, and are provided with strong hooked nails. The patagium is generally destitute of hairs on both sides, and is of leathery consistence. The body itself is covered by a light, delicate fur. In the structure and disposition of the skeleton, the bats do not present many further peculiarities than those included in the elongation of the fingers. The neck vertebrae are large in proportion to the other spinal segments. The ribs are also large, and the chest is capacious. The breast-bone possesses a keel-like crest or ridge, to which the muscles moving the wing-like fore-limbs are attached. The collar-bones are strong. The *ulna* is most frequently of rudimentary description, the *radius* forming the chief bone of the fore-arm. The pelvic-bones are long and narrow, and are not united in front at the pubis—a disposition of parts also seen in *Insectivora*. The *fibula*, or smaller bone of the leg, like the *ulna* of the fore-arm, is rudimentary. A special bone, known as the *calcar*, exists to the inner side of the ankle-joint, and supports the wing-membrane. None of the bones are filled with air as in birds. Three kinds of teeth—incisors, canines, and molars—are present. In those bats that eat fruit, the molars are tuberculate; whilst they are provided with sharp-pointed cusps or processes in the insectivorous forms. The stomach is most complex, and the intestine largest in the fruit-eaters. No caecum exists. The brain-surface is smooth, and destitute of convolutions, and the cerebellum, or lesser brain, is uncovered by the lobes of the cerebrum, or true brain. The senses of the bats are present in tolerable perfection. The eyes are small. The ears are generally large, and these, together with the nose, may be provided with folds of skin, of service in increasing the intensity of sound, and in intensifying the sense of smell. The sense of touch is present to a high degree in the patagium. In habits, most of the bats are nocturnal, and sleep by day suspended in the crevices of buildings, in caves, or in the recesses of trees. During winter they hibernate. The food varies, some forms subsisting on insects, others on fruits, whilst some (e.g., vampire bats) have attained a notoriety from

their habit of sucking the blood of other vertebrate animals. The testes of the males are abdominal, but descend into the perineum at the breeding season. The uterus of the female may be horned, or present a rounded extremity. As an order of Mammals, the bats present near affinities to the *Insectivora* (e.g., moles, shrews, &c.), and by most naturalists are regarded as insectivorous forms modified for an aerial life.

The *Cheiroptera* are divided into two sections. The *Frugivora*, or fruit-eaters, represent the first of these. These forms are distinguished by the number of incisor teeth, which do not exceed four in each jaw. The nose and ears possess no foliaceous or leaf-like appendages. The hinder part of the stomach is greatly elongated. With a single exception (*Hypodermis*), all the *Frugivorous* bats possess nails on the second finger of the hand. The crowns of the molar teeth are marked by a longitudinal groove. These bats, sometimes termed 'fox bats' from the fox or dog-like shape of the head, possess elongated muzzles. The tail is short or wanting. Incisor and canine teeth exist in both jaws, and the molars are tuberculate. The *Pteropida*, or fox bats of the Eastern Archipelago, of which the Kalong B. (*Pteropus adulis*) may be cited as an example, represent this group. This family includes several other genera—such as *Hypodermis*, *Harpyia*, &c. These bats do not refuse to eat birds, or even mammals of small size. They are chiefly inhabitants of Java, Borneo, Australia, and Africa. They are not found in the New World.

The second group of bats is the *Insectivora*, or insect-eating forms, whilst some suck the blood of mammalia. The second finger of the hand is nailless in these forms. The molar teeth are provided with cusps, and number more than six or less than four on each side of each jaw. The incisors may number four on each jaw, or four above and six below, but are occasionally present in less number. The nose and ears are usually provided with curious leaf-like appendages, giving to these bats a most singular appearance. The tail is long, and may be prehensile. The *Vespertilionida* form the first family, and are represented among many others by the little Pipistrelle (*V. pipistrellus*), which forms the common British species; by the Long-eared bat (*Plecotus auritus*), distinguished by the length of the ears, which meet above the forehead; and by the Noctule (*V. noctula*), which measures 6 inches in length, and about 15 in expanse of wing. In this family the nose has no leaf-like appendages. The *Rhinolophida*, or horse-shoe bats, possess leaf-like nasal appendages. In other respects they resemble the members of the previous family. The greater and lesser horse-shoe bats of Britain (*Rhinolophus ferrum-equinum* and *R. hipposideros*) are examples of this group. Their popular name is derived from the form of the nasal appendages. The *Phyllostomida* or Vampires form the last family of the order. The ears in these latter bats are small, and the nose has foliaceous appendages. The canine teeth are large, and four incisors exist in each jaw. The vampires are found only in tropical America. The typical vampire (*Phyllostoma spectrum*) measures about 2½ feet in expanse of wing. These forms suck the blood of birds and larger mammals—such as horses, cows, &c.—although it appears they attack man only under exceptional circumstances. Darwin mentions the fact of a horse having been bitten, the bite leaving no bad effects save a little inflammation, which soon disappeared.

The bats are first represented as fossil organisms in the Upper Eocene rocks by the *Vespertilio Parisiensis* of the Gypseous series of Montmartre, in France. In Miocene, Pliocene, and Pleistocene rocks, other species of this genus occur. The *Rhinolophida* are found in cave-deposits, and the vampires occur in similar deposits in Brazil.

Batan'gas, the capital of a province of the same name, stands on the W. coast of Luzon, the largest of the Philippines, 50 miles S. of Manila. It was founded in 1581, and carries on considerable trade. Pop. of town and province, 17,000.

Batar'deau (diminutive of Old Fr. *bastard*, a dyke; perhaps from *bastie*, to build), a strong wall built across the ditch of a fortification, with a sluice-gate to regulate the height of the water on both sides of the wall.

Bata'tas, a genus of Dicotyledonous belonging to the natural order *Convolvulaceae*, embracing about twenty species. *B. adulis* yields the sweet potato. The plant has handsome purple

flowers, resembling those of a *convolvulus*, and large edible roots, which are largely used as food in tropical countries. It is cultivated throughout the globe wherever the climate is suitable, extending from S. America to the warmer parts of the United States in the New World, and from the Malayan Archipelago to Japan in the Old. It is also grown in Spain.

Bat'avi, or **Bata'vi** (also **Vatavi**), a people first mentioned by Caesar, were an offshoot of the Chatti, a German nation, who left their home, and, along with the Canninefates, occupied an island in the Rhine. This island—*Insula Batavorum*—was formed by the N. branch of the Rhine, by the Waal, and thereafter the Maas, and by the sea. The B. were good horsemen, and served as cavalry in the Roman army. In A.D. 69 they rose in rebellion under Claudius Civilis, but were completely subdued. They remained, however, exempt from taxation, and enjoyed the title of brothers and friends of the Roman people. After the 3d c. they disappear among the Salian Franks.

The *Batavian Republic* was the name applied to the Netherlands after the change of their constitution by the French, 16th May 1795, and retained till 5th June 1806, when Louis Bonaparte was declared King of Holland.

Bata'via, the capital of the Dutch possessions in the E. Indies, situated on the N.W. coast of Java, at the mouth of the Tjiliwong, is the chief emporium of the Eastern Archipelago. Its proverbial unhealthiness has been considerably modified by draining the marshes, by a better arrangement of the streets, and other sanitary improvements. The town is intersected by canals, and the harbour affords anchorage for large ships. The Dutch established a factory here in 1612, but when Holland became subject to France, B. fell into the hands of the French. It was taken from them in 1811 by the English, who restored it to the Dutch in 1816. A telegraphic cable has been laid between B. and Singapore, which threatens to divide with it the trade of the East. A railway from B. to Buitenzorg has been worked since 31st January 1873. Pop. (1872) 65,000.—The province of B., in the N.W. end of the island, is in general flat, and owing to the scarcity of water, not quite so fertile as other districts of Java; but it produces rice, coffee, sugar, tobacco, rattans, tea, pepper, fruits, and vegetables. The forests in which it once abounded have been cut down for the use of the sugar-factories. The Chinese element is rapidly increasing, and the principal industries are now mostly in their hands. There are sugar-works and distilleries, tin, copper, and dye works. The religion of the natives is Mohammedan, and the language is a mixed tongue, known as the Low Ma.ay. Pop. (1872) 401,563, of whom 4145 are Europeans, 41,137 Chinese, 943 foreign orientals, and the rest natives.

Batawa' Palm. See **CENOCARPUS**.

Bat'enburg, a small town in the province of Gelderland, Netherlands, on the Maas, 26 miles S.E. of Utrecht, chiefly notable as the *Oppidum Batavorum* of the Romans.

Bath, the largest city in Somersetshire, lies on the Avon, in the N.E. of the county, 10 miles S.E. of Bristol, and 106 W. of London by railway. It was long the gayest watering-place in the kingdom, and is still one of the most beautiful cities of Europe, nestling in a well-wooded valley, and built of fine white freestone or oolite obtained from quarries in the vicinity. Its principal buildings are the Abbey Church, with a tower 150 feet high; St James's and St Michael's Churches; an assembly, theatre, and concert-rooms; a museum, guildhall, club-house, and the establishments connected with its baths. There are also two public parks, a philosophical institution, a mechanics' institute, a subscription library, and many high-class schools. New waterworks were introduced (1876) at a cost of £100,000. B. owes its importance to its hot chalybeate springs, of which there are four, having a temperature of from 97° to 117° F., and discharging 184,320 gallons daily. The complaints chiefly benefited by the waters are palsy, rheumatism, gout, scrofula, and diseases of the nerves, bile, and skin. From the middle of the 18th c. to the time of the Regency of George IV. was perhaps the most brilliant period in the history of B., and it still continues to be a resort of the fashionable. It sends two members to Parliament. Pop. (1871) 53,704, greatly increased occasionally by visitors. The springs of B. were known as early as the 1st c. to the Romans, who had here a station called *Aqua Solis*, or *Aque Calide* or *Sudate*. The present name was given to it

by the English conquerors, to whom it was known as *Las Bathas*, also *Acmannes Caester* ('city of the sick man'). The first extant charter of the town dates from the reign of Richard I. In 1092 the see of the Bishop of Wells was transferred to B., and since 1135 the bishopric has been styled after both places. Many valuable Roman remains have been found, including extensive remains of baths.

Bath. The practice of bathing has existed from the earliest times. It seems to have had a moral significance, a connection being generally recognised between 'the bodies washed with pure water,' and 'the hearts sprinkled from an evil conscience.' Among the Egyptians it was a religious rite. Among the Jews it formed part of the ritual of purification prescribed by Moses; and the reference to 'pools,' as Hezekiah's and that of Siloam, indicate the existence of provision for public bathing. Among the Greeks, also, the practice was familiar. It is frequently mentioned by Homer, as in the charming scene in the *Odyssey* where Nausicaa and her companions bathed in the river. The cold daily B. in the Eurotas was a prominent feature of the hardy training of the Spartans; and their use of a chamber heated with warm air supplied the Romans with the name *laconicum*. Very little, however, is known of the nature of the baths of the Athenians. Among the Romans in early times the B. was used sparingly, and only for sanitary purposes. In the days of the Empire, the appetite for it became immoderate, and it degenerated into an enervating luxury. We have abundant means of forming a clear idea of the arrangement of the Roman baths from ancient writers, from the remains in existence, as the *Thermae* of Titus, Caracalla, and Diocletian in Rome, and especially the public baths excavated at Pompeii in 1824-25, and also from the well-known picture, given below, found upon a wall in one of the rooms of the *Thermae* of Titus. The essential

Roman Baths.

parts of a Roman B. were (1) the *apodyterium*, or undressing room, connected with the *laconicum*, or anointing room; (2) the *frigidarium*, an unwarmed room, having within it, or adjoining it, a cold B.; (3) the *tepidarium*, a chamber heated with warm air, to obviate the danger of a sudden change of temperature, and sometimes containing a tepid B.; (4) the *caldarium*, the chamber in which the hot B. was placed, was the most important part of all, and contained several objects of interest. The floor rested on small pillars, and through the flues (*suspensurae*) thus formed the heat from the furnace (*hypocaustum*) was circulated. The *laconicum* was a vapour B., the temperature of which was raised by a pipe or hollow pillar, which communicated directly with the fire, and from which the flames streamed out through the valve, or *clypeus*. The *labrum* was a shallow vase of not less than eight feet in diameter, containing cold water, with which the bathers sprinkled themselves. The *alveus* was a hot-water B., sunk in the floor. The water was heated in three vessels, placed at different heights (the cold water being highest, and the hot lowest), and connected by pipes with one another, and with the B.-rooms. The bathers took with them oil to anoint themselves, as well as *lintea* or towels and *strigiles*, to dry themselves with. The *strigiles* were scrapers, made of horn or metal, by which oil and impurities were removed from the skin. The public baths were frequented not only by the common people, but by persons of rank, and latterly even by the emperors themselves. They were opened at sunrise, and closed at sunset. The price of a B. was a *quadrans*, about half a farthing of our money. The B. was usually taken after exercise, and previously to their principal meal. At first the women bathed in company, apart from the men; but under the

Empire the custom prevailed of men and women bathing indiscriminately together. This was indeed forbidden by several emperors; but the baths became by degrees the scenes of unbridled debauchery. It was a common way of courting popular favour to give the people the free use of baths. Agrippa carried this so far as to erect 170 free baths; and he too was the first to construct the palatial edifices known as *Thermae*, where the citizens thronged to enjoy the pleasures of gymnastic exercises and of bathing, and which were splendidly adorned with pictures and statues. The baths of Agrippa were far surpassed by the baths of Titus, and they in turn by those of Caracalla, Diocletian, and Constantine. Indeed, the necessity for propitiating in this and other ways the indolent and exacting populace of Rome was one of the earliest signs, as it was one of the chief causes, of the decline and fall of the Roman empire.

The code of Mohammed enjoins frequent ablutions, and hence the practice of bathing is common in all countries that have adopted the religion of the Arabian prophet. Among northern nations the use of the B. was long unknown. Tacitus, indeed, speaks of the cold river-bath of the Germans, but this, like the plunge of the Spartan in the Eurotas, was designed to harden rather than to purify the frame. It is believed that the first knowledge which the northern Europeans obtained on the subject dates from the period of the Crusades; but, as some one has wittily remarked, a great many ages of civilisation passed over the nations of Western Europe before it occurred to the people that they ought to wash themselves. At the root of this dangerous neglect were ignorance of physiological law, and some superstition, originating perhaps in the coarser forms of monachism (unhappily not yet quite extinct even among those who hate monachism), which led men to believe that to neglect the body was to benefit the soul. The spread of the public B. in modern times is, therefore, to be hailed as a wholesome sign of the advance of morality. If it be true that a large share of the crime and disease prevalent in the lower classes of society is owing to dirt and untidiness, the institution of the public B. must be regarded as one of the most important social improvements of our age; and we may further feel encouraged to hope that it is as yet but begun, and that philanthropic and legislative effort will not pause until dirt, and foul drainage, and bad ventilation are banished to the realms of 'chaos and ancient night,' until the humble home of the mechanic is as pure and wholesome as the country-seat of the gentleman. That this result is not an impossibility, the success of the efforts of the last thirty years goes far to prove. The first public B. was opened at Liverpool in 1842, and was followed by the establishment of similar institutions in London and Edinburgh in 1844. Taking advantage of the Act of Parliament passed in 1846, the parish of St Martin's-in-the-Fields erected an extensive establishment of public baths and wash-houses, and the example of this parish was soon extensively followed in London. In all these establishments arrangements are such as to ensure cleanliness and propriety. One or two of the establishments add shower and vapour baths; others have swimming-baths; but plunge, cold, and tepid are generally the only kinds provided. The compartments for washing clothes are fitted up with every convenience. The 'wringing' is performed by machinery, and the clothes are dried in apartments heated with hot air. There is an ironing-room with all conveniences. In some of the institutions there is an ironing-board and drying compartment attached to each washing apartment. The charge is from 1d. to 2d. or 3d. per hour, according to accommodation and class.

Most of our great towns have now followed the example of London; so also have some of the Continental towns, among the earliest being Hamburg and Brussels (1852), Berlin (1853), and Vienna (1856). As early as 1855 numerous public baths had been constructed in Paris, and in that year the French government voted £24,000 to assist their establishment throughout the country. It is satisfactory to be led, as we are, to believe that in England and Scotland at least these B. and washing establishments have been so far appreciated by the community as to be generally self-supporting, or nearly so. It is also satisfactory to note that wealthy philanthropists are directing their wealth and philanthropy into this channel, and that the truth is coming to be understood and acted upon, that to benefit the human body is to benefit the human soul, and that the welfare of the two is inseparable. Mr Bell, M.P. for Derby, in June 1873, presented the borough with a free bathing

and swimming establishment. A large public B. on the Thames was also opened in 1875.

Bath (in medicine). The term B. is used to denote the complete or partial immersion of the body in a fluid or gaseous substance, for the purpose of producing some beneficial effect on the patient. Baths may consist of water varying from 30° F. to 112° F., according to the condition of the patient and the object to be gained. The effects of baths are very different, according to their temperature, and the time during which the patient is subject to their influence. The effect of a *cold B.*, of a temperature below 60° F., is first a sensation of cold accompanied by oppressive breathing in convulsive gasps. This state is due to the contraction of the cutaneous blood-vessels, and the retraction of the blood to the internal organs, and also in part to the shock upon the nervous system. This is soon followed by a feeling of warmth, and unless the patient remains too long in the B., there is invigoration of the whole system. In a B. of this temperature the patient should not remain more than five minutes. This B. is useful in certain debilitated states of the system, but is to be avoided by feeble persons, by those in whom there is a tendency to congestion of the heart, and by those in whom there is organic disease of the heart or kidneys. The *warm B.* is specially useful in the convulsions of children, inasmuch as it soothes nervous irritation, and relaxes muscular spasm. Baths, by removing mechanical obstructions, tend to promote perspiration and restore a healthy action to the skin. A *foot-B.* consists in immersing the feet and legs in water, generally used as hot as the patient can bear it. It is valuable in the early stage of congestion of the lungs, bronchitis, congestion of the heart, and allied diseases. Baths frequently contain some substance in solution, whereby their efficacy is greatly increased, as mustard in the foot-B. A B. containing nitric and hydrochloric acids, in the proportion of one drachm to two or three gallons of hot water, is specially recommended in torpid states of the liver. Various organic salts in solution often increase the value of a B., as common salt in sea-water. Soda, iodine, creosote, sulphur, and arsenic in variable proportions, have all been recommended with more or less advantage in skin diseases. A mercurial vapour-B. has been highly recommended in syphilis. This is administered by placing the patient on a chair surrounded with an oil-cloth lined with flannel, and underneath the seat is burned a small quantity of some salt of mercury, and thus the patient is soon exposed to the vapours of mercury. Many medicated baths exist naturally, as sea-water; so too with many mineral springs, as the baths of Switzerland, so highly recommended in chronic skin diseases. The Turkish B. (q. v.) consists essentially of a *hot-air B.* The wet-sheet packing, so advantageous in certain febrile states of the system, is just a modification of the cold B. As baths exert such a powerful influence on the system, they should only be taken by invalids for medicinal purposes, under the advice of a physician.

Baths and Wash-Houses, Acts regarding. In the health and welfare of the inhabitants of towns, the Act 9 and 10 Vict. c. 74 provides for the establishment of B. and W. and open bathing-places. The council of any incorporated borough may adopt this Act, and any parish not within an incorporated borough may adopt it, with the approval of the Secretary of State. In parishes not forming part of a borough, the expenses of executing the Act are to be paid out of the poor-rates, and in boroughs they are to be charged on the borough fund, or paid for by a separate rate to be levied for the purpose, the income arising from the B. and W. being applicable towards the expenses. In boroughs, the management of the B. and W. is vested in the council; in parishes not within boroughs, it is intrusted to commissioners appointed by the vestry. The council, with the approval of the Lords of the Treasury, and the commissioners, with the approval of the Treasury and vestry, may borrow money for the purposes of the Act. Corporate lands and parish lands, with consent of the Treasury, may be appropriated for B. and W. A schedule of charges is appended to the Act; by it, a cold or shower bath for one person is not to exceed a penny; a warm or shower bath, or vapour-bath, is not to exceed twopence. For four or fewer children, not over eight years old, bathing together, these charges are respectively twopence and fourpence. For higher-class baths, the council or commissioners may fix the charges at any price not exceeding three times the above charges. Wash-houses are to be provided with all requisite appliances: the charge for one hour is not to exceed a penny; for two hours,

it is not to exceed twopence. Wash-houses of a higher class to be charged as the authorities think fit. Open bathing-places, where several bathe in the same water, are to be charged, for one person one halfpenny.

Bath-Brick, a yellow, friable brick of siliceous material, largely used for metal polishing, especially in domestic economy. It is manufactured at Bridgewater from a very fine siliceous sand.

Bathgate, a town of Linlithgowshire, in the centre of a rich mining district, 17 miles W.S.W. of Edinburgh, and 24 E. of Glasgow by railway. The barony of B. belonged to Robert the Bruce, and passed to Walter the Steward of Scotland, who married his daughter; but in 1663 the charter of Charles II. made the town a free burgh of barony. The inhabitants are chiefly engaged in the coal, iron, paraffine oil, and lime works in the vicinity. The famous Torbanehill mineral or gas-coal is wrought here. Pop. (1871) 4991.

Bath, Knights of the. The origin of this order is thought to belong to the reign of Henry IV., who, it is said, at his coronation, made knights of forty-six gentlemen who had watched all night and bathed themselves before the ceremony; but the practice of bathing as an initiatory rite in knighthood reaches back probably to the dawn of chivalry. The order, which during the latter half of the 17th c. had fallen into oblivion, was revived by George I. in 1725. Its numbers were materially increased at the end of the war with France in 1815. It was, however, still purely military; but in 1847 it was opened to civilians. There are three classes:—*First class*, Knights Grand Cross (K.G.C.), limited to 50 military and 25 civil members, exclusive of the royal family and of foreigners. *Second class*, Knights Commanders (K.C.H.), limited to 92 military and 50 civil members, exclusive of foreigners. The members of both of these classes are addressed 'Sir,' and take precedence of Knights Bachelors. The first has precedence of all other knights except those of the Garter. *Third class*, Companions (C.B.), limited to 525 military and 200 civil members. They are not of the rank of knighthood.

Order of the Bath.

Bathori, a famous Hungarian family, which in the 14th c. divided into two branches, that of Ecsed and that of Somlyó, and for hundreds of years contributed men of consideration to the country. **Stephan B.** (died 1493), of the Ecsed family, is best known by his famous victory over the Turks at Kenyérmező in Transylvania (1479). Another **Stephan B.** of the same family was Count Palatine in 1516, and was conspicuous by his unavailing antagonism to Zapolya, who, after the battle of Mohacz (1527), sought to obtain the Hungarian crown. **Stephan B.** of Somlyó was appointed Vaida of Transylvania by Zapolya, after the latter had been chosen monarch of Hungary. His son, **Stephan B.**, elected Prince of Transylvania in 1571, was confirmed in that dignity by the Sultan Selim II., and also by the Emperor Maximilian. He was elected to the throne of Poland, was crowned at Cracow in 1576, and reigned prosperously till his death in 1586. His uncle, **Christoph B.** of Somlyó, was Prince of Transylvania from 1576 to 1581. He invited the Jesuits into his dominions, and gave them his son **Sigismund** to educate. The result was that **Sigismund** became a mere tool in their hands, and after a restless career and a double abdication, died at Prague, 27th March 1613. The last B. was **Gabor** (Gabriel), a son of **Stephan**, King of Poland, who was Prince of Transylvania from 1608 to 1613, but provoking by his cruelties an insurrection of the nobles, was murdered at Grosswardein, 11th October 1613. His purpose was to have handed over the government of Transylvania to Matthias of Hungary, but this scheme was frustrated by Bethlen Gabor (q. v.). The name of B., however, is more likely to be remembered by the crimes of **Elizabeth B.**, niece of **Stephan B.**, King of Poland, and married to Count Franz Nádasdy. She seems to have believed that the blood of young girls, used as a cosmetic, was effective in heightening and intensifying her

beauty, and on one occasion is said to have caused more than three hundred young women to be murdered, and to have bathed in their blood. The rumour of her horrible deeds at length became public, and the Palatine Georg Thurno surprised the Countess in her castle, and caught a wretch in the act of torturing a maiden. Two of her women servants were beheaded, and one of her male attendants was burned alive, 7th January 1612. The Countess herself was immured in a castle, where she died in 1614. The 'process acts' of the trial of this extraordinary character are still extant.

Bat-Horses (Fr. *bât*, a pack-saddle) are horses used in military service for carrying the regimental baggage, such as books, tents, stores, medicine-chests, &c. Those who manage the horses are termed *bât-men*, and the money set aside for providing this commodity is known as *bât-money*.

Bathos (Gr. *bathos*, depth), an unconscious descent from the elevated to the mean in thought or style. The ludicrous effect produced by the essential absurdity of the transition is heightened by this unconsciousness on the part of the speaker or writer. In the *of Sinking*, written conjointly by Swift and Arbuthnot, *B.* is opposed to the sublime.

Bath-Stone, a limestone of a yellow colour much employed for building purposes, quarried from the great oolite beds in the country around Bath. When taken from the quarry, the stone is soft and easily worked, but it quickly hardens on exposure.

Bathurst, a town in New South Wales, on the Macquarie river, 122 miles W. of Sydney, with which it is connected by rail. Gold was first discovered in Australia 20 miles from B. in 1851, and gold-mining is still very extensively prosecuted in the district. B. is the third town in New South Wales, and is well built and laid out. It supports three newspapers, and has numerous industries. It is a see of the Anglican and Roman Catholic Churches. Pop. (1871) of city and suburbs, 5000; of city and district, 16,826.

Bathurst, the capital of the British possessions on the Gambia, situated on St Mary's Island, at the mouth of the river, and the residence of the lieutenant-governor. It was founded in 1816. The pop., about 3000, consists chiefly of negroes. Stores and private dwellings occupy the principal street, and African huts the others. There is a government house, an hospital, and some schools. Exports, gum, hides, wax, gold, ivory, tortoise-shell, rice, cotton, teak, and palm-oil.—**B.**, a district of Canada W., on the right bank of the Ottawa, admirably situated for trade, to the development of which the removal of the government offices to Ottawa in 1858 has materially contributed.—**B.**, an island in the Arctic Ocean, lat. 75° N., long. 100°, discovered by Sir E. Parry.

Bathurst, an English family, several members of which, during the last three centuries, have achieved distinction.—**Ralph B.**, theologian, physician, and poet, was born at Howthorpe in Northamptonshire in 1620. He studied at Oxford, took orders in 1644, and the degree of M.D. in 1654. He assisted in founding the Royal Society in 1658, but at the restoration returned to the Church, and ultimately became Bishop of Bath. He died 14th June 1704. B. wrote a good deal of Latin verse, besides several medical and theological treatises. See *W. n's Life and Literary Remains of R. B.* (Lond. 1761). Of their sons of his brother George, the youngest, **Benjamin B.** was raised to the order of knighthood in the reign of Queen Anne, and died in 1704. His eldest son, **Allen**, first Earl of B., was born in 1684, and, after an education at Oxford, became, in 1705, member for Cirencester. He was an ardent Tory, and was one of the twelve peers created in 1711 to enable the ministers of the day, Harley and St John, to carry certain measures through the House of Lords. Later on he was a keen opponent of Sir Robert Walpole, on whose downfall he became a Privy Councillor. In 1772 he obtained an earldom, and died in 1775. B. is best known as the intimate friend of Pope and Bolingbroke, and seems to have been a man of great good-temper, taste, and wit. His son **Henry**, second Earl, born in 1714, took to the profession of law, and reached great eminence in it. In 1754 he became Chief Justice of the Common Pleas; and in 1771 was created Baron Apsley, and was made Lord Chancellor. He died in 1794. He is the author of a *Theory of Evidence*. **Henry**, the son of the Chancellor, and

third Earl B., was a notable Tory statesman. He was born 22d May 1762, became in succession teller of the Exchequer, commissioner of the Board of Control, Master of the Mint, President of the Board of Trade, Foreign Secretary, and (in 1812) Colonial Secretary. This last office he held till 1828, when he was made President of the Council. Such was his popularity, that many localities in the colonies were named B. in honour of him. On the accession of the Whigs to power, in 1830, he resigned office, along with the rest of the ministry. A man of integrity and good business habits, he was very highly esteemed by the members of his own party, while outside of it his amiability gained him many friends. He died July 26, 1834. His son, **Henry George**, who succeeded as fourth Earl, died in 1866, when the earldom passed to his brother, William Lennox.

Bathybius, the name applied to undefined masses of protoplasm existing in the beds of the oceans, and having imbedded in their substance minute calcareous bodies known as coccoliths. These coccoliths are frequently found associated together in the form of spherical masses termed *coccospheres*. The living protoplasmic B. has been assumed to be a Foraminiferous or animal organism allied to those which inhabit the sea-beds, whilst the coccoliths are presumed to be unicellular *Alga* or low sea-weeds, the coccospheres being the sporangia or seed-cases of these *Alga*. Their presence in B. would in this view be of an accidental kind. It has recently (October 1875) been asserted that B. has no real existence as an organism; the protoplasmic appearance being probably derived from the decomposing sarcoid matter of other organisms.

Bat'ides, a division of *Elasmobranchiate* fishes, represented by the *Skates* and *Rays*, in which the mouth and gill-openings are situated on the under surface of the body, which is generally greatly flattened and broadened. This broad appearance is given to those forms by the large size of the pectoral or breast fins, which are concealed beneath the skin, and thus add to the breadth of the body. The upper surface of the body bears the eyes and *spiracles* or apertures of tubes by which water may be admitted to the gills.

Batignolles. See BAGNOLET.

Batley, a town in the W. Riding of Yorkshire, 2 miles N. of Dewsbury, and a station on the London and North-Western Railway. It has a church, in the Perpendicular style, built in the reign of Henry VI., and also a handsome public hall. It is the chief town in the kingdom for the manufacture of army cloths and coarse woollens. There are over thirty factories. Pop. (1871) 20,871.

Batn-el-Ha'gar ('womb of rocks'), a wild, stoney region in Nubia, traversed by the Nile, and lying S. of the second cataract, in lat. 21°-22° N., and long. 30° 40'-31° 10' E. It is almost destitute of vegetation, beans and the fruit of the *ker-kedan*, a hardy shrub, being the chief food of the inhabitants, who are chiefly Beduins.

Bat'on, in heraldry, another name for the Bastard Bar (q. v.).

Baton, the name given to the short staff of a field-marshal, a drum-major's long staff, the wand of the conductor of a musical choir, and a policeman's truncheon.

Baton Rouge, a town, and formerly the capital, of the State of Louisiana, on an eminence on the E. bank of the Mississippi, 150 miles by the river above New Orleans. Pop. (1870) 6498. The district is very fertile, and produces abundantly cotton, sugar, and maize. B. R. was the scene of several important operations during the American civil war.

Batrach'ia. This term is used by Owen synonymously with AMPHIBIA (q. v.), to denote a distinct class of *Vertebrate* animals, represented by the frogs, toads, newts, land-salamanders, and allied forms. The name B. is used by Huxley to denote the *order* of Amphibia represented by the frogs and toads. The B. were formerly, and in some systems of classification still are, included in the class of *Reptiles*. But this arrangement is inconsistent with the structure and true nature of the amphibia, which possess much nearer relations with the fishes than with reptiles. The fishes and amphibia are thus included to form the *Branchiate* vertebrata, or those which breathe by *gills* or *branchia* at some period of life, or during their whole existence:

and Huxley has included these two classes to form his province of the *Icthyopsida*, or 'fish-like' vertebrata. The B. are distinguished,

Young or Larval Form of Triton.

firstly, by the fact that in early life they all possess gills, and later become provided with lungs. The invariable presence of gills in early life, and lungs in adult life, is the first great characteristic of these forms. The gills in some amphibia (as in frogs, toads, &c.), disappear when the lungs of adult life are developed; but in other B. (such as *Proteus*, *Axolotl*, *Siren*, &c.), the gills remain throughout life, and the animals in their adult state thus breathe both by gills and lungs. The limbs when present are not, as in fishes, converted into fins, and are supported, as in higher vertebrata, by definite appendages of the true or internal skeleton. The amphibia may possess *central* or *median* fins placed like those of fishes along the back or under the surface of the body, but such fins are never, as in fishes, supported by *fin-rays*. The skin of existing B. is generally destitute of any outside skeleton or external hard parts, such as scales or bony plates. Some forms (e.g., *Cæcilia*, *Ophippiger*) possess small scales concealed under the skin. In one extinct Batrachian genus (*Labyrinthodon*), an outside armour of bony plates was developed on several portions of the body. The skin in amphibia is thus usually soft and moist, and greatly aids in the breathing process of these forms. The skeleton of amphibia is always formed of true bone. Ribs are either wanting or rudimentary in these forms; the place of these bones being supplied (as in frogs, &c.) by the long transverse processes of the vertebrae. The skull is joined to the spinal column by two *occipital condyles*—a feature highly distinctive of the amphibia. The *Cæciliada* or amphibian blind-worms found in tropical regions, of all the B. alone want all the limbs. *Siren*, an American form, alone wants hind-limbs—and in all other amphibia, both fore and hind limbs are developed, although the limbs may be of a weak or rudimentary nature. Simple teeth generally exist, and are borne upon the other bones of the mouth besides the jaws. In some forms (e.g., Surinam toads) no teeth may be developed. The tongue may be undeveloped (as in Surinam toads and *Dactylethra*), or it may be fixed to the floor of the mouth (as in newts, &c.); whilst in frogs, toads, &c., the tongue can be protruded from the mouth, but is fixed to the front of the lower jaw instead of to the back of the mouth. Salivary glands are wanting, as such, in B. The digestive system is simple; the intestines ending in a *cloaca*, or cavity common to the digestive, urinary, and generative systems. The heart in all consists of two auricles and a ventricle. The impure blood from the body is returned to the right auricle, and is sent thence into the ventricle. The pure blood from the breathing organs is sent into the left auricle, and thence into the ventricle, so that a mixture of the venous or impure, and arterial or pure blood takes place in the ventricle, from which cavity the mixed blood is circulated through the body. This imperfect circulation is one well calculated to serve the slow, torpid lives of these creatures, and is characteristic of adult amphibia; the younger stages, as will be presently noticed, possessing a different circulation. The eyes are small, and are covered by skin in *Proteus*, *Pipa*, and the *Cæciliada*. The nostrils in all open posteriorly into the mouth. The sense of touch is subserved by the skin. A urinary bladder and kidneys exist in all. A very important and distinctive character of Batrachians is the occurrence of *metamorphosis*. The young (as in the frog) leave the egg as *tadpoles*. These larval forms soon develop external gills from the sides of the neck; these outside branchiæ soon disappearing, and being replaced by internal gills, borne upon the branchial arches. The hind-limbs then appear, and the fore-legs follow in order of development. Then the lungs are formed, and at this stage the tail and gills disappear, the frog leaving the water, and breathing throughout its future life by lungs alone. In other forms (e.g., *Proteus*, *Siren*, &c.), the external gills of early life are retained throughout the whole existence, lungs being developed in addition to the gills, and such forms are thus truly *amphibian*, being thus provided with two sets of respiratory organs.

In the tadpole, or larval state, breathing is solely performed by gills, and the heart then consists of a single auricle and ventricle, and of an arterial bulb as in fishes, and the purified blood from the gills passing to the body without returning to the heart. When lungs are developed, the pulmonary or lung arteries carry a certain proportion of the blood to these new breathing-organs, and thus the gills and lungs—in those forms in which both sets of breathing organs exist—each participate in the respiratory process. In those forms in which, like the frog, the gills of early life disappear, the pulmonary arteries grow larger and larger as the lungs are developed, the gills being deprived of blood, and thus shrivelling up; whilst the pulmonary arteries, or those which return the blood from the lungs, also increase in size, and develop a second (the left) auricle of the heart at their lower portion. The circulation then proceeds by means of the three-chambered heart as already described.

The different groups and animals of amphibia are described in articles relating to each group or animal.

Batrachomyomachia (Gr. 'the war of the frogs and mice'), a Greek mock-heroic poem parodying the *Iliad*. The author was not Homer, as popularly supposed in ancient times; but probably (as stated both by Suidas and Plutarch) Pigres, brother or son of the famous Carian queen, Artemisia. A good edition is that of Barrmeister (Gött. 1852).

Batrachus. See FROG-FISH.

Batsch, August Johann Georg Karl, a German naturalist, born at Jena, 28th October 1761, studied medicine under Gruner, Loder, and others, established himself as a physician at Weimar in 1781, and devoted his leisure to researches in natural history. After 1787 he successively filled at the University of Jena the functions of interim professor of natural history and medicine, titular professor of philosophy, and director of the society for the advancement of natural science. He died 29th September 1802. B.'s works are numerous and valuable. The principal are, *Elenchus Fungorum* (Halle, 1783); *Versuch einer Anleitung zur Kenntniss und Geschichte der Pflanzen* (Halle, 1787-88); *Versuch einer Historischen Naturlehre* (Halle, 1789-91); *Blumenzer gliederung aus verschiedenen Gattungen der Pflanzen* (Halle, 1790). A work remarkable for its new and original observations; and *Tabula Affinitatum Regni Vegetabilis* (Weim. 1802), in which one finds the first attempts at classification by natural families.

Batahan, one of the island groups of the N. Moluccas, taking its name from the principal island of the group, which lies S.W. of Gilolo, from which it is separated by the Patientia Strait, between lat. 0° 11'-0° 54' S., and long. 127° 10'-127° 27' E. Its chief products are rice, cloves, and sago. It also contains gold, copper, coal, and hot springs. A mountain range runs through the island, with many peaks from 2270 to 4050 feet high, and these are clad by forests of ebony, nutmeg, and satinwood, abounding in deer, wild hogs, reptiles, and birds of splendid plumage. Area 900 sq. miles; pop. not known. The chief village is Amassing, which lies on the W. shore of the island, at the head of a deep bay. The group, which is volcanic, consists of some twelve other islands, of which the largest are Kasiruta and Mandoli. These are in great part mountainous and sterile. See Bernstein's *Reisen in den Nördlich. Molukken* (1873); and Dr Petermann's *Mittheilungen* (vol. xix. part 6, 1873).

Batt's, an allowance made to British officers in India in addition to their pay. *Dry B.* is money given instead of rations; *wet B.* is given in kind; *full B.* is given when the troops are in the field, or above 200 miles from the capital of the presidency; and *half B.* when they are in garrison or cantonment within 200 miles from the seat of government.

Battalion, a division of infantry of variable size, comprising at present, in the British army, about 800 men, and seldom in any nation containing more than 1000 men even in time of war. In the British army, regiments consist of one or two battalions, except in the case of two, each of which comprises four. A B. is usually subdivided into twelve companies, of which those placed at the extremities of the line formed when the B. is drawn up in parade, and known as the 'grenadier' and 'light infantry' companies, are designated the wings. See REGIMENT.

Battas, a free people in the interior of Sumatra, neither of Negro nor Malay race, and without any kind of government. They are industrious, friendly, and hospitable, claim to be the first settlers in the island, and have a primitive form of religion. Cannibalism, however, is practised among them to a limited extent. They have been described by Junghuhn in his *Battaländer auf Sumatra* (1847).

Battaszek, properly *Bataszek*, a town in the county of Tolna, Hungary, near the right bank of the Danube, 10 miles W. of Maria Theresienstadt, produces excellent wine. Pop. (1871) 6542.

Battel, Trial by. In former times, in civil and criminal cases, the defendant had a right to appeal to this mode of deciding on whose side justice lay. It consisted in a battle with baton and target between opposing parties or between their champions. They fought from an early period of the day, either till one was killed or till twilight; and whoever killed his opponent, or had the best of the fight when the stars began to twinkle, was held to be victor, and consequently winner in the suit. In England, so late as 1818, the defendant in a case (*Ashford v. Thornton*) claimed the right of appeal to T. by B., and Lord Chief-Justice Ellenborough and his brother judges sustained the appeal. 'Whatever prejudices,' said Lord Ellenborough, 'may justly exist against this mode of trial, still, as it is the law of the land, the court must pronounce judgment for it.' The combat did not however take place, and an Act was passed abolishing T. by B. In Scotland, and in the nations of Europe, the legal doctrine is that a statute may become obsolete. In England the legal doctrine is that a statute has force until it has been repealed. The above incident should, we think, lead to some modification of the English doctrine.

Batten, the swing-frame of a hand-loom that beats home the weft or woof to the web, and along the bottom of which, on a ledge, the shuttle travels. The same instrument in Scotland is called the *lay* or *lathe*.

Battens, in carpentry, strips of wood from 2 to 7 inches broad, and from $\frac{1}{2}$ to 2 inches thick, used in walls for securing the laths before the plaster is laid on; on roofs the slates are nailed to them; they are employed also as flooring.

Batter, in architecture, when used as a verb, denotes that a wall slopes gently backwards; as a noun, it is the name given to a backward slope in a wall.

Battering-Ram, a military engine employed among the

Battering-Ram.

For the protection of those working it, a wooden roof (*testudo*) covered it, the whole apparatus moving on wheels.

Battersea, a suburb in the S.W. of London, in Surrey, on the S. bank of the Thames, and nearly opposite Chelsea, with which it communicates by means of B. Bridge, Albert Bridge, Chelsea Suspension Bridge, and also by a railway bridge. It was formerly famed among botanists on account of its fertile 'fields,' subsequently converted into the well-known public park which, since 1870, has been beautifully ornamented.

Battery, in criminal law, means an attack on any one by physical force. We restrict consideration of the subject under this title to cases in which insult alone is intended. The subject is further treated of in article *Beating and Wounding* (q. v.). To constitute the criminal offence of B., it is not necessary that

there be any intention on the part of the aggressor to injure or wound the person whom he assaults. The law does not permit any one even to touch the person of another in a rude or insulting manner; and any one so insulted has ground either for an action for damages, or he may proceed against the offender by a criminal indictment for a misdemeanour. It is essential, however, to sustain either procedure, that the offence complained of be serious in its effect; and it may be a sufficient defence that no harm was intended; or that the defender's position towards the plaintiff authorised the act complained of; as that the former was the father, guardian, or master of the latter. When the B. is towards a man's wife, procedure and reparation are regulated by statute of 16 and 17 Vict. cap. 76.

Battery (Fr. *batterie*, from *battre*, to beat), a military term of various significations. In the Army Regulations published in 1873, it is applied to a number of artillerymen, corresponding to a troop of cavalry or a company of infantry. There is a *field-B.*, in which the men are on foot and the officers mounted; and the *horse-B.*, in which both officers and men are mounted. The number of men and officers in each is proportioned to the weight of the ordnance: a field-B. of six 12-pounder rifle-guns consisting of 158 in time of peace, and of 277 in time of war. In a wider sense of the term B. it includes also the pieces of ordnance under the charge of these men, together with the horses, gun-carriages, ammunition-waggons, and other necessary *matériel*. In the British army a B. consists of 6 pieces of ordnance; in the French army, 6—under the Empire it was 8; in the German army it may be 4, 6, or 8 pieces; while in the Russian army it is 12.

A third meaning of the term B. has no reference to horses or waggons. In this sense it denotes two or more guns placed in position for attack or defence, called the *siege B.* and the *B. for defence*. There are many names for batteries in position, but there is a general similarity in their construction. The parapet is thrown up for shelter, and the guns are placed behind it. The platform on which the guns rest is the second general feature; the other is the ditch outside the parapet. According to the level on which the gun is placed, there is the *cavalier B.*, which fires over the enemy's parapet; the *elevated B.*, which has its guns on the natural level of the ground, the parapet being formed of earth dug up in front of it; the *half-sunken B.*, which stands in a shallow trench, the earth for the parapet being partly dug from behind; the *full-sunken B.* which is down in a ditch, the earth being all dug from behind. The kind of ordnance used gives name to the *gun*, the *howitzer*, and the *mortar B.* According to the direction or manner of firing, there is the *breaching B.*, which fires straight against the enemy's works, or *point blank* as it is called; the *enfilading B.*, which stands at right angles to the line of the enemy's rampart, and sends its shot so as to graze the interior of his parapet in the direction of its length; the *ricochet B.*, which discharges its shot so that it makes low bounds along the ground, with a view to its dropping over the parapet and disabling the enemy's gunners. In placing a *siege B.*, the guns are sometimes arranged parallel to each other, sometimes as portions of a triangle, at other times as portions of a polygon. See *Fortification*, *REDAN*, *EPAULEMENT*.

Battery, Electric and Galvanic. See *ELECTRICITY* and *GALVANISM*.

Battery, Floating. See *FLOATING BATTERY*.

Bathyan'yi, an ancient family of Hungarian magnates, taking its name from the territory of Battyán. Among its members who appear in history may be mentioned: 1. **Benedict**, who was treasurer to Vladislav II. (the Bohemian) about the time of the Hungarian peasant war.—2. **Balthasar**, who fought against the Turks in the time of Mohammed III. and Prince Mansfield.—3. **Charles Joseph, Prince B.**, born 1697, was an eminent field-officer in the Austrian service; he defeated the French-Bavarian army under Ségur at Pfaffenhofen in 1745, and was opposed to Frederic II. in the second Silesian war.—4. **Louis, Count B.**, was born at Presburg in 1806. He was a member of Kossuth's Nationalist party, against Chancellor Appony and the 'administrator' system. In 1848 he was president of the experimental ministry under Archduke Stephen as Palatine, and carried through the constitutional laws of 11th April. He tried to settle the Croatian question, and, in spite of the appearance of Ban Jellachich's army, he worked to the last for a political union with Austria. Subsequently, he persuaded

the Diet of Pesth to attempt a settlement with Windischgratz before hostilities began. B. did not fly with the Committee of Safety to Debreczin, but was captured at Pesth, and put to death at Vienna, 6th October 1849. See Horvarth, *Louis B., Martyr Politique*, 1850. In 1870 a festival was held in his honour, and his corpse was taken from the grave for the occasion.—**5. Oasimir** (Count), born 4th June 1807, a leading opposition member in the diets of 1840–43–44, and President of the Ved-Egylet (society for encouraging national production of all kinds). Emancipation of the serfs and publication of works in native speech were two of his objects. In 1848 he became 'Obergespan' in the district of Barany, and successfully held Essek and the navigation of the Drav and Danube against the Croatian army. On the proclamation of independence in 1849, B. became Minister of Foreign Affairs; and through the struggle which ended with the dictatorship and surrender of Görgei he shared the fortunes of Kossuth, with whom he was 'interned' by the Turkish government in Schumla and Kutayeh till 1851, when he went to France, and died at Paris, 13th July 1854. A Prince B. occupies at present a prominent position on the French turf.

Battle, a market-town in E. Sussex, 8 miles N.W. of Hastings. In the neighbourhood there are extensive works for the manufacture of gunpowder, for the excellency of which B. has long been celebrated. Pop. (1871) 3495. B. derives its name from the decisive victory won by William the Conqueror, October 14, 1066, on the heath between B. and Hastings, and which is commonly called the battle of Hastings. The following year William founded B. Abbey on the heath, endowed it with all the land within a league, and ordered prayer to be perpetually offered for the repose of the souls of all who had fallen in the conflict. B. Abbey had the privileges of a sanctuary. The abbot was mitted, freed from the authority of the metropolitan of Canterbury, invested with archiepiscopal jurisdiction, and possessed the prerogative of pardoning a criminal on his way to execution. In the abbey church were long preserved the sword and coronation robe of the Conqueror, as well as the roll of the chief nobles who had accompanied him to England. But the ancient pomp and solemnity are gone. 'The perpetual prayer has ceased for ever, the roll of B. is rent, the shields of the Norman lineages are trodden in the dust, the abbey is levelled with the ground, and a dank and reedy pool fills the spot where the foundations of the quire have been uncovered' (Palgrave, *Hist. of the Anglo-Saxons*, p. 328); yet the ruins, which occupy three sides of a quadrangle, are still extensive.

Battle-Axe, a weapon formerly employed in battle for purely offensive purposes. It was not in use among the Greeks

Battle-Axes.

and Romans, but was extensively used by the Gauls and the northern nations. In England, Scotland, and Ireland it was well known.

Battlement, in architecture, a wall or parapet with embrasures, or notches, through which to shoot missiles, or to watch. It was originally used only in fortifications; but was afterwards employed for ornament on ecclesiastical and other edifices.

Battle, Military. The manœuvring by which a general endeavours to gain preliminary advantage over his adversary—that is, the securing of his own line of communications, the cutting off of his enemy from his base, or putting him into disadvantageous position for battle—is called Strategy (q. v.). The manœuvring on the field is called Tactics (q. v.). On both of these elements will the result of a M. B. plainly depend. If troops are weakened from inadequate supply of food, and if they feel that their commander has been outwitted, there is

both a physical and a moral obstacle to contend against; and victory is seldom on the side of those who have lost confidence. Assuming equality, or something near it, in force and animus of opposing troops, victory must fall to the general who succeeds in being the stronger at that point of attack at which to prevail is to divide the force of the enemy, so that each division may in succession be attacked by a decidedly stronger force. Such were the tactics of Napoleon. He formed his attacking force into a column, which he threw in overwhelming force against the centre of his enemy; having cut through which, he was generally able to throw his whole force against one-half of that of the enemy, this half being thus commonly routed before the other could come to its support.

Battle, Naval. The grand endeavour in a N. B. was to get the 'weather-gage' of the enemy; that is, to get to windward of him. This gave the superior power of navigation, and subjected the opponent to the inconvenience of the smoke. To break the enemy's line, and then, by tacking 'its rear, to place his ships between two fires, was a favourite plan of the British naval commanders during the French war. It was thus that Nelson won the battle of the Nile. Under steam, and with the ironclad ships and tremendous ordnance and appliances of our own day, the theory of naval tactics has wholly changed. It is plain that battles will not now be decided almost hand to hand as formerly, but with the hostile vessels at a distance of two or three miles from one another.

Battue, a beating of the trees and underwood of preserved lands (Fr. *battre*, to beat), in order to raise and drive the game to a certain spot, where the sportsmen have agreed to take their stand, and bring down the advancing game. The common, but inaccurate, use of the word is to signify, not the beating of the birds, &c., out of cover, but the slaughter of them by the sportsmen after they have been so beaten out. In this sense the annual pigeon-shooting matches at Hurlingford may be described as battues; though in this case the game is not beaten up from cover, but brought up in baskets and liberated on the spot. Though the term B. is modern, the practice of driving game together and destroying them is old, and perhaps universal; and when justified by the necessity of providing a large quantity of food to meet an emergency, or in a locality in which game may be rapidly passing to a distant feeding station, is unobjectionable. As *sport*, however, the B. may be regarded as the cruel and foolish method in which gentlemen take over into their own hands the legitimate work of the slaughterman.

Batum, or **Batumi** (anc. *Bathys*), a seaport in the vilayet of Trebizond, Turkish Armenia, on the E. coast of the Black Sea, with a good harbour. It is very unhealthy, and there are several ruins in the vicinity belonging to the period of the middle ages. Pop. 3000.

Baturin, a town of European Russia, government of Tchernigov, on the Selma, founded by Stephen Bathory, and for a time the residence of the Hetmans of the Ukraine Cossacks, of whom the notorious Mazeppa was one.

Baud, a small town of France, department of Morbihan, on the Blavet, 16 miles from the sea, and 75 miles S.E. of Brest, with some trade in cattle and agricultural produce. It has a very ancient chapel, and in the vicinity is a rude statue called the Venus of Quinipily. Pop. (1872) 1446.

Baur, **Bruno** (not to be confounded with an earlier theologian, author of *Hebrew Mythology of Old and New Testaments*, 1802), born at Eisenberg, 6th September 1809, studied and graduated in theology at Berlin. From 1839 to 1842 he lectured in theology at Bonn. On being suspended, he retired to Berlin, where he has since remained. His suspension gave rise to an acrid controversy among the Prussian universities as to the liberty of teaching given to licentiates and professors in theology and philosophy (*Gutachten der evangelischen theologisch Facultäten*, &c., Berlin, 1842). B. was from the first a rationalist, but in his early works, e.g., *Criticism of Strauss's Life of Jesus* (1835–36), and *Critical Exposition of the Religion of the Old Testament* (1838), he has not abandoned the hope of extracting a positive historical faith from the documents. In his critical works on the Gospels which appeared in 1840–42 (which Renan classifies with those of De Wette and Wilhe), B. entirely rejects the idea of Strauss that the Gospels arose naturally in accord-

ance with a pre-existing Christology, or Messianic tradition, and maintains that the Messianic idea is not Judaic, but derived entirely from the contest between the Christian Church and the Synagogue. Rejecting the fourth Gospel, and not even admitting the partial authenticity of Mark, B. seems almost to doubt the historical existence of Christ, whom he nevertheless represents as the author of an 'ungeheures werk.' He accuses Strauss of orthodox prejudice; and, as Renan observes, makes too much of his own persecution. His rather intemperate spirit is shown more clearly in his *Trumpet of the Last Judgment, or Hegel the Atheist and Antichrist*. The year 1843 was spent by B. in writing *Christianity Unveiled*, a satirical work in which he defends the agnostic position, and a pamphlet against Jewish emancipation. The next few years produced able and learned historical works on the 18th c. and its results, written with a constant reference to the political situation of the day. In 1850-51 he returned to theology, publishing critical works on the Gospels and the history of their origin, and on the Epistles of Paul. B. has great acuteness, fervour, and industry, but he wants the scientific impartiality so necessary in theological criticism.

Bau'gé, the chief town of an *arrondissement* of the same name, France, department of Maine-et-Loire, on the Couesnon, 23 miles E.N.E. of Angers, with some manufacture of linens, woollens, and wooden shoes. Pop. (1872) 2891. B. owes its origin to Foulques-Nerra, and was an important town in the middle ages. In 1421 the English, under the Duke of Clarence, were defeated here. The residence of the mayor is a château of the 15th c., with a magnificent staircase.

Bauhinia, a genus of plants belonging to the natural order *Leguminosæ* (sub-order *Cesalpinoæ*), consisting of numerous species, natives chiefly of the tropics of India and Brazil. The greater number of them are gigantic climbers, only a very few are trees or large shrubs. *B. Vahlii*, the Maloo climber of India, is a shrubby climber often 300 feet in height, whose woody stem will frequently overtop the tallest trees of the forest, and by compressing their trunks strangle them to death. The fibrous bark of this and other species are employed in making ropes, used in the construction of the suspension-bridges slung across the upper waters of the Jumna. *B. tomentosa* is a small tree of Ceylon, the flowers of which, from being spotted with crimson, are popularly believed to be sprinkled with the blood of St Thomas. The dried buds, flowers, and leaves, form a native remedy in dysentery. *B. variegata* is a small tree of about 20 feet in height, a native of India, China, and the Molucca Islands, and is also now naturalised in some of the W. Indian islands. Its wood is sometimes called ebony. The bark is employed in medicine, and in dyeing and tanning leather in India. The bark of another Indian species is used in making the slow matches used with the native firelocks. Most of the plants of the genus *B.* have leaves composed of two lobes; hence it was named in honour of the brothers Bauhin, its twinlike leaves being supposed to be symbolical of those botanists, whose labours were generally given to the world in the form of works, their joint authorship.

Baumgarten, Alexander Gottlieb, the founder of *Æsthetics* (q. v.), or the philosophy of the beautiful, was born at Berlin, 14th July 1714, studied at Halle under Wolf, and was appointed Professor of Philosophy at Frankfort-on-the-Oder, where he died, 26th May 1762. His *Æsthetica*, the work in which his special philosophy is developed, was published in two vols., Frankf. 1750-58. His *Metaphysica* (Halle, 1739, 7th ed. 1779) is still thought highly of.

Baumgarten-Cru'sius, Ludwig Friedrich Otto, a distinguished German theologian, was born at Merseburg, 31st July 1788, became Professor of Theology in the University of Jena, where he died, 31st May 1843. B.'s chief works are *Lehrbuch der Dogmengeschichte* (2 vols. Jena, 1831-32); *Compendium der Dogmengeschichte* (2 vols. Leips. 1840-46); *Handbuch der Christl. Sittenlehre* (Leips. 1827); *Grundzüge der Bibl. Theologie* (Jena, 1828); *Exegetische Schriften zum neuen Testament* (3 vols. Leips. 1844-48). B. had a tendency to the pious rationalism of Schleiermacher.

Baumgartner, Andreas Freiherr von, born at Friedberg, in Bohemia, 23d November 1793, was educated at Linz and Vienna, and published his first work, *Aräometrie* (Vien. 1820), while a teacher in the Lyceum of Olmütz. In 1823 he was appointed Professor of Natural Philosophy in the Vienna Uni-

versity, and in the same year published his *Mechanik in ihrer Anwendung auf Künste und Gewerbe*, and his *Naturlehre*, the latter of which was extremely popular, and was in its 8th ed. in 1844-45. In 1846 B. was intrusted with the establishment of the Austrian electric telegraph. Five years later he was appointed Minister of Commerce, Trade, and Public Buildings; and was also elected President of the Austrian Academy of Sciences. In 1851 he was made a baron of the Austrian empire, and in 1861 a member of the Imperial Council of the House of Lords. He died 30th July 1865. B.'s principal works are, *Chemie und Geschichte der Himmelskörper nach der Spectralanalyse* (1862), *Die mechan. Theorie der Wärme* (1864), and *Freiherr von B., Eine Lebensskizze*, published in 1866 after his death.

Baumgartner, Gallus Jakob, a Swiss statesman, born 18th October 1797 at Altstätten, in the canton of St Gall, and died in July 1870. He was noted among his countrymen for his devotion during the greater part of his career to the *parti prêtre*, vindicated the Jesuits, opposed the armed suppression of the *Sonderbund*, and displayed in a variety of political offices great oratorical and much administrative power.

Baumgärtner, Karl Heinrich, a distinguished physiologist of Germany, was born at Pforzheim, 21st October 1798, and since 1824 has been Professor of Clinical Therapeutics at Freiberg. He may be considered the originator of the cell-theory, subsequently worked out and expounded by Schwann. Among his writings are *Über die Natur und die Behandlung der Fieber* (Freib. 1827); *Handbuch der speziellen Krankheits- und Heilungslehre* (2 vols. 1835, 4th ed. 1840); *Dualistisches System der Medicin* (Stuttg. 1835-37); *Lehrbuch der Allgem. Pathologie und Therapie* (1837, 3d ed. 1854); *Schöpfungsgedanken* (1856-59).

Bauppethah, a town of India in the province of Madras, 29 miles from Guntur. Pop. about 20,000.

Baur, Ferdinand Christian, a distinguished German theologian, born 21st June 1792, at Schmiden, near Cannstadt, was the founder of the Tübingen school of theology. His first important work was *Symbolik und Mythologie, oder die Naturreligion des Alterthums* (3 vols. 1824-25), while a professor at Blaubeuren. In 1826 he was called to the chair of Protestant theology at Tübingen, which he held till his death, 2d December 1860. His first work was a useful preparation for his after labours, implying as it did a general acquaintance with the genius of antiquity. The task he set before himself, and to which he devoted his life, was to supply, in a thoroughly free spirit, what was yet wanting for the comprehension of early Christian literature. Strauss had previously sought to show only what the Gospels are not; B. sought to discover what they are,—to disclose the peculiarities of their structure, and to show how all the New Testament writings grew out of contemporary circumstances. The aim of previous criticism had been to expose the alleged discrepancies and contradictions of the Christian literature, especially of the Gospels; the object of B. was to restore the continuity of the New Testament history, and link the facts intelligibly together. Among B.'s works are *Die Christl. Gnosis, oder die Christl. Religionsphilosophie* (Tüb. 1835); *Die Christl. Lehre von der Versöhnung* (Tüb. 1838); *Die Christl. Lehre von der Dreieinigkeit und Menschwerdung Gottes* (3 vols. Tüb. 1841-43); *Lehrbuch der Christl. Dogmengeschichte* (Stuttg. 1847, 3d ed. 1867); *Paulus, der Apostel Jesu Christ* (Stuttg. 1845, 2d ed. 1867); *Kritische Untersuchungen über die Kanon. Evangelien; ihr Verhältniss zueinander, ihren Ursprung und Charakter* (Tüb. 1847); *Das Christenthum und die Christl. Kirche der drei ersten Jahrhunderte* (Tüb. 1853, 3d ed. 1863); *Die Christl. Kirche vom Anfang des 4. bis zum Ende des 6. Jahrh.* (Tüb. 1859, 2d ed. 1863); *Die Christl. Kirche des Mittelalters* (Tüb. 1861, 2d ed. 1869). See Mackay's *Tübingen School*.

Bautain, Louis Eugène Marie, a French philosopher and theologian, was born at Paris, 17th February 1796. After studying at the Normal School, he became Professor of Philosophy at Strasbourg College, then Dean of Faculty of Literature, and, lastly, Director of the College of Juilly. In 1828 he entered the Church; was suspended for several years for heresy contained in his *La Morale de l'Évangile comparée aux divers Systèmes de Morale* (1827), but latterly became Vicar-General or Promoter to the Archbishop of Paris. He held for some years a chair in the Theological Faculty of Paris. B. is a mystic in philosophy, but, like his master, Cousin, he is extremely eloquent. He died

October 18, 1867. B.'s chief books are his *Psychologie-Experimentale* (Strasb. 1839, 2d ed. 1859), *Philosophie Morale* (Par. 1842), and *Philosophie du Christianisme* (1835).

Bautzen (Slav. *Budissen*, 'the huts'), capital of the circle of B., kingdom of Saxony, stands on a height overlooking the Spree, 33 miles E.N.E. of Dresden. It is well built; has several churches, a cathedral, with a tower 300 feet high, a palace, once the residence of the Markgrafs of Meissen, and an hospital. It has manufactures of woollens, linens, hosiery, tobacco, &c., and is an important commercial centre. Pop. (1871) 13,165. B. was already in existence when the Emperor Heinrich I. founded the Markgrafdom of Lausitz in 931, but it first became a town and a fortress in the time of his successor, the Emperor Otho. It suffered much in the Hussite wars, the Thirty Years' War, and the Seven Years' War, but is best known in modern times as the scene of the defeat of the combined Russian and Prussian forces by Napoleon, May 20 and 21, 1813.

Bavaria (Ger. *Bayern* or *Baiern*), next to Prussia the largest kingdom in the German empire, lies in Middle and Lower Germany, between lat. 47° 20'–50° 41' N., and long. 9°–13° 48' E. It is bounded N. by Hesse-Nassau, the Thuringian principalities, and the kingdom of Saxony; W. by Würtemberg, Baden, and the Grand Duchy of Hesse; E. by Bohemia and Austria; and S. by the Tyrol. It also includes an outlying portion called *Bayern Pfalz*, or the Rhenish Palatinate, situated in an angle between the province of Alsace-Lorraine and the left bank of the Rhine. The frontier has a total length of some 1280 miles, and the following are the divisions, areas, and populations, excluding the military:—

Circles.	Area in Square Miles.	Pop. in 1874.
Upper Bavaria	6,493	841,707
Lower Bavaria	4,691	603,789
Palatinate (Pfalz)	2,772	615,025
Upper Palatinate, with Regensburg	3,679	497,861
Upper Franconia	2,632	541,053
Middle Franconia	2,914	383,666
Lower Franconia, with Aschaffenburg	3,400	586,132
Swabia and Neuburg	3,648	582,773
Total	29,138	4,863,450

Character of People, Religion, and Education.—The principal towns are Munich, the capital, Nürnberg, Augsburg, Würzburg, Bayreuth, Regensburg, Fürth, and Bamberg. The people in the N. are industrious, intelligent, and sprightly; the Swabians are sturdy, good-natured, and independent; but the Bavarians proper are a heavy, taciturn, and superstitious race. In 1872 the Roman Catholics numbered 3,464,364, the Protestants 1,342,592, Jews 50,662, and the members of various other small sects 5453. There is the utmost religious toleration, but the state of late years has shown itself opposed to Ultramontanism by favouring the 'Old Catholics,' and by its expulsion (1873) of the Jesuits. The system of education is compulsory, and is under the direction of a Minister of Public Instruction, who is assisted by several members of the provincial government, under whom again there is a large body of regular inspectors. Children are obliged to attend school until their 14th year, and for two years longer are required to go to a Sunday-school. B. has three universities—(1) Munich, with (1873) 77 professors and 1219 students; (2) Würzburg, with 43 professors and 803 students, both Catholic; and (3) Erlangen, with 43 professors and 371 students, Protestant.

Physical Features, Mountains, Rivers, &c.—The country is for the most part hilly. The S. half of B. forms the middle part of the Bavaria-Swabian plateau between the Iller and the Inn, and is hemmed in on the S. by the Noric Alps, from 3000 to 12,000 feet high; the Böhmerwald on the E. separates B. from Bohemia; and on the N. rises the Rhöngebirge. The central area is intersected by several low mountain chains, and consists alternately of fertile valleys, wide plains, and extensive forest tracts. Among the highest peaks are the Zugspitz, 10,150 feet high, in the Noric Alps; the Arber, 4613, and Rachelberg, 4561, in the Böhmerwald; and the Schneeberg, 3481, in the Fichtelgebirge. There are several ranges in the Palatinate, of which the Harzt (2300 feet) is the principal. B. contains the stream-system of the Danube from Ulm to Passau, while the Palatinate is watered along its entire eastern boundary by the Rhine. The

length of the Danube in B. is 270 miles, all of which is navigable. It receives 38 affluents, the chief of which on the right bank are the Iller, Lech, Isar, and the Inn; and on the left the Würnitz, Altmühl, Kocher, Naab, Regen, and Ilz. The river Main rises in the N., has many affluents, and flows in a S.W. direction, joining the Rhine at Mainz. There are some fifty lakes, mostly situated among the offsets of the Noric Alps, the chief of which are the Ammer, Starnberger, Staffell, Kochel, Wacheim, Tegern, Chiem, and Waginger. Lake Constance borders B. for nine miles.

Climate, Products, &c.—Except in the valleys of the Rhine and the Main, the general climate is cold and inhospitable for Germany; but in summer again the heat in the plains and valleys is extreme. The average temperature is 47° F., nearly corresponding to that of the Scottish E. coast. B. is, nevertheless, one of the most fertile countries of the empire, the S. plateau being called the German granary, on account of its productiveness. Cultivation is not in an advanced state; but besides wheat, rye, oats, and barley, the articles of produce include buckwheat, maize, rice, hops, tobacco, flax, hemp, linseed, beet-root, and liquorice. B. yields also some 9,000,000 gallons of excellent wine yearly. The forests are chiefly composed of fir and pine trees, and much of the timber is exported. Cattle-rearing and the breeding of sheep, goats, and other live stock, is one of the chief occupations. Among the minerals that are mined are salt, coal, iron, and a little gold; but in Rhenish B. a much larger variety is wrought, including copper, manganese, mercury, cobalt, quicksilver, black-lead, marble, gypsum, alabaster, lithographic-stone, and the finest porcelain-clay. There are famous mineral wells in Upper B. and in Middle Franconia.

Manufactures.—The industrial products are mainly beer, linen, cottons, woollens, leather, paper, porcelain, glass, sugar, cigars, and jewellery. Beer is by far the most important of these, yielding, it is said, nearly two-thirds of the revenue. In 1871 there were 5177 breweries, Swabia itself having 1018, producing at the rate of about 160 million gallons yearly. This beverage is universally relished; and, while it is consumed in enormous quantities within the state, it also forms one of the principal exports. The other exports are timber, wine, grain, wool, hops, glass, jewellery, scientific instruments, &c. Munich is famed for the manufacture of mathematical and optical instruments. As communication is developing, B. is profiting by the greatly increased transit trade between Italy, Switzerland, Austria, and N. Germany.

Canals, Railways, &c.—The principal canal is *Ludwig's*, which links the Danube and Rhine, and thus connects the German Ocean with the Black Sea. It was constructed by the state at a cost of over £800,000. In 1873 there were over 1100 miles of railway, 6000 of public roads, and 1500 of telegraphs. Munich is the great railway centre.

Government, Revenue, &c.—According to the fundamental state law of 26th May 1818, modified by the electoral law of 4th June 1848, B. is a constitutional monarchy, with the crown hereditary in the male line, and its domains remaining inalienable. The executive belongs to the king, and the legislature consists of two chambers—the one of senators or peers, the other of deputies. The former of these chambers is hereditary, the king, however, having a limited power of appointing senators for life; the latter is elective by various orders and classes of the community, the landed gentry, ecclesiastics, burghers, university councils, &c. By treaty of November 3, 1870, B. became an integral part of the German empire, retaining, however, among other unusual privileges, the right of conducting its own postal and telegraphic system. The estimated revenue of B. for 1874–75 was £10,602,593, and the expenditure £6,842,329. In 1873 the national debt was £39,657,360, of which £19,917,257 was for railways.

The army of B. was organised in 1871 after the Prussian system. Every citizen requires to serve, and no substitution is allowed. The term of service is twelve years, of which four years are spent in active service, three in reserve, and five in the Landwehr. The Bavarian army has an administration independent of that of the imperial army, and is under the command of the King of B. in times of peace; but in time of war is under the control of the Emperor. In 1872 it consisted of 52,029 men, of whom 32,602 were infantry, 11,562 cavalry, 5528 artillery, and 1213 'technical troops,' or engineers. On a war footing this number can be increased to 149,538 men. During the Franco-Prussian

war, the army of B. behaved with unsurpassable spirit and promptitude under the leadership of the Crown Prince of Prussia.

History.—The present *Alt Bayern*, originally peopled by the Celtic Boii, was formed under Augustus into the Roman province of Noricum. At the time of the great movement of the Teutonic races (5th and 6th c.), various tribes pressed into the land, and formed the confederated Bojoarii, who, although under chiefs of their own, were dependent on the Frankish kings of Austrasia. Foremost amongst these stood the *Agilolfinger* (first mentioned in 556), one of whom, Odilo, assumed the title of king. Thasilo II. was banished to a cloister in 777 by Charlemagne, on account of his alliance with the Avars, and in 788 Charlemagne entirely abolished the sovereign dignity in B., and appointed his brother-in-law, the Swabian Count Gerold, as governor. After the extinction of the Karoling dynasty in 911, Arnulf II., who had been Markgraf since 907, assumed the ducal dignity. Under his successors the land suffered much through internal discords, struggles with external enemies, and the perpetual change of dukes, until in 1180 the *Pfalzgraf* (Count-Palatine) Otto von Wittelsbach, the founder of the present reigning house, received it as a grant from the Emperor. Otto, who died in 1183, as also his successor, Ludwig I., considerably increased their possessions. The latter (died 1131) received as a fief from the Emperor Friedrich II. in 1216 the *Rheinpfalz* (Rhenish Palatinate), and though this was for a time lost, it was regained at the Peace of Westphalia in 1648, as a reward of the enthusiasm and energy shown by Maximilian I. in the creation of the Catholic League. B. sided with France in the Spanish Succession War (1700), and met with great loss. On the death of the Emperor Karl VI. in 1740, Karl Albrecht, Duke of Bavaria, opposed the Pragmatic Sanction, claimed the Archduchy of Austria as against Maria Theresa, seized the country in 1741, and was chosen Emperor of Germany in 1742. He was soon after driven out of his own territories by the Austrians, restored by Friedrich II. of Prussia in 1744, and died in the year following. In the war of 1805 B. sided with France, and Napoleon rewarded the Elector (a title dating from 1777) with the dignity of king, receiving in return important military assistance in his Austrian and Russian campaigns. The territory and title thus gained was ratified by the treaties of 1814-15, the King of B. meantime having luckily abandoned the cause of France. In 1818 the new constitution was established, and in 1825 Ludwig I. became king. Enlightened and generous to extravagance, this monarch, when advanced in life, formed a scandalous connection with Lola Montez, the famous adventuress, which did much to alienate his subjects, already dissatisfied with various governmental abuses. At last the inhabitants of Munich arose, March 1848, captured the arsenal, and forced the consent of the king to the exile of Lola Montez, and to the passing of various reforms. Ludwig I. abdicated, March 20, 1848, in favour of his son Maximilian-Joseph II., who died March 10, 1864. In the same year Ludwig II. ascended the throne, and during his reign the most striking events have been the incorporation of B. with the empire, the expulsion of the Jesuits in 1873, and his stubborn opposition to an Ultramontane majority (1875). See Buchner, *Geschichte von B.* (Münch. 1820-51); Zschokke, *Sachs Bücher der Geschichte des Bair. Volks* (2d ed. Aarau, 1821); Mannert, *Geschichte B.'s* (Leips. 1826); Böttiger, *Geschichte B.'s* (Erl. 1832); Rudhart, *Älteste Geschichte B.'s* (Hamb. 1841); Siegert, *Grundlagen zur ältesten Geschichte des Bair. Volkstammes* (Münch. 1854).

Bavaria, Statue of, a statue of colossal dimensions erected at Munich by King Ludwig I. as a personification of his kingdom, and uncovered August 7, 1850. It represents a German female standing, with the Bavarian lion sitting by her side. The whole monument is 95 feet in height, the statue being 65 feet and the pedestal 30. A door at the back of the pedestal leads, by a stone staircase, into the lion, through the neck of which an iron staircase takes up to the head, in which there are two sofas, and standing-room for thirty-one persons. The head bears the following inscription:—'This colossal figure, erected by Ludwig I., King of Bavaria, was designed and modelled by L. von Schwanthaler, and cast in bronze in the years 1844 to 1845 by Ferdinand Miller.'

Be'vius are small faggots of brushwood, the bush-ends being dipped in some inflammable composition, and are employed among the combustibles in fireships.

Baxter, Richard, one of the most eminent of Nonconformist divines, was born November 12, 1615, at Rowton in Shropshire, of pious but poor parents. Circumstances did not allow him to have a university education, but he went through a careful course of private study. A short visit to the court at Whitehall, followed by a serious illness, tended to deepen his naturally strong religious convictions. He was ordained at the age of twenty-three, and after being a schoolmaster, first at Wroxeter and then at Dudley, he became, in 1640, parish minister at Kidderminster, and soon earned a high reputation both as a preacher and as a moral and social reformer. B.'s eminent conscientiousness made him hold a peculiar position. After the outbreak of the civil war, although he acted as chaplain in the Parliamentary army, and held Presbyterian principles, he did not admit the unlawfulness of Episcopacy, upheld the monarchy, and was opposed to the execution of the king and the usurpation of Cromwell. On the restoration of Charles II., B. became one of the king's chaplains, but declined the bishopric of Hereford when it was offered him. On the Act of Uniformity being passed, he left the Church of England, and sided entirely with the Nonconformists. For many years he lived and wrote theological works in retirement at Acton, in Middlesex, returning to London on the passing of the Act of Indulgence in 1672. In 1685 B. was tried for writing sedition before Judge Jefferies, and, after being brutally insulted by him, was sentenced to a fine of 500 marks, or, in default, to lie in prison till it was paid. After eighteen months' imprisonment, he was released. B. lived beyond the period of the Revolution, and died 8th December 1691. He was one of the most voluminous theologians and ecclesiastical pamphleteers of his own or any other time, having produced in all about 145 treatises. His theology was a compromise between Calvinism and Arminianism, and his followers are known as Baxterians. Some of his works, such as his *Saint's Rest*, have been very popular. The last complete edition was published in 1830.

Baxterians, adherents to certain theological views advocated by Richard Baxter, the two most distinguished of whom were Drs J. Watts and P. Doddridge. The three salient points, regarding which they tried to pursue a middle course between the Calvinists and the Arminians, were—(1) the atonement, general for all mankind, but special for the elect; (2) the rejection of the doctrine of reprobation; (3) the possibility of saints falling away from saving grace.

Bay, a name given to a number of trees and shrubs. For instance, *Laurus nobilis* is the laurel or victor's B., out of which the laurel crown of the ancients was made; the name *B.*, originally only applied to the fruit, is now used for the whole plant. The cherry or B. laurel, so common in our shrubberies, is *Prunus Laurocerasus*. The red B. of the Southern United States is *Laurus Carolinensis*. The white B. of America is *Magnolia glauca*, while the Loblooly B. of the same country is *Gordonia Lasianthus*. The Indian or royal B. is *Laurus Indica*, while the rose B. is *Epilobium angustifolium*, a plant of an entirely different order. See LAUREL, GORDONIA, EPILOBIUM. B. leaves have been from the earliest times, and among widely different nations, associated with victory and rejoicing; or, as in this country, believed to be an antidote against the effects of thunder.

Bay, an inlet of the sea around which the land forms a bend, and the opening to which is wider than its depth. A gulf is supposed to be deeper, but Baffin's B., Hudson's B., and the B. of Biscay show with how little precision the word is used.

Bayaderes (Fr. from Poitu. *bailadara*, a dancing-girl) denote exclusively that very numerous class of women in India who follow the business of dancers and singers. These women have different denominations in their different countries. They are divided into two great classes, each of which has several subdivisions. The first great class, that of the *Devadassi*, or servants of the gods, is consecrated to the service of the temples and of the priests; the second, that of the *Nautchis*, comprises the B. who are not attached to a temple, and who travel the country in the exercise of their profession as singers and dancers. Among the Devadassis, those of the first rank are recruited from the Vaisya caste. They dwell in the enclosure of the temple, and may not go outside of it without the permission of the chief priest. Within the temple they prepare the garlands of flowers to adorn the effigies of the gods, they dance before the sacred statues, celebrate the praises of the gods in song, and form the

principal ornamental figure of the processions and religious ceremonies. Those of the second rank of the Devadassies are recruited from the families of the Sudra or labouring caste. Their functions are almost the same as those of the first class, but they are not obliged to dwell within the precincts of the temple, in which they take their turn of service. They are allowed to visit the houses of persons who employ and pay them for dancing and singing. They are engaged for fête-days, festivals, marriages, &c., by the rich Hindus. Female children enter the order of Devadassies shortly after the period of infancy, and physical beauty and faultless symmetry are the conditions of their admission. From the day on which they are admitted, they cease to belong to their families, who, by formal contract, renounce all right to them. The Nautchis travel the country in bands. Like the Devadassies of the second rank, they are employed on festive occasions; they dance at the places of entertainment for travellers. Some associate themselves with musicians, with whom they share their profits. Others are under the direction of a leading dancer, who provides for them and receives the profits of their labours. Others are simply slaves, bought very young by the women who train them to their business, with a view of making a profit of them. The dance of the B. is not so much a dance proper as a pantomime.

Bayamo, or **San Salvador**, a town in the E. of Cuba, near the left bank of the Cauto, 20 miles E. of its entrance into the sea, and 65 N.W. of Santiago. It has an unhealthy situation, but carries on considerable trade. Pop. 7500.

Bayard, or rather **Bayart**, **Pierre du Terrail, Seigneur de**, the *Chevalier sans peur et sans reproche*, called also by his companions 'Piquet,' was born in 1476 at his father's chateau near Grenoble in Dauphiné. Under the care of Carlo I., Duke of Savoy, and then of the Count de Ligny, B. rapidly rose into favour with Charles VIII. of France, whom he served faithfully at Fornova and Novara in the campaign of 1494-95 against the Italian League. In 1503 Louis XII. sent him with D'Aubigné to Naples, where he long resisted the Spanish occupation. In 1507 he suppressed the rebellion of Paul de Novi at Genoa; and in the campaigns of the Cambrai League against the Venetian General Petigliano, at Aignadel, the siege of Padua, and the occupation of Verona, he is the foremost figure. In 1510 his brilliant actions before La Bastia decided the campaign of Pope Julius II. against Alfonso of Ferrara. He was the hero of the storming of Brescia against the Venetians, fought under Nemours at Ravenna (1512) when the Spanish general Don Pedro was taken prisoner; and greatly distinguished himself at the Battle of the Spurs near Terrouenne (1513). B. also enjoyed the confidence of Francis I. who, after the battle of Marignano (1515), asked the honour of knighthood at the hand of his subject. B.'s defence of Mézières against the Imperialists (1522), his taking of Lodi from the Duke of Mantua (1523), and frequent campaigns in the Milanese territory, fill up the rest of his life. He was killed 30th April 1524, and was buried in the church of the Minims near Grenoble. B. was remarkable for chivalrous courage, military skill (especially in skirmishing), generosity towards his fellow-soldiers, the vanquished, and the poor, purity of life, and devotion to France. His story is told in *La tres joyeuse plaisante Histoire*, by 'le loyal serviteur,' published at Paris 1527, and rendered into English by Southey, Walford, &c. See *De Terre Basse, Histoire de Pierre Terrail, Seigneur de Bayard; suivie de Recherches genealogiques, Pices et Lettres inédites* (Par. 1826, 3d ed. Lyons, 1832).

Bayazid, a fortified town in the vilayet of Erzeroum, Turkish Armenia, 15 miles S.W. of Mount Ararat, and 230 miles W.S.W. of Trebizond. It was the scene of a Russian victory over the Turks during the Crimean War, August 1854. B. was formerly a flourishing centre of trade, but has greatly declined. Pop. 5000, chiefly Kurds.

Bayazid. See **BAJAZET**.

Bayberry. See **CANDLEBERRY**.

Bayr, **Johann**, a German cartographer, celebrated for his star-charts, was born at Rhain in Bavaria in 1572, and died at Augsburg, 7th March 1625. In his great work, *Uranometria* (Augsb. 1603; Ulm, 1607 and 1633), which contained fifty-one maps, B. introduced the now universal method of naming the stars in a constellation by the Greek letters. A second work of

B.'s is his *Explicatio Characterum aneis Tabulis Insculptorum* (Augsb. 1654).

Bayeux, an old episcopal town of France, department of Calvados, on the Aure, 6 miles from its mouth, and 17 miles N.N.W. of Caen. Pop. (1872) 7716. Its splendid cathedral, of mixed Gothic and Norman, begun in the 12th c. and completed in 1497, was destroyed by lightning in 1676, but was rebuilt in 1715. In the Hôtel de Ville, the famous B. tapestry is preserved. B. has manufactures of porcelain, linen, calicoes, serges, leather, and hats, but is particularly famous for its lace. The town takes its name from the ancient *Bajucassi*.

Bayeux Tapestry, a curious piece of needlework, a relic of the middle ages, preserved in the Hôtel de Ville at Bayeux, in Normandy. It is composed of a roll of canvas or linen cloth, about 220 feet long and 20 inches wide, on which is embroidered, in woollen thread of eight different colours, a pictorial representation of the history of the Norman Conquest of England. Although its great age is undoubted, where and by whom it was executed form matter of speculation. It is traditionally reported to be the work of Matilda, wife of William the Conqueror, assisted by her maids, and that she presented it to Odo, Bishop of Bayeux, in recognition of his services at the invasion. In length, however, it exactly corresponds to two sides of the nave of the present Bayeux Cathedral which was built early in the 12th c., and this circumstance renders it probable that the tapestry belongs to a subsequent period. Indeed, some critics contend that it is English work of the 12th c., executed, probably in London, to the order of three Bayeux knights who figure frequently in the tapestry, and who shared in the apportionment of English land. The entire web embraces seventy-two scenes, which collectively exhibit upwards of 1500 figures of men, horses, and various other animals, buildings, ships, &c. Each particular event is portrayed in a distinct compartment bearing a Latin explanation, and the whole design illustrates in a graphic manner the history of the Conquest from Harold's interview with Edward the Confessor previous to the former setting out on his mission to Normandy, the events which transpired there, the sickness, death, and funeral procession of Edward the Confessor, on to the accession of Harold to the throne, the Norman invasion, the battle of Hastings, the death of Harold, and flight of the English, which closes this remarkable work. Although the drawing is rude, with no attempt at perspective, the B. T. has the artistic merit of preserving the resemblance of individuals and classes throughout. It affords a curious insight into the manners and customs of the Norman epoch, and it is peculiarly interesting and valuable for its costumes, warlike implements, military ensigns, regal pageantry, &c. This extraordinary piece of needlework was preserved for centuries in the cathedral at Bayeux, and exhibited at a particular season of the year to the people of the city; but French antiquaries were ignorant of its existence till about 1724, when their attention was directed by M. Lancelot to an illuminated drawing of a portion of an obscure historical embroidery, and the original work itself was found by Père Montfaucon in the keeping of the

Bayeux Tapestry—Harold on his Departure to Normandy takes leave of Edward.

canons of Bayeux Cathedral. In 1730 Père Montfaucon published a reduced engraving of the whole in his *Monuments de la Monarchie Française*, and an elaborate description of the needlework is also given by Dr Ducarel in the appendix to his *Anglo-Norman Antiquities*, published in London in 1767. The Society of Antiquaries, in 1816, despatched Mr Charles Stothard to Bayeux to copy it; and the result of his labours is given in a coloured engraving in the sixth volume of the *Vetusta Monumenta*. A full-sized coloured photograph of the tapestry may also be seen in the

South Kensington Museum in London, where too a small but valuable fragment of the original is preserved. In 1803, by the desire of Napoleon I., then First Consul, who at that time meditated an invasion of England, the B. T. was exhibited in the

Bayeux Tapestry.—Harold takes Oath to William.

National Museum at Paris, and afterwards in some other French towns; it was thereafter consigned to the charge of the municipality of Bayeux, with which it has since remained. See *The Bayeux Tapestry Elucidated*, by J. C. Bruce (Lond. 1856), and *The Bayeux Tapestry Reproduced in Autotype Plates with Historic Notes*, by F. R. Fowke (Arundel Society, Lond. 1875).

Bay Islands, a small group in the Bay of Honduras, in about lat. 16° 30' N. and long. 86° W. The chief islands are Ruatan (q. v.), Bonacca, Uti, and Burburet. They belonged to Spain till 1821, became a British colony in 1852, but were ceded to Honduras, 28th November 1859.

Bayle, Pierre, a famous French critic and philosopher, was born 18th November 1647, at Carlat, in county of Foix, S. of France. His father, a Protestant minister, educated the eager and intellectual boy with great care; but even in B.'s earliest literary preferences we can see the future character of his genius. The admirer of Montaigne could not fail to be sceptical. His studies at Toulon brought him into contact with the Jesuits, who formed the teaching staff of the university, and the homage which his ardent nature paid to the zeal and talents of his masters was a temporary apostasy from the faith of his father. But he returned to Protestantism as rapidly as he had left it, and to escape the penalty of perpetual banishment, imposed on those who relapsed from Catholicism, he went to Switzerland, where he pursued at Geneva, under wide and less mediaeval forms, his theological and philosophical studies. Descartes supplanted the false Aristotle of the schoolmen. In 1675 he was appointed to the chair of philosophy in the Protestant College of Sedan, where he laboured with such rigour that he actually forgot to correspond with his friends. His first public appearances as an author were in harmony with the rational character of his intellect. When the Duc de Luxembourg was gravely accused by a learned tribunal (which included councillors of state) of having dealings with the devil, B., in a defence prepared for the Duc, conclusively exposed the absurdity of the charge. His next attempt to enlighten his age was a pamphlet entitled *Cogitationes rationales de Deo, Animo et Malo*, in answer to an enthusiast called Poinet; and this was followed by a third in 1682, *Pensées sur la Comète écrites à un Docteur de la Sorbonne*. Meanwhile Louis XIV., inspired by religious prejudices, had suppressed the College of Sedan in 1681, but B. found welcome and honour in the city of Erasmus. Appointed a professor of history and philosophy in Rotterdam, he was not slow to embroil himself in honourable controversy. His *Critique Générale* (1682) on Père Maimbourg's *Histoire du Calvinisme* was publicly burnt and universally read. Even Maimbourg himself valued the work, but it cost B. the friendship of a distinguished colleague, the theologian Jurieu, who had wished himself to refute the Catholic father. In 1684 B. conceived the idea of a periodical entitled *Nouvelles de la République des Lettres*, which achieved a great success, and made its editor a sort of literary dictator; but it also involved him in thorny questions, and the implacable Jurieu was vigilant in his enmity. A work of B.'s, worthy of all praise, *Commentaire Philosophique sur ces Paroles de l'Évangile: Contrains-les d'entrer*, in which the author took occasion to recommend the principle of toleration on philosophical grounds, led Jurieu to accuse him of religious indifference,

and even hostility to Protestantism. Additional calumnies of an odious character were cleverly exposed in his *Cabale chimérique*; but it is always easy for ecclesiastical bigotry to secure a triumph, and in 1693 B. was deprived of his license to teach. But B. was a student of few wants, and he at once turned, with the fine fervour of a literary enthusiast, to the execution of his long-meditated *Dictionnaire historique et critique*. The first edition was published at Rotterdam in 1696, and the second in 1702. It was attacked by Jurieu, by the consistory of the Walloon Church, and by other theologians, for its articles *David*, *Pyrrhonisme*, *Manichéens*, &c. The *Dictionnaire* was followed by his *Réponse aux Questions d'un Provincial*, and other controversial works. These had the effect of raising around the head of their author a final storm of theological controversy, under which his health gave way. He died 28th December 1706. The earnest conviction which B. mainly sought to impress upon his contemporaries was, that morality does not depend on religious dogma, and that good men and bad are to be found alike in Catholic and in Protestant churches. The result of this creed may have been to lead B. to a culpable indifference to all dogma—Protestant as well as Catholic; but it was necessary to the evolution of the great doctrine of toleration, which established itself in France and England during the course of the century. The force of his thoughts ran in a destructive rather than in a constructive course. We do not find from his works evidence of his having a religious or philosophical system, or of his having any fundamental belief on which a system could be built. 'My talent,' he said, 'is to form doubts, but they are only doubts.' But this fact, though it proves him to have been a thinker only of the second order, does not detract from the value of his work historically considered. And above all, his life and literature alike reveal him as, in the highest sense of the word, an *honest* man. The best editions of the *Dictionnaire* are those of Bâle (1740) and Amsterdam (1740). An extremely interesting one is that by Beuchot (Par. 1820 et seq.). See Maizeaux, *Vie de P. B.* (Amst. 1712); and Feuerbach, *P. B., seine Verdienste für die Geschichte der Philosophie* (Amst. 1838).

Baylen, a Spanish town, province of Jaen, 56 miles N. of Granada, situated in a mountain pass, where the Spaniards won their sole victory in the Peninsular War, July 23, 1808. Some 20,000 men under General Dupont here surrendered, and were sent to the hulks at Cadiz, although permission to return to France had been previously promised them. B. has manufactures of linen, tiles, glass, and soap. Pop. 7831.

Bay of Islands, an inlet on the N.E. coast of the N. Island of New Zealand, situated in S. lat. 35° 13', and E. long. 174° 11'. On it are the settlements of Kororarika and Russell. The former was the first place in New Zealand settled in by Europeans. Russell is a great rendezvous for whalers, and from it is exported the coal from the Kawakawa mines, which is largely used in Auckland (q. v.). The B. of I. forms a magnificent harbour. It is the most southerly limit of the S.E. trade-wind on the New Zealand coast.

Bayonet, a side-arm carried by infantry, and adapted for fixing to the muzzle of small-arms. It is popularly believed that the B. was invented at Bayonne about 1640, but at that time it was in general use among European armies, having replaced the pike in some instances, and so early as 1570 it was known in France. In the oldest form of B., the blade had a wooden handle which was inserted into the muzzle of the arquebus, but it was discarded for the socket-and-collar pattern, the existing form, which admits of shooting with the B. fixed. Mackay, a Scottish general of the 17th c., has been credited with the invention of the latter weapon; an example of it, however, belonging to the end of the 16th c., is now in the Culmann Collection at Hanover. The British pattern B. of the present day is of steel, 17 inches long in the blade, which has three fluted sides. The adoption of an arm which is at once a sword, saw, and B. has been suggested for the Martini-Henry rifle.

Bayonne, a fortified town of the first-class in the department of Basses Pyrénées, France, at the junction of the Adour and Nive, near their entrance into the Bay of Biscay. It consists of Great and Little B. and of the suburb Pont St Esprit, separated by the two rivers, and exports ship-timber, tar, cork, chocolate, and the celebrated hams; but the bar at the mouth of the Adour greatly hinders trade. The chief manufactures are glass, sugar,

Baigneurs, and ropes, and there are also large shipyards and distilleries. B. is the see of a bishop, with a cathedral and schools of navigation and commerce. Pop. (1872) 17,977. B., the *Lapurdum* of the Romans, was a fortress and a place of trade as early as the 3d c., the seat of a bishop in the 4th, and after the 10th c. shared the fortunes of Gascony. In 1565 Catherine de Medici here met the Duke of Alva, and arranged measures for the destruction of Protestantism. Charles IV. of Spain abdicated (1808) at B. in favour of Napoleon. The British with great loss forced the passage of the Nive, and in 1814 invested B., from which (April 14) the French made a desperate but unsuccessful sally. The convention of B., between the Duchy of Warsaw and France, was signed May 10, 1808. The inhabitants of the district are of Basque origin.

Bay Rum, a spirit prepared in the West Indies from the berries of *Eugenia acris*, used for toilet purposes and as a liniment in rheumatic affections.

Bay Window, or **Bow Window**, a window forming a recess, or bay, in a room, and projecting outward from the wall in a rectangular, polygonal, or—in debased Gothic—semicircular shape. The B. W. is peculiar to Gothic architecture.

Ba'za (the *Basti* of the Romans, and the *Bastania* of the middle ages), a town of Spain, province of Granada, in a rich plain 53 miles E.N.E. of the town of Granada. Pop. about 11,000, chiefly agricultural. B. is famous for the excellence of its wines and the beauty of its women. On the 10th of August 1810, the French under Soult here gained a victory over the Spaniards. Under the Moors it was a large and flourishing town, with 50,000 inhabitants.

Bazaar (from an Arabic word denoting traffic or merchandise), a market-place, open or covered, where merchants in Eastern countries have their warehouses and meet to transact business. The term is now frequently applied in the West to places opened for the sale of fancy goods.

Bazaine, François Achille, a French general not likely to be soon forgotten by his countrymen, was born 13th February 1811. Joining the army in 1831, he served in Africa in 1832. In 1837, having obtained a lieutenancy and the cross of the Legion of Honour, he was engaged in the Carlists and Christians war, and in 1839 distinguished himself in Algiers. In the Crimea he commanded a brigade of infantry. Appointed a General of Division, he joined the Mexican expedition in 1862, succeeded Forey in chief command, defeated President Juarez, and, in spite of crippled resources, maintained his army till 1867, when he effected a retreat by Vera Cruz. He had in 1864 been named Marshal of France, and was now placed at the head of the Third Army Corps and of the Imperial Guard. In the Franco-Prussian war, B., on the surrender of the Emperor Napoleon at Sedan, occupied Metz, where, after a seven-weeks' siege by Prince Frederick Charles of Prussia, he capitulated with an army of 175,000 men. For this act he was summoned in August 1871 before the Military Commission of the National Assembly sitting at Versailles. After some delays he was, on the downfall of M. Thiers, tried by court-martial, and found guilty of having negotiated with the enemy before doing all that duty and honour required, and having surrendered a fortified place and laid down his arms before the enemy in open field. He was condemned to death and degradation, a sentence commuted to 20 years' seclusion in the Isle St Marguerite, his escape from which, shortly afterwards, was probably connived at. B. has since resided in Spain.

Bazard, Amand, an ardent but mercurial French political thinker of the 19th c., was born at Paris, 19th September 1791. In 1820, along with some others, he introduced Carbonarism from Italy into France, but after a few years joined the disciples of Saint-Simon; and in 1825 became one of the editors of *Le Producteur*, a Socialist and Communist journal, which did not succeed. B., however, made a great impression on those with whom he came into contact, and in the public conferences of the sect in 1828 he was one of the most conspicuous speakers. But after the July revolution he quarrelled with a man far more subtle and powerful than himself, Père Enfantin, who soon displaced him in the leadership of the Saint-Simonians. B. died 29th July 1832, from the effects of a stroke of apoplexy, caused by the excitement of a public discussion.

Bazoche. See BASOCHÉ.

Bdellium, a gum resin, allied, as well botanically as in its physical properties, to myrrh. It is found to be produced by two species of *Balsamodendron*, *B. Roxburghi*, and *B. Mukul*, and in the E. Indies, where it is produced, it is known as Googul. This is supposed to be the B. mentioned in Scripture. It is used in the E. Indies both internally and externally as medicine; it is likewise employed in Hindoo incense, and it is much employed in the East for mixing with plaster in walls to render it more tenacious.

Beach'es, Raised, elevated tracts of land formerly B. of the sea, whether raised by earthquakes, or left high and dry by the receding ocean, is a question which has to be answered in each particular case. That they were formerly sea-B. is evident from the shells found in them peculiar to species which now are found in northern seas, the alternating sand and gravel beds, and their levelness for considerable distances, generally in the direction of the present shores. There are also produced by similar causes terraces of erosion, which supply evidence of the action of the sea on the face of rocks, in lines somewhat parallel to those at present being formed, but elevated high above them. In Scotland, round the coasts of the Highlands and Islands, such terraces are to be seen 25 feet above the lines at present being formed; in Lapland there is one declining from an elevation of 220 to 85 feet in a course of 30 miles; in Norway, behind Drontheim, there is one at the great height of 520 feet above the present level of the sea.

Beach'y Head (a corruption of the Fr. *beau-chef*, 'beautiful headland'), a lofty promontory on the S. coast of England, in Sussex, formed of chalk cliffs, rising 564 feet above the sea-level. In 1828 the Bell Tont Lighthouse was built here, with an elevation of 285 feet. Its light is visible 22 miles off. Caverns have been cut in the cliffs as places of refuge for shipwrecked mariners.

Beacon (Old Eng. *bedcen*, a sign), a fire-signal set on an eminence as a warning of impending danger. Such signals have been used by almost all nations; their antiquity is shown by the frequent allusions in ancient classical writings to the employment of fire-beacons during war; and in Jeremiah vi. 1, mention is made of a 'sign of fire,' betokening approaching disaster. During the reign of Edward III. pitch-boxes were lighted as beacons, and the expense of watching and maintaining them was defrayed out of the Exchequer. At the death of Henry VIII., when England decided to prosecute the war with Scotland, the Scottish court ordered beacons to be lit on all the hills near the E. coast as a warning of the approach of the enemy's fleet; and when the 'Invincible Armada' threatened descent on our shores, beacons were placed along the coast from Land's End to Lindisfarne to enjoin the people to watch and pray for succour and safety. Fire-pots and B.-grates are yet to be seen in many parts of the United Kingdom, and they are generally turned to account on occasions of rejoicing.

Beacon, Maritime, a mark for the guidance of mariners placed on projecting headlands, tidal rocks, banks or shoals at an estuary or river mouth, or entrance to a harbour. Beacons are usually of a conical form, constructed of stone, wood, or cast-iron plates, or, in exposed situations, of an open framework of cast-iron pipes, and are erected in places where it is not expedient to establish lighthouses. As beacons generally exhibit no light, and therefore are useful only by day and in clear weather, buoys or floating sea-marks, though less permanent, serve much the same purpose. Suggestions have been thrown out at various times for lighting beacons; and Mr Thomas Stevenson has introduced with success a method of indicating the position of beacons by transmitting from the shore a beam of light which is dispersed by means of reflecting apparatus on the top of the beacon. Mr Stevenson has also proposed to light beacons by electricity; and, in 1870, Mr Fleeming Jenkin patented a method of lighting beacons and buoys, by producing a rapid succession of electric sparks by alternate charges and discharges of a condenser placed on the beacon or buoy, communication with the shore being maintained by means of submarine wires.

Bead, also in the earliest English, *Gebéd* (comp. Ger. *Gebet*), signifies a prayer, and retained this meaning down to the close of the 16th c. As late as the age of Spenser we find it so used (*Faery Queen*, b. 1, c. 1, st. 30): 'Bidding his beades all day for his trespass,'—the explanation of which is given in the glossary published with the *Shepherd's Calendar* by the same author—

'Te bidde is to pray, whereof cometh beades for praiers, and so they say "to bidde his beades," sc. to say his prayers.' But at a very early date the word had come to denote also the roll of little balls made of gold, silver, ivory, glass, wood, &c., by means of which an account was kept of the number of prayers repeated. In Chaucer (*Prolog. Cant. Tales*, l. 159) we have a *peire of beades* gaudid al with grene; and in the *Romaunt of the Rose* (7372) both uses together—

'A peire of bedis cke she bere
Upon a lace, alle of white threde,
On which that she her bedes bede.'

One who prayed for another was called a *bedesman*. The name did not at first necessarily denote a pauper hired to pray for the rich, by whose alms he was maintained. It was applied to any pious recluse or hermit whose life was devoted to prayer, and who might receive, though he would not ask, support from those who lived near him; but gradually it came to denote mere dependents on the bounty of others, and the primary idea of prayer totally disappeared. Edie Ochiltree in the *Antiquary* was a king's *bedesman*, but it may be doubted if the pawkie gaberlunzie was often on his knees for the safety of King George's soul.

Bead, in architecture, a small round moulding, seen chiefly in Grecian and Roman architecture. It is sometimes cut into embossments, resembling beads on a necklace, and is much used in wood-carving. It is often called an astragal.

Bead, a small ornament, usually globular in shape, of glass, porcelain, or other material, and perforated so that numbers can be strung together into a necklace, or fastened with thread to the surface of any textile fabric. In the form of beads traces of the most ancient glass manufacture are found in ancient Egyptian tombs, and glass beads yet continue to be made in enormous quantities. Venice has long been the principal seat of the manufacture of fancy glass beads, and there artistic combinations of the various colours and qualities of glass characteristic of Venice are employed in bead-making. Imitations of pearls, precious stones, and metals are also made in glass for beads, the chief seat of this manufacture being in Paris. Large quantities of plain beads are made in Birmingham, which are used for embroidery and fancy work. Beads are universally prized among all savage tribes, and they form the readiest and most convenient medium of exchange in commercial transactions with such races. Beads of more valuable materials are much worn in civilised countries as necklaces. In Westphalia amber beads are much used for necklaces, and red coral is generally esteemed for like purposes. Ornamental fruits and seeds are also frequently bored for use as Necklaces and Rosaries (q. v.).

Bea'dle (Old Eng. *bydel*, a crier or summoner, from *bidan*, to command or summon), is an officer frequently attached to the church in England. He is appointed by the vestry. His business is to give notice when a vestry meeting is appointed; to attend upon it when met; and to execute its orders. He is also to assist the churchwardens, overseers, and constables in their respective duties, and to make himself generally useful in vestry and parish business.

Beagle (Gael. *beag*, 'small'), a variety of dog, of comparatively small stature, and formerly much employed in hunting hares. It is 10 or 11 in. high at the shoulder, but the favourite specimens were of less height. These dogs are of an enduring, patient disposition; their scent is keen; and their cry may be described as pleasant or musical in tone. The ears are long. The colour is dark-brown, with white on the fore-paws; or the body-colour may be white

with red markings. The hair is short. The Harrier (q. v.) has almost entirely superseded the B. in sport.

Beagle.

Beak. See BILL.

Beak'd, in heraldry, means that the beak of a fowl is of a tincture different from that of the body. 'B. and membered' signifies that the legs are of the same tincture as the beak. B. does not apply to birds of prey.

Beaker, a large cup or drinking-bowl, originally of *beech*-wood, hence the name. The word does not occur in the oldest English, but the analogous *becher* of the Germans suggests its derivation. The form in Lowland Sc. is *bicker*, which is still restricted in its application to a wooden cup or bowl.

Beam (same as Ger. *baum*, Dut. *boom*, a tree, hence timber), in mechanics, denotes any piece supported at one or more points, and loaded at others, in such a way as to be subjected to a cross-breaking stress.—B. of a ship, a word used by ship-builders, meaning the *breadth* of a vessel measured amidships.

Beaming, the operation of winding weft-yarn on a beam, called the yarn-beam, preparatory to weaving. The loom contains two beams—the one which holds the unwoven weft-yarn, and the other, which receives the cloth as it is woven.

Bean, a term applied to the seeds of many plants of the sub-order *Papilionaceæ* of the *Leguminosæ* (q. v.). The common B. (*Faba vulgaris*) has been cultivated in Europe and Asia from a remote period. It is perhaps a native of the borders of the Caspian. It is very nutritious, containing about 36 per cent. of starch, and 23 per cent. of legumine. The varieties most famous for garden cultivation are—the Windsor B., long pod, and early Mazagan. The roots of the B. are diuretic. The plant is apt to be injured by the Collier aphid, or black dolphin-fly (*Aphis fabæ*), which destroys the leaves. The best remedy is to cut off the tops, which are usually first attacked, as soon as the fly makes its appearance. Kidney-beans, scarlet-runners, and haricots (all belonging to the genus *Phaseolus*), lentils (*Ervum*), &c., though sometimes called beans, are entirely different from the above.

The variety of B. cultivated is the *common tick* or *field B.*, closely resembling the *horse* or *Scotch B.* In England, an average soil will yield from 20 to 40 bushels per acre, but in some of the good soils of Fife and the Lothians 60 bushels per acre, each bushel averaging 66 lbs., will be obtained. It is now little used as an article of food, though at one time generally employed for making meal, out of which a coarse but nutritious bread was baked. It is an excellent feeding material for horses. Farmyard manure is the best, and indeed the almost essential one to be applied in the growth of beans.

Bean, Calabar. See CALABAR-BEAN and PHYSOSTIGMA.

Bean Caper. See ZYGOPHYLLACEÆ.

Bean Goose. See GOOSE.

Bean-King's Festival, a relic of the Roman Saturnalia, of clecting a mock-king by lot, which has lingered in some countries; the use of the bean being also a relic of the superstitious veneration paid to beans from the belief that they contained the souls of the dead. On Twelfth Night there is distributed to each of the company a piece of a cake into which a bean (and sometimes a pea for a queen) has been baked, and whoever gets the bean in his piece is made controller of the festivities for the night.

Bean, St Ignatius. See STRYCHNOS.

Bear, a genus of *Carnivorous* mammals belonging to the *Plantigrade* section of that order—that is, to the section characterised by the fact that the whole sole of the foot is applied to the ground in walking. The bears form the types of the family *Uridæ*. These animals are less typically of *carnivorous* habits than their congeners of the order; many of the bears feeding on fruits and vegetable matter, on honey, &c. The molar or grinding teeth are tuberculate, the *carnassial* or flesh-molar possessing a tuberculate crown instead of a sharp trenchant edge, as in other and typical canivora. The dental formula of the bears shows six incisors, two canines, eight præmolars in each jaw; four true molars existing in the upper, and six in the lower jaw—making a total of forty-two teeth in all. The foremost præmolars generally fall out as the animal advances in age. The feet are provided with five toes each, and the soles are generally destitute of hairs, although the Polar bears possess hairy soles. The front-limbs are generally shorter than the hind-limbs, and are very muscular and mobile, a conformation of great service to these animals in climbing. The toes are armed with strong claws, which

are non-retractile, and which are used in digging and burrowing. The tongue is smooth and fleshy. The intestine is destitute of a cæcum. The ears are of small size, rounded and erect. The tail is short and rudimentary. The nose is prolonged slightly to form a truncated mobile snout. The pupil of the eye is of circular form. The body is covered by a thick, close-set fur, consisting of shaggy hair. The gait is generally lumbering and clumsy; and most of these animals hibernate during the colder seasons of the

Polar Bear.

year. In their distribution, the bears occur in every quarter of the world—Australia, however, proving in this, as in the case of other and higher mammals generally, an exception to this statement. The African continent is also somewhat exceptional, in that bears exist only towards the northern portions, and these in limited numbers.

The European or common brown B. (*Ursus Arctos*) is a familiar species. This form occurs in the forests of Europe from the N. to the Pyrenees and Apennines, and in Northern Asia. In recent geological times this form existed in Britain, and had a much wider European distribution than at present. Its food consists of roots, fruits, worms, insects, honey, and more rarely of flesh. Its average length is four feet, and its height about two and a half feet. This species is hunted for the skin, fat, and tongue. It may be tamed in a very complete fashion, and is by no means fierce or quarrelsome unless irritated. The black B. of America (*U. Americanus*) is a nearly-related form, and is found throughout N. America. The fur is of a glossy black colour, and it is chiefly hunted for the sake of its skin. Varieties of this species with lighter skins exist. In winter, the black B. approaches human habitations, and may then carry off domestic animals. The American grizzly B. (*U. ferus*) is a much more formidable species, inhabiting mountainous regions such as the Rocky Mountains and the eastern plains to 61° N. lat. It averages eight feet in length, and is of a ferocious disposition, although it generally subsists on roots and acorns. In other cases the grizzly B. may not only kill the large Bison of America, but drag away the carcass with ease. All the foregoing species hibernate in winter. The Arctic or Polar B. (*Thalassarctos maritimus*) is found exclusively in the Arctic regions. Its fur is of a white colour; the hair-clad soles of the feet giving this form a sure hold upon the ice. The paws are very long, and the neck is also elongated. It swims well, and feeds upon dead whales, seals, &c., but is also an expert fisher. The Syrian B. (*U. Syriacus*) found in Mount Lebanon is probably the biblical B. It is of a light-brown colour, the fur between the shoulders being long and mane-like. The sloth or jungle B. of India (*Prochilus labiatus*) is distinguished by the protrusion or elongation of the lips. This B. is frequently tamed by jugglers. The Malayan sun-B. (*Helarctos Malayanus*) of Sumatra and Borneo, and its variety of Borneo (*H. euryspilus*), possess smooth glossy hair, and feed on fruits and honey. They are much less fierce than the other members of the family, and are very playful when tamed. The cave-B. (*U. spelæus*), the fossil remains of which occur in Britain and elsewhere, in Tertiary deposits, is an extinct form which was of larger size than the Polar B. It apparently survived the human epoch.

Bear. See EXCHANGE.

Bear, Bere, or Beer. See BARLEY.

Bear-Baiting. The provoking and harassing of a bear by dogs used to be regarded as sport in various Christian countries. Although, like bull-baiting and badger-baiting, it has long been

discontinued in England, it used to be one of the entertainments passionately frequented by all classes—royalty witnessing the cruelty with as deep delight as the rabble.

Bearberry. See ARCTOSTAPHYLOS.

Bear, Great and Little. See URSA MAJOR and URSA MINOR.

Bear Lake, Great, the most northerly of the large lakes in the centre of British America, lat. 65° to 67° N., and long. 117° to 123° W. Its form is irregular, and its surface is estimated to be 14,000 sq. miles in extent, and 230 feet above the sea. A river of its own name drains it into the Mackenzie river.

Bear-Pit, a circular pit in zoological gardens, about 25 feet in diameter and 20 feet in depth, with vaults around it for the bears to retire to. A thick pole with cross-spars rises from the centre of the pit, on which the bears are fond of climbing, and where they catch many various morsels of food from visitors.

Bear's Grease. The solid fat of the white bear at one time possessed an enormous reputation as an application for the human hair, and B. G. was in great demand. A factitious compound of hog's lard very frequently was substituted for the genuine article, and that fact may account for the decreased popularity of B. G. as a preventive from baldness.

Beard, the hair upon the chin, cheeks, and upper lip, which in the human family appears at the age of puberty as a distinctive mark of the male sex. It is usually rather lighter in colour than the hair of the head, and as a general rule its character depends upon the nature of the climate. In hot and dry countries, it is invariably dark, dry, and long; and, on the other hand, thick, curly, and fair in cold and damp countries. The hair, being a bad conductor of heat, protects the face and throat from cold, and acts as a safeguard against excessive heat. The B., particularly the mustache, or hair of the upper lip, is of great utility in preventing dust of any kind being inhaled with the breath, particularly so to masons, bakers, glass-engravers, and workers in metals, who in their avocations are constantly exposed to an atmosphere charged with minute particles of the materials operated upon. Among some nations the B. grows in great profusion, and among others very stintedly; with the former it is generally regarded as a graceful ornament, while some of the latter thoroughly eradicate it. In Old Testament times great respect was paid to the B., and special attention was given to it. Among the upper classes it was perfumed, anointed with oil, and occasionally dyed. An uncouth and dishevelled B., or its entire removal, denoted a state of mourning or deep sorrow, and no greater insult could be offered than spitting on or pulling one's B. Slaves in ancient times were deprived of their beards, and with the Turks even now a state of servitude among the attendants of the seraglio is indicated by a shaven face. The Turkish husband and father is accustomed to have his B. kissed by his wives and children as a mark of affection. The intense love of cleanliness on the part of the Egyptians would not suffer them to wear a B., save, according to Herodotus, in times of mourning. Though a shaving people, they had a singular custom of wearing upon the chin a false B. of plaited hair, which differed in shape according to the rank and position of the wearer. Kings wore long and square-bottomed beards, those of private individuals were very short, and gods were distinguished by their long beards curling up at the end.

Among the early Greeks a thick B. was considered a mark of manliness, and the Greek philosophers thought that a certain dignity of character attached to its long growth. Shaving was introduced into Greece by Alexander the Great, who ordered his soldiers to perform that operation, and the practice continued general till the time of Justinian. About A.C. 300, Ticius Menas is said to have introduced to the Romans a Sicilian barber who inaugurated shaving, and Pliny states that Scipio Africanus was the first Roman who shaved daily. Later on, the festival which celebrated the assumption of the *toga virilis* by a young Roman was made the occasion of the first operation of shaving, and the hair then cut off was consecrated to some deity. The Bayeux tapestry shows that mustaches were worn by the English soldiers prior to the invasion of the Normans, who shaved not only the entire face, but the back of the head likewise. This Norman custom caused Harold's spies to report that the invaders were all priests. Louis XIII., of France, not being endowed

by nature with a B., his courtiers revived the fashion of shaving, and soon after partial shaving, and trimming the mustaches and B. to an ornamental form, became general over Europe. In the 16th c. the English clergy were noted for their beards of great length. In the beginning of the 18th c. the face was wholly shaven, and continued so till early in the present century, when the French led the van in again wearing the B. During the reign of Czar Peter the Great, a tax was imposed upon beards, and collected at the gates of every town. Of late years the British soldiers and sailors have been allowed, within certain limits, to cultivate beards, and by the removal of what was an unjust restriction, the great extremes of temperature to which the men are exposed may be endured with comparative impunity.

Beard'ie, the Scotch name for the fresh-water fish belonging to the family *Cyprinidae*, and known as the Loach (q. v.) (*Cobitis*).

Beard Moss. See *USNIA*.

Bearing is a nautical term much in use. It denotes chiefly the direction in which a ship is sailing with reference to the points of the compass. But objects seen from the ship also are said to have their B. *ahead*, *astern*, *port* (*larboard*) *quarter*, *starboard bow*, as the case may be. Sailors also speak of B. *off*, *in*, *away*, *up*, &c.

Bearing the Bell, a phrase denoting excellence in any art or pursuit. The person who carries off the prize in a contest is said to *bear the bell* away from his competitors. The phrase dates from the beginning of the 17th c., when it was customary to gift the winner of a horse-race with a small bell of gold or silver.

Béarn' (Lat. *Benarnia*), a former province in the S.W. of France, now included in the present department of Basses-Pyrénées (q. v.). It originally formed part of the Roman Aquitania. In the time of Ludwig the Pious, son of Charlemagne, Centullus, a scion of the ducal house of Gascony, obtained the county or viscounty of B. One of this family, Gaston IV. (1088-1130), was a distinguished warrior in the first Crusade. In the 14th c., B. passed by marriage to the Counts of Foix. Subsequently the land, along with Foix and Navarre, belonged successively to the houses of Foix, Grailly, and Albret. Jeanne d'Albret, the heiress of the lands, married Antoine de Bourbon in 1548. Their son Henri, surnamed the *Bearnois*, ascended the throne of France as Henri IV. in 1593, but B. was first made a French crown-land by Louis XIII. in 1620. Its capital was Pau. The modern inhabitants of B., descended from the old *Benarni*, are the finest of the Gascons. Their proper language is Basque, but since the French revolution French has been displacing it.

Be'as (anc. *Hyphasis*), a tributary of the Sutlej, and one of the rivers from which the *Funjab* ('land of five rivers') was named. It rises in the Ritanka Pass of the Himalaya, 13,200 feet above the sea, and joins the Sutlej 50 miles S.W. of Lahore, after a course of 220 miles.

Beat, in music, has two meanings: (1) a musical ornament resembling a short shake; and (2) a subdivision of a bar or measure. B. has also a third meaning, belonging more properly to acoustics. When two simple musical tones, differing slightly in pitch, are sounded together, the sound heard varies regularly in loudness. Each recurrence of maximum loudness is called a B., and it is these beats which are the physical cause of the sensation we call *discord*.

Beat of Drum, in military language, is a signal, order, or instruction given by a particular kind of beat. The best-known of such signals are the reveillé, the assembly, the march, the retreat, the call to arms, &c., some of which may be also given by the bugle or trumpet.

Beatification, an inferior degree of Canonisation (q. v.), by which the Pope allows religious honours to be paid to some one without pronouncing *ex cathedra*, as in canonisation, on the state of the blessed.

Beating and Wounding. The legal offences included under this title may be held to include that of Battery (q. v.); but B. and W. is rather held to express a graver offence than would be included by battery. B. and W. is in law subdivided into *assault* and *mayhem*. *Assault* is an attempt or offer to do corporal injury to another; and it is essential to the offence that

there be the intention and the power to do the injury. But that the intention failed will not be held to excuse or even palliate the offence. *Mayhem*, or, as it is more correctly written, *maimem*, is a much graver offence than the other. It consists in depriving another of the use of a member of his body, useful in defence or attack. It has accordingly been decided that the loss of an ear, the ear being valueless for either purpose, did not constitute mayhem. But corporal maiming is now generally held to be a crime of equal gravity to that of legal maiming. These personal injuries are crimes against the public as well as private wrongs, and consequently render the offender liable to action at the instance of the crown as well as to action at the instance of the person injured. No words, however irritating, can constitute an assault; on the other hand, they may palliate one. It has been decided that any illegal act which ultimately causes personal injury to another may constitute a ground of civil action. The essence of the offence is malicious intention or culpable carelessness.

There is a very wide range, indeed, in the criminality which the law attaches to assault. What is called an *aggravated assault* may render the criminal liable to penal servitude for life. Here again *intention* is the essence of the crime; assault, with intent to rob, murder, or commit other felony, being an indictment which, followed by conviction, carries a greatly severer penalty than an indictment without such allegation. At the same time, even though the intention be not otherwise obvious, it may be inferred from the nature of the assault itself. Thus, if it be made with a loaded pistol, knife, or other lethal weapon, intent to murder may be presumed. In Scotland the law is nearly the same as in England with regard to these offences. What is called *hamesucken* is, in Scotch law, a special aggravation of assault. It consists in assaulting any one in his own house or dwelling-place. To constitute the crime there must, however, be premeditation. To assault any one in his own house, in immediate consequence of a quarrel there, is not *hamesucken*.

Beating Judges is, in Scotch law, the title of the offence of assaulting a judge. To assault a judge on the bench is, under an old Scotch statute, a capital crime.

Beating the Bounds, is, in England, the popular expression for the ceremony by which a knowledge of the boundaries of a parish is preserved. The legal term is *Perambulation of Parishes*. It is done by the clergyman, churchwardens, and some of the parishioners going over and surveying the boundaries once a year, towards Ascension Week. The surveyors are entitled to go over any one's land which it is necessary to traverse. It is said that boys used to be whipped at special boundaries, to impress the spot on their memories. See *BOUNDARY*.

Beat'on, **Betoun**, or **Bethune'**, **David**, Cardinal and Primate of Scotland, one of the most memorable of Scotch ecclesiastics, and a keen opponent of the Reformation, was a son of John B. of Balfour, in Fifeshire, and was born in 1494. Educated at Oxford and Paris, he early entered the Church, under the auspices of his uncle, James B., Archbishop of Glasgow, and was made Rector of Campsie. His career, both as an ecclesiastic and politician, was brilliant and rapid. In 1519 he was appointed by Regent Albany resident for Scotland at the French court; in 1525, Abbot of Arbroath; and in 1528, Lord Privy Seal. He was sent to France as ambassador to negotiate King James's two marriages—the first with the French king's daughter, the Princess Magdalene, who died six months after marriage; and the second with Mary, daughter of the Duke of Guise, himself solemnising the latter in St Andrew's Cathedral in 1537. We once more find him in France, in which he was appointed Bishop of Mirepoix. He was very much attached to this country, to which his family originally belonged; and, as Dr Hill Burton says in his *History of Scotland*, 'He was deep in Italian and French politics—more, indeed, of a Frenchman, and a servant of the Guises, than of a Scotsman.' This proved a great misfortune for his country, his Church, and ultimately for himself. Returning to Scotland, he became coadjutor to his uncle as Archbishop of St Andrews, and on his death, his successor, with the additional title of Primate of Scotland. Prior to this he had been made a cardinal by Pope Paul III. He now began a vigorous persecution of the Scotch reformers, carrying King James with him in this. He also persuaded his master into a war with England, which ended in the disastrous battle of Solway Moss, December 14, 1542. After the king's death, which was the result

of this defeat, he endeavoured, by means of a forged will, to become one of the regents of the kingdom; but the document was rejected by the nobility, the Earl of Arran was made regent, and B. was thrown into prison. In a somewhat suspicious manner he was released, and became reconciled with the regent, whom he induced to abandon the doctrines of the Reformation. On Queen Mary's coronation, in 1543, B. again rose into favour, and was made Chancellor. He resumed his persecution of the Protestants, and among his victims was the celebrated preacher George Wishart, who was burnt at the stake at St Andrews. A popular story that his sufferings were witnessed and gloated upon from a window by B. is now believed to be without foundation. B. had, by his persecutions, and his haughty conduct generally, made himself very unpopular; several conspiracies were formed against him, and at length he was assassinated by John and Norman Lesly in his own castle, May 29, 1546. B., in his character, resembled Mazarin, the French ecclesiastical statesman, and would probably have been both much more successful and more popular in France than in Scotland. He was an immoral as well as a cruel man, and had by his mistress, Marion Ogilby, three sons and three daughters, of whom the former were legitimated in his lifetime, while the latter were well married. He is said to have written memoirs of his embassies, but nothing that may have come from his pen has been published.

Beattie, James, a Scottish poet and philosopher, was born at Laurencekirk, Kincardineshire, October 25, 1735. He studied at Marischal College, Aberdeen, with much success; and after being for a time one of the masters in the grammar school of that town, became in 1760 Professor of Moral Philosophy in Marischal College. In 1770 he published an *Essay on Truth*, a defence of Christianity against Hume, which, although it is now admired more for the vigour of its language and the religious enthusiasm displayed in it than for the accuracy of its reasoning, made him very popular. The University of Oxford conferred on him the degree of LL.D., and he had a personal interview with George III., from whom he received a pension. He was also offered preferment in the Church of England, but declined lest his motives should be misinterpreted. In 1761 he had published a volume of original poems and translations, and during 1771-74 appeared his beautiful poem of *The Minstrel*, which established his reputation, and which is still admired by lovers of picturesque description and genuine emotion. Before his death, August 18, 1803, which seems to have been hastened by the death of his son, a young man of much promise, he produced several other works, the chief of which are *The Evidence of the Christian Religion Briefly and Plainly Stated* (1793), and *The Elements of Moral Science* (1786). See Sir William Forbes's *Life of B.*, accompanying an edition of the poet's works (2 vols. 1805).

Beaucaire (anc. *Ugernum*), a town in the department of Gard, France, on the right bank of the Rhone, about 30 miles N. of its entrance into the Mediterranean. It stands opposite the town of Tarascon, with which it communicates by means of a suspension-bridge 1354 feet long, and is a station on the railway from Tarascon by Nîmes and Montpellier to Cette. It is celebrated on account of its annual fair (held 22d to 28th July), said to have been established by Count Raymond II. of Toulouse in 1217, but first mentioned in a document of date 1315, and which formerly attracted immense numbers of merchants from the most distant parts of Europe, and even from Asia. It is still an important market for the sale of wines, oil, skins, drugs, wool, cotton, and fruits. Pop. (1872) 7604. Under the Romans, as a *castrum* and station on the great road from Nemausus (Nîmes) to Italy, B. was a place of importance, as the discovered columns, statues, mosaics, and other relics of antiquity prove. In the middle ages it was a strong fortress, and is prominent in the literature of the Troubadours. It favoured the Albigenses, and shared in their misfortunes. Also in the Huguenot wars of the 16th, and in Richelieu's wars of the 17th c. it suffered much.

Beau'champ, Alphonse de, a French author, born at Monaco in 1767, entered the Sardinian service in 1784, was imprisoned some months for refusing to serve in the war against France, and on his liberation repaired to Paris, where he was intrusted with the surveillance of the press by the Directory, a position which supplied him with materials for his *Histoire de la Vendée* (3 vols. Par. 1806). Fouché deprived him of his office

for alleged indiscreet use of documents confided to him as a minister, and in 1809 he was banished to Rheims, but was recalled in 1811, and again employed by the government on condition that he should publish nothing on contemporary politics. In 1814 he lost this place, but in 1820 he received a pension, which, on his death, June 4, 1832, was continued to his widow. B.'s literary activity was great, and he contributed largely to many journals; but the value of his historical writings is impaired by his evident party bias, from which, however, his *Histoire de la Conquête et des Révolutions du Prou* (Par. 1808), and *Histoire du Bréuil depuis sa Conquête en 1500 jusqu'en 1810* (Par. 1815), are free. The *Mémoires* printed (1824) under the name of Fouché have been ascribed to B.

Beaufort, the name of sixteen different towns and castles in France, of which the most important is **B.-en-Vallée**, a town in the department of Maine-et-Loire (Anjou), 15 miles E. of Angers, with manufactures of sailcloth, leather, &c., and a trade in grain, hemp, nuts, prunes, and wine. Pop. (1872) 2623. B. had formerly a strong castle, and gave title to the English Dukes of B. (q. v.).

B. is also the name of several places in N. America, of which the best-known are B., a port of N. Carolina, at the mouth of Newport river, in Albemarle Sound, with a pop. (1870) of 2850; and B., in S. Carolina, on the Port-Royal river. Before the outbreak of the civil war the place was prosperous, the wealthier of the S. Carolinian planters living in the neighbourhood.

The name is also given to a district in the S.E. of Cape Colony, with an area of about 13,050 sq. miles, and a pop. of 1000. It is bounded on the N. by a lofty range of mountains, and in the S. by the Great Fish River, and contains a great quantity of excellent pasture. **Fort B.** is the capital, and stands on the Kat, a branch of the Great Fish river, 110 miles N.E. of Port Elizabeth, on Algoa Bay.

Beaufort is the name of historical families in England, France, and Belgium.

1. *The English Beauforts*.—Their origin dates from the second half of the 14th c., when Katherine Swynford became the mistress of John of Gaunt, Duke of Lancaster, and third son of Edward III. The offspring of this connection, both male and female, were afterwards legitimised on the marriage of Katherine to the Duke after the death of her husband. Undoubtedly the most able was **Henry B.** (the name was taken from a castle in Anjou, where they were born), who was born about 1376, and educated in Germany. At the Council of Constance in 1417 he supported the election of Martin V. as Pope, who in return made him a cardinal. When his nephew, Henry V., wished to impose a new tax on the clergy to enable him to carry on his war with France, B. boldly opposed the measure, but privately lent his kinsman £28,000 out of his own purse. The Pope was so pleased with his zeal that he sent him as his legate to Germany to organise a crusade against the Hussites. The scheme did not succeed, and as B. employed the money he had received to assist in fitting out an English force against France, he lost the papal favour. On the death of Henry V. (1422), he became the virtual head of that great oligarchy of lords temporal and spiritual who ruled the nation and directed its policy—persecuting the Lollards at home, fighting the French abroad. In 1431 he caused the young King Henry VI. to be crowned in Paris, and later on laboured hard in the English interest to bring about a reconciliation between the Dukes of Burgundy and Bedford, but withdrew from the conduct of affairs when the English cause in France became desperate. He died at Winchester (of which see he was bishop), 14th June 1447, suspected of complicity in the murder of his chief political rival, Humphrey, Duke of Gloucester, leader of the war party. B. was the only English member in the ecclesiastical court that tried and condemned Joan of Arc. **John B.**, elder brother of the cardinal, was made Earl of Somerset by Richard II. in 1397, and Marquis of Dorset in 1398, the latter of which titles he resigned to his brother, Thomas, afterwards Duke of Exeter. He died in 1410. His son John was created Duke of Somerset by Henry V., and died in 1444, leaving an only daughter, Margaret, who married Edmund Tudor, Earl of Richmond, father of Henry VII. **Edmund B.**, Earl of Dorset and second Duke of Somerset, brother of the preceding, is notable for his inextinguishable hatred to the Duke of York, who prevented him from becoming regent of France after the death of Bedford (1435). Having, however, obtained this

office in 1445 by disgraceful intrigues, he conducted affairs so badly that soon nothing was left to the English in France save Calais and Guines; and on his return home, in 1450, the public anger against him was so great that for a short time it was necessary to keep him prisoner in the Tower. On obtaining his liberty he soon reacquired favour and influence at court, and worked with malignant zeal against his old rival. Once more thrown into the Tower (1454), he was again pardoned, and appointed governor of Calais and Guines; but was slain at the battle of St Albans in 1455, in the beginning of the 'Wars of the Roses.' His three sons—Henry, Edmund, and John—vainly sought to revenge their father's death. The first two were executed (respectively 1463, 1471) by command of Edward IV.; the third died childless, and with him expired the lawful line of the Dukes of Somerset belonging to the house of B. But a natural son of Henry, the eldest of the three, viz., Charles, was made Earl of Worcester in 1514, and one of his successors, Henry, fifth Earl of Worcester, was raised to the rank of marquis in 1642, while his grandson, Henry, was made Duke of B. by Charles II. in 1682. From this last are descended the modern English Dukes of B. whose present representative is **Henry Charles Fitzroy Somerset**, eighth Duke of B., born 1st February 1824, succeeded to the title on the death of his father in 1853.

2. *The French Beaufoirts.*—These take their origin from the mistress of Henri IV., Gabrielle d'Estrées, who raised into a duchy the little town of B., in Champagne, which belonged to her family. By far the most noted of this line is François de Vendôme (q. v.), Duc de B., the grandson of Gabrielle and Henri.

3. *The Belgian Beaufoirts.*—The Comtes and Ducs of B. who belong to Belgium take their title from a castle in Namur. Their origin goes back to the dawn of the middle ages, and as early as the 13th c. the house had divided into four branches—B. de Gones, B. de Fallais, B. de Celles, and B. de Spontin, the last of which in particular produced some eminent men, of whom we can only mention **Frédéric August Alexandre**, Duc de B., who was appointed governor-general of Belgium by the Allies in 1814.

Beaugency, a town of France, department of Loiret, on the right bank of the Loire, 16 miles S.W. of Orleans; pop. (1872) 3882. B., once strongly fortified, occupied a prominent place in the civil and military history of France, especially in that of the religious wars of the 16th c., and still preserves its feudal appearance. It has manufactures of woollens, leather, sugar, and brands, and a trade in corn, wood, and wine.

Beauharnais, Alexandre, Vicomte de, a member of an ancient French family, was born in 1760, in the island of Martinique. He served under Marshal Rochambeau in the American War of Independence, proceeded subsequently to Paris, where, although his elegant figure and manners gained him the favour of the court, he espoused the popular side, was one of the few nobles who joined the *tiers état*, voted on August 4, 1789, for the equality of citizens, and was in consequence appointed secretary to the National Assembly. He served with distinction in the army of the north, but retired to his country residence on its being determined to exclude nobility from the service. Being accused of having participated in the surrender of Mainz, he was sentenced to death by the revolutionary tribunal, and guillotined 23d July 1794. He had married, at an early period in his career, Mdlle. Josephine Tascher de la Pagerie, who, after his death, became the wife of Napoleon Bonaparte. The latter adopted Eugène and Hortense, the son and daughter of B. Hortense became Queen of Holland and mother of Napoleon III.

Beauharnais, Eugène de, son of the Vicomte de B., was born in Paris, September 3, 1781. On his mother's marriage with Napoleon he threw in his fortunes with his stepfather, and never deserted him. By force of character and military ability he rapidly rose to a high position, was made Viceroy of Italy, and in 1805 Prince of France and Venice, and declared by Napoleon his adopted son, and heir to the crown of Italy. B. showed very considerable administrative ability; and throughout his life had the character of being a man of probity and honour. During the Napoleonic wars his talents as a commander were of the greatest service to his stepfather; and it was he who, along with Ney, saved the French army from total destruction after the disastrous expedition into Russia. The fifty days'

march from Poznan to Leipsic of the 12,000 famished spectres, the relics of the great host that had crossed the Niemen, seems the most heroic incident in the campaign, and one can appreciate Napoleon's words—'We have all committed faults, except Eugène.' Before leaving for Italy he won the battle of Lützen. After the Hundred Days he retired to Bavaria; and having purchased from the king, whose daughter, Amalie Augusta, he had married, the landgraviate of Leuchtenberg and principality of Eichstadt, became known as Duke of Leuchtenberg. He died 22d February 1824. His two sons, Auguste Charles and Maximilien-Joseph, succeeded in turn to the duchy. The former married Queen Donna Maria of Portugal, and died 28th March 1835; the latter married the daughter of the Emperor Nicholas of Russia, was also well known in the scientific world as a keen mineralogist, and died November 1, 1852. For the history of the Viceroy, see Gallois, *Histoire du Prince Eugène de B.* (Par. 1821); Aubriet, *Vie Politique et Militaire d'Eug. B.* (Par. 1824); and Armandi, *Vie Militaire du Prince Eugène*, &c. (Par. 1843).

Beaumarçiais, Pierre Augustin Caron de, a French wit and poet of bright and lively genius, was the son of a watchmaker named Caron, and was born in Paris, 24th January 1732. After a somewhat light and careless youth, he betook himself to his father's business with zeal; made a little invention, a new sort of escapement; was appointed *Horloger du Roi* (1753); married a widow, Madame Franquet (1757), and from a little property of hers took the aristocratic name of B. In 1768 he married a second time, obtaining on this occasion a splendid fortune with his wife. Meanwhile devoting himself to literature, he produced, in 1767, *Eugénie*, a drama in five acts; *Les Deux Amis, ou Le Négociant de Lyon* (1770); *Le Barbier de Seville* (1775); and *Le Mariage de Figaro* (1784). On these last two well-known productions his fame now rests. He lost largely by the publication of a complete edition of the works of Voltaire, for whose manuscripts he had paid 200,000 francs. B. died May 19, 1799. M. de Loménie gave an interesting record of the life and times of B. in several papers in the *Revue des Deux Mondes*, which, in 1855, were published as a biography in 2 vols. An edition of his works, with an introduction by M. Saint-Marc Girardin, was published at Paris in 1827, in 6 vols. 8vo.

Beaumaris (Fr. 'fair marsh'), the chief town of Anglesea, N. Wales, on the W. side of the beautiful bay of B., near the N. entrance to the Menai Strait, 238 miles N.W. of London, by the Holyhead Railway. It is said to owe its origin to the castle built here by Edward I. in 1295, of which the ivy-covered ruins still exist. B. is a favourite watering-place, has a good harbour, and exports marble, slates, copper, and other metals. The number of vessels that cleared the port in 1873 was 2978, of 809,181 tons. Along with Amlwch, Holyhead, and Llangefni, B. returns one member to Parliament. Pop. (1871) 2291.

Beaumont, Francis, poet and dramatist, best known by his literary partnership with John Fletcher (q. v.), was the third son of Sir Francis B., Justice of the Common Pleas, and was born at Grace Dieu, Leicestershire, in 1586. He was ten years younger than Fletcher, but predeceased him by ten years, dying in 1615 at the early age of thirty. B. wrote a number of miscellaneous pieces of poetry, distinguished, some by lyrical sweetness, and others by wit, one of the best being a *Letter to Ben Jonson*, of whom he was a friend and warm admirer. It was about 1612 that he became acquainted with Fletcher, and so friendly did they become, that they lived in the same house till B.'s marriage, in 1613, to Ursula, daughter of Henry Isley of Sundridge in Kent. A mystery rests on B.'s share in the authorship of those plays which bear his name and Fletcher's; and for long a vague belief prevailed that he wrote the graver and tragic, Fletcher the lighter and comic, portions. It seems, however, to be the general opinion, as expressed by Mr Minto in his recent *Characteristics of English Poets*, that 'B.'s chief share lay in correcting the exuberance of Fletcher.' The character and merits of conjunct work will be considered in the art. **FLETCHER**. See also Ward's *English Dramatic Literature* (Lond. 1875).

Beaumont, Gustave Auguste de la Bonnière de, a French publicist and writer, was born at Beaumont-le-Chartre (Sarthe), December 2, 1802. In 1831 he was sent with Tocqueville to America to study prison discipline. On his return he devoted himself to politics, and after the revolution of 1848 was appointed ambassador to the English court by Cavaignac. He

suffered imprisonment for a time in 1852, and died at Tours, April 2, 1866. His chief works are *Du Système pénitentiaire aux Etats-Unis et de son Application en France* (2 vols. 1832, 3d ed. 1845); and *L'Irlande, Sociale, Politique, et Religieuse* (2 vols. 1839, 7th ed. 1863).—**B. Vassy**, Edouard Ferdinand de la Bonnière, Vicomte de, a cousin of the above, born 1813, has written several works of romance, as *Une Marquise d'Autrefois* (Par. 1839); besides the *Histoire des Etats Européens depuis le Congrès de Vienne* (Par. 1843-53).

Beaumont, Jean Baptiste, Armand, Louis Leonce (Elie de), a celebrated French metallurgist and geologist, was born at Canon, in the department of Calvados, 25th September 1798; in 1832 became Professor of Geology in the Collège de France, and Chief Engineer of Mines; in 1835 was chosen member, and in 1853 secretary, of the Académie des Sciences. He has written numerous works; among others, *Mémoires pour servir à une Description Géologique de la France* (1833-38); *Observations Géologiques sur les différentes Formations dans le Système des Vosges* (1829); and his chief work, *Carte Géologique de France* (2d ed. 1855). His name will probably remain most associated with his theory as to the separate periods of elevation of the terrestrial mountain systems.

Beaune, a town in the department Côte-d'Or, France, near the source of the Bouzaise, 23 miles S.S.W. of Dijon by railway. It is beautifully situated at the foot of the Côte-d'Or, and contains many fine buildings, of which the chief are the collegiate church of Notre Dame, founded in 976, and a grand hospital of the 15th c. The clock-tower of the old town-hall (*le beffroy de B.*) is singularly picturesque. In the arrondissement of B. there is produced much first-rate wine of the kinds known as *B., Pommard, Volnay, Romanée, Clos-Vougeot*, &c. Pop. (1872) 10,100. B., supposed to have derived its name from the Latin *Bellona*, and to have had a Roman origin, was certainly a fortified town in the 7th c. It was long governed by hereditary counts, and was frequently the residence of the Dukes of Burgundy.—**B. la-Rolande**, a town in the department Loiret, 24 miles N.E. of Orleans, with a pop. (1872) of 927.

Beaune, Florimond, a distinguished French mathematician, and a great friend of Descartes, was born at Blois in 1601, and died 1652. He was the first to determine the nature of curves by the properties of their tangents. His only extant work is *De Aequationum Limitibus Opuscula duo, et Notæ breves*, printed in the *Géométrie Latine* of Descartes.

Beauregard, Peter Gustave Toutant, a Confederate general during the American War of Secession, born in 1818, near New Orleans. He entered the military college at West Point in 1834, graduated in the Corps of Engineers in 1838, distinguished himself under General Scott in the Mexican campaign; in 1853 was appointed surveyor of the fortifications on the coast of the Gulf of Mexico, and in 1860 superintendent of the Military Academy at West Point, an office which he held only five days. He resigned his commission in the U.S. army, February 20, 1861, and joining the Confederates, commenced the war by bombarding Fort Sumter, April 12. He inflicted a signal defeat on the Federal troops at Bull Run, July 21; was second in command at the battle of Shiloh, April 6, 1862, and held the chief command after General A. S. Johnston was killed; and during 1862-64 defended Charleston successfully against Generals Gillmore and Hunter. In 1864 he defeated General Butler at Drury's Bluff, and defended Petersburg against the attacks of Grant and Meade. After the capture of Richmond he surrendered to General Sherman, at Greensboro, in April 1865. Since the re-establishment of the Union, he has been president of railways in Louisiana. B. has quietly adapted himself to the altered condition of political affairs in his country.

Beauty. See **ÆSTHETICS**.

Beauvais, the capital of the department of Oise, France, at the junction of the Avelon and the Thérain, 40 miles N.N.W. of Paris, formerly within the old province Ile de France. It was the chief town of the ancient *Bellovacum*, was called by the Romans *Casaramanus*, later *Bellovacum*, from its original occupants, and was known as *Belvacum* in the middle ages. The Norsemen sacked B. in 886 and again in 1180, when they had become Normans; the English unsuccessfully besieged it in 1443; and in 1472 the Burgundians under Charles the Bold were repulsed, chiefly by the valour of Jeanne Lainé, surnamed

La Hachette from the battle-axe with which she fought. There is still an annual fête in honour of the latter victory, when the Burgundian flag which was captured by La Hachette is borne by a procession of girls: a monument was erected to her in 1850. B. is the residence of a bishop (it was a bishop of B. who accused Joan of Arc of sorcery and heresy), and has a splendid Gothic cathedral, commenced about 1225, the choir of which is said to be the loftiest in the world, rising 153 feet from floor to ceiling. There are celebrated manufactures of woollens, shawls, carpets, and Gobelin tapestry. Pop. (1872) 13,532.

Beaver, a genus of *Rodent* quadrupeds, forming the type of the family *Castoridae* of that order. The beavers possess distinctly developed clavicles or collar-bones. Each foot is furnished with five toes. The hinder toes are webbed, and adapt these feet for swimming. The incisor or front teeth—so characteristic in form, structure, and growth in all *Rodentia* (q. v.)—are large; and the molars, numbering eight in each jaw, exhibit a complicated folding of their enamel covering. The tail is flattened and scaly. The B. (*Castor fiber*) found in Northern Europe and Asia is the typical representative of the family. The American form, if at all different from the European B., is at most a variety, and not a distinct species, as some naturalists allege. In America the beavers live in social communities, but in N. Europe and Asia they appear to live singly or less singly. The B. averages about 2 feet in length exclusive of the tail; the latter appendage being about 10 inches long, and 3 inches in breadth. In general shape the B. is thickly set, and broad at the rump, narrowing suddenly towards the tail. The head is broad, and the snout abrupt. The ears are short and rounded, the eyes being of small size. The outer fur is coarse and long, the under fur being soft, silky, and closely set. The usual colour is a dark or chestnut brown, but lighter shades are not infrequently met with. In habits the beavers are aquatic, these forms living in the neighbourhood of rivers and lakes.

social community, and when living together in numbers build dams across the rivers on the banks of which they reside. The stems of trees are gnawed across, and thus broken off, the lesser branches being woven together, and the entire structure being plastered with mud. In the latter operation, the flat scaly tail is used. Their houses or 'lodges' are built in the same fashion. Much that has been written and told of the extraordinary habits and instincts of the beavers is utterly unworthy of credit, these animals exercising simply an ordinary amount of activity and instinct in the formation of their abodes. Their food consists of leaves, herbage, and bark, and it is alleged they occasionally fish, although there is little doubt that worms, &c., may form part of their dietary. The food is sometimes eaten by holding it between the paws, whilst the animal sits erect on the hind-legs. From two to seven young are produced at a birth in April or May; the young beavers being born with the eyes open. These animals are captured in traps. The winter generally drives them from their lodges, when they take refuge in holes or burrows excavated in the river banks, the entrances to which are trapped. The beavers afford a valued fur, upwards of 80,000 skins being imported annually into Britain from N. America. The substance employed in medicine, and known as *Castoreum* (q. v.), is also obtained from the B., and is secreted in glandular sacs placed in the vicinity of the generative organs, and named *preputial glands*. This secretion has probably some intimate connection with the reproductive habits of these forms. The American castoreum is alleged to be of inferior quality to the secretion of the Old World beavers. The fur has been used in England, chiefly for the manufacture of hats, from an early period—from the middle of the 17th c. at least. The flesh of the B. is oily and strong-tasted. The Coypu (*Myopotamus Cuypos*) of Chili, and the Musquash (*Fiber Zibethicus*) of N. America, are also included in the B. family. The beavers are represented in a fossil state in Miocene and Pliocene deposits. The *Castor spelæus*, or cave-B., found in European caves and bone-deposits, is indistinguishable from the existing B. The

Beaver

large *Trogontherium*, found in European Post-tertiary deposits, may be included in the same genus with the B. The *Castoroides ohioensis* of N. American Post-tertiary deposits is a distinctly specific or generic form from the existing American B. This latter form attained a length of five feet.

Beaver. See **HELMET**.

Beaver-Wood, or Beaver-Tree, *Magnolia glauca*, a native of Pennsylvania, Virginia, and Carolina, 15 to 20 feet in height, with beautiful fragrant white flowers. The bark is tonic and aromatic, resembling that of Cinchona (q. v.) in its action. The unripe fruits of *M. fraseri* and *M. acuminata* have similar properties. B. W. is also called White Bay and Swamp Sassafras.

Bebeerine, or Bib'rine. Under this name an alkaloid was in 1835 obtained from the Greenheart-Tree (q. v.), which was introduced into medicine as an effective febrifuge, and a substitute for quinine. Recent investigations have demonstrated that it is identical with buxine, an alkaloid obtainable from the common box, *Buxus sempervirens*.

Beb'eri, or Bib'iri. See **GREENHEART**.

Beccaf'co (Sylvia or Curruca hortensis), an Italian name applied to the garden warbler or pettychaps, a passerine bird included in the family of the *Sylviade* or Warblers (q. v.). It occurs in Britain; but is more common in Italy and S. Europe, where it is valued as a table delicacy. It is migratory in habits, wherever found. The upper parts are coloured brown, and the under parts white.

Beccamoschi'no (Sylvia isticola), a member of the family *Sylviade* or Warblers (q. v.), so named by the Italians. It occurs in Italy, and makes a nest like that of the tailor-birds, of leaves and vegetable fibres curiously interwoven.

Beccaria, Cesare Bonesana, Marchese de, a political and social writer of Italy, born at Milan in 1735, was a pupil of the Neapolitan economist Genovesi, and afterwards a leading member of the literary society which existed in Milan for some time before the French Revolution. In 1762 he published a work on the currency of Milan, and in 1764 produced his noble *Trattato dei Delitti e delle Pene*, which has been translated into most European languages. In 1768 he became a Professor of Political Philosophy at Milan, where he died, 28th November 1794. His lectures are published in a series of *Italian Economists* (Milan, 1804). A complete edition of B.'s *Opere* was published by Villati in 1854. The main idea of his *Essay on Crimes and Punishments* (on which Voltaire wrote a short commentary in the 34th volume of his collected works) is, that in each case punishment should be adjusted so that the dread of it may counterbalance the particular motives to crime, and should also be immediate and certain, not depending on the discretion of the bench. The probability of prevention alone justifies the infliction of suffering. This principle leads B. to oppose capital sentences, torture, and many prevailing notions on judicial procedure and criminal law. The essay is the work of a keen mind and a warm heart; it develops the suggestions of Montesquieu, and laid the foundation of many legal reforms. It concludes with the following general theorem: 'That a punishment may not be an act of violence, of one or of many, against a private member of society, it should be public, immediate, and necessary, the least possible in the case given, proportioned to the crime, and determined by the laws' (p. 135, Edinb. transl. 1778).

A common French name applied to many small birds, belonging chiefly, but not exclusively, to the *Sylviade*.

Beccard, Thomas de la, an English geologist, born 1796, educated at the military school at Sandhurst, entered the army in 1814, and served in the army of Great Britain, which was afterwards sent to the continent, and of which he was appointed a captain, and subsequently became director of the British School of Science. He died 13th April 1855. B. was the author of a treatise *On the Discovery of a New Fossil Animal, the Pleiosaurus* (1823), *Geology of Jamaica* (1826), *Classification of European Rocks* (1828), a *Geological Manual* (1831), *Researches in Theoretical Geology* (1834), *The Geology of Cornwall, Devon, and West Somerset* (1839), and *The Geological Observer* (1851, 2d ed. 1853).

Beche-de-Mer, or Trepang, an edible marine slug, procured on the coral reefs of the Pacific, and cured in immense quantities for the Chinese market. There are many varieties of B., all species of *Holothuria*, of which ten kinds are marketable in China; and of these, four are of a superior quality. They are of an oval shape, dark-coloured on the back, and vary in length from 6 to 24 inches. Much skill and care is required in the operation of curing, which is performed by gutting and boiling the slugs, and spreading them out on a perforated platform over a wood fire to dry. Sun-dried B. is esteemed a great delicacy in China, and is in special request for making soups.

Bech'er, Johann Joachim, a German chemist and physicist, was born at Speier in 1625. After a youth of great hardship and laborious study in all branches of physical science, he became a professor at Mainz; was elected a member of the Imperial Council at Vienna in 1660, but fell into disgrace, and returned to Mainz. Subsequently he lived in Munich, Würzburg, Haarlem, and London, where he died in October 1682. Though he adopted many of the fanciful theories of the alchemists, yet his principal work, *Actuum Laboratorii Chymici Monacensis, seu Physice subterraneae Libri duo* (Frankf. 1669, and again 1675, with additions in 1681), was the first attempt to establish a logical connection between physics and chemistry. His other writings are numerous, but not valuable.

Bech'uans, or Betjuans, a scattered people, occupying the country S.W. of Lake N'yassa, and on both banks of the Zambesi, S. Africa, between 15° and 28° S. lat., and from 23° to 29° E. long. They are allied to the Kaffirs, but are less intellectual and less warlike, living chiefly by husbandry and cattle-rearing, and working with some skill in iron, copper, ivory, and skins. The chief tribes are Batoka, Basunga, Bayeye, Baquaina, Bakatla, Basuti, and Barolong. There are several rudely-fortified villages, the largest of which are Kuruman, Shoshong, and Kolobeng. The Boers (q. v.) of the Orange River States and Transvaal Republic have settled in the S. of the country of the B., whom they treat with great cruelty.

Beck, the name of several eminent Germans, of whom the following are the most important:—1. **Christian Daniel B.**, historian and philologist, born at Leipsic, 22d January 1757; became professor of Greek and Latin in the university of his native city, and died there, 13th December 1832. Among his numerous editions of the classics may be mentioned his *Pindar*, *Aristophanes*, *Euripides*, *Apollonius Rhodius*, *Plato*, *Cicero*, and *Calpurnius*. Besides these, B. wrote an *Anleitung zur Kenntniss der allgemeinen Welt- und Volksgeschichte* (4 vols. Leips. 1787-1805); *Grundriss der Archäologie zur Kenntniss der Geschichte der alten Kunst* (Leips. 1816), &c.—2. **Johann Tobias B.**, an able Protestant theologian, born at Bahlingen, in Württemberg, 22d February 1804; studied at Tübingen, became professor at Basel in 1836, whence he was called to Tübingen in 1843, and acquired a great reputation as a preacher and teacher. B. was one of the first to oppose, on the basis of independent scholarship, the conclusions of the critico-speculative school of Baur, and endeavoured to introduce a more exact study of the New Testament literature. His chief works are, *Einleitung in das System der Christl. Lehre* (Stuttg. 1838); *Die Christl. Lehrwissenschaft nach den Biblischen Urkunden* (Stuttg. 1841); *Die Geburt des Christl. Lebens* (Basel, 1840); *Umriss der Biblischen Seelenlehre* (Stuttg. 1853, 2d ed. 1862); *Gedanken aus und nach der Schrift* (Frankf. 1859, new ed. 1868); *Christliche Reden* (six collections since 1834).—3. **Karl B.**, a lively, picturesque, and musical poet, born 1st May 1817, at Baja, in Hungary, was the son of a Jewish merchant converted to the Protestant religion; studied at Vienna, and after some time settled in the Austrian capital. He has written *Nächte. Gepanzerte Lieder* (Leips. 1838); *Der fahrende Poet* (Leips. 1838); *Stille Lieder* (Leips. 1839); *Saul*, a drama (Leips. 1841); and *Junko, der Ungar. Rosshirt* (Leips. 1842, 3d ed. 1853), a metrical romance. His *Gesammelten Gedichte* appeared in 1844, and again in 1854. Since then B. has written, among other things, *Lieder vom armen Manne* (Berl. 1846, 4th ed. 1861); *Aus der Heimat* (Dr. 1852, 4th ed. 1862); *Mater Dolorosa* (Berl. 1853); *Jadun* (Leips. 1863); and *Still und Bewegt* (1870).

Beck'er, Gottfried Wilhelm, a German physician and prolific author, born February 22, 1778, at Leipsic, where he studied, took his degree, and practised medicine for upwards of

thirty years. He died January 17, 1854. Among his writings, which are literary rather than scientific, may be mentioned *Beschreibung von Leipzig* (1806); *Gemälde von Leipzig* (1823); *Reisebilder aus Süd-Deutschland* (1837); *Andreas Hofer* (1841); *Ägypten wie es jetzt ist* (1841); *Napoleon, dargestellt nach den besten Quellen* (1846-47). B. left his fortune (53,000 thalers) to found a blind-asylum in Leipsic.

Becker, Johann Philipp, a German politician, born at Frankenthal, Rhenish Bavaria, 19th March 1809, and brought up to the trade of a brushmaker. The events of July 1830 turned his attention to politics, and he became an ardent advocate of radical opinions, for promulgating which he was several times imprisoned. Withdrawing to Switzerland in 1838, he took a prominent part as a journalist; fought against the Sonderbund in 1847, and in 1848 organised volunteer corps among the German emigrants and Swiss radicals to aid the South German revolution. On the failure of Hecker's preliminary attempt, B. returned to Switzerland, and resolved to march with his corps to the help of the insurgents in Rome and Sicily. The outbreak in the Palatinate and in Baden altered his purpose. He hastened to the scene of action; reached Karlsruhe, 17th May 1849, covered the retreat at Waghäusel, commanded at Durlach (25th June), was present in several other engagements, and on the suppression of the revolution settled in Geneva. He reappeared in the Franco-Italian war against Austria (1859-60), when he was employed to organise a German battalion to act under Garibaldi; and again in 1863-64, when the Slesvig-Holstein difficulties began, with a theory of a 'People's Union,' which excited no attention. B. wrote in conjunction with Esselen a *Geschichte der Süd-Deutschen Mai-Revolution* (Gen. 1849).

Becker, Karl Ferdinand, an eminent German philologist, born 14th April 1775, at Liser, on the Moselle; became a medical practitioner at Offenbach in 1815, and in 1823 converted his house into an academy. Devoting his leisure to linguistic studies, B. was led by philosophical speculation rather than by historical investigation to view language as an organism pervaded by ascertainable logical laws. From this point of view he wrote his *Ausführliche Deutsche Grammatik* (2d ed. 1843); an outline of it, *Schulgrammatik* (8th ed. 1862); *Organism der Deutschen Sprache* (1841-42), &c. B. died at Offenbach, 5th September 1859.

Becker, Karl Ferdinand, son of Gottfried Wilhelm B. (q. v.), was born at Leipsic, 17th July 1804, received his early musical training from Schicht and Schneider, and became Professor of the Organ at the Leipsic Conservatoire in 1843, a post which he resigned in 1856, to devote himself exclusively to study. He is a great, probably the greatest, authority in Germany upon the history and construction of that instrument, for which he has composed excellent music. He is one of the best German writers upon the history of music, and has written largely also upon the chorale, the hymn-tune of the Lutheran Church. Among his works may be mentioned *Systematische-chronologische Darstellung der musikalischen Literatur* (Leips. 1836); *Die Hausmusik in Deutschland in dem 16ten, 17ten, und 18ten Jahrh.* (Leips. 1840); and *Die Choral-sammlungen der verschiedenen Christl. Kirchen* (Leips. 1841).

Becker, Nikolaus, the author of the famous German *Rheinlied*, was born 15th January 1810, at Geilenkirchen, in Rhenish Prussia, and in 1840, when the war-party in France threatened the seizure of the left bank of the sacred river, set the patriotism of his countrymen on fire by his *Sie sollen ihn nicht haben*, which, though not a wonderful poem, was everywhere sung with enthusiasm. The French were stirred into a jealous rage, and Alfred de Musset wrote a witty but rather ignoble answer, *Nous l'avons eu votre Rhin Allemand*. B. died after a lingering illness, 28th August 1845. A collection of his *Gedichte* was published at Cologne in 1841.

Becker, Wilhelm Adolf, a German archaeologist, was born at Dresden in 1796; studied philology and theology at Leipsic, and travelled in Italy in 1840. He was called to the chair of archaeology at Leipsic in 1842, and died at Meissen, 30th September 1846. B.'s knowledge of classical antiquity enabled him to reproduce private life at Rome and Athens in a series of compendious but interesting portraiture, the former in his *Gallus, oder Römische Szenen aus der Zeit Augustus* (2 vols. Leips. 1838, 3d ed. 1863); and the latter in his *Charikles, oder Bilder Alt-*

Griechischer Sitten (2 vols. Leips. 1840, 3d ed. 1854). These works have been translated into English by Metcalfe. His *Handbuch der Röm. Alterthümer* (Leips. 1843-46) was continued after his death by Marquardt, and is in some respects his chief work. The *Gallus* and *Charikles* display great powers of combination and research, and are exquisitely finished.

Beckerath, Hermann von, a German politician, born at Krefeld in Prussia, December 1801. On the accession of Friedrich Wilhelm IV. in 1840, B. resolved to work for the constitutional freedom of his country, and for several years was an influential member of the Provincial Diet. He was a deputy in the National Assembly which sat at Frankfurt in 1848, received the portfolio of Finance at Berlin, but being unsuccessful in constructing a cabinet, he returned to Frankfurt. Though a zealous advocate of German unity, he refused to promote it otherwise than by constitutional means. As a member of the second Prussian chamber, he strenuously opposed the retrograde policy of Manteuffel, and withdrew from active politics in 1852. Failing health decided him to refuse to sit again on his re-election in 1858. He died at Krefeld, 12th May 1870.

Becket, Thomas, the son of Gilbert B. (a London merchant of Norman family), was born 21st December 1117. He probably studied at Paris, and in 1142 he attached himself to Theobald of Canterbury, who in 1153 made him archdeacon of Canterbury. During these years B. went to Rome about the legateine privileges of Canterbury, and the proposed succession of Eustace to King Stephen. On Henry's accession (1154) he was made chancellor, a position of wealth as well as dignity. He became a pluralist in Church and State, and lived magnificently on the proceeds of vacant benefices. In the campaigns against Louis VII. he did service in the field, and defrayed part of the costs of the war by 'second subsidies' from the clergy, and by a scutage of £3 on the knights' fees. On 3d June 1162 B. succeeded Theobald as primate, and resigned his chancellorship. He at once began a life of the strictest discipline and self-devotion to the Church. His claims to excommunicate at pleasure the king's tenants, and that priests guilty of murder and rape should be amenable only to spiritual courts, were angrily opposed by Henry, who (after demanding at the council of Westminster that convicted priests should be 'degraded') in 1166 submitted to his great council the celebrated Constitutions of Clarendon, which, professedly codifying the ancient customs of the realm, provided not merely for the supremacy of the king's courts in matters both civil and criminal affecting the clergy, especially in the matter of advowsons, but also for the control by the king of ecclesiastical presentations, and the discontinuance in all cases of appeals to Rome. After resistance, B. was forced to swear to obey these councils; but, although important as a declaration of national feeling, the chief articles were annulled by Pope Alexander III. In the same year, at the Council of Northampton (in which Norman bishops sat), B. was tried for alleged failure to account for moneys received by him as chancellor. He declined to receive sentence, formally appealed to Rome, and fled under the assumed name of Brother Christian to the Abbey of Pontigny in Burgundy, and afterwards to Sens. Henry deposed him from his see and confiscated his possessions, but B., supported by Pope Alexander, who made him legate for England, and by Louis VII., continued to assert his authority by issuing from Vezelay sentences of suspension and excommunication on English priests and laymen, e.g., on Gilbert Foliot, Bishop of London, in 1167. In 1168, however, after an attempt to mediate through cardinal-legates, the Pope suspended B. for a time, but next year the coronation of Henry's son by the Archbishop of York, in defiance of a bull, improved the exile's position considerably. Finally, in 1170, a reconciliation was arranged between Henry and B. at Fereitville in Touraine. Returning to Canterbury, where he was well received, B. put into force sentences of excommunication issued by the Pope against three independent English prelates. This probably was the occasion of his murder on 29th December 1170. The murderers were at once excommunicated, but do not seem to have suffered any temporal punishment. In 1174 Henry performed penance at the tomb of B., who had previously been canonised; he also undertook large obligations to the Pope's envoys. Until the Reformation pilgrimages were frequent to the shrine in which the saint's bones were deposited by Henry III. So late as 1857 Pius IX. confirmed the celebration of an annual festival (a double of the

first class with an octave) in memory of St Thomas. See Canon Morris's *Life and Martyrdom of Saint Thomas B., Archbishop of Canterbury*, and *Legate of the Holy See* (Lond. 1859); Canon Robertson's *B., Archbishop of Canterbury* (Lond. 1859); and Freeman's *Historical Essays* (Lond. 1872). The last-mentioned is particularly valuable for the lucidity and breadth of its historical portraiture. It gives in all probability the most just estimate, at once liberal and strictly critical, of a man who has been the subject alike of extravagant praise and unmerited blame.

Beck'sta, the nautical name for hooks, pieces of rope, or brackets on which to fasten ropes, tackles, oars, or spars.

Beckford, William, an eccentric English author, was born in 1760. He was the only legitimate son of the celebrated Alderman B. At nine years of age, B. succeeded to his father's property, the income from which, including the celebrated Fonthill, in Wiltshire, amounted to £100,000 a year. In 1780 he came before the public as an author, with an essay entitled *Biographical Memoirs of Extraordinary Painters*, which had the one merit of showing his powers of wit and sarcasm. The two subsequent years were spent in restless travel. In 1783 he entered Parliament as member for Wells, and in 1784 married Lady Margaret Gordon, daughter of Charles, Earl of Aboyne; and in the same year appeared an English translation (by Dr S. Henley, Vicar of Rendlesham) of his celebrated Arabian tale of *Vathek*, which he had written in French, he himself says, 'in three days and two nights.' The original French first appeared at Lausanne in 1787. *Vathek* obtained for the author, from the extraordinary powers of sarcasm and description which it showed, a great and almost unique name in British literature. The remainder of B.'s life was spent in travel and impulsive actions, and latterly in absolute retirement, except during the short period in which he sat in Parliament. He erected a remarkable mansion at Fonthill, and then, in a freak, sold it for £350,000 to Colonel Farquhar. Similarly he bought Gibbons' library at Lausanne, and then handed it over to his physician, Dr Scholl. He wrote nothing remarkable after *Vathek*, although in 1834 he produced a work upon Italy, Spain, and Portugal, and, in 1835, *Recollections of an Excursion to the Monasteries of Alcobaca and Batalha*. Always a hard student, B. finally shut himself up with his books and fancies. He died 2d May 1844.

Beckmann, Johann, a meritorious German author, born at Hoya, Hanover, June 4, 1739. He was Professor of Natural Philosophy at St Petersburg from 1763 to 1765, thereafter travelled in Sweden to acquaint himself with the working of mines, and in 1766 became a professor, first of Philosophy, and in 1770 of Political Economy, at Göttingen, where he died, February 4, 1811. B. was the first German who wrote scientifically on agriculture and commerce. Among his numerous other writings are *Anleitung zur Technologie* (5th ed. Gött. 1809); *Physiko-ökonomische Bibliothek* (33 vols. Gött. 1770-1808); *Beiträge zur Oekonomie, Technologie, Polizei und Kameralwissenschaft* (11 vols. Gött. 1779-91); and *Beiträge zur Geschichte, der Erfindungen* (5 vols. Leips. 1780-1805), the last of which has been translated into English by Bohn, and is still valuable.

Beoquerel, Antoine César, an eminent French physicist, was born at Châtillon-sur-Loire (Loiret), March 7, 1788. On leaving the Polytechnic School in 1808, he became an officer of engineers, and served in Spain under General Suchet. In 1815, he quitted the military service, and subsequently turned his attention to electricity. Elected a member of the Academy of Sciences in 1829, he has since then been a very voluminous writer on chemical and electrical subjects. Of his numerous works we may mention his *Traité de l'Electricité et du Magnétisme* (7 vols. Par. 1834-40; new ed. 1855-56, with additions, 1858); *Traité d'Electro-chimie* (Par. 1840); and in conjunction with his son, **Alexandre-Edmond B.** (born March 24, 1820), *Eléments de Physique terrestre et de Météorologie* (1847). The latter was made Professor of Physics in the Paris Conservatoire des Arts in 1853, and has written a good deal on the solar spectrum, magnetism, and electricity.

Beo'se, Neu, or Turkish B., a town in the county of Torontal, Hungary, 40 miles S.E. of Zombor, on the Theiss, with a trade in cotton goods and tobacco. It is also one of the largest corn-markets in the Austrian empire. Pop. (1869) 7193.—**B., Alt**, or Servian B., on the Bacsá Canal, 5 miles W. of the above, has also a great trade in corn.

Beo'skerék, Nag'y (i.e., Great B.), the capital of the county of Torontal, Hungary, 45 miles S.W. of Temesvár, lies on the Bega Canal, here crossed by a fine bridge. It has an old ruined castle, several fine buildings, a Greek church, and a Roman Catholic college. There is considerable trade in corn and cattle, and fishing and bee-keeping are carried on. Pop. (1869) 19,664. **B., Kis**, or Little B., is a village in the county of Temes, 8 miles N.N.W. of Temesvár, with some trade in wool and honey. Pop. 3004.

Bed, the sleeping-place of mankind, which, in modern times, is an article of furniture consisting of bedding and B.-hangings, with a bedstead or framework to support them. When man led a nomadic life, he doubtless spread leaves or other materials on the ground and slept thereon, the device of a bedstead belonging to less remote times, when people aggregated in towns, and built permanent dwellings. Domestic comfort increased with the progress of civilisation, and from mural paintings we know that the Egyptians used couches, ottomans, and other articles of furniture which are now indispensable to ease and luxury. It would appear that the divan by day served, with the addition of some kind of bedding, as a B. by night, as is still the custom among Western Asiatics. Wicker bedsteads, similar to those of the modern Egyptians and Arabians, formed of the mid-ribs of palm leaves, are also figured in Egyptian painting, and early Egyptian head-rests of wood and alabaster, of a crescent shape, are preserved in the British Museum. There are frequent allusions in Holy Writ to the great luxuriousness of beds and B.-hangings among the ancient Jews. In the heroic ages of Greece, beds consisted of skins, or dried herbs spread on the ground. In later times the wealthy Greek had his mattress and pillows stuffed with wool, and rugs, carpets, and linen sheets for B.-clothes; his bedstead was a magnificent object, being made of costly wood inlaid with tortoiseshell, or of ivory, and adorned with feet of silver; it always had a head-board, and sometimes a foot-board also, in which case it would resemble a modern French B. During the Roman empire, mattresses were stuffed with down or swans' feathers, coverlets were formed of rich textiles of a purple colour, and embroidered with gold, and bedsteads even surpassed in splendour those of the Greeks. The use of B.-curtains by the Greeks and Romans is not distinctly alluded to by ancient writers, but the fact that the dinner-couch was adorned with drapery, makes it probable that the B. was so also. The Anglo-Saxons usually slept on a sack filled with straw, laid on a bench in a recess at the side of the room; bedsteads were rare even among the rich, and the skins of goats and bears were used as coverlets. From ancient illuminated manuscript drawings, it would appear that the Anglo-Saxon entered his B. in a nude state—this custom prevailed even till Queen Elizabeth's time—and, enveloping his body in a sheet, drew the coverlet over him. In early Norman times the tester B., or B. with back and roof, was introduced, and while the mattress was still of straw, a greater degree of taste characterised the B. coverings and hangings. A little later, straw was replaced by down, and sheets of rich silks, and coverlets of green say or cloth, made of the hair of the badger, were not uncommon. The simple and unadorned bedstead of the Norman period continued in use till the 15th c., when the *celure* or roof, and the *tester* or back, which were independent of the bedstead proper, and attached to the wall and ceiling, were decorated with coats-of-arms and other carved ornaments; canopies were also enlarged, and *costers*, or ornamental cloths for the sides of the B. now appear. At this period feather-beds were so valued as to be bequeathed like other property. The large four-posted bedsteads were introduced in the 16th c. and had their origin in an arrangement like a square tent, in which the curtains were not suspended from the roof as hitherto, but on a frame with four corner posts, inside of which the B. was placed. Fine examples of the four-posters of this period, with elaborate carvings, remain in some old mansion-houses. The celebrated 'B. of Ware,' still preserved in an inn at Ware, Hertfordshire, was made in the reign of Queen Elizabeth. It is remarkable for its size—12 feet square—and for its curiously-carved back, which, rising at the head, supports, with the aid of two massive pillars at the foot, a heavy canopy, beautifully enriched with carved work. The richly-embroidered counterpanes, and B.-hangings, display at this time a degree of unsurpassing splendour. The modern styles of bedsteads—Elizabethan, French, and tent, are too well known to call for more

than passing notice. In the march of improvement, feathers as a stuffing material have given way to curled horse hair, wood bedsteads are being replaced with those of iron or brass, or both metals, and other changes are being effected which tend to promote conditions of perfect cleanliness and ventilation with softness and elasticity. Of late years mattresses of small coils of wire, woven by an ingenious process of double weaving, have been made in Great Britain, and at Hartford, Connecticut, a similar industry has assumed large proportions. See AIR-BEDS and WATER-BEDS.

Bed, or **Stratum**, the term applied in geology to the *layers* seen in *sedimentary*, *aqueous*, or *fossiliferous* rocks, which result from the slow deposition in water of the soft sediment or materials from which the rocks were formed. It is the arrangement of these layers or beds that give to aqueous or water-formed rocks their regular and *stratified* appearance—a characteristic not seen in rocks formed by fire. Stratification or arrangement in beds is to be distinguished from *lamination*, or that property whereby, in virtue of the thin nature of the smaller layers composing a S., the B. or S. itself, may be split up into thin *laminae* or plates, as seen in many clay and slate deposits. Lamination generally results from the material of a S. having been deposited at short or appreciable intervals.

Be'da, or **Bede**, more properly **Bæda**, surnamed the **Venerable**, was born near St Peter's Monastery, Wearmouth, in 673. At the age of ten, he entered St Paul's Monastery at Jarrow, where he was ordained priest in his thirtieth year. The life of B. was that of a Christian scholar, not that of a Christian evangelist, and it is therefore little broken by outward events—strikingly contrasting in this respect with the picturesque career of Columba, the restless hero of the Scoto-Irish Church. B. attained a wide repute as a teacher, and many gathered to his monastery for instruction, besides the 600 monks who belonged to the house. His years were spent in gaining knowledge, and in spreading it, both by his teaching and his writings. This he esteemed the labour most proper to him; and so refused either to leave his monastery, or to hold any high office in it. His life was passed at Jarrow, and there he died in 735.

B. was the greatest scholar of his time in England, the 'father of English learning,' and had a fame not limited to the island. He was the first of moderns to grasp the true notion of history. Although there is a liberal infusion of the marvellous in his works, it can easily be severed from the narrative of facts. He must always hold a high rank among English men of letters as well as among English scholars; for, though he wrote chiefly in Latin, yet the spirit of his writings is thoroughly English, and the work on which he was engaged at his death was a translation of St John's Gospel into the mother-tongue. His learning was truly encyclopædic, embracing all subjects known in his own age and the ages before. Such science as the time possessed may be seen in his treatise *On the Nature of Things*; and he was also a master of rhetoric, grammar, music, poetry, philosophy, and medicine, on all of which he wrote. Besides these, he composed books on Church matters and theology, commentaries, digests, homilies, and religious biographies. But his great work is the *Historia Ecclesiastica Gentis Anglorum* (Church History of the English Nation), the fifth and concluding book of which was finished in 731, three years before its author's death. B. was fortunate in his subject, because the Church in England was at that time gaining a unity and organisation which the State did not possess till long after. The value of the *History* as an accurate and trustworthy record of events can hardly be over-estimated. Its sources were the chronicles of Roman and native writers, the records of the monasteries, and—most valuable of all—the personal and contemporaneous knowledge of the historian. All that we know of that interesting and most important period in English history—the 7th c. and first half of the 8th—is derived from B.'s history. It was translated into English under the care of King Alfred. A complete edition of B.'s works was published by Dr Giles (6 vols. Lond. 1843-44). Translations of the *History* were published by Hurst (1814), Wilcock (1818), and Giles (1840). The Latin original has been recently edited with English notes by Moberly (Macmillan, 1869).

Bedarieux, a thriving town in the department of Hérault, France, on the Orb, 18 miles N. of Beziers, with manufactures of fine and coarse cloths, hosiery, hats, leather, paper, oil, and soap, and a trade in wood and grain. Pop. (1872) 7374.

Bedchamber, Lords or Ladies of the, are officers of the British royal household, appointed to wait upon the king or queen. In the reign of a king the head officer is the Groom of the Stole. When a queen is regnant, the Mistress of the Robes is at the head of the officers of the B.

Bedd's Nuts, the fruit of a species of myrobalan (n. p. Combretaceæ, q. v.), *Terminalia Bellerica*, largely imported into this country from the E. Indies for the use of the tanner and to produce a very permanent black dye employed by calico printers. They are also called *bustard* and *belleric myrobalans*. The seeds are eaten by the natives in some parts of the E. Indies, but they possess narcotic poisonous qualities. The fruits of *T. Chebula*, under the name of *Chebulic myrobalans*, are also used in dyeing. The flowers are used in Travancore as a dye, and the fruits are purgative.

Bedd'oes, Thomas, M.D., an English physician, was born at Shifnal in Shropshire, April 15, 1760. At Oxford and Edinburgh, where he studied, he soon distinguished himself for his acquaintance with both ancient and modern languages, but his favourite studies were the natural sciences, especially chemistry, which he regarded as of great importance in the treatment of diseases. In 1787 he was appointed to the chemical chair in Oxford, which he resigned in 1792; and six years later, assisted by his father-in-law, Mr Edgeworth, he opened a pneumatic hospital at Bristol, which was successful only in bringing out the talents of Humphrey Davy, who was superintendent to the chemical laboratory. B. died 24th December 1808. Of his numerous works, may be mentioned *A Popular Treatise on Consumption* (1779); *Chemical Experiments and Opinions* (1790); *History of Isaac Jenkins* (1792); *Hygeia, or Essays Moral and Medical* (3 vols. 1802); and *An Essay on Fever* (1807). See Stock's *Life of B.* (Lond. 1810).

Beddoes, Thomas Lovell, son of Dr Thomas B. and of his wife Anna, sister of the novelist Maria Edgeworth, born at Clifton, 20th July 1803, entered at Pembroke College, Oxford, in 1820, went to Gottingen to study medicine in 1825, and continued to live much abroad till his death, at Basel, 26th January 1849. While still in his minority he had published *The Improvisator* (1821), and *The Bride's Tragedy* (1822). B.'s ambition was to be a dramatist; but though his verse was rich and musical, and his imagery at once felicitously and surprisingly original, his command of character and plot were too limited to render the realisation of that ambition possible; yet if single lines of Shakesperian quality could preserve the name of a writer, B. might hope to be remembered. In a posthumous work, *Death's Jest-Book, or the Fool's Tragedy* (1850), there are things which no dramatic poet has approached since the Elizabethan age. See Kelsall's *Memoir of B.* in his edition of the *Poems, Posthumous and Collected*, of Thomas Lovell B. (2 vols. Lond. 1851).

Bedeau, Marie Alphonse, a French general, was born at Vertou, near Nantes, August 10, 1804, and received his commission in 1825. He gained military distinction in Algeria, and was for a short time (1847) governor of the colony. He was in Paris on leave of absence at the time of the revolution of February 1848, and Marshal Bugeaud gave him command of one of the five columns which failed to quell the insurrection. The Provisional Government appointed B. commander-in-chief of the army of Paris, and he afterwards took a seat in the constituent and legislative assemblies as a republican deputy. On Louis Napoleon's *coup d'état* (December 2, 1851), he was arrested with others of his party, and subsequently retired into exile. He lived for many years in Belgium, but afterwards took advantage of the Emperor's amnesty, returned to France, and died at Nantes, October 30, 1863.

Bedell, William, a popular, learned, and pious divine of the 17th c., was born in 1570, at Black Notley in Essex. After an education at Cambridge, which ended in his taking holy orders, he went to Venice as the chaplain of Sir Henry Wotton, made the acquaintance of the celebrated Father Paul Sarpi, who gave him the MS. of his *History of the Council of Trent*, and other works, subsequently published in London. He returned to England, but it was long before he obtained preferment, mainly on account of his Calvinistic opinions. In 1629, however, he was appointed to the united bishoprics of Kilmore and Ardagh, Ireland. B. devoted himself with great energy and no little success to reform the abuses he found existing in his diocese, at the

same time that his virtue and amiability won him the esteem of the people. When the rebellion broke out, in 1641, the rebels, although they expelled him from his diocese, did not injure him, and when he died, February 7, 1642, they followed his body to the grave, and fired a volley over it, exclaiming, 'May the last of the English rest in peace!' Among the literary works B. either wrote or edited may be mentioned his translation of two volumes of Father Paul's *History of the Council of Trent*, a translation of the Old Testament into Irish, and a theological treatise on the two following subjects not without interest:—*Where was our Religion before Luther?* and *What became of our Ancestors who died in Popery?* His Life has been written by Bishop Burnet.

Bedes'men or Beadsmen. See BEAD.

Bed'ford, a ducal title first borne by John Plantagenet, third son of Henry IV. He was born about 1389, and in his father's lifetime was governor of Berwick and warden of the Scottish marches. He fought for his father at the battle of Shrewsbury, and in 1422, by the will of his brother Henry V., was created regent of France. On his way thither, he destroyed a French squadron in the Channel; then rapidly conquered northern France, captured Meulan, made himself master of the line of the Yonne by a victory near Auxerre, and at Verneuil (1424) routed with immense slaughter the united chivalry of France and Scotland. But the blundering ambition of his brother, the Duke of Gloucester, cost him, for a time, the Burgundian alliance, and after it was restored, the devout heroism of Joan of Arc, inspiring the French with fresh courage and a sentiment of patriotism never known before, frustrated his efforts, though in military capacity he was hardly inferior to Henry himself. Though steadily and liberally supported by the Bishop of Winchester (see BEAUFORT), he abandoned all idea of retaining possession of the realm of France, and only sought to secure his conquest of Normandy. He died at Rouen, 19th September 1435, of vexation (it is said) on hearing that a treaty had been arranged prejudicial to English interests between the Duke of Burgundy and Charles VII. Like all the family of John of Gaunt, B. loved arts and literature, and while in Paris purchased and sent to London the library of Charles V. His widow, Jacobina de Luxembourg, married Richard Woodville, Earl Rivers, to whom she bore Elizabeth, wife of Edward IV., and ancestress of the Queen of England and of most European sovereigns. The title of **Duke of B.** was again borne for a short time by George Neville, nephew of Warwick, the 'king-maker,' and Henry VII. conferred it on his uncle, Jasper Tudor, Earl of Pembroke, who had given him important help on Bosworth Field (1485). Pembroke died childless in 1495, and the dignity lapsed for 200 years, when it was again revived (1694) in the house of Russell (q. v.), whose chiefs had been Earls of B. since 1550.

Bedford, the county town of Bedfordshire, on the Ouse, 65 miles N.N.W. of London by rail, situated in a rich arable district. It has important manufactures of agricultural implements, straw-plait, and lace, and contains also an extensive ironwork. The river, here crossed by a bridge of five arches, was formerly navigable, and the means of considerable trade with Lynn Regis, on the coast, 74 miles distant. The town is first mentioned in the *Chronicle* under date A.D. 571, in which year Cuthulf fought against the Britons at *Bedicanforda*, i.e., at the ford of the *bedyket* or fortified place. The name *Bedicanford* became in succession *Bedanford* and *Bedford*. It is again mentioned, A.D. 1010, as one of the places burned by the Danes in their horrible devastation of the S.E. of England. After the Norman conquest, a massive castle was built at B., which was frequently besieged in later times. In 1561, Sir W. Harpur, alderman of London, founded a free school at B., and its endowment of 13 acres of land has increased in value from £150 to upwards of £14,000 a year, with which sum a popularly-elected trust now maintains a free grammar school, commercial, preparatory girls' and infant schools; a children's hospital, and sixty-five almshouses. This immense charity is said greatly to prejudice the industry of the place. John Bunyan, who was born at Elstow, in the vicinity, wrote his *Pilgrim's Progress* in B. jail, and was for seventeen years minister of the Baptist congregation in Mill Lane. The Bunyan schools were transferred to a fine new building completed in 1867, and a bronze statue of Bunyan, by Boehm, was unveiled by Dean Stanley, June 10, 1874. Pop. (1871) 16,850. B. returns two members to Parliament.

Bedford Le'vel, a flat, marshy district on the E. coast of England, called also *The Fens*, situated to the S. and W. of the Wash, and comprising portions of the six counties, Lincoln, Northampton, Huntingdon, Cambridge, Norfolk, and Suffolk. It extends from the river Welland, in the S.E. of Lincolnshire, to the town of Milton, 3 miles N.E. of Cambridge; and from Peterborough, on the Nen, in Northamptonshire, to Brandon, on the Little Ouse, in Suffolk. Its length from N. to S. is about 40 miles, and its greatest breadth, the same. Area, about 400,000 acres. B. L. is divided into three levels: the N., lying between the rivers Welland and Nen; the Middle, between the Nen and the Old Bedford river; the S., lying to the S.E. of the Old Bedford river, and extending to Stoke, Feltwell, and Mildenhall. Writers of the 12th c. describe this district as a fruitful and agreeable country. In the 13th c. violent incursions of the sea stopped up the outflow of the rivers, its natural drains, and left it a morass. In the 15th c. partial attempts were made to drain it. In the 17th c., Francis, Earl of Bedford, whose title-name the district has retained, undertook to drain it on condition of receiving 95,000 acres of the reclaimed land, and obtained a charter to that effect from Charles I. Events hindered the completion of the work, but the charter was confirmed to his son by Parliament in 1649, and he fulfilled the contract. In 1688 the corporation of B. L. was formed, for the management of this peculiar district. The middle level has always been the worst to contend with. In 1862, St Germain's sluice, at the confluence of the great drain in this level with the Ouse, gave way, and the western bank of the drain burst, flooding about 6000 acres of fertile land; but extensive new works have been sufficient to prevent any recurrence of extensive mischief since.

Bedfordshire, one of the midland counties of England, 37th in respect both of size and pop., having an area of 463 sq. miles, and a pop. (1871) of 146,257. It presents for most part a flat surface, but in the S. is invaded by a spur of the Chilterns, and in the N.W. is traversed by another low range of chalk-hills. None of the hills are over 900 feet. The Great Ouse and its tributary the Ivel are the chief rivers, the former having a course within the county, including windings, of 45 miles. In the N. the geological formation is oolite, in the S. greensand and chalk, and the soil varies from the stiffest clay to the lightest sand, but is mostly under tillage. In 1873 there were 150,071 acres in corn. Onions, cucumbers, and other vegetables are extensively produced for the London and Cambridge markets. The principal towns are B., Luton, Polton, Biggleswade, and Dunstable, all centres of the manufactures of straw-plait for bonnets, and pillow-lace, the only existing industries. The straw-plait of B. rivals that of Tuscany. Two members of Parliament are returned for the county. B. contains the remains of three Roman roads, besides several fine specimens of early English and Norman church architecture. The Duke of B., the Marquises of Tavistock and Bute, Earl de Grey, Lords Holland and Carteret, are the chief proprietors.

Bed'lam, a corruption of Bethlehem, the name of a religious house in London, the Hospital of St Mary, Bethlehem, which was founded in the year 1246 by Simon Fitzmary, who had been one of the Sheriffs of London. It originally stood in Bishops-gate Street Without, and, on the suppression of religious houses in the reign of Henry VIII., was handed over to the corporation of London, since which time it has been an hospital for the cure of the insane. About 1644 it was determined to enlarge the hospital, but the situation had become close and confined, and a new Hospital of Bethlehem was built in Moorfields 1675-76. In 1814 the 'new' hospital gave way to a fitter building, in a more commodious situation, on the other side of the Thames, in the parish of Lambeth. This building in turn was enlarged in 1838. The patients of B. used to be exhibited, like wild beasts, in cages, for so much a head; and convalescent patients were sent out to beg, with badges on their arms, and known as 'B. beggars' or 'Tom-o'-Bedlams.' This practice, the object of which was to raise funds for the institution, was put down in the latter part of the 17th c.

Bed'mar, Alfonso de Cueva, Marquis de, a Spanish ecclesiastic and politician, born 1572, was appointed Spanish ambassador to Venice in 1607, and in 1618 (it is said) he united himself with the Duke of Ossuna, viceroy of Naples, and Don Pedro de Toledo, governor of Milan, in an infamous conspiracy

to destroy the city. A man of singular genius, penetration, knowledge of men and of the proper conduct of affairs, daring enough for the wildest ventures, yet perfectly tranquil under excitement, his conspiracy, which embraced the seizure of the arsenal, the Doge's palace, and the senate, and afterwards the sack of the city, was as ingenious as it was bold. It was to have been carried out on Ascension Day, and during the festal wedding of the Doge with the Adriatic; but on the eve of that day, when all preparations were complete, the plot was betrayed, the conspirators seized, tried in secret, and executed, and the Spanish ambassador dismissed from the republic. Otway's fine play, *Venice Preserved*, is based on the conspiracy. After leaving Venice, B. went to Flanders, where he was appointed president of the Spanish Council, and in 1622 obtained a cardinal's hat. He subsequently withdrew to Rome, and obtained the bishopric of Oviedo, where he died, 2d August 1655. Some writers, notably Grosley, in his *Discussion historique et critique sur la Conjuración de Venise* (Troyes et Paris, 1756), have endeavoured to show that the so-called 'conspiracy' was an invention of the Venetians, who wished to get rid of a hostile ambassador, but this view has not obtained much credence.

Bednors, or **Nugur**, a city in the division of Nugur, province of Mysore, India, situated among the luxuriant forests of the Western Ghats, at a height of 4000 feet, 145 miles N.W. of Seringapatam. In 1763 it was taken by Hyder Ali, and made the seat of his government. Twenty years later it was captured by the British under General Matthews, but soon retaken by Tippoo Saib. The division of Nugur has the oldest coffee plantations in Mysore.

Bed of Justice (Fr. *Lit de Justice*), originally the seat occupied by the French king in Parliament, afterwards applied to a session held by the king in presence of the princes, the estates, and the Presidents of the Chambers of Inquest and Chambers of Petitions, for the purpose of enforcing the registration of edicts. The constitutional fiction was that the authority of Parliament ceased in presence of the king. Thus, in 1407, on the death of the Duke of Orleans, a law regulating regencies during royal minorities was registered. The reign of Louis XIII. is marked by repeated protests of Parliament against the registration of taxation-edicts. In the following reign Omer Talon resisted the fiscal oppressions of Mazarin, but in 1667 an ordonnance declared that the Parliament held no absolute veto. In 1787 the refusal of the Parliament to register the land and stamp taxes and the successive loan proposed by Calonne and De Brienne led to the last B. of J. The popular contention was that only the States-General could grant supplies.

Be'dos de Celles, Don Jean François, born at Chaux, 1714, died 25th November 1797. He was a Benedictine monk, and member of the Academy of Sciences in Paris. As the author of a great work on organ-building, *L'Art du Facteur d'Orgues* (4 vols. 1766 and 1778), he was the most noted authority upon that subject in the 18th c.

Bed-Straw (*Galium*), a genus of plants belonging to the natural order *Galiaceæ* or *Stellata* (q. v.). It possesses many species, scattered over the temperate regions of the Old and New Worlds; is particularly abundant in Europe and Northern Asia, but is found also in the tropics, where, however, the species are chiefly confined to mountain regions. About ten species are found in Britain. Among them are some of the most common weeds, e.g., *G. cruciata* (crosswort or Maywort), *G. aparine* (cleavers or goose-grass), the inspissated juice of which has been used with success in various skin-diseases, and its seeds as a substitute for coffee. The recurved spines on the leaves cause it to stick to clothing. *G. verum* (ladies' bed-straw) is called also the cheese-rennet, because it has the property of curdling milk; and the flower-tops boiled in alum yield a bright yellow dye, much used in Iceland and in the Highlands of Scotland. The roots and bark have been long used to dye yarn red. The roots of other species of *Galium*, such as *G. tinctorium* of Canada, and *G. septentrionale*, another North American species, possess the same properties. Like Madder (q. v.), which they rival in dyeing qualities, they impart a red colour to the bones and milk of animals fed upon them. The extract of *G. rigidum* and *G. molle* has been beneficially used in epilepsy. The roots of *G. subserotum* are used in China for food. The name B. is said to be derived from the practice, at one time in vogue, of strewing beds with some of the softer foliaged species.

Bed'uins (Arab. *Bedawi*, plural *Beduin*, i.e., children of the desert), the name universally given in the East as well as in Europe to the nomadic inhabitants of the deserts of Arabia, Syria, Egypt, and N. Africa. Scattered over an immense area (from the Atlantic on the W. to Persia on the E., and from the Syrian waste on the N. to the borders of Sudan on the S.), and ungoverned in a strict political sense, they roam hither and thither in families under *kaid*s or *sheiks*, or in tribes under *emirs*, and live by cattle-breeding, trade, and occasional plunder. The religion of the B. is Mohammedan, and their habits are uniformly temperate. Polygamy is not prevalent. Their dress, which they themselves manufacture, consists of a *haikh*, or white robe, forming a hood, and descending to the feet, and a *burnuse*, or large open mantle. Their horses are noted for fleetness and docility. The B. are occasionally found intermingling with other nations, and among the five N. spurs of the Abyssinian highlands a few villages of this restless people have been established. Suakin, a Beduin town, with over 3000 inhabitants, lies on the W. shore of the Gulf of Suez, where, during the dry season, pasturage for camels and goats is procurable on the slopes exposed to the action of the damp sea-air. The life in the desert, precarious and full of danger, has given to the B. valour, activity, and endurance. It cannot escape observation, however, that modern travellers speak with contempt and pity of their present starved, stunted, and harmless condition. The name B. was originally applied only to the nomads of the Arabian deserts, and especially to those of the plateau of Nejd, in contradistinction to the *Hadesi*, who were engaged in agriculture and trade. But at an early date Beduin hordes had passed into the Syrian and Egyptian deserts, while with the decay of ancient civilisation they spread into Mesopotamia and Chaldea; and later the Mohammedan conquest of the 7th c. led them into N. Africa. It sometimes happens, as in the case of the Berbers of N. Africa, that the name B. is applied to nomad people who falsely claim an Arab origin, because they have adopted the Arab speech and habits. See E. H. Palmer, *The Desert of the Exodus* (1871).

Bed'win, Great, a town in Wiltshire, 69 miles W. by S. of London by railway. It was a place of note in the earliest times of English history, and figures in the *Chronicle* as *Bed-anheaf* 'the head stronghold?', and the scene of a battle in 675 between the kings of Mercia and Wessex. To this battle there may be a reference in the later name *Bedwin*, 'win' meaning battle or victory in old English. Some Roman remains were discovered in the neighbourhood in the end of last century, proving that B. had an existence even before the English came to the island, though neither its Roman nor British name has come down. St Mary's Church, built at different dates and in different styles, and not completed till about 1312, has some ancient and interesting monuments. Jane Seymour, and Dr Willis, one of the first Fellows of the Royal Society, were natives of B. Pop. (1871) 2068.

Bees, a family of insects included in the order *Hymenoptera*, of the Holometabolic ('complete metamorphosis') section of the insect class. These insects possess four membranous wings, the nervures or supporting ribs of the wings being few in number and not prominently marked. The mouth in bees exhibits a combination of the suctorial with the masticatory form of oral

Bees

apparatus. Thus the labrum or upper lip, and the mandibles or larger pair of jaws, are well developed, whilst the maxillæ or lesser pair of jaws are elongated to form a tubular organ through which, together with the tongue, the flower-juices may be sucked up. The labium or lower lip also exists in an elongated form, and the palpi or organs of touch with which the labium is provided are also lengthened to form a protective apparatus. The mandibles or larger jaws are thus employed by the bees in the execution of the multifarious tasks connected with the construction of their abodes, whilst the suctorial portion of the mouth is devoted to the reception and prehension of nourishment. The

four wings can be joined together during flight by means of hooked processes, the hinder pair of wings being the smaller pair. The abdomen of the females is provided with a defensive or offensive apparatus, forming in other insects an ovipositor or egg-depositing organ, but known in the bees, &c., as the *aculeus* or 'sting.' This consists of a pointed process enclosed within a sheath-like structure. A poisonous or irritating fluid is furnished by a glandular structure placed at the base of the sting, and the injection of this fluid into the wound causes the well-known and painful effects of the B.'s attack.

The basal or first joint of the tarsi of the hinder pair of legs in the working-bees or neuters is enlarged and flattened in the typical bees, and may be furnished with bristles—this structure adapting these members for conveying the pollen of flowers. The food of adult bees consists of saccharine and flower juices, whilst the larvæ are fed upon a paste known as 'B. bread,' and which is composed of the pollen of flowers mixed with honey. It is notable that a difference in the food on which the larvæ are fed appears to influence the development of the sex in young bees. Thus, ordinary food, composed of honey and pollen, produces 'workers,' whilst larvæ fed on a special paste termed 'royal food' are said to be transformed into 'queens' or 'fertile females.' Landois states that an insufficient or scanty dietary produces male bees from larvæ, a more generous food-supply producing females. Bees, undoubtedly, with many other insects, play an important part in the fertilisation of many flowers, the pollen of one plant being carried by the bees to impregnate other plants. In their distribution, bees occur in all the temperate and warm regions of the world. Very many species are known—over 200 species being found in Britain alone. The bees, as will presently be noticed, are divided by their structural differences into several distinct genera and groups.

In their reproduction, bees exhibit many interesting phenomena. The 'social' bees, or those which, like the ants, live in communities, exemplify these phenomena in their most typical aspects. A social B.-community consists of three kinds of individuals—*drones*, or males; *females*, and *neuters*, or workers. A single female only—the *queen B.*—exists in each community. The impregnation of the queen is effected in summer, at which season only the drones or males are developed. The queen takes her 'nuptial flight' into the air, and is there impregnated by sexual union with the males. The latter are destroyed thereafter by the workers, as being of no further use in the economy of the hive, which is thus for the greater part of the year tenanted by the single queen, the neuters, and the larvæ. The seminal fluid, or impregnating matter received from the males, is contained within the body of the queen in a special sac or receptacle, termed the *seminal receptacle*. This sac communicates by a special duct or tube with the oviduct, along which the eggs pass from the ovary where they are formed, to be deposited. This communication between the oviduct and the seminal receptacle can be opened or shut at will; and it has been definitely ascertained that those eggs from which *females* or queens are to be developed, are allowed to come in contact with the fluid of the male; while those eggs which are to give origin to male bees or drones are allowed to pass from the queen's body without any such contact. This curious phenomena appears, therefore, to constitute a case of *Parthenogenesis* (q. v.), or of that anomalous process seen also in other insects (see APHIS), by which the eggs of a female can thus develop into new beings without being fertilised by the male animal. The larvæ which are to produce *females* or queens, as already stated, are fed on royal food, the males being fed on ordinary nutriment. The eggs which are thus to develop queens, are further deposited after those which are to produce males and workers, and are placed in cells of special construction known as 'royal cells,' and the cells containing the larvæ, which are to become male bees are larger than those containing eggs which are to produce simple workers or neuters.

What is known as the *swarming*, consists in the departure from a parent hive of a large body of workers, accompanied by a young queen B. This offshoot from the colony, determined probably by its increase in too great numbers, is destined to found a new community, and contains therefore the necessary sexual elements for that end. The *queens*, or *fertile females*, possess fully-developed reproductive organs, and in this way represent the truly sexual-part of an ordinary community. They are of larger size than the other individuals. The under parts of the body are of a yellower colour than in the *drones* or neuters, and

the wings are shorter than in the latter forms. The queens do not possess wax-sacs or pollen-baskets. The legs of the queens are not so fully provided with hairs, and the mandibles are notched or indented, whilst the sting is curved. The *drones* or *males* are larger in turn than the neuters. Their eyes are of large size, and the antennæ or feelers are slightly larger than in the workers. The latter possess bodies averaging about $\frac{1}{2}$ an inch in length. The antennæ are 12-jointed, and end in a knob-like process. The abdomen consists of six joints; the four middle segments bearing the wax receptacles, whilst they carry pollen, as already explained, on the basal joint of the hinder pair of legs.

Concerning the number of individuals contained within each B.-community, no exact estimate can be furnished, the number being subject to much variation at different seasons. The total number of bees in an ordinary hive has been said to vary from 10,000, or 15,000, to 30,000, or even 60,000. And of these numbers, from 600 to 2000 may be males, the rest being neuters, only one female or queen being found within the colony in ordinary circumstances. The queen is said to deposit eggs at an average rate of 200 or 300 per day, although this number may be greatly exceeded. The queen is also said to live for three years or more; the average life of the neuters extending to about a year. The neuters, it is to be noted, are simply *sexless* individuals, most probably females, in which the generative organs are undeveloped. On the workers, or ordinary bees, all the labour of the hive devolves; and they not only construct the abode, but tend and feed the young, and otherwise wholly devote themselves to the care of the colony. The bees undergo a perfect metamorphosis—that is, the young first appear as *larvæ*, or grubs, then change to *pupa*, and finally, developing wings, become the *imago*s, or perfect insects.

The *honey secretion*, for which the bees are famed, consists of the flower-juices drawn from the flower-receptacles by the B.'s proboscis, and elaborated within the *honey-bag*, which forms in fact a part of the digestive system, corresponding to a crop or first stomach. From this receptacle the honey is rejected, and is stored up in cells, or is used to feed the larvæ, as already mentioned.

The bees have been divided into the family or section *Andrenidae*, and into that of the *Apidae*—this latter including the ordinary social bees. The *Andrenidae* are distinguished by possessing a short trunk with an obtuse blunted apex; the *ligula* or basal portion of the lower lip forming the proboscis in this group. The hinder legs do not carry pollen. These are solitary bees. They inhabit burrows which they excavate in the ground, or which they cut out of wood, &c., the eggs being deposited among masses of pollen and honey. Males and perfect females only appear to be developed in this section, no neuters being found. This group includes various genera of bees, among which *Colletes* is a familiar form. The better-known *Apidae* generally live in communities, and possess a mouth of the structure described at the commencement of this article. Various genera, differing in form and habits, are included in this group. Some of the best-known of these are solitary in habits. Familiar examples include the carpenter-bees (*Xylocopa*), which excavate cells and nests in wood; the mason-bees (*Osmia* and *Megachile*), which form nests of particles of sand, &c.; the upholsterer-bees (e.g., *Apis papaveris*, &c.) or leaf-cutters, which line their nests with leaves and plant-tissues, &c. The latter bees are so named from their habit of cutting the leaf-tissues of plants, and of forming and lining their nests with these tissues. The sharp mandibles or larger jaws furnish the means of carrying on their operations.

The humble-bees (*Bombi*) are social in habits, and possess males, females, and neuters in their colonies; the females, however, numbering more than in the hive-bees, taking part in the duties of the hive. Two kinds of females, in fact, are found in the colonies of the humble-bees—larger egg-producing females, and smaller ones, which assist in the labours of the hive, and which are believed to produce male eggs only. These

Upholsterer-Bee.

bees resemble the wasps, in that the continuation of the species is dependent upon the impregnated females, which lie torpid throughout the winter, and lay impregnated eggs in the succeeding spring; the other and greater portion of the colony being killed by the winter's cold of each year. A colony of humble bees numbers from 60 to 200 members. They are of larger size than the hive-bees, and possess hairy bodies, coloured generally black with bright orange bands.

The hive-bees (*Apis mellifica*) are the most familiar and typical of the species. Many varieties or breeds of this one species, as well as several distinct species of the genus *Apis*, exist. These bees chiefly inhabit the warm and temperate regions of the E. hemisphere, although they have become acclimatised in America also. In Egypt the *A. fasciata* is the most common species, and in Greece the *A. Ligustica* occupies a similar position. *A. unicolor* occurs in Madagascar; *A. Indica* in India; and *A. Adansonii* in Senegal. A genus *Melipona* occurs in S. America, and presents species nearly allied to the *Apis*.

The science of B.-culture, and the economy and functions of the hive, form subjects demanding an extended notice, and such breadth of treatment as can most satisfactorily be given in special treatises on the subject, whilst further details regarding the organisation of bees as related to insect structure in general will be found in the article on INSECTS (q. v.). The parasites that infest bees are noticed under the head of B.-PARASITE, whilst information concerning HONEY, WAX, &c., will be found in the articles devoted to these subjects.

Beech, a genus of trees (*Fagus*) of the N. O. *Cupuliferæ* (q. v.), containing few species, all of which are beautiful forest trees. The common B. (*F. sylvatica*) forms extensive forests in some portions of Europe, such as the island of Seeland, in Denmark, and more particularly in the vicinity of Copenhagen, and is also a native of some parts of Asia. It will often attain a height of from 100 to 120 feet and a diameter of 4 feet. Its wood, though hard and solid, is too brittle for the purposes of the carpenter, but it is very durable under water, hence is employed in making mill-sluices. In France, Denmark, and other countries, it is extensively employed for making sabots or wooden shoes, and it is considered the best firewood. The ashes yield much potash, and vinegar is prepared from the shavings. B.-mast (the seeds and fruit-coat) is used for feeding cattle, and in France for the purpose of obtaining *B.-oil*, a bland fixed oil which is used for food, lamps, &c. B.-mast is also used for adulterating cocoa. The red-leaved variety of the B., now so common in woods, is said to have sprung from a single twig which was accidentally found in a German forest. The American *F. ferruginea* (the fruits of which are caten) has leaves naturally of the same colour. Among the other species of B. may be mentioned *F. Forsteri* of the Tasmanian mountains and of Tierra del Fuego; *F. antarctica* of the Straits of Magellan, and *F. procera* of the Andes of Chili. This, with the two preceding species, would form beautiful ornamental trees in our parks and forests. The genus is also represented in the mountains of Java and of Southern New Zealand.

Beech Drops. See CANCER ROOT.

Beecher, the name of an American family, several members of which have attained considerable distinction in various ways.—1. **The Rev. Lyman B., D.D.**, born at Newhaven, Connecticut, October 1775, studied under Dr Dwight, and settled as minister in East Hampton, Long Island, in 1798. For some years he was minister of the Congregational Church, Litchfield, Connecticut, and in 1826 was called to Boston, to stem the current of Unitarianism. In 1832 he was appointed President of Lane Theological Seminary, Cincinnati, and he also took charge of the second Presbyterian Church there. Soon after he was tried for heresy, and his case helped to divide the Presbyterian Church into 'Old' and 'New' School. He returned to Boston in 1842, and died at Brooklyn in 1863. B. was one of the great lights of New England in his day, and was distinguished as a pulpit orator, advocating New School theology, or moderate Calvinism, temperance and anti-slavery. He had six sons in the ministry (*Autobiography and Correspondence*, 2 vols. New York, 1864).—2. **Catherine Esther B.**, daughter of L. B., was born September 6, 1800. She has devoted herself to the cause of education, was Principal of a female seminary in Hartford from 1822 to 1832, and afterwards filled a similar position in Cincinnati. She has written much on

Philosophy, Physiology, and Theology, with a view especially to the higher culture of her own sex.—3. **Rev. Charles B.**, son of L. B., was born at Litchfield, 1815. He was a minister in Newark, New Jersey, and afterwards in Georgetown, Mass., where he was tried for heresy. He travelled in Europe with his sister, Mrs Stowe, wrote part of her *Sunny Memories*, edited the *Life* of his father, Dr Lyman B., and is the author of various other works, which do not require mention.—4. **Edward B.**, son of L. B., born at East Hampton, L.I., in 1804, graduated at Yale College in 1822, and studied divinity there and at Andover. He was pastor of Park Street Congregational Church, Boston, 1826-31, and afterwards President of Illinois College. One of his books, *The Conflict of Ages*, made some stir in America when it came out.—5. **Rev. Henry Ward B.**, son of L. B., was born at Litchfield, Conn., June 24, 1813. He graduated at Amherst College, Mass., in 1834, and settled at Laurenceburgh, Indiana, in 1837, whence he removed to the Presbyterian Church, Indianapolis, in 1839, and to the Congregational Church, Brooklyn, in 1847, where he still officiates. When he came to Brooklyn, he soon made a national reputation by a style of preaching peculiar to himself. It was distinguished by poetical description, emotional sentiment, sympathetic knowledge of human nature, and censure of moral and public wrong; and it was also relieved or disfigured by dubious strokes of humour. B. has also devoted much time to editing and lecturing, besides attending to his farm at Peekskill on the Hudson. In 1874 his former protégé and friend, Theodore Tilton, brought a criminal charge against him, in reference to his wife, Mrs Elizabeth R. Tilton. The trial lasted from January 4 to July 2, 1875, but the jury were unable to agree, and no verdict was returned. B. has written *Norwood*, a novel, and the *Life of Christ*.—6. **Harriet Elizabeth B. Stowe**, daughter of L. B., and wife of Professor Calvin E. Stowe, was born at Litchfield, June 15, 1812. She was a teacher in Hartford; married in 1836 to Rev. C. E. Stowe, Professor in Lane Seminary, Ohio. Her early literary efforts were confined to stories in the *Mayflower* and Sunday-school books. In 1850 her husband removed to a professorship in Bowdoin College, Maine, and in the following year she began *Uncle Tom's Cabin* as a serial tale in the *National Era*, Washington. After some difficulty in finding a publisher, it was brought out in book form in Boston in 1852. In three and a half years 313,000 copies were sold in the United States, and in all, a million copies have been sold there, and it has been translated into twenty languages. In 1853 Mrs Stowe travelled in Europe, and on her return published *Sunny Memories*. She afterwards wrote *Dred*, a slave story, which was on the whole reckoned a failure. She was, however, again successful in the *Minister's Wooing*, 1859, a work which contains some of her best character-painting. In 1869 Mrs Stowe brought out what she chose to consider the *True Story of Lady Byron's Life*, which made a sensation on both sides of the Atlantic, but has not added to her reputation, at least in England. Her recent writings treat mainly of New England life.

Beechey, Sir William, B.A., a portrait-painter of great reputation in his own day, was born at Burford, Oxfordshire, December 12, 1753. He became a student in the Royal Academy in 1772; was made an Associate, and portrait-painter to Queen Charlotte, in 1793; was knighted by the king, and elected a Royal Academician, in 1798, for his equestrian picture of George III., the Prince of Wales, and the Duke of York reviewing the 3d and 10th Dragoons. Henceforth till 1836, when he retired from his profession, he was the favourite limner of the aristocracy. Among others, he painted Lord Nelson, Lord St Vincent, Lord Cornwallis, John Kemble, and Mrs Siddons. B. died at Hampstead, 28th January 1839.

Beechey, Frederick William, an English admiral and Arctic explorer, son of the preceding, was born in London, 17th February 1796, and entered the navy at ten years of age. In 1818 he was appointed to the *Trent* under Franklin, whom he accompanied in his search for the N.W. Passage; and for his excellent drawings of objects in natural history received a parliamentary grant of £200. In 1819 he joined the *Hula* and took part in another Arctic expedition under Lieutenant, afterwards Sir Edward Parry. In 1821, in the *Adventurer*, under Captain Smith, he surveyed the coast of N. Africa, and rendered special service by his examination of the Greek antiquities of Cyrenaica, of which he published a description, together with a narrative of

the expedition, in 1828. In 1825 B. was appointed to the *Blossom*, and sailed for the Polar Sea by way of Behring's Strait, to communicate with Franklin, who was to make the attempt overland from N. America; but returned in 1828, without accomplishing his object, though the expedition rendered important services to geographical science by his discoveries of harbours and channels. In less than three years he sailed 70,000 miles. His *Narrative* was published in 1831. In 1847 B. was requested by Government to create and superintend a marine department of the Board of Trade, in which office he remained till his death. He was made Rear-Admiral of the Blue in 1854, President of the Royal Geographical Society in 1855, and died 29th November 1856.

Beechworth, a town in Victoria, 185 miles N.E. of Melbourne. It is the chief centre of population on the Ovens (q. v.) goldfield, and is a thriving place. Pop. 3167; of the shire, 6222. The mining plant in the B. district was valued in January 1874 at £50,160. Oxide of tin is found throughout the district, and is worked to some extent.

Bee'der, properly **Bidar**, capital of a district of the same name in the feudatory state of the Nizam of Hyderabad, on the right bank of the Manjira, an affluent of the Godavary, 75 miles N.W. of Hyderabad. It was at one time a flourishing town, but has fallen off of late years. Three-fourths of the population are Hindus, and the remainder Mohammedans. B. has some manufactures in an alloy of one part of copper to twenty-four of tin. Pop. 20,000.

Bee-Eater, a genus of birds belonging to the Fissirostral section of the Insectivores or Perchers, and forming the type of the family *Meropidae*. The bill is elongated and curved. The nostrils are partly hidden by short bristles. The wings are long

Bee-Eater.

and pointed, the tail being broad and long, and having the two middle feathers longer than the rest. The toes are also of large size, and the two lateral toes are united more or less completely to the middle digit. These birds are confined to the Old World. The common or European B.-E. (*Merops apiaster*) is rare in Britain. It occurs in Russia and in the S. of Europe, although its native region is Africa. It is about 11 inches in length, and is coloured brownish-red and yellow on the upper parts, the forehead being pale-blue. The head possesses a black streak on each side behind the eye, and a black band also crosses the throat, which is bright yellow underneath. The lower parts, wings, and tail are coloured green. *Merops viridis* is a familiar Indian species. They all feed upon insects, which they dexterously capture on the wing. They appear to be social in habits, like the swallows; the nests being excavated in banks.

Beef. See **FOOD**.

Beef-Eater, a corruption of the French *buffetier*, an officer who attended the buffet or sideboard. The term is popularly applied to the Yeomen of the Guard, some of whom, since the time of Henry VII., have been stationed at the table at royal banquets, and attended the sovereign on solemn festivals.

Beef-Eater, or **Ox-Pecker** (*Buphaga*), a genus of Insectorial or Perching birds, belonging to the section *Coniostres*, and so named from their habit of alighting on the backs of oxen, buffaloes, camels, &c., and of extracting therefrom the larvæ of the *Cesridæ* or 'Bot-flies', which infest cattle, &c. The common B.-E. (*Buphaga africana*) averages about 8 or 9 inches in length, and is coloured reddish-brown above and yellowish-white in the under parts. The bill is yellow, the legs brown, and the tip of the beak red. These birds exclusively inhabit the warmer regions of Africa. The cattle are said to rise when the birds fly off or are disturbed.

Beef-Tea, a preparation from lean beef or other meat of great value for invalids and delicate persons, made by mincing the flesh small, mixing it with weight for weight in water, and slowly heating up to the boiling point. The juice is then strained off and seasoned for eating. A more nutritive extract can be obtained by treating minced raw meat with distilled water acidulated with hydrochloric acid and a little salt; the proportions being $\frac{1}{2}$ lb. of meat, 14 oz. of water, and 12 or 18 grains of salt. After digesting for an hour, the liquor should be strained off and the residue washed with 5 oz. of water, and thus about 1 pint of excellent extract is secured. See also **EXTRACT OF MEAT**.

Beefwood. See **CASUARINA**.

Beehive-House, in archaeological nomenclature, denotes a rude, primitive dwelling, of which traces are abundantly found in Scotland and Ireland. A B.-H. is circular in plan, and its thick dry-stone walls converge as they rise, and give it a conical appearance, and at the apex a small opening is left for light and ventilation. Their antiquity is unknown; Lubbock supposes that some of them belong to the Stone Age, but there are instances of very recent occupation of such dwellings. A group of them on the shores of Loch Resort in Lewis was tenanted so late as 1823, and to this day they are sometimes used as summer shielings by the inhabitants of the Hebrides and Skye. Their modern occupants know nothing of their origin.

Beelzebub (Heb. *Fly-Baal*) was worshipped by the Philistines at Ekron. The origin of this worship is probably to be sought in the scourge of flies to which the hot plain of Philistia has always been subject. It was Baal who sent it; it was Baal who could remove or mitigate it; hence his name of *Fly-Baal*. The name **BEELZEBUL**, applied in the New Testament to the prince of the demons (Matt. xii. 25), has probably no connection with B. *Zebul* in the Talmud means—(1) dung; (2) an idol, an abomination. Now with the Jews all idols or false gods were demons; hence probably the name Beel-Zebul given in the Talmud to Asmodeus, as if head of idolatry. But many other conflicting explanations are given.

Bee-Parasite, the name given to the *Stylops*, a curious insect, distinguished by possessing twisted filaments in place of the front pair of wings, and forming of itself the sole example of the order *Strepsiptera*. The males alone are winged as above described, the females existing as soft maggot-like creatures, which live within the bodies of bees and wasps, and protrude their heads from between the abdominal segments of the infested animals. The young or larvæ are hatched within the body of the female, the young males developing wings and living a free existence, whilst the females pass from the body of their parent, and seek fresh hosts wherein to reside. *Stylops Dalii* and *S. Spencii* are familiar species.

Beer (Ger. *bier*) and **Brewing**, the fermented infusion of malted grain, or of any substance containing sugar or starch; and the art of making it, which is of great antiquity. The Egyptians were acquainted with it; 'wine of barley' is frequently mentioned in early Greek writings; and there is abundant evidence that the Romans prepared B. from wheat, barley, and other cereals. Tacitus, speaking of the customs of the Germanic tribes, refers to their great love of B., a disposition, by the way, which is not wanting in their modern descendants. The Gauls, Britons, and Scandinavians used B. on all festive occasions, and offered libations of it to their gods. At the present day, while B. is in almost universal use, the substances from which it is prepared, and the mode of preparation, vary with different nations or tribes. Maize furnishes some S. American tribes with a fermented liquor called *chica*; the Russians prepare a thick, muddy kind of B., which they call *kvass* or *quass*, from a decoction of rye-flour; from millet and kindred grain the Crim Tartars and many African tribes obtain alcoholic drinks; and an infusion of rice is of equal utility to Eastern Asiatics. Fermented mare's milk forms the *koumiss* or *kumiz* of the Central Asian tribes, the *leban* of the Arabs is a similar product, and from a species of pepper plant the Polynesians, by a preliminary process of mastication, prepare their *Ava*. Barley is the material principally operated on in Great Britain.

In the manufacture of beer there are two distinct stages: (1) the preparation of malt from the raw grain, called *malting*; and (2) the formation of a fermented liquor from the malt, termed *brewing*. In the process of *malting* there are four operations, *steeping*, *couching*, *flooring*, and *kiln-drying*; the first three are concerned with the germination of the grain, and when this is sufficiently advanced, it is checked by the application of heat. *Steeping* consists in placing barley into a large cistern, and covering it with water to the depth of some inches; the grain absorbs a portion of the water, and becomes swollen and soft, and after steeping for forty or sixty hours, the superfluous liquid is drained off. *Couching*.—The grain is next thrown into a heap or couch on the floor, and allowed to lie for twenty-four hours, during which time the barley rises in temperature, absorbs oxygen, and gives off carbonic acid. With the increased heat the couch parts with a portion of its moisture, a process technically called *sweating*, and germination is induced, evidence of which is afforded by the presence of rootlets or fibrils of the radicle, and an incipient plumula or stem, the *acrospire* of the maltster. *Flooring*.—In this operation the barley is spread over the floor to the depth of twelve to sixteen inches, in order to further the growth to a certain point; and to prevent unequal heating and too rapid growth, the grain is lifted with spades from time to time, and scattered over a wider area till its depth is not more than four inches. From fourteen to twenty-one days, according to the temperature of the couch, are occupied in this operation, and when the acrospire has reached the length of the seed, it is necessary to check further germination. This is accomplished in *kiln-drying*, by spreading the grain, usually to a thickness of four inches, over the kiln-floor, which is perforated with innumerable small holes to admit of the passage of heat from a fire below; while drying, the grain is frequently turned over. According to the temperature of the kiln and the management of the drying process, the malt acquires distinguishing colours, being either pale, amber, brown, or black, the highest temperature producing the latter. The pale and amber varieties, produced by a heat of 90° to 100° F., are used in the manufacture of light beers; the brown, dried at from 150° to 170°, is used for sweet ale; and the black, prepared by roasting in cylinders, heated to 360°–400°, for Porter (q. v.). Good malt should be lighter than water, full, plump, and unshrivelled, crisp and easily broken between the teeth, disclosing a soft floury kernel with a sweet taste and agreeable flavour; the plumula should also extend two-thirds of the length of the grain. Malt, though greater in bulk by $\frac{1}{10}$ to $\frac{1}{5}$, is lighter by $\frac{1}{3}$ than raw grain—that is to say, 100 parts raw grain yield only 80 parts malt, an apparent loss of 20 per cent. Raw grain, however, on being dried, parts with the water present in it, about 12 per cent.; this leaves the real loss of material in conversion from raw grain to malt as 8 per cent., including 3 per cent. of rootlets or *comings*, which drop off in drying, and are removed by a wire screen. During the malting process a remarkable change is effected in the substance of the grain. The glutinous or albuminous constituents of the grain in great part break up and disappear, passing partly, it is supposed, into rootlets, producing also in the body of the seed a peculiar nitrogenous substance called *diastase*, which reacts on the starch of the grain, and converts part of it into soluble dextrin and grape-sugar. Dr Thomson gives the following comparative analyses of barley and malt, taking 100 parts of each:—

	Barley.	Malt.
Starch,	88	69
Sugar,	4	16
Gluten,	3	1
Gum,	5	14
	100	100

Brewing, the second stage in the manufacture of beer, embraces six distinct operations, namely, crushing the malt, mashing or infusing with hot water, boiling the wort with hops, cooling, fermenting, cleansing, and storing.

Crushing the malt is sometimes done by grinding it like oatmeal between circular stones, but a newer and preferable mode is to pass the malt between iron cylinders, the space between which is so regulated as to crush and not to pulverise the malt.

Mashing.—This is a most important operation, for on it depends to a great degree the character of the B. It is conducted in a large vessel called a mashing-tun, in which the

malt is thoroughly mixed with hot water to facilitate the conversion of the remaining starch into grape-sugar by the soluble diastase, the whole saccharine matter dissolving to form *mash wort*. The mashing-tun is formed of wooden staves firmly hooped together, and the malt, passing from a hopper above by means of the shoots, is led into the tun through the feeder and its trunk-like appendage. Hot water of the proper temperature being run in upon the malt, the whole is thoroughly mixed by means of strong wooden rakes fixed to an iron shaft, which rotates on its axis, and also revolves round the tun. At the bottom of the tun are several pipes to convey the wort into a vessel called the *'underback'*, and also a false bottom perforated with a number of small holes. After mashing, the tun is covered up for two hours to allow the wort to clarify by the settling of the malt, after which the liquor is drained off into the underback. The unexhausted malt or *'goods'* remaining after the first mash is again treated with water at a slightly higher temperature, and, after settling, this second mash is drawn off and mixed with the first. Sometimes the operation is repeated a third time to exhaust the saccharine matter of the malt. The temperature which gives the best extract of malt is the range between 158° and 167° F., and therefore, in mashing, it is usual to begin with water at the lowest of these heats (the tun having previously been scalded with hot water), and to conclude with the highest. It is also better to employ the water in three separate portions; the first dissolves the more soluble ingredients, and brings the dissolved starch into intimate contact with the diastase and free sugar; the second and third portions remove the remaining starch, and extract all the available products. The first and second mashes are used for superior beer, and the third is used for small beer, or for the first mash of new malt. The exhausted grains or *draff* left in the mashing-tun is used for feeding cattle. In brewing the

different kinds of beer, it is essential that the wort be maintained of a definite strength; and to ascertain the amount of saccharine matter present the brewer employs an instrument called a saccharometer, a form of hydrometer (q. v.), then, if necessary, he mixes the wort of the different mashes till the required density is obtained.

Boiling the wort with hops.—The wort is transferred as quickly as possible from the underback into the copper *a*, to be boiled with hops. The object of boiling the wort is to coagulate the remaining albuminous matter, which is apt to cause putrid fermentation, to concentrate the wort, and convert any residuary starch into sugar or dextrin, but chiefly to extract from the hops certain constituents—a volatile oil, a bitter resinous principle called *isupulin*, and tannin—which preserve the beer, and impart to it an agreeable flavour. The quantity of hops added to the wort varies with the kind of beer being produced, the season of the year, the length of time the beer is to be preserved, and the climate for which it is destined. Export beer is always more richly hopped than that for home consumption, and cold-weather produce less so than beer brewed in warm weather. For each quarter of malt 4½ lbs. of hops are required in ordinary beer, for superior ales 8 lbs. are employed, and as high as from 14 lbs. to 20 lbs. for export beer. Boiling with hops is continued for from one to three hours, during which time the wort clears by the coagulation and subsidence of the nitrogenous matter; and to prevent the

hops adhering to the bottom of the copper and charring; the iron shaft *d*, fitted at the bottom end with cross arms with pendant chains, called a *roaster*, is kept rotating. The cistern above the copper contains water, for the purpose of condensing the steam and the volatile oil of the hops that escape through the pipe *c*, and are forced down four pipes (two of which, *d*, are shown) into the water, which is used in the next mashing. The boiling completed, the whole contents of the copper are drawn off into the *hop-back*, a large square cistern of wood or iron, with a false bottom, perforated with minute holes. The hops and matter in suspension are allowed to settle, and the liquor is then strained off into the coolers to the depth of 2 or 3 inches.

Cooling the wort.—The coolers are shallow vessels of wood or iron, with a slight inclination towards one end, where the fermenting tuns are placed. There is an exposure on all sides to currents of air; and to expedite the work horizontal fans are caused to revolve rapidly, creating a powerful draught over the surface of the liquor, for it is essential to cool quickly to prevent acidity in the wort, termed *foxing*. An improved method of rapid cooling is often practised: by it the wort is conveyed through long tinned iron pipes placed in a stream of cold water, and the tendency to foxing is greatly diminished.

Fermenting the wort.—This constitutes the most important and most critical operation in brewing, and it is one that calls for constant attention and special skill. At a temperature ranging from 54° to 64° F. the wort is introduced into the fermenting tuns, which are either square or circular, of wood or iron; and from 1 to 1½ per cent. of Yeast (q. v.) is added, either all at once or in two separate portions. Among other things, the quantity of yeast is regulated by its quality, on which, to a great extent, depends the success of the fermentation. Much heat is developed during the fermenting process, and as a temperature of 95° F. is favourable to acetic fermentation, great care is necessary to guard against the liquid heating so high; and in most breweries a simple apparatus, consisting of a coil of metallic tubing through which cold water circulates, is placed in the tun to keep down the temperature. In the manufacture of the finer pale ales, 72° F. is never exceeded in the fermenting tuns—a temperature which ensures the retention of the delicate flavour of the hops. The appearance of small bubbles of gas at the sides of the tun is the first indication that fermentation has begun, and these bubbles are gradually displaced by others and driven towards the centre of the cistern. As the action becomes more energetic a greater quantity of carbonic acid gas is liberated, and the froth, which by this time has collected on the surface of the liquid, swells and breaks up into *rocks*; then the mass, as yet colourless, gradually assumes a yellow or brownish-yellow colour—the former colour indicating a superior quality of beer to the latter. Soon thereafter the fermentative action lags, and the head is skimmed off before it subsides. In what way the yeast acts is still obscure, but its province is to set up a *vinous Fermentation* (q. v.): that is, the grape-sugar is converted into alcohol and carbonic dioxide—each molecule of grape-sugar splitting up into two parts of alcohol and two parts of carbonic dioxide—thus:

This conversion is attended with *attenuation*, or a diminished density of the liquid, and by means of his saccharometer the brewer can ascertain when the required degree of attenuation is attained. The fermentation is seldom allowed to run its full course, for, when the proper strength is attained, the yeast is separated and the liquor drawn off into casks, where a slow and almost insensible fermentation takes place owing to some particles of the ferment remaining suspended in the beer.

Cleansing and storing.—Each of the casks or cleansing vessels is provided with an orifice on the upper surface, and as the yeast rises to the bung-hole, it is carried over into a trough. After the beer is thoroughly clarified it is racked off into large store-vats, or into barrels to be sent to the consumers. Frequently *finings*, as gelatin or isinglass dissolved in sour beer, are employed to assist the clarification by precipitating suspended matter. The saline ingredients in water materially assist brewing operations, and in particular lime plays an important part in clarifying beer.

The amount of alcohol in the different kinds of beer varies considerably, and is in proportion to the degree of attenuation. Ales, sweet and mild, for home consumption, possess more body, or are richer in malt extract, and consequently poorer in alcohol than bitter beer or ales for export. Professor Brand found that the amount of alcohol in strong ales averaged between 6 and 7 per cent.; in brown stout, a strong kind of porter, from 6 to 7 per cent.; and in London porter, 4 per cent. Burton ale, according to the same authority, yields 8 to 9; Edinburgh ale, 6 to 7; and Dorchester ale, 5 to 6 per cent.

In respect to adulteration of beer, the law allows nothing but malt and hops to be used in brewing, except burnt sugar as a colouring agent in porter; and the brewers of the present time are a law-abiding class compared with their predecessors of fifty years ago. The adulterants of that period—for instance, quassia, wormwood, ginger, &c., to give bitterness and pungency, sulphate of iron, alum, salt, and molasses, to impart a head—are now seldom if ever used; but picric acid and *cocculus indicus* are sometimes added with hops to increase the bitterness; both substances are highly objectionable, the latter specially so, as it is poisonous.

Beer Acts. By 32 and 33 Vict. cap. 27, and subsequent amended Act, no license nor renewal for the sale of beer, cider, or wine can now be granted, except upon the production of a certificate granted under the Act. Every one intending to apply to the justices for a certificate under the Act is to give notice in writing, at least twenty-one days before he applies, of his intention to one of the overseers of his parish. Penalties were under this Act imposed upon all the ordinary offences committed by the keepers of beer-houses; but the Act not proving adequately stringent, its provisions were largely supplemented by the Licensing Act of 1872. Provisions for the granting or renewing of licenses are amplified and made more stringent. Regulations are made for the closing of premises, with special regulations for London. Severe penalties are imposed upon illicit sales, and upon adulteration of liquor, and on those who knowingly sell adulterated liquor. Any one permitting drunkenness upon his premises is liable to a fine of £10 for the first offence, and of £20 for the second. Any one who permits gaming or betting in his house is liable to a penalty of £10 for the first offence, and of £20 for subsequent offences. Nothing in the Act is to apply to privileges enjoyed by any university in England.

This Licensing Act of 1872 does not apply to Scotland, where the sale of liquor and the regulation of hotels is under the Act known as the *Forbes Mackenzie Act*. No liquor or refreshment of any kind is allowed to be sold under this license on Sunday, at any hotel, inn, shop, or public-house, except to those resident on the premises, or to travellers. It has generally been held by magistrates that to be a *bona fide* traveller, the applicant for beer, or other refreshment, must have come from a distance of seven miles.

Beebeern. See GREENHEART.

Beerbhoom, an executive district of the division of Burdwan, province of Bengal, British India, with an area of 1344, and a pop. (1872) of 695,921. It contains 2471 villages, but the only place of any size is Soory, which has a pop. (1872) of 9001.

Beer-Money. From the year 1800 till 1873, the non-commissioned officers and privates of the British army received a penny a day, while on home-service, in lieu of an issue of beer and spirits. This allowance, called B.-M., is now incorporated with their ordinary pay. *Pour-boire*, in France, and *Trink-geld*, in Germany, each the equivalent of B.-M., are not applied to allowances to soldiers, but to gratuities given to servants, &c.

Beer-she'ba (Heb. 'the well of the oath,' or 'of seven'; modern, *Bir-es-Saba*), the place on the southern borders of Canaan where Abraham made a covenant with Abimelech, King of the Philistines (Gen. xxi. 22-32, and another account xxvi. 31-33). It was always spoken of as the southern limit of the kingdom, and its position on the road to Egypt rendered it a place of importance, which it continued to be under the Romans and down to the time of the Crusades. All that remains of it now is a heap of ruins, near which are two larger and five smaller wells.

Bee'sha, a genus of grasses, natives of the E. Indies, remarkable for the fleshy pericarp or wall of the fruit, which surrounds the seeds like a berry.

Bees'wax, a hard solid fatty substance secreted by bees, and employed by them to form the cell-walls of honeycombs. That wax is a substance truly elaborated within the animal body, and not merely collected from plants, as has been supposed, is demonstrated by the fact that bees entirely fed on sugar yet produce wax. In its natural condition it is a dull yellow unctuous body, possessing a slight sweetish odour. It is bleached or whitened for use by cutting it into thin slices and exposing it to the influences of light and moisture, or by treating it with dilute nitric acid. It can also be bleached with chlorine, but, as it takes up traces of this substance, such a method of treatment is objectionable for many purposes. Purified wax contains three chemical principles—myricin, cerin, and cerolein. Myricin forms about two-thirds of the entire composition, and is insoluble in alcohol; cerin or cerotic acid is soluble in boiling alcohol; and cerolein, to which the odour and tenacity of wax is due, is soluble in cold alcohol. Wax is chiefly used in the manufacture of candles, and, notwithstanding the variety and excellence of other illuminating fats now available, wax-candles are still consumed in enormous quantities, chiefly in the Roman Catholic and Greek Churches. It is also largely employed in modelling perishable fruits and flowers for the purposes of instruction and for ornament. It is likewise useful in surgery, and it has many minor applications. Wax is produced very generally throughout the world, but in the tropical forests of America and the East it is found in large quantities, and forms an important article of commerce.

Beet (*Beta*), a genus of plants of the natural order *Chenopodiaceae* (q. v.), few in number, and mostly biennials and natives of the temperate parts of the Old World. The common B. (*B. vulgaris*) is a native of the shores of the Mediterranean, and is now extensively cultivated in Europe and America for its fleshy carrot-shaped roots, as an article of food for man and the domestic animals, and as a source of sugar. The varieties grown for the purpose of obtaining sugar are *Betterave à Sucre* and the white or Sicilian B. (*B. Cicla*), which latter is most esteemed.

In 1868, about 8,000,000 tons of B., yielding 650,000 tons of sugar, was grown in Europe, chiefly in France. In 1875 the yield of sugar in France alone was 440,000 tons, the value of which was £25,000,000. The grated root ('sugar-cake') and the molasses—both refuse products in sugar manufacture—are also useful, the former for feeding cattle, and the latter, when slightly acidulated with sulphuric acid, yielding, on fermentation, from 24 to 30 per cent. of a coarse spirit used to adulterate brandy with. Mangel-wurzel (*B. vulgaris macrorrhiza*), probably only a coarser variety of the common B., is extensively grown as a food for cattle. *B. maritima*, a native of England, is sometimes used as a substitute for spinach or greens, as are also the leaves of *B. Cicla*, especially in early spring. The leaf-stalks and mid-ribs (*chards*) of the latter species are also used as a table-vegetable. It is eaten like sea-kale or asparagus, and is a favourite of the French under the name of *Poirée à Cardé*. The leaves of *B. Bengalensis* likewise furnish a kitchen-vegetable in the E. Indies.

Beet-Fly (*Anthomyia Beta*), a *Dipterous* insect belonging to the *Muscida* or Fly family, and which deposits its eggs in the leaves of mangold-wurzel plants, and of other kinds of beet. The larvæ eat the plant-tissues, and produce *bulla*, or blister-like structures on the leaves. The full-grown B.-F. resembles the common fly in appearance, but is not so large.

Beethoven, Ludwig van, the greatest of musicians, was born at Bonn, 17th December 1770. His father was a tenor singer in the service of the Elector of Cologne, from whose court-organist he received his first lessons, and at the age of fifteen was himself appointed to the same office. In 1792 the Elector sent him to Vienna, where he studied hard successively under Haydn, Schenk, and Albrechtsberger. Except a few brief excursions, B. spent the remainder of his life in this city. He did not hold any musical office, but devoted himself exclusively to composition. At first, indeed, he appeared as a pianoforte-player, but afterwards entirely withdrew from the world, and lived in a solitude that was aggravated latterly by total deafness. He died 26th March 1827.

B. was essentially an instrumental composer. He wrote several

masses, a sacred cantata (the *Mount of Olives*), and one opera (*Fidelio*); but beautiful and original as these are, they show he is not at his best in choral writing. His fame rests upon his instrumental works, and chiefly upon his orchestral symphonies. Of these there are only nine in existence, for B. (although a wonderful *improvisatore*) prepared the works which he intended for publication with great deliberation and care. To that deafness of which mention has already been made have been ascribed the peculiarities and unintelligibility of some of his later compositions, which are assigned to what is generally called his 'third period.' But a musician like B. would know the effect of his scores just as well by looking at them as by hearing them played, and the 'third period' seems to have been simply a convenient limbo to which his critics assigned the works they could not understand. With the growth of musical culture, the works covered by this period (including the wonderful ninth or 'choral' symphony) are becoming better appreciated, because better understood. Of B.'s treatment of the symphony, the greatest of his successors—Richard Wagner—has said:—'B. developed the symphonic work of art to such astonishing breadth of form, and filled this form with such marvellously various and entrancing wealth of melody, that we now stand before it as before a landmark of an entirely new period in the history of art; for in this symphony a phenomenon has arisen, the like of which has never existed in the art of any period or any nation.' Biographies of B. are numerous. Among others, we may mention those of Ries and Wegeler (1838), Schindler (3d ed. 1860), Marx (2d. ed. 1863), Nohl (1864), Thayer (1866-71). See also Nottebohm, *Sketches of B.'s* (1865), and the *Letters of B.*, published by Nohl (1865-67).

Beetle, the popular name of insects belonging to the order *Coleoptera*. This order is distinguished by the front pair of wings being converted into horny *elytra* or *wing-cases*, beneath which the hinder and functionally useful pair are folded when at rest. The hinder wings are therefore the only pair useful for flight. The mouth is eminently masticatory, or adapted for biting—two large mandibles, and two maxillæ, or lesser jaws, existing.

Beetle.

The antennæ, or feelers, vary greatly in form. The legs may be adapted for running or for swimming. The tarsi are generally composed of five joints. The metamorphosis is of the holometabolic, or complete variety, the pupæ being free and quiescent, whilst the larvæ, composed of thirteen joints, are active grubs. This order includes an immense number of species, and is classified chiefly by a reference to the number of joints in the tarsi or feet, as recommended by Latreille. The B. thus forms the sections *Pentamera*, *Heteromera*, *Tetramera*, and *Trimera*, accordingly as the tarsi are five-jointed, the front tarsus five, and the under four-jointed, all four-jointed, or all three-jointed respectively. See also *COLEOPTERA*, and the respective articles on the various kinds of beetles.

Beetling, a process largely employed in the finishing of bleached, dyed, or printed cloth, when it is not wished to give a flat or glazed finish to the texture. The process now employed on a manufacturing scale is to wind the cloth on a strong wooden or metallic beam, which is laid under a frame containing a range of heavy falling piles. The beam is slowly rotated, and a toothed roller causes the piles alternately to rise and fall, striking heavily on the cloth.

Beet'root-Sugar, a saccharine substance identical with cane-sugar residing in the juice of the beet to the extent of from 7 to 15 per cent. In 1747, Marggraf, a Berlin apothecary, made known its existence, and proposed the systematic cultivation of the white beet for the extraction of sugar, but owing, among other causes, to the cheapness of cane-sugar imported into Germany, no practical result ensued. About fifty years later Achard and Hermstädt called attention to the subject, and shortly after the commercial manufacture of B.-S. was begun. The desire of Napoleon to render France independent of British colonial produce gave the new industry a powerful impetus in France,

and although it collapsed after his fall, the B.-S. manufacture was soon re-established on sounder principles than before, and during the past thirty years it has prospered in a remarkable degree in that country, as well as in Germany, Belgium, Holland, Austria, and Russia. An idea of its enormous development may be gathered from the fact that the total B.-S. produce in Europe in 1872-73 was 1,025,000 tons, of which France furnished 375,000, and Germany 250,000 tons. The ordinary process of obtaining the B.-S. is briefly as follows:—The washed roots are macerated by circular saws making ten revolutions in a second, and the pulp thus produced is placed in strong linen bags, and subjected to hydraulic pressure, averaging 500 to 700 lbs. per square inch. The expressed juice is then heated in a pan by steam to 85° C. (185° F.), and milk of lime is added and stirred with the juice, the mixture being raised to near its boiling-point; the albuminous constituents are removed by the lime, and other impurities and colour by filtering through flannel and animal charcoal; a current of carbonic acid neutralises the excess of lime; a density of 42° Beaumé (sp. gr. 1.412) is acquired by evaporation in a vacuum pan; and after heating in another vessel to over 120° C. (248° F.), stirring the while, the magma is left for several days to drain off the molasses from the crystalline sugar. The molasses has a disagreeable taste, and is not fit for sweetening, but it yields spirit on distillation, and mixed with other fodder it is used as food for cattle. The production of B.-S. has been successfully carried out in some parts of England, but not on a scale commensurate with the adaptation of English soil for the culture of the sugar-beet. The imports of B.-S. into Great Britain from the Continent amounted in 1873 to over 220,000 tons.

Beffa'na, or **Befa'na** (a corruption of *Epiphania*), according to tradition in Italy, is an old woman who has a great deal to do with children on Twelfth Night, but who keeps, all the year round, so sharp a watch over their conduct that her name is used as a scare-word, (like *Knecht Ruprecht* in Germany, or the 'Bowsy Man' (*der Böse I*) in Scotland), to awe them if they are naughty. Her industry as a housewife was so great when the three wise men of the East were passing her house on their way to make presents to the infant Saviour, that she had no time to go out and look at them, but she hoped to see them on their way back. They, however, returned another way; and she, in her ignorance of this fact, has been watching for them ever since, busying herself about children, as they gave their treasures to the Child in the manger. On Twelfth Night youngsters are put early to bed, a stocking of each being hung before the fire; into it she is supposed to put a present, expressive of her sense of their conduct during the year—ashes being her rebuke for really bad conduct. In Florence, the name is given both to the festival of the Epiphany, and to a sort of puppet made up of bits of cloth, which on the eve of the festival is carried through the streets with shouts of rejoicing. There is little doubt that the practice is a 'survival' from the mystery-plays of the middle ages, but it is not clear what the puppet symbolises. Perhaps the babe Christ. See EPIPHANY, BEAN-KING'S FESTIVAL.

Beffroi was a wooden tower constructed in several stages or stories communicating with each other by ladders. It was used in siege operations in ancient and in mediæval times. The B. was moved upon wheels close to the wall of the besieged town. Its highest story was fitted with a hinger draw-bridge, which was let fall upon the coping of the wall, and across which the soldiers that crowded its different stages poured over upon the besieged. This contrivance is mentioned by Cæsar, described by Froissart, and was last seen on the field in England during the wars under Charles I. See BELFRY.

Beg, or **Bey**. See BEY.

Be'gas, **Karl**, a distinguished German painter, born at Hemsberg, near Aix-la-Chapelle, 30th September 1794, became a pupil of Gros (Paris) in 1812, studied afterwards at Rome, and was a Member of the Academy and court-painter at Berlin from 1825 till his death, November 23, 1854. B.'s pictures are partly biblical, partly romantic, and partly genre-pieces. Of the first may be mentioned his 'Baptism of Christ' (1825), in the style of the old Florentines, which was placed in the garrison church at Potsdam, and his fine fresco of Christ and the four Evangelists surrounded by a choir of angels in the church of

Cracow. Specimens of the other classes are the 'Loreley,' 'Girls under the Oak-Tree,' 'The Vine-Dressers,' &c. He is chiefly memorable as a master of light and shade. His three sons, Oscar (born 1828), Reinhold (born 1831), and Adalbert Franz Eugen (born 1836), are also artists of merit. The first is a professor in the Berlin Academy, and noted for his skill in portraiture; the second is a sculptor; the third was originally an engraver, but is now a painter.

Beggar, one who asks for alms—a mendicant. Considered merely with regard to the *wealth* of nations, the problem of how to deal with those who cannot, or who will not, support themselves, is not very difficult of solution. If a man, through misfortune, or even through his own imprudence, has got into circumstances in which he cannot support himself, and there is reasonable hope that assistance will ultimately enable him to do so, the law of political economy sanctions our giving assistance. But if there is no hope of the man becoming self-supporting, then the dictum of the law in question is that he should die. And there can be no doubt that the material prosperity of a community acting on this law would be advanced. Mendicancy would die out. But, plainly, to carry out the law to this stern extremity is not possible. There are laws which affect human nature besides those of political economy. We could not see our fellow-mortals dying round us for want of sustenance and refuse to give it, even though the want arose wholly from their own fault, and however greatly our refusal might ultimately conduce to national prosperity. But if political economists must keep in mind that the highest culture of human nature cannot be arrived at through political economy alone, another and a larger class will do well to remember that the laws of political economy cannot be infringed with impunity, and that the excellence of the motive which led to the infringement will abate nothing from the evil consequence.

In dealing with the poor, then, the legislature should keep in view both of these forces, and endeavour to assist in the difficult task of making them work in harmony. To the same end it is the duty of individuals to remember that to do good is the work of knowledge, and that the indulgence of feeling, without the knowledge required to guide it, may do, almost surely will do, mischief and not good. It may indeed be questioned if malevolence does as much harm in the world as misdirected benevolence. By our law (see next article) begging is not allowed. Nevertheless it greatly prevails, usually more or less disguised, but not unfrequently without disguise—facts which, did space permit, might lead us to consider the question of What constitutes begging? The boy who offers you a box of matches or a newspaper may be troublesome, but he is not a B., and should be spoken to encouragingly, because there is a reasonable probability that one may want a newspaper; but the man who reads you a Scripture verse with the view of being paid for it is a B. under a very flimsy disguise. In some Christian countries, notably in Spain and in the East, indiscriminate almsgiving is considered a religious duty. Hence these lands swarm with indolent and filthy beggars, and thus does the cancer of pauperism eat into the vitals of the country till the whole body becomes diseased. Climate has unquestionably much to do with mendicancy. Where there is no winter, where soil and climate give the means of subsistence without labour, *there* are conditions favourable to it; where the bulk of the population must work hard or starve, *there* are conditions unfavourable—that soil and that climate being on the whole most favourable to man which award wealth to labour and starvation to indolence.

Beggars, **Law of England relative to**. The Vagrant Act, 5 Geo. IV. c. 83, classifies B. first, as 'idle and disorderly persons'; second, as 'rogues and vagabonds'; and, third, as 'incorrigible rogues.'

In the first class are every person able wholly or partly to maintain himself or family, neglecting to do so, whereby they become chargeable to the parish; petty hawkers, or pedlars, without licence; prostitutes in the streets or highways; those who in any public place, court, or passage, beg or cause any child to do so. All such are 'idle and disorderly persons,' punishable with one month's imprisonment, or with being sent to the House of Correction.

'Rogues and vagabonds' are all convicted a second time of being 'idle and disorderly'; fortune-tellers; expositors of wounds or deformities in order to get alms; players or betters in the streets; loiterers, or persons suspected of having picklock or

other suspicious implements in their possession. All these are 'rogues and vagabonds,' whom a justice of the peace may send for three months to the House of Correction.

'Incorrigible rogues' are those escaping from confinement before expiry of the period embraced in their sentence; those twice committed as rogue and vagabond; and those violently resisting apprehension as rogue and vagabond, and subsequently convicted of being so. This class is liable to one year's imprisonment, and male offenders may be whipped.

The Act 34 and 35 Vict. c. 108, makes some additions to the first and second class.

Justices are under statutes enabled to give some small pecuniary assistance to prisoners on their discharge. See POOR and POOR-LAWS.

Beghar'mi, or **Baghir'mi**, a kingdom of Central Africa, to the S.E. of Lake Tchad, watered by the Shari and its tributary the Serbenal, with an area of 43,200 sq. miles, and a pop. of about 1,500,000. The country is flat, and moderately productive, but worms and ants abound, and are very destructive to the crops. The inhabitants profess Mohammedanism, but are grossly superstitious. Throughout the Sudan the beauty of the women is famed. Masenja is the capital. B. is tributary to the adjoining state of Bornu, but is ruled by a sultan who is absolute within his dominions.

Beg'kos, or **Beik'kos**, a small seaport in the Turkish vilayet of Scutari, on the Bosphorus, the scene (according to tradition) of the pugilistic fight in which King Amycus was killed by Polydeukes, the Argonaut. The allied fleets anchored here (1854) before the Crimean War began.

Beg'lerbeg. See BEY.

Begonia'ceæ, a natural order of dicotyledonous plants, allied to *Cucurbitaceæ* (q. v.); herbaceous plants or low succulent

Begonia discolor.

shrubs, alternate leaved, with long dry stipules; flowers in cymes, unisexual, perianth-coloured, with four unequal divisions in the male flowers, and five to eight in female ones; stamens numerous; fruit winged, capsular, three-celled, dehiscing by slits at the base; seeds minute, numerous, and without endosperm. There are about 400 species and 42 genera, natives chiefly of India, S. America, and the W. Indies. Most of them have astringent, bitter, and occasionally purgative properties. Nearly all have pink flowers; and some are cultivated in our hothouses. One, however, grows on the Himalayas, at the height of 11,000 to 12,000 feet. Some are used as pot herbs, but none are of particular importance.

Beg-Shehr Göl, a fresh-water lake in the tableland of Asia Minor, vilayet of Konia, 39 miles S.W. of Konia. It is about 30 miles long, and from 8 to 12 broad. On its shores lie the towns of B. and Kereli, the ancient *Caralis*.

Beg'tash'i, a Turkish religious order, founded in the 14th c. by Hadji Beg'tash, a famous dervish. It is a secret order, the members of which are numerous, and many of them influential; but it has not made itself felt either as a religious or political force in the Ottoman empire.

Beguines', **Begui'næ**, or **Begutt'æ**, the name given to a German and Belgic religious order of women. The date of its origin is somewhat uncertain, but it became prominent in the 13th c. Of the causes which led to the establishment of the sisterhood, one was no doubt the Crusades, since they were a constant drain on the male part of the population. As another cause has been assigned the prevailing dissoluteness of the time, which caused many widows and virgins, desirous of a peaceful and virtuous

life, to form into these societies. There has been much discussion as to the origin and precise significance of the word B. Popular tradition has derived it from a certain mythical St Begga, who was supposed to have founded the order in the 7th c. It has been also suggested that one Lambert le Bègue (or Stammerer), a priest, gave his name to a society which he instituted at Liege in 1180; and finally, some have conjectured that the title of *beguine*, applied first to women of singular devoutness, was afterwards restricted as the name of the sisterhood. The B. did not live under any appointed rule, and were not bound by any vows of celibacy. There was a lady superior at the head of each society, and the time of the sisters was spent in devotions, works of charity, and various suitable industries, such as weaving and embroidering. The *beguinage*, or *vineyard*, as the habitation of the B. was called, consisted generally of a number of small dwellings clustered together; and each community had its chapel, hospital, and house for the accommodation of guests and strangers. In the 12th and 13th centuries, these societies spread over Germany, Holland, and France, till hardly any town of consequence wanted its *beguinage*. Among the chief were those of Aix-la-Chapelle, Hamburg, Brussels, Cambray, Leipsic, Cologne, Magdeburg, Bruges, Ghent, Douay, Mons, Namur, Tournay, and Valenciennes. In the 14th c. the B. became infected with the heterodoxy of the 'Mystic Brethren and Sisters of the Free Spirit.' They shared the persecution which the Mystics met with from the Inquisition; and besides, the wealth of the B., and certain suspicions of immorality, exposed them to violence and oppression. Being disliked by the labouring class, particularly by the weavers, their houses were broken into, and their goods plundered. Several of the Popes endeavoured to protect them; and in various places they joined the regular monastic orders as a means of safety. But the decline of the B. commenced in the 14th c., especially in France; they continued longer to exist in the Low Countries and Germany. The *beguinen-hauser* of the latter country are nothing more than almshouses; but there is a *beguinage* at Ghent, and the order still survives at Amsterdam, Antwerp, Mechlin, and Bruges.

Beghards (Ger. *begghard* *begheren*, to seek eagerly, to importune) the German name for a class of irregular monks, called in France *Bèguins*, in Italy *Bisachi* and *Rocassoti*, but not connected with the B. proper. They appeared first at the commencement of the 13th c., and soon swarmed over Europe. The B. were held in low repute, as is testified by the names popularly given them—*bons garçons*, 'vagabonds,' &c. They were originally an offshoot from the Franciscans, and were divided into various sections, according to discipline and belief, but all included under the one name. The fraternity was suppressed in the 14th c. on account of its heresies, and was absorbed again into the Franciscan order. See Mosheim's *Ecclesiastical History* (vol. iii. ed. Lond. 1783), and his *De Beghardis et Beguinabus*, (Leips. 1790), also Hallmann's *History of the Origin of B. in Belgium* (Berl. 1843).

Behaim', Martin, a navigator and geographer, was born at Nurnberg, 1459, and as a merchant visited Venice, Mechlin, Antwerp, and Vienna, and resided at Lisbon for four years from 1480. Having here acquired a reputation for map-making, he was appointed by King John I. president of a *Junta de Mathematicos*, which was to form tables of the sun's declinations, and to teach pilots to navigate by the altitude of the sun and stars. He made an important expedition to the west coast of Africa with Diego Cam, and lived from 1486 to 1490 in the Azores, after which he returned to Nurnberg, where he resided for two years. In 1492 he completed his famous globe or 'world apple,' which is still preserved in the B.-house at Nurnberg. B. returned to the Azores, and lived there from 1494 to 1506. He died at Lisbon, July 29, 1507. See Ghillany, *Geschichte des Seefahrers Ritter Martin B.* (Nurnb. 1853).

Behaim, Michael, a German meister-singer of the 14th c., was born at Sulzbach, near Weinsberg, in 1416, and died in 1475. By none of his contemporaries was he excelled in fertility. His chief works are his *Buch von den Wiennern*, on the insurrection of the Viennese against Friedrich III. in 1462 (Karajaz, Vien. 1843); *Leben des Pfalzgrafen Friedrich I. bei Rhein* (1469, unpublished); *Gedicht von der Liebhabung Gottes*; *Geistliche Gedichte*, &c.

Behend'ing. See CAPITAL PUNISHMENT.

Behistun is the name of a ruined town in the Persian province of Irak-Ajemi, and of a sacred rock close by. On the perpendicular face of the rock, 300 feet from the ground, is cut the great trilingual cuneiform inscription deciphered by Sir Henry Rawlinson in 1839 and following years. The work in all the columns—Persian, Median, and Babylonian—is beautifully finished, the faults in the polished limestone surface being filled with new stones secured by lead, and the whole inscription coated with siliceous varnish. The inscription gives a list of the nine Achaemenian monarchs of Persia, and of the victories of Darius Hystaspes, by whom it was erected, probably in 516 B.C. The five Persian columns, containing 400 lines, have yielded an alphabet of Persian cuneiform of forty characters. Before 1839 the value of a few characters had been ascertained; but the translation is substantially due to the comparative analysis of Rawlinson, based on suggestions from the Zend and Vedic Sanskrit languages. There is also on the rock-face a representation of Darius, his foot on the body of Gomates the magian; before him stand nine captive rebels, viz., Atrines and another of Lusiana, Natitabirus and Aracus of Babylon, Phraortes of Media, Sitratathmes of Sagartia, Veisdates of Persia, Phraates of Margiana, and Sarukha, the Sacan, whom Darius in person defeated on the Tigris. Frequent reference is made in the text to the rooting out of heretics by the help of Ormazd, to whom B. is sacred. The rebel leaders seem usually to have been crucified after mutilation of ears, nose, and lips.

Behn, **Aphra**, or **Aphaar**, perhaps the most licentious dramatic writer of the most licentious English era, belonged to a Canterbury family named Johnson, was born in 1642, resided for several years, when young, in Surinam, returned to England, and married Mr B., a Dutch merchant. She is said to have been introduced to Charles II., who deputed her to watch his interests in Flanders. On her return to England she became a writer of letters, tales, poems, plays, which are happily now remembered only by antiquarians. She died in London, April 16, 1689. *The Plays written by the late Ingenious Mrs B.* were reprinted in 4 vols. 1871. See Ward's *English Dramatic Literature* (Lond. 1875).

Behring, properly **Bering**, **Vitus**, a famous navigator, was born at Horsens, in Jutland, in 1680, and served with distinction as a captain in the navy of Peter the Great during the Swedish wars. He was appointed subsequently by Catherine to explore the Sea of Kamchatka, and in 1728 gave his name to the strait which separates Asia from America, although it is now believed that the expedition did not sail so far north. *The coasts of Kamchatka and Okhotsk were investigated and the settlement of Petropaulovski founded by B., who afterwards led a second expedition along the American coast, which reached a point beyond lat. 60° N., but which was forced to return, and was wrecked on B.'s (formerly Avatska) Island, where he died, December 8, 1741.

Behring Strait, the channel which separates Asia from America, some 50 miles broad at its narrowest part, between E. Cape in the former and Cape Prince of Wales in the latter continent. It is nowhere deeper than 30 fathoms, and is therefore comparatively free from large icebergs. Deschnew, a Cossack, is believed to have discovered it in 1648, but his story was discredited till B.'s expedition in 1728.—**B. Sea** is a name occasionally applied to the Sea of Kamchatka, which extends from the Aleutian Islands N. to B. Strait.—**B. Island**, a Russian possession, is the westernmost of the Aleutians, and the place of B.'s death. It has an area of 30 sq. miles.

Beilan, a pass and town in the N. of Syria. The pass still forms, as it did in ancient times, the great highway from Asia Minor through Cilicia into Syria. The town of B., 1584 feet above the level of the Mediterranean, has a pop. of 5000. In 1832 the Turks were defeated here by the Egyptians.

Beira (Port. the 'river-bank'), the most populous province of Portugal, bounded N. by the river Douro, S. partly by the Tagus and partly by the province of Estremadura, and extends from the Spanish frontier to the Atlantic Ocean. It is for the most part mountainous, the Sierra d'Estrela ranging from N. to S., but the valleys are fertile, and there is abundance of good pasturage. The rivers Mondego and Vouga water the centre of the

province. Viseu is the capital. The chief products are corn, wine, flax, honey, oil, and fruits, and the mountains are rich in iron, coal, and marble, which are, however, little wrought. Area 8586 sq. miles; pop. (1874) 1,390,092.

Beiram, or **Bairam**, the Persian name of the only two festivals of the Mohammedan year. The rejoicings of the Greater B. begin on the first of the month Shawal, at the end of Ramadan, the month of fasting—just as Easter follows Lent in the Christian Church—and last three days. Sixty days later, on the 10th of the month Shidji, the Lesser B. commences, and lasts four days; it is called *Kurban B.*—i.e., the B. or Festival of Sacrifice, for during its rejoicings sheep and goats are slaughtered and distributed among the poor.

Bel'rout. See BEYROUT.

Beit is the Arabic form of the Hebrew *beth*, or more correctly *baith*, a house. Both are derived from verbs signifying 'to build' (like the Gr. *domos*, from *domō*); and enter into the composition of numerous names in their respective languages: e.g., Arab. *Baitullah* ('house of Allah' or 'God'), the name given to the sacred edifice at Mecca containing the Kaaba; *Bait-al-Haram* ('the house of the sanctuary'); in Heb. *Bethel* ('house of God'); *Bethany* ('house of dates'); *Bethoron* ('house of caves'); *Bethlehem* ('house of bread'); *Bethsaida* ('house of fish'); *Bethphage* ('house of figs'), &c. In Palestine, where the Arab has displaced the Jew, we now find the Arabic form instead of the Hebrew, as *Brit Dejan* ('house of Dagon').

Beit-el-Fa'kih ('house of the saint'), a town of Tehama, Arabia, 12 miles from the coast of the Red Sea and 85 N.W. of Aden, formerly a great entrepôt for the vast coffee trade of Yemen. There is still some trade in gum, wax, coffee, and pearls. The ports are Lohaja and Hodeida. B. has an extremely hot climate. Pop. 8000.

Beja (a corruption of the Lat. *Pax Julia*), the name of a fortified town of Alemtejo, Portugal, on a small feeder of the Guadiana, 18 miles S.E. of Lisbon, with which it is connected by rail. It has a cathedral, and contains many Roman and Moorish remains. Its chief manufactures are leather and earthenware. Pop. 5300.

Bejan, or **Bajan** (Fr. *béjaune*, a greenhorn or ninny; Old Fr. *bec-jaune*, 'yellow-nob'), a term still applied to junior students in the Universities of St Andrews and Aberdeen, and formerly in many universities on the Continent. It was intended to convey, with mild irony, the idea of their being still callow. *Bejaunia*, payments exacted from students on their entering college, and corresponding to the 'pay-off' of handicraftsmen now, were forbidden by statute in more than one French university about the close of the 14th c. In the University of Vienna, the name B. assumed the form *Beanus*.

Bejapur (Sansk. 'the victorious city'), a decayed city in the executive district of Kaldagi, province of Bombay, about 155 miles S.E. of Poonah, on an affluent of the Krishna. For centuries it was a great and splendid city, but after its capture by Aurungzebe in 1686, it sank into comparative insignificance. It afterwards came into the possession of the Mahrattas; but after the final destruction of the Mahratta empire in 1818, the British assigned B. to the Rajah of Sattara, resuming possession in 1848 on the extinction of the dynasty. In the height of its prosperity, it is said to have contained 100,000 dwellings; and a succession of ruins, the principal of which are Mohammedan tombs, extends from the western gate for a distance of five miles. There is still preserved at B. a piece of brass ordnance, cast in 1549, that carried shot weighing above a ton. Pop. (1872) 12,935.

Bejetlan, **Langsat**, **Lanseh**, or **Ayer Ayer**, the edible fruits of the genus *Lansium* (natural order *Meliaceae*, q. v.), natives of the E. Indian Archipelago.

Beka's, or **El-Beka's** ('the valley'), the Arabic name now given to the Coele-Syria (Hollow Syria) of the Greeks, the Plain of Lebanon of the Old Testament, a remarkable hollow or valley, extending for a distance of nearly 100 miles from N. to S. between Libanus and Anti-Libanus. Though fertile and well-watered, not much of it is under cultivation; but the Arabs avail themselves of its pasture grounds in spring for their cattle and

young horses. 'A screen, says Stanley (*Sinai and Palestine*, p. 431), 'through which the Leontes breaks out, closes the S. end of the plain. There is a similar screen at the N. end, but too remote to be visible,—"the entering-in of Hamath," so often mentioned as the extreme limit in this direction of the widest possible dominion of the Israelite empire.'

Beke, Charles Tiltstone, the celebrated Abyssinian traveller, was born in London, October 10, 1800, and for some time studied at Lincoln's Inn. His taste, however, led him to other studies than law, and his first publication, *Origines Biblicæ* (vol. i. 1834), displayed genuine attainments in philology and ancient history. In 1836 he was made British consul at Leipsic, and in 1840 joined a private expedition to Abyssinia, which had for its object to open up commercial relations with the countries S. of Egypt. The result of his observations appeared in *Abyssinia, a Statement of Facts, &c.* (Lond. 1846), an *Essay on the Nile and its Tributaries* (1847), and *On the Sources of the Nile* (1849), a *Mémoire Justificatif en Réhabilitation des Pères Paës et Lobo* (Par. 1848), and in many contributions to journals. In acknowledgment of his services, he received the gold medals of the Geographical Societies of London and Paris. Accompanied by his wife, in 1865, he made an ineffectual effort to release the European captives in Abyssinia, and subsequently contributed greatly to the success of Sir Robert Napier's expedition by recommending the landing-place, line of march, &c. He was granted a civil list pension in 1870. In the last year of his life B. visited the desert region N. of the Red Sea, where, in a peak to the E. of the Gulf of Akabah, he claimed to have discovered Mount Sinai, which he contended had not been identified by the Sinai Ordnance Survey Expedition. He was preparing an account of this journey when he died, July 31, 1874.

Békés (pron. *Bekesh*), the capital of a county of the same name, Hungary, at the junction of the White and Black Kőrös, has a trade in cattle and corn, and is noted for the culture of bees. Pop. (1869) 20,125.

Bekker, Immanuel, an eminent German Hellenist, born at Berlin in 1785, studied at the University of Halle under F. A. Wolf, who considered him his most distinguished pupil. Appointed Professor of Philology in the newly-founded University of Berlin (1810), he was almost immediately sent to Paris to examine the Greek MSS. in the Imperial Library. Having become a member of the Academy of Sciences at Berlin in 1815, he was sent by that body to Paris again to gather materials for the *Corpus Inscriptionum Græcarum*. Two years later he proceeded to Italy, and afterwards examined the libraries in England and Holland. The fruits of his labour and intelligence both at home and abroad are seen in his *Anecdota Græca* (Berl. 1814-21), and in his splendid recensions of the texts of classical writers, the results of his careful examination of MSS. Among these may be mentioned his *Plato* (10 vols. Berl. 1814-21); *The Attic Orators* (7 vols. Oxf. 1823); *Aristotle* (4 vols. Berl. 1831-36); *Sextus Empiricus* (Berl. 1842); *Thucydides* (3 vols. Oxf. 1821); *Theognis* (Leips. 1815); *Aristophanes* (3 vols. Lond. 1825); *Photius' Library* (2 vols. Berl. 1824), &c. His part in the preparation of the *Corpus Scriptorum Historiæ Byzantinæ* amounts to 24 vols. B. died June 7, 1871.

Bel and the Dragon, History of, one of the apocryphal additions to the Book of Daniel, which in the LXX. bears the title 'Part of the prophecy of Habakkuk.' In all probability it is a legendary exaggeration of the record of the deliverance of Daniel (ch. vi.), as the original story in the LXX. was further embellished in later times.

Belä. Four Hungarian kings of the Arpad dynasty were so named, of whom the first and fourth are the most important.—**B. I.**, son of Ladislaus, spent the greater part of his life in Poland and Pomerania, and with some hard fighting made himself ruler of Hungary after the death of his brother, Andreas I. His reign was short (1061-63) but important; he suppressed the last attempts to re-establish idolatry, confirmed internal peace, strengthened the regal authority, fixed the standard of weights and measures, and introduced the representative system into the diet.—**B. IV.** (1235-70) was the son of Andreas II., who in 1222 had been compelled to sign the *Bulla Aurea* (Golden Bull), the great charter of Hungarian liberty. To the principles laid down

in the Golden Bull B. continued uniformly faithful, and he incurred the enmity of the nobility by his persistent attempts to break their power. In the midst of his struggles with the magnates the Mongols invaded Hungary, and defeated the royal troops on the Sajó in 1241. B. took refuge with Friedrich II., Duke of Austria, who ungenerously deprived him of his treasures and of the border counties of Hungary. The Mongols left the country in the second year of their conquest, when B. returned, restored the towns and villages, possessed himself once more of the border counties, and defeated Friedrich at Vienna in 1246. His son Stepan headed a rebellion against him, which was not suppressed in 1270, the date of B's death. There is also a **B. V.**, a grandson of B. IV. by the mother's side, who reigned over Hungary for a year.

Belaying, a nautical term, denoting the fastening of a rope by giving it several turns round a cleat, kevel, or *B. pin*: the latter, an ashen staff fully a foot long.

Belbeys, or **Belbeis**, a town of Lower Egypt, on the E. side of the Pelusiac branch of the Nile, 28 miles N.N.E. of Cairo, with a pop. of about 5000. It was once more important and populous than now, but it is still a station on the great caravan-route between Egypt and Syria. About 10 miles N.N.W. of B. are the ruins of Tell Bastah, the *Bubastis* of antiquity, and about the same distance N. the ruins of *Putumos*, the Pithôm of Exodus, which the Hebrews built for their Egyptian masters.

Belcher, Sir Edward, C.B., F.R.S., and F.G.S., an English naval officer and explorer, born in 1799, and entered the navy in 1812. He was assistant-surveyor in the expedition fitted out under Captain Beechey to explore Behring's Strait (1825-28); in 1830 he was engaged on the survey of the coast of Africa; and from 1836 to 1842 on that of the Pacific. On his return he published a narrative of the voyage, during which he had made the circumnavigation of the globe, and rendered valuable service to Lord Gough by his soundings taken in the Canton river. It is entitled *Narrative of a Voyage Round the World, performed in H.M. Ship Sulphur, &c.* (1843). In 1843 he was promoted to the rank of post-captain, and knighted. In 1844 appeared his *Voyage of the Samarang to the Eastern Archipelago*. From 1852 to 1854 he commanded the expedition sent to search for Sir John Franklin, and brought the crews of the ice-bound vessels to England, October 1854. He gave an account of this expedition in *The Last of the Arctic Voyages* (Lond. 1855). B. was appointed rear-admiral in 1861, vice-admiral in 1866, and K.C.B. in 1867. He died 18th March 1877.

Belchite, a town in the province of Saragossa, Spain, 220 miles N.N.E. of Madrid, famous as the scene of a decisive victory of the French, under Suchet, over the Spanish, commanded by General Blake, June 18, 1809.

Belem (pron. *Beleng*, a Portuguese corruption of *Bethlehem*), a suburb of Lisbon, Portugal, formerly an independent village, lies towards the S.W., on the right bank of the Tagus. In November 1807 it was taken by the French, and the Portuguese court sailed hence for Brazil. B. has a royal castle, a beautiful church, in which are the tombs of the kings of Spain, and a building formerly a monastery, now an orphanage.

Belem, or Para. See PARA.

Bel'mnites, a genus of fossil *Cephalopoda* (q. v.), or Cuttlefishes, belonging to the family *Belemnitidae*, and to the *Dibranchiate*, or two-gilled section of the above class. The forms known as *B.* are exclusively found in the rocks of the Mesozoic Period, and consist of the fossilised internal shells of cuttlefishes allied to the *Sepias* and *Loligos*, or *Squids* of our own day. The extinct genera *B.*, *Belemnitella*, *Belemnodonta*, and *Xiphoteuthis*, are included under the general name of *B.* The *B.* were cuttlefishes possessing ten arms, furnished with suckers and lateral fins. The perfect fossilised shell consists of a chambered cone or *phragmacone*, containing the *ink-sac*, and prolonged in front into a *pen* or *pro-ostacrum*; whilst posteriorly the phragmacone is lodged in a conical cavity or *alveolus*, excavated within a cylindrical sheath, the *guard*. A tube or *apophysis* perforates the septa, or partitions of the chambered portion, at their ventral or lower margins. These fossils have received the

popular name of 'thunderbolts,' 'arrows,' 'spectro-candles,' &c. Some specimens indicate the size of the living animal to have been 2 to 4 feet in length. Familiar species are *B. acurarius* (Lias); *B. clavatus* (Lias); *B. hastatus* (Oolite); *Belemniteella mucronata*; *B. plana*, &c.

Belfast (Gael, originally *Bel-feirsde*, 'the ford of the farset, or sandbank'), the most important manufacturing city in Ireland, the capital of Ulster, and the chief seat of the linen trade, is situated at the point where the Lagan enters B. Lough, 12 miles from the Irish Sea, and 101 N. of Dublin by railway. It is only 6 feet above the sea, and stands partly on a site reclaimed from the marshes of the river, which is here 250 yards wide, and is crossed by four bridges. Divis Hill (1567 feet) and Cave Hill (1185) form a picturesque background to the city, and the principal buildings are Queen's College, the Royal Academic Institution, the Wesleyan Methodist College, Ulster Bank, the Harbour Office, Ulster Hall, the Post-Office, a Museum, a Linen Hall, Commercial and Corn Exchanges, a Convalescent Hospital (1877), numerous fine churches, and a Botanic Garden of 17 acres. Queen's College, a fine building in the Tudor style, which cost £26,000, was opened in 1849, and has (1875), nearly 300 students and 18 professors. The staple manufactures of B. are linen and cotton, the former industry dating from 1637; besides which there is extensive linen and cotton spinning, calico-printing, bleaching, dyeing, iron-founding, and brewing. B. is the greatest shipbuilding place in Ireland, employing upwards of 2000 men in iron-shipbuilding alone. In 1874 there were five ships of 16,000 tons built. There are also flour, oil, barilla, and alabaster mills, several chemical works, rope and sailcloth yards, and sawmills. B. will, on completion of vast improvements now in progress, be one of the first-class ports of the United Kingdom, having five new docks and a tidal basin of 25 acres. In 1874, 7012 vessels of 1,305,016 tons entered the harbour, and 3964 of 922,009 tons cleared. The customs duties for 1874 amounted to £401,839. Pop. (1871) 174,394; estimated pop. (1876) over 200,000. In the 14th c. Edward Bruce sacked B., and it may again be said to have risen to importance in 1611, when its charter was granted. During the civil war it first supported the side of the Parliament, and then embraced the royal cause. A rupture between the Protestants and Catholics of B. led to one of the most formidable and destructive riots of late years, August 15-21, 1872. B. sends two members to Parliament, and is under a corporation consisting of a mayor, 9 aldermen, and 30 councillors. It is the northern headquarters of the military. The rateable property was valued in 1864 at £270,930, and in 1874 at £482,419. There are in B. (1875) 14 newspapers, including 7 dailies. See Bann's *History of B.* (Belf. 1877).

Belfort, the chief town in the Territoire de B., in the N.E. of France, on the Savoureuse, with a considerable trade in iron, leather, wine, and fruit. It was fortified by Vauban, was long a stronghold of the first rank, and commands the *Troude de B.*, the gap between the Jura and the Vosges. In October 1870 the Germans under Treskow besieged B., which showed a resolute defence till 16th February 1871, when, on capitulating, the troops were allowed to march out with all the honours of war. Pop. (1872) 7910. The *Territoire de B.* consists of those portions of the department of Haut-Rhin which were restored

to France by the Germans on the peace of Versailles, February 26, 1871. Area 234 sq. miles; pop. (1872) 56,781. In a three days' fight (15th-17th January 1871) General Werder here successfully resisted General Bourbaki.

Belfry (Old Fr. *ber-froi*), a bell-tower, usually attached to a church, but sometimes separate from it. The term is sometimes applied to the frame on which the bell is suspended. B., meaning a tower, is synonymous with *Campanile*

Belfry.

(q. v.). Where there is only a single bell, it is sometimes

placed in an arch constructed on the W. end of a church or chapel, called the *bell-cote* or *bell-gable*, in which case a smaller arch is sometimes formed on the E. gable, over the altar, for the sanctus-bell. The origin of the term shows that the word B. is a corruption. The Old Fr. *berfroi*, Low Lat. *beresfradus*, has etymologically nothing to do with bell. It is formed from the Middle High German *bervrit*, a watch-tower, in which a bell would naturally be placed to ring an alarm. Then the name would easily pass over to the bell-tower of a church, and the word be corruptly spelled to suit the new application. For a quite different use of the term, see BEFFROIL.

Bel'gæ, occupied one of the three great divisions of Gaul, being bounded on the W. by the ocean, and on the E. and N. by the Rhine, and separated from the Celtæ in the S. by the Seine and Marne. Cæsar sometimes uses the name Belgium, or B., in a limited sense; for example, as the designation of the country of the *Bellovacii*. The name, indeed, seems to have belonged to a few powerful tribes bordering on the Seine, and to have been adopted by Cæsar as a generic name for all people N. of the Seine. The B. were a Celtic people, though to some extent mixed with Germans. They had a reputation for bravery beyond all the other inhabitants of Gaul. Cæsar found Belgic immigrants on the coasts of Kent and Sussex; and Ptolemy mentions a British population of that name in Wilts and Somerset. The British B. seem to have belonged to the same race as the Gallic.

Belgaum, a fortified town, capital of an executive district of the same name, province of Bombay, British India, 42 miles N.W. of Dharwar. B., taken by the British under General Munro in 1818, after the victory of Korygaum, in which Sepoy and European rivalled each other in valour and fortitude, is now one of the most important military stations in India. An institution for the education of the native youths is liberally supported. Pop. of the town (1872) 26,947, exclusive of the cantonment, which at the same date contained 5330 more.—The district of B. has an area of 4591 sq. miles, with a pop. (1872) of 938,750, of whom 814,651 were Hindus. The Mohammedans only numbered 71,386; Buddhists and Jains, 47,564; and Parsees, 82. The prevailing languages are Marathi and Kanarese.

Belgiojo'so, a town in the province of Pavia, N. Italy, with a pop. of about 4000. It has a magnificent aqueduct and a fine castle, in which Francis I. spent the night before his defeat and capture at Pavia.

Belgiojoso, Cristina, Princess of, an Italian lady distinguished for her patriotism, the daughter of the Marchese Geronimo Isidoro of Trivulzio, was born 28th June 1808, married in 1824 to Prince Emilio of Barbiano and B. She took an active part in the revolutionary movement of 1830, and raised a corps of volunteers at her own expense in 1848. After the occupation of Rome by the French, she went first to Athens, and afterwards to Constantinople, but returned to Italy on the proclamation of the amnesty of May 1856; received back her property, and, abandoning the extreme views of the Mazzinists, worked for Cavour's policy after 1858. She died at Milan, 5th July 1871. The Princess was also an authoress of some merit.

Bel'gium, the most densely peopled state of Europe, bounded N. by the Netherlands, N.W. by the German Ocean, S.W. and S. by France, and E. by Dutch Luxembourg, Rhenish Prussia, and Dutch Limbourg, lat. 49° 30'–51° 30' N., long. 2° 33'–6° 5' E. It is somewhat in the form of an isosceles triangle, with its base, 382 miles in extent, resting on France, and has a flat and regular coast-line, only measuring 42 miles. On the whole a flat country, it is along the coast little raised above the high-water level, and has to be protected against the inroads of the sea by artificial dikes, where the natural barriers, consisting of sandhills, are either wanting or inadequate. The southern provinces slope gently towards the N., and those in the S.E. are traversed by a portion of the Ardennes, in which the greatest height is the peak of Stavelot with an elevation of 2000 feet. This tract of the highlands of Ardennes separates the basin of the Maas from that of the Moselle. In the N.E. of B. a sterile, heathy region (Peel and Campine) breaks the general prospect of rich, well-cultivated country, abounding in villages, clad with vegetation, and intersected by canals. B. has an extreme length from

N.W. to S.E. of 173 miles; a breadth from N. to S. of 112 miles; and an area and pop. (1874) distributed as follows:—

Provinces.	Area in Square Miles.	Pop. in 1874.
Antwerp	1,093	522,735
Brabant	1,267	942,247
E. Flanders	1,160	691,100
W. Flanders	1,250	863,695
Hainault	1,436	949,346
Liège	1,117	635,076
Limbourg	931	204,619
Luxemburg	1,705	208,339
Namur	1,413	319,386
Total,	11,372	5,336,634

The kingdom is further portioned out into 41 arrondissements, which again are subdivided into 303 cantons de milice, and 2568 communes, but the whole area so minutely divided is only about twice as large as Yorkshire. It is, however, extremely populous, having an average of 462 inhabitants to the sq. mile—a number exceeded greatly in the northern provinces; as, for example, in E. Flanders, which has 735 to the sq. mile. There are four towns of above 100,000 inhabitants (Brussels, Antwerp, Liège, and Ghent).

Hydrography and Climate.—The only great rivers of B., the Scheldt and the Maas, both rise in France, and flow into Holland before reaching the sea. They are both navigable throughout B., in which country the course of the former is 135 miles, and that of the latter 110. Each has numerous tributaries, the principal of those belonging to the Scheldt being the Lys, Dender, and Rupel; and of those joining the Maas, the Sambre, Ourthe, and Roer. Admirable means of intercommunication are thus afforded by nature, and these advantages have formed a basis for the construction of an artificial water-system (300 miles) only second to that of Holland. The *Zeuarts* and *Deynse* canals are the principal arms of this system, which links together the various rivers, and brings the remotest town within the circle of communication. The climate of B. is chilly and humid, the prevailing winds being from the S.W., the W., and the E., and the annual fall of rain amounting to some 26 inches. There are on an average some 150 rainy days in the year. A clear autumn season is unknown, the cold spring giving place to a capricious summer, which is immediately followed by a long, dreary winter. In summer the heat is sometimes extreme. The temperature ranges from 102° F. to 23° F.; the mean summer temperature is 55° F., and that of winter 36° F.

Geology and Mineralogy.—The N.W. and centre parts of B. are covered with Tertiary formations, in which the different periods are completely represented; the Pleiocene alone, however, containing many fossils. In the E. and S. is the Palæozoic region, in which Silurian, Carboniferous, and Devonian strata prevail, and which contains vast deposits of coal and iron. B. ranks next to Britain as the best coal-producing country of Europe, the fields of Namur alone far exceeding in extent those of all France. As many as 83 coal-fields are enumerated in the three provinces of Hainault, Liège, and Namur; and in 1874 there were 193 mines, employing over 800 steam-machines and 94,186 men. The average yearly amount of coal produced for the five years 1868–72 was 13,662,945 tons; for the year 1871 it amounted to 13,733,176 tons; value, £6,152,120. The 'output' of Hainault alone in 1873 was 11,652,953 tons, at 17s. 4d. per ton; the number of men employed was 79,556, the quantity raised being thus 146 tons per workman; and as the cost of production is estimated at £7,596,664, or 0.652l. a ton, the aggregate profits were £2,614,396. The export of coal from B., which is chiefly to France, amounted in 1874 to £5,130,883. The central region of the iron trade lies between the Maas and the Sambre, where there are numberless mines. About two million tons of ore are produced annually, but of late years the iron trade of B. has been considerably injured by the steel manufacture of Germany. The other important minerals of B. are copper, chiefly in Hainault and Liège; lead, in Liège, Namur, and Luxembourg; calamine or carbonate of zinc, in Liège; and black marble, at Dinant. In various parts of the country there are also found manganese, sulphur, alum, slate, and building-stone.

Botany, Agriculture, and Zoology.—The botany of B. closely resembles that of the N. of France, and presents a wide variety of

indigenous vegetation. The principal 'forest-trees' are the oak, chestnut, beech, elm, ash, walnut, fir, and poplar, and among the 'fruit-trees,' the vine, apple, pear, cherry, and plum are conspicuous. England is indebted to B. for the cabbage, lettuce, clover, the gooseberry-tree, the carnation, and the wallflower. For many years B. has taken the lead in agriculture, and has been justly regarded in this respect as the foremost country in the continent of Europe. The soil consists of either sand or clay, and is not naturally fertile, but indomitable energy and skill have brought seven-eighths of the whole surface under cultivation, and forced from it twice as much corn as is required by the vast population of the whole country. Much attention is given to the rotation of crops, and artificial manures are widely used. The general crops are wheat, rye, barley, oats, and buckwheat, and in the central provinces there is much beetroot (for sugar), chicory, and tobacco. Flax, hops, and clover are extensively grown, and form valuable articles of export, and along the banks of the Maas the vine is carefully cultivated, but the produce is of inferior quality. To Flanders belongs a famous breed of large horses, of which great numbers are sent to England and other countries. Of these, B. had in 1866 as many as 283,163; also of horned cattle, which are usually stall-fed, 1,242,445; and of sheep 686,015. In the forests of Ardennes there is still much wild game, such as the bear, wolf, boar, and roebuck, while the moors round Verviers are said to be the last asylum of the heathcock on the Continent. The ordinary domestic animals of Europe are reared everywhere in perfection, and the culture of bees and of the silkworm is pursued successfully.

Manufactures and Commerce.—Even as far back as the Roman invasion the Belgians were remarkable for the same love of trading which has particularly distinguished them in later times; but it was in the middle ages that the foundations of the modern prosperity were laid. In the 13th c. Bruges had become the great northern seat of manufactures, and carried on a lucrative commerce with Italy. Bruges was soon to be outshone, however, by Antwerp, which, after the discovery of America, rose to the rank of the wealthiest commercial city of Europe, and which still continues to be the chief emporium of the Belgian trade. Among the manufactures for which B. is chiefly celebrated are Brussels carpets, unequalled for elegance and texture; fine lace and thread, made from flax so fine that it costs occasionally £400 a pound; and the rare lawn and damask fabrics of Bruges. There are also extensive manufactures of various linens, woollens, cottons, lace, silk, leather, and metals. At Ypres alone some 50,000 men are engaged in the woollen manufacture, and throughout E. and W. Flanders vast numbers are employed in the cotton industry. At Ghent and other places there are sugar-refineries; Waesland has great wooden-shoe factories; Boom and Rupelmonde have extensive brick-kilns; throughout the country are scattered 2670 breweries; and at Seraing, near Liège, there is one of the largest ironworks of Europe, producing chiefly locomotives and firearms, and employing over 5000 artisans. B. trades chiefly with France, Holland, England, Prussia, and N. America; and her principal ports are Antwerp, Ostend, and Nieuweport. The merchant navy in 1872 numbered 59 vessels (19 steam), of 32,346 tons; and in the same year the total entry at the ports was 6134 vessels of 1,878,106 tons. In 1873 the imports amounted to £96,992,320, and exports to £86,556,000; but these sums, it must be remembered, include the value of 'goods in transit;' the value of purely Belgian products exported being £46,344,000; and of imports for Belgian consumption alone, £56,908,000. The chief articles of export are coal, corn, cattle, woollens, linens, silks, cottons, flax, hemp, cloverseed, oak-bark, petroleum, lace, lawn, cambric, carpets, nails, arms, cutlery, and refined sugar.

Railways and Finance.—The railway system of B. is perhaps more complete than that of any other country of the Continent, and the cost of permanent way and buildings is estimated at no less than £18,280 a mile. It was originally laid down on a somewhat regular plan, having Mechlin as a centre, and radiating thence to the N., the W., the S.W., and E., but with its growth it has become an involved network of communication, stretching in all directions. In 1874 there were 2100 miles of railway in operation, of which 470 miles belonged to the state. The net revenue in the same year was about £1508 a mile. There were also 7031 miles of telegraph lines, and 23,994 miles of wires, transmitting annually about 2,300,000 messages. The national expenditure in 1874 was £9,536,696, and the revenue was

£9,185,720; and in the same year the public debt amounted to £36,981,960. The franc, as in France, is the unit of the monetary system of B., which was one of the countries that accepted the decimal system of coins, weights, and measures in 1865.

Government, Army, &c.—According to the constitution of March 3, 1831, B. is governed by a hereditary monarch, and by a Senate and a House of Representatives, both of which are elected by the people. Electors must be born or naturalised subjects above 25 years of age, and must pay £1, 13s. 4d. of taxes. There are some 60 senators, and double that number of representatives, elected by the same constituencies, the former for eight, the latter for four years. The King alone possesses executive power, but in Parliament he is represented by a responsible ministry, which controls the subjects of finance, public works, home and foreign affairs, war, and justice. Liberty of the person and of conscience, trial by jury, and freedom of speech and of the press, are secured by the laws. The administration of justice is almost similar to that of France, the statute-book being the Code Napoléon. In 1868 the army was remodelled and put on a compulsory footing, the period of service being nominally eight years; several years are, however, allowed for furlough. In 1874 the army consisted of 103,900 men, 12,894 horses, and 240 guns, and the civic militia numbered 125,000 men, with a reserve of 275,000 men. Among the fortified towns of B. are Antwerp, Charleroi, Philippeville, Ath, Menai, Namur, Ostend, Nieuwepoort, Ypres, Tournay, and Mons. Though still insignificant, the navy is increasing, and recently several large steam-vessels have been constructed, which are equally adapted for war or commerce.

Education.—As regards education, B. is said to rank higher than France or Austria, but the system is still in many respects defective. Since 1830 attendance at school has not been compulsory, and only of late years has the state succeeded to any extent in preventing the clergy from controlling public instruction. The sum assigned for education in the budget of 1874 was £388,064. There are four universities, at Brussels, Liège, Ghent, and Louvain, the last of which is Roman Catholic. There are also a large number of *Athénées* or national schools, for combined classical and commercial instruction; upwards of 50 *Écoles moyennes* preparatory to these; two training-schools for teachers at Liège and Nivelles; numerous technical schools, gymnasia on the German model, and normal *ateliers*. Among high-class æsthetic institutions are the Academies of Fine Arts at Brussels and Antwerp, the Museum of Painting and Sculpture at Brussels, and the Music Conservatories at Brussels, Liège, and Ghent.

Ethnography, Language, and Religion.—The population of B. is mainly composed of two distinct races—the Flemings, a Teutonic people, of whom there are some two and three-quarter millions, and the Walloons, a branch of the Celtic family, of whom there are about two millions. The former chiefly occupy the northern provinces, and have a language (*Flemish* or *Flemish*) closely allied to Dutch, from which indeed it differs chiefly in pronunciation and orthography: the latter dwell in the S. and S.E., and their speech is a dialect of the French, or, more correctly, it resembles the Northern French of the 13th c., and contains besides a large infusion of Spanish words, which of course date from the period of the Spanish rule. Flemish is still the language of the majority, and of some forty newspapers, as well as of the revived literature of the country, though French has long been the adopted speech of the court and the legislature, and therefore of society. B. is almost entirely a Roman Catholic state, there being only of other creeds some 13,000 Protestants and 1500 Jews. The smaller denominations, however, are not only tolerated, but a certain portion of the income of ministers of all churches is paid by the state. The head of the Roman Catholic Church in Belgium is the Archbishop of Mechlin, and there are five bishops—viz., those of Bruges, Ghent, Namur, Liège, and Tournay.

Literature and Painting.—In B. there are two distinct literatures, Flemish and French, the one eminently a national growth, the other an exotic, and the favoured child of circumstance. A healthy revival of the former took place in the beginning of the present century, inaugurated by Jans Franz Willems, whose example has been followed by some of the ablest writers of the country, and at last there seems the prospect of a literature for B. which shall be a pure and independent counterpart of the national life. This is seen in the formation of many literary societies, in the extensive publication of old Flemish remains, in the general cul-

tivation of the vernacular, and not less in the opening of the magnificent national theatre at Antwerp in 1874 for the production of Flemish plays. Among the celebrated names belonging to the country in mediæval and modern times are Jacob van Maerlant, 'father of the poets of the Netherlands'; Philip de Comines, Schott, Strada, and Altmeyer, in history; Lipsius, Drusius, and Oudenarde, in philosophy and criticism; Simon Stevin and Quetelet, in mathematics; Willems, the originator of the Flemish 'movement'; and among the later Flemish writers, Hendrik Conscience, and Tony Anton Bergmann, novelists; De Geyter, Vervier, Rens, Iliel, and Anthelmis, poets; and Boone, Heremans, and Sabbe, critics and political writers. Founded by Hubert and Jan van Eyck, the old Flemish school of painting is famous for its scrupulous drawing and glories of colour, but in the choice of subject it often shows an indifference to dignity, and even occasionally a preference for the vulgar and commonplace. Its chief ornaments are Rubens, Vandyk, Jordaens, and Teniers. A society of painters was in existence at Antwerp as early as 1442, and the celebrated Academy in the same city was founded in 1510. In the modern art revival the principal names are De Keyser, Wappers, Gallait, De Biefve, and Verboeckhoven. Among the sculptors of B. are Geefs, Simons, Jehotte, and Fraikin; among the engravers, Calametta, Brown, and Meunier. In music it can also show a long list of distinguished composers and instrumentalists.

History.—The earliest information concerning the country now called B. is derived from the Romans, who found it inhabited by Celtic and German tribes, whom they named *Belgæ* (q. v.), probably thus giving a general application to the name of some particular tribe. The territory, as *Gallia Belgica*, became one of the three divisions of Gallia, and remained under Roman domination till A.D. 409, when the Franks, who had been settled there since the time of Julian, made themselves masters of the region. After the conquest of the rest of Gaul by Chlodwig, it shared the fortunes of the Frankish kingdoms which owed their existence to his sword, more particularly of the Neustrian kingdom, to which it mainly belonged. By the treaty of Verdun, 843, certain parts (now Flanders and Artois) went to the Karolings of the newly-formed kingdom of France; but all the N. (including Brabant) was included in Lotharingia, a strip of land extending from the Mediterranean to Holland, and named after Lothar, a grandson of Charlemagne, who in the division of the great empire of the West had obtained this region, together with Italy and the title of Emperor. Lotharingia soon lost kings of its own, and its possession was often disputed between the Karolings of France and the kings of Germany. In the confusions that ensued, the land was broken up into various dukedoms, counties, earldoms, and other petty sovereignties. Of these, the richest was the County of Flanders, which, on the extinction of the line of counts in 1385, went to the house of Burgundy. Through marriage, inheritance, and purchase, the rulers of Burgundy, by the beginning of the 15th c., had acquired all the other provinces of the Netherlands, and, with the view of raising up a great and undivided power between France and Germany, had curtailed the privileges and violated the charters of those growing towns, in which a republican spirit was becoming too visible. This policy was pursued to an extreme of tyranny by Charles the Bold, till the busy communities found their wealth appropriated and their freedom crushed. Relieved from a centralised despotism only by the death of the Duke (1477), they rallied round his only daughter, Maria, to rescue her from the grasp of the crafty Louis XI. of France; obtained from her a liberal charter; and finally selected for her the husband whom her father had opposed, the Archduke Maximilian I., thus making over the Netherlands to the house of Hapsburg. Of this union was born Philip the Fair, who married Joanna, daughter of Ferdinand and Isabella of Castile and Aragon, in 1496, and who was succeeded by his son, the celebrated Charles I. of Spain, better known by his loftier title of Karl V., Emperor of Germany. In 1555, Karl V., after a reign marked by gross extortion and cruel persecution of the early reformers, abdicated in favour of his son, Philip II., who by his marriage with Mary Tudor (1554) had already become titular king of England. Animated by the fiercest hatred of the new faith, the relentless cruelty of Philip stirred up the provinces (1568-1609) to a strenuous defence of religion and liberty. (See ALBA.) The seven northern or Teutonic provinces were alone successful, however, in throwing off the Spanish yoke, a result chiefly due to

the sagacious leadership of William, Prince of Orange. (See NETHERLANDS.) The southern or more Celtic provinces, mainly inhabited by Catholics, remained in the power of Spain, and were ceded by Philip, in 1598, to his daughter Isabella, wife of the Archduke Albert, when they were formed into a separate kingdom. On the death of Albert (1621), the Austrian Netherlands reverted to Spain, and in the wars of the declining monarchy the counties of Artois, Thionville, and other districts (1659), and of Lille, Charleroi, Oudenarde, Courtray, &c. (1668), were wrested from her by the rapacity of France. Only a small portion of these and other conquests was restored to Spain at the Peace of Ryswick in 1697. In 1700, on the death of Charles II. of Spain, the country became a great theatre of the war of the Spanish succession, which was concluded by the Peace of Utrecht (1713-14) placing B. once more under Austrian rule, with, however, one very important condition annexed, known as the *Barrier Treaty*, in virtue of which, the right of garrisoning the fortresses along the French border, and of closing the Scheldt, was vested in the States-General. During the Austrian war of succession (1744-48), the French, under Marshal Saxe, conquered nearly the whole of the country, but had to restore it at the Peace of Aix-la-Chapelle in 1748. It then remained undisturbed throughout the reign of Maria Theresa, and regained much of its former prosperity. But its peace was again interrupted on the succession of Joseph II., son of the 'Empress-queen,' who, in contradiction of his express promise, withdrew the legal privileges of the states secured by the Barrier Treaty. A revolt followed, the foreign troops were defeated, Brussels was captured, and in 1790 the provinces of the Austrian Netherlands proclaimed their independence. The differences between the aristocratic and democratic parties among the insurgents encouraged the Austrians to attempt the re-conquest of the land before the close of the year. They were successful; but in a short time republican France fiercely challenged the monarchies of Europe. The Austrian Netherlands was the first great battlefield, and B. was finally conquered by Pichegru in 1794. Later it was annexed to France by the treaties of Campo-Formio and Luneville, and remained in all respects a province of that country under the Consulate and the Empire, until the Peace of Paris (March 30, 1814), when, along with Holland (long since a separate state), it was put under the government of William Prince of Orange, who, on the 23d March 1815, took the title of King of the Netherlands. The want of political and religious sympathy between Protestant Holland and Catholic B. soon showed itself, and a breach of all good feeling was created by the one-sided character of the new constitution. All its important provisions were in favour of Holland; the Dutch language was adopted for administrative purposes; the clergy of B. were deprived of their privileges, and the poor were severely taxed; while the Belgians, although the more numerous people, were almost excluded from any share in the government. Liberals and Catholics were alike dissatisfied, and the French revolution of 1830 was a signal for an expression of their discontent. After a peaceful attempt to gain a separate administration, which was foiled by the obstructive delay of the Dutch deputies, the exasperated Belgians rose in open insurrection. The authorities of the state were speedily overthrown, and on October 4, 1830, B. was proclaimed independent by a provisional government. A national assembly was summoned, and the Baron Surlet de Chokier was appointed regent, only 13 votes out of 187 declaring for a democracy. On the 10th December the London Congress met and resolved to recognise the autonomy of B., and on the 4th of June following Prince Leopold of Saxe-Coburg was elected king by the Belgian Assembly. The selection was a happy one for B., and henceforth the peace of the country may be said to have been established, the constitution firmly securing the freedom of religious worship, of the press, and of education. Meantime Holland declared war against B., but was checked by the interference of England and France. On the 15th November 1831 a conference of the five great powers was held in London, and the 'definitive treaty' was drawn up, the twenty-four articles of which were duly accepted. The treaty provided (Art. 24) that B. and Holland should divide Luxembourg and Limburg between them. This Holland refused to do, whereupon an English and French fleet having blockaded the Scheldt and the Dutch coast, and a French army having captured the citadel of Antwerp, Holland was forced to yield,

and a treaty ratifying the severance of the disputed territory was signed in London, April 19, 1839. Leopold I. died December 10, 1865, and was succeeded by his son, Leopold II., who continues to abide by the wise policy of his father, holding himself entirely aloof from party strife. Although the country in 1875 was considerably disturbed by religious riots, there was the evidence everywhere visible of a national sentiment animating both Liberals and Ultramontanes, who honestly seek the triumph of their opinions only by constitutional means. At present, the great question in B. (as in many other countries) is whether education is to be controlled by the State or the Church. See Juste, *Histoire de Belgique* (5th ed. 1868); Oppelt, *Histoire Générale et Chronologique de la Belgique de 1830 à 1860* (1861); Malon, *Notice Historique sur les Finances de la Belgique* (Par. 1868); *Statistique Générale de la Belgique* (7 vols. Bruss. 1865-74); Prof. Van Bommel, *Belgique Politique et Sociale* (1874); and Paul Frédéricq, *Essai sur le Rôle Politique et Social des Ducs de Bourgogne dans le Pays-Bas* (Ghent, 1875).

Belgorod' (Russ. *Bialgorod*, 'white town'), a town in the province of Kursk, Russia, on the Donez, founded in 1593, has manufactures of leather, soap, candles, &c., with considerable trade in wax, bristles, and hemp. Pop. 13,168.

Belgrade' (Slav. 'white fortress,' of which the Ger. name *Weissenburg* is only a translation), the capital of Servia, situated on the S. side of the confluence of the rivers Save and Danube, is a strongly fortified and important town. To the N. of the citadel, which commands the Danube at that point, is the Water town, to the W. lies the Raizen town, and to the E. and S. the Palanka. B. is a great emporium for the exchange-trade of Austria, Servia, Turkey, and Rumania. It imports for itself and the Principality corn, horses, wine, beer, tobacco, leather, dried fish, piece-goods from England (to the value in 1871 of £30,000), coffee, rice, &c. Its great export trade is in pigs (one half of the export trade of the country), wool, and salt. B. has manufactures of arms, cutlery, silk goods, carpets, and similar materials. There were only two banks in the city in 1872. The population of the city, excluding the garrison, was in 1874 estimated at 27,603. B., in virtue of its position, has been the scene of many a fierce battle and siege, hence, probably, its Turkish name, *Darol-fihad* ('house of the holy war'). We first hear of it in ancient times under the name of *Singidunum*, when it was the headquarters in Upper Moesia of the 4th Legion (*Flavia Felix*). Wrested from the Eastern emperors in the 5th c. by the Huns and Ostrogoths, and again by the Magyars in the 11th and 12th centuries, it next passed into the hands of the Bulgarians and Servians. The Turks captured it in 1521, the Imperial forces in 1688, the Turks again in 1690, and in 1717 it surrendered to Prince Eugene. By the treaty of B. (1739), known as the 'Eternal Peace,' it was restored to the Turks, was again captured by the Austrians under Loudon in 1789, and once more handed back to the Turks at the peace of 1791. Since then it has shared the fortunes of the restless state of which it is the capital. The Turkish garrison that formerly held the citadel and overawed the city was withdrawn in 1866.

Belial, properly **Beli'al** (Heb. ? 'good for nothing'), in the Old Testament, is not to be understood as a proper name; *man of or son of B.* is simply a Hebraism for a worthless, lawless fellow. In the New Testament (2 Cor. vi. 15) it is used as a proper name, and applied to Satan or Antichrist, and hence it came to be represented in this light in our translation of the Old Testament.

Belief' is a name given to a large class of widely-differing mental states, which, however, agree in implying an intellectual operation, more or less directly connected with some proposed action, and greatly liable to be influenced by the feelings. B. was at one time (e.g., by Locke in chapter on Probability, *Essay on the Human Understanding*) applied to affirmative judgments which come short of demonstrative knowledge, and was described as the purely intellectual assent of the mind to such propositions as conform to personal or reported experience. The retentive analytic power of the mind, however, while it secures the truth or accuracy of B., is far from constituting B. itself. Hume perceived this to some extent when in his *Inquiry* he pointed out that B. was distinguished from imagination by some 'feeling or senti-

ment.' As Locke had described the degrees of B. by names, such as assurance, confidence, which includes an element of feeling, so Hume resolves this 'sentiment of B.' into 'a more vivid, lively, forcible, firm, steady conception of an object' than is afforded by imagination; and he gives some valuable illustrations of the joint operation of the affections and the intellectual associations in producing B. Reid unfairly ridicules Hume as teaching that B. depends on the intensity of ideas, offers no explanation of B. generally, and regards particular beliefs, e.g., in memory, causation, testimony, and an external world, as original and undecomposable powers of the mind. It is now generally seen that, while we believe many things (e.g., as astronomical facts) which do not directly influence our actions, and while the force of passion frequently leads us to act in opposition to our beliefs, yet the characteristic of B. is that we are prepared to act on the assumption of its truth. Hence, a large number of early beliefs is generated by man's spontaneous and instinctive tendencies to activity. Gradually, by a system of trial and error, by an enlarged experience of the sources of pain and pleasure, these impulses to act, and in acting to believe, are in some directions starved out by disappointment, in others controlled into habitual dependence on the observed uniformities of nature. To perceive the completeness of evidence, to draw a necessary inference, or to recognise a self-evident proposition, is, therefore, not to believe, but is only the intellectual part of accurate B. The mind then throws itself into the active confident state of B., and according to the intensity with which an object is desired, the fulness of the connection established between the end and the means, the general vigour and elation of the system, proceeds energetically to act out the ideas which have in many cases been for long the subject of intentions or resolutions. B. is therefore well defined by Professor Bain as 'a growth or development of the will under the pursuit of intermediate ends.' This at once suggests how powerful an influence the mere anticipation of pleasure, the shrinking from pain, abnormal excitement or normal temperament of the individual, exercise upon B. This psychological account of B., which corresponds with the pain, depression, and fatigue which attend the opposite state of doubt, is wholly independent on the metaphysical theories regarding the origin of the most general and elementary beliefs. It is, however, closely connected with the question of responsibility for B., of which it exhibits the partly voluntary character. Were B. not so largely colored by feeling, and supported by being asserted in action, it would be foolish, as well as wrong, to attempt the propagation of particular opinions by penalties and rewards. On the other hand, the great security of science (which makes it independent of patronage) is, that its results are constantly becoming the basis of human activity.

Belisarius (Slav. *Beli-tsar*, 'White Prince'), 'one of those heroic names familiar to every age and to every nation,' was born at Germanica, in Illyria, about A.D. 505. On the accession of Justinian (527), B. became general of his Eastern armies, and after almost unvarying success, made peace with the Persians on the death of Cobad. At this time he married Antonina, a woman of birth and profligate character, whose power over her husband has alone left blots on his fame, and who was alternately favourite and the foe of the Empress Theodora. In 532 a riot against Justinian was excited in Constantinople by the union of the rival factions, striped 'blue' and 'green,' whose mutual hatred long destroyed the peace of the city; and Justinian's life was saved by B., who displayed that unflinching loyalty to his sovereign which so conspicuously characterised him through life. In 533 Justinian despatched an expedition to Africa, ostensibly to assert the rights of Hilderic and punish the usurper Gelimer, but in reality to restore to the empire the lands which the Vandal, Genseric, had taken from it a century before. At the head of 15,000 men B. landed at Caput Vada, twice defeated the Vandals, reduced Carthage, and in three months achieved the conquest of Africa. In 534, with Gelimer as his captive, he returned home, and the first triumph ever witnessed in Constantinople was celebrated in his honour. The ambition of Justinian now (535) prompted him to attempt the recovery of Italy. He took advantage of the dissensions of the Ostrogoths, and demanded the abdication of King Theodatus. B. conquered Sicily, took Naples, entered Rome, which he defended for a year (537-38) against the new king, Vitiges, and after the recall of Narses, effected by stratagem the surrender of Ravenna.

Vitiges was captured, and the Ostrogothic kingdom subdued (539). After two years spent in the defence of the East, B. was recalled, disgraced, and heavily fined by the emperor, whose baseness or jealousy induced him to lend his ear to the slanders of malicious rumour. Yet he was again despatched to Italy to oppose Totila, the Ostrogothic king; and though he failed, from inadequate supplies, to raise the siege of Rome, or seriously to repulse the foe, he succeeded for five years (544-48) in skillfully keeping their hostility in check. B.'s last victory was gained (559) in repelling an invasion of the Bulgarians. In 563, B., for alleged complicity in a conspiracy against the life of Justinian, was again disgraced, and his fortunes were sequestered; but in the following year his innocence was acknowledged, and his honours restored. He died A.D. 565. The statement, derived from a work of Tzetzes, a monk of the 12th c., that B. was deprived of his eyes and reduced to beg his bread in the streets, is generally discredited. The works of Procopius, the secretary of B., are our chief authority for the events of this period; and the more romantic though fictitious version of the close of B.'s life is embodied in Marmontel's *Belisair*, and defended in Earl Stanhope's *Life of B.* The fictitious incident in B.'s life also forms the subject of a picture, now in the Leuchtenberg gallery at St Petersburg, which was the first famous work of the French painter Gérard.

Belize. See **BALIZE**.

Beljurie, a town in the British district of Moradabad, Rohilkhand division, N.W. Province, India. Pop. in 1872 (including a part of Kashipur), 8253.

Bell, Andrew, was born at St Andrews (1753) and educated at its university. After a visit to America he entered into holy orders, and officiated as Episcopal pastor at Leith. He subsequently settled in Madras, where, by lecturing and by filling various clerical offices, he made a fortune of nearly £26,000. At Madras he organised, on the monitorial system, and administered for six years, a military orphan asylum. In 1796 he returned to England, and in 1797 published his *Experiment in Education*. In 1798 Joseph Lancaster established a school in London, which was soon crowded by free scholars, and where the education problem was solved by the crude expedient of employing children to teach children. The scheme became popular, and issued in the formation of the British and Foreign School Society. Lancaster, however, refused to admit into his religious instruction anything peculiar to any sect or party, and this alarmed the Church of England. A rival society, the National, was formed, of which B. was the champion, and the country was divided into the followers of B. and the Church and of Lancaster and the Bible only. Both societies still exist, and have done much good, though they have long outgrown the systems they were formed to promote. B. handed over to trustees £120,000 to be devoted to education. Schools bearing his name were founded in Edinburgh, St Andrews, Glasgow, Leith, Inverness, Cupar, and Aberdeen. In 1874 B.'s trustees offered £10,000 to the Universities of Edinburgh and St Andrews to aid in the foundation of Chairs of the Theory and Practice of Teaching. B. died at Cheltenham, 28th January 1832.

Bell, Benjamin, author of *A System of Surgery*, born at Dumfries, 1749, studied medicine at Edinburgh, where, after visiting the medical schools of Paris and London in 1770, he established himself in 1772, and entered upon an extensive practice. B. died April 4, 1806. His *System of Surgery* has passed through seven editions.

Bell, Sir Charles, an eminent surgeon, author of *The True Theory of the Nervous System*, was the son of the Rev. William Bell, an Episcopal minister. He was born at Edinburgh in 1774, and received his education at the High School and the University of his native city. He studied anatomy under his brother John, whom he assisted in his lectures and demonstrations. In 1806 he removed to London, where, in 1811, he began to lecture on anatomy and surgery at the Hunterian School in Windmill Street. To obtain a knowledge of gunshot wounds, he repaired to Brussels in 1815, after the battle of Waterloo, where he did great service in attending to the wounded. His subsequent career in London was brilliant, his lectures being attended with great and deserved success. In 1831, on the accession of William IV., he received the honour of knighthood.

In 1836 he was elected to the Chair of Surgery in the Edinburgh University, for which class he published his *Institutes of Surgery* (Edinb. 1838). B. died suddenly at Hallow, Worcestershire, on May 27, 1842. He wrote numerous treatises and works, the more important of which are his *Nervous System* (1824); his *Animal Mechanics* (1828); the *Anatomy of Expression* (1st ed. 1806; posthumous edition 1844); and the *Bridge-water Treatise on the Hand* (1834). An interesting work recently published (*The Correspondence of Sir Charles B.*, Lond. 1870) shows him to have possessed a keen, courageous, yet sensitive spirit.

Bell, George Joseph, a distinguished Scottish lawyer, brother of the foregoing, was born at Edinburgh, 26th March 1770. His knowledge of commercial law in general, but especially of the laws relating to bankruptcy, was exact and profound. In 1822 he was appointed to the Chair of Scots Law in Edinburgh University; he was appointed a member of the commission for simplifying the mode of procedure in the Court of Session; clerk of the Court of Session in 1831; and chairman of the Royal Commission for inquiring into the state of the law in general in 1833. He died 23d September 1843. B.'s chief works are, *Commentaries on the Law of Scotland*, and on the *Principles of Mercantile Jurisprudence* (Edinb. 1810; 6th ed. by Shaw, 1858); *Principles of the Law of Scotland* (Edinb. 1829; 5th ed. by Shaw, 1860); *Illustrations of the Principles of the Law of Scotland* (3 vols. Edinb. 1838); *Commentaries on the Recent Statutes relative to Diligence or Execution against the Movable Estate, Imprisonment, Cessio Bonorum, and Sequestration in Mercantile Bankruptcy* (Edinb. 1840).

Bell, Henry, who introduced steam-navigation into Europe, was born at Torphichen, Linlithgowshire, April 7, 1767. After acquiring a knowledge of mechanics in Scotland, he went to London, and wrought with the famous engineer Mr Rennie. In 1790 he returned to Scotland, and commenced business as a carpenter at Glasgow; removed to Helensburgh in 1808, and kept the principal inn there, but occupied himself with experiments in mechanics. In January 1812 he launched the *Comet* on the Clyde, the first steam-vessel on European waters. The engine, at first of three-horse power, was afterwards increased to six. Although Mr Miller of Dalswinton, in Dumfriesshire, in 1788, and Mr Fulton on the Hudson river, New York, in 1807, had each succeeded in propelling a boat by steam, it is really to B. that the practical introduction of steam-navigation is due. He died at Helensburgh, November 14, 1830. At Dunglass, on the Clyde, a monument has been erected to his memory.

Bell, John, an eminent English sculptor, born in 1811, first exhibited in 1832, and has produced numerous admirable works in monumental, religious, and imaginative art. His first productions were classical in subject and style of treatment, but soon abandoning the traditions of the ancients, he sought original inspiration, chiefly in the characters of Scripture and of the national history. His *Babes in the Wood* and *Andromeda* were the chief attractions in the 1851 Exhibition; while among his best-known statues are *Sir Robert Walpole* (St Stephen's Hall), *Wellington* (Guildhall), and the *Guard's Memorial*. His last great work was a group (*The United States Directing the Progress of America*) for the base of the Prince Consort memorial.

Bell, John, an eminent Edinburgh surgeon, brother of Sir Charles and of George Joseph B., was born in Edinburgh, May 12, 1763. He studied under Black, Cullen, and Monro; began lecturing in his native city on surgery and anatomy in 1786; and after a laborious and earnest career, died of dropsy at Rome, April 15, 1820. B.'s principal works are his *Anatomy of the Human Body* (3 vols., pub. 1793, 1797, 1802); *Engravings of the Bodies, Muscles, and Joints* (3d ed. 1794); *Discourses on the Nature and Cure of Wounds* (1793-95); *Principles of Surgery* (3 vols. 1801-8; new ed., edited by Sir Charles B., 1816); and *Letters on Professional Character and Manners*.

Bell, John, a well-known Scotch traveller in Asia, was born at Campsie in Stirlingshire in 1691, studied medicine, and went to St Petersburg in 1714, where he was appointed physician of a Russian embassy to Persia. B. returned to Russia in 1718, and was sent by the Czar to China in 1719, and in 1737 to Constantinople, where he became a merchant. In 1747 he returned to Scotland, and died at Antermoney, July 1, 1780.

He published his *Travels from St Petersburg to Various Parts in Asia* at Glasgow in 2 vols., 1763, a work much admired for the directness and simplicity of its style and narrative.

Bell, Robert, a meritorious critic and editor, was born at Cork, 10th January 1800, became the editor of the *Atlas* in 1829, and retired from it in 1841. He died April 12, 1867. B.'s services to contemporary literature were numerous and valuable, from the honest, careful, and discriminating manner of their performance. He is also a dramatist and novelist of merit. His *History of Russia* (Lardner) and *Outlines of China* are most useful handbooks. But he will be best remembered for his annotated edition of the English poets, begun in 1854 (the last issue is that by C. Griffin & Co., Lond.), which is excellent for the Elizabethan and later writers. His *Chaucer* is not a good text, nor does he seem to have been strong in the scholarship of the English language. B.'s series has nothing equal to the *Chaucer* of Morris or the *Gray* of Mitford in the new edition of the Aldine poets by Bell & Daldy, but it is still a respectable monument of honest industry.

Bell, Thomas, an eminent living naturalist, was born at Poole, Dorsetshire, October 11, 1792; studied at Guy's and St Thomas's Hospitals, 1814, and passed as surgeon in 1815. He lectured at Guy's Hospital from 1816 to 1860; was elected to the chair of Zoology in King's College, London, 1832; was president of the Ray Society from its institution in 1844 till 1859, secretary of the Royal Society from 1848 till 1853, and president of the Linnæan Society from 1853 to 1861. He is also corresponding member of many foreign scientific societies. Among his numerous contributions to science are *History of British Reptiles* (1829); *History of British Mammalia* (1836); *History of British Stalk-eyed Crustacea* (1853). These formed portions of Van Voorst's series of British Natural History. A monograph of the *Testudinata*, folio, commenced in 1833, is still uncompleted. B. has also contributed numerous valuable papers to the *Transactions* of the several societies with which he is connected. He is now (1875) engaged on an edition of White's *Natural History of Selborne*, to which much new matter is to be added. Lord Selborne is to furnish a chapter on the antiquities, and Mr Curtis one on the geology of the district.

Bell's, a rising town in the Italian province of Basilicata; pop. about 6000.

Bella, Stefano Della, an Italian engraver, born at Florence, 18th May 1610. His works, upwards of 1400, embrace almost every subject, historical incidents, hunting-scenes, landscapes, sea-pieces, animals, and ornamentation, and are distinguished no less by delicacy of touch than by careful manipulation. Many were executed in France by the order and under the patronage of Richelieu. On his return to Florence he was loaded with honours by the Grand-Duke. He died 12th July 1664.

Belladonna (*Atropa Belladonna*), a plant belonging to the natural order *Atropaceæ* (q. v.), is a herbaceous perennial, from 2 to 6 feet in height, with bell-shaped flowers of a lurid purple. The berries, which are about the size of cherries, are, when ripe, of a black, shining colour, and have a sweetish or mawkish taste; but, like the rest of the plant, the flower has a disagreeable 'heavy' smell. B. is a native of the S. of Europe, and is narcotic and poisonous in all its parts, death being preceded by dryness of the throat, dilatation of eyes, dimness of sight, paralytic trembling, loss of sensation, stupor, and delirium. It is of use in medicine for soothing irritation and pain, and is employed by oculists for the purpose of dilating the pupil during examination of the eye, and for diminishing the sensibility of the retina to light. It owes its activity to the alkaloid *atropine*, which

Belladonna.

is also a powerful poison, and is used for the same purpose as the extract of the plant. The juice of B. is said to have been at one time employed by ladies for staining their skins; hence the name B. (beautiful lady). The other popular names—Dule (Fr. *deuil*, grief), and Deadly Nightshade, express the popular appreciation of its fatal properties. Its botanical generic name is from *Atrapos*, one of the Fates. There are several other species in S. America which possess similar properties.

Belladonna Lily (*Amaryllis Belladonna*), a fine species of *Amaryllis*, a native of the Cape of Good Hope and the W. Indies; commonly cultivated in English gardens.

Bellamy, Jakob, a young Dutch poet, one of the restorers of the national literature of Holland, was born in humble circumstances at Vliessingen (Flushing), November 12, 1757. Assisted in his education by friends, he went to the University of Utrecht to study for the Church, but devoted his attention mainly to poetry. His first effusions, *Gezangen Mijner Jeugd* (Amst. 1782), were lively and amatory; the *Vaderlandsche Gezangen* (Utr. 1785) breathed a thoroughly patriotic spirit. The Dutch put great value on a poetical romance of his, *Koosje* (Utr. 1784). A third edition of B.'s poems appeared in 1842. He died 11th March 1786.

Bell Animalcules, the popular name of a genus of Infusorian animalcules, scientifically known as *Vorticella*. Each animalcule consists of a bell-shaped body or *calyx*, borne on a stalk, which is rendered contractile by the presence of a spiral fibre. By aid of this structure the Vorticella can quickly contract itself upon its stem when alarmed or irritated. These animalcules occur in groups, and are generally found attached to aquatic plants. The margin of the bell or calyx is fringed with vibratile filaments termed *cilia*. These animalcules reproduce themselves by *fission*, by *gemmation* or *budding*, and by a process of *encystation*, allied in many points to the sexual generation of higher animals. See also INFUSORIA and PROTOZOA.

Bellarmin, Robert, Cardinal, a famous Roman Catholic theologian, was born at Monte Pulciano, Tuscany, October 4, 1542. He entered the order of Jesuits in 1560, and distinguished himself by his study of all departments of theology. In 1569 he was ordained priest, and was appointed Professor of Theology in the following year at Louvain, where he taught with such success, that even Protestants came from England and Holland to hear his lectures. After seven years spent in the Low Countries, he returned to Italy, and in 1576 was chosen by Pope Gregory XIII. to fill the chair of Polemical Theology in the new college founded by that pontiff in Rome. In 1599 he was made a cardinal, and in 1602 Archbishop of Capua; but honourably resigned this dignity in 1605 when made keeper of the Vatican Library by Paul V. He would probably have been Pope, but for the fears entertained by the cardinals that the order of Jesuits would become too strong. B. died at Rome, September 17, 1621. B. was the main defender of the Church of Rome against the attacks of the Reformers, and according to Bayle, was the best controversialist of his age. A work in which he had advocated the supremacy of the Pope over kings (*De Potestate Pontificis in Temporalibus*) was condemned respectively in Paris, in Venice, and in Mainz. But his masterpiece is the *Disputationes de Controversiis Fidei, Adversus hujus Temporis Hæreticos* (3 vols. Rome, 1581; Ingolst. 1587; Paris, 1688; and Mainz, 1842). It is substantially his lectures as Professor of Polemical Theology, and exhibits method, moderation (in language), learning, and subtlety, but is charged by Protestants with unfairness, and a determination to prove his point at all hazards. Despite his eminent services to his Church, no Pope has as yet authorised his canonisation. The other works of B. do not require mention. A collected edition was published at Cologne in 7 vols. 1619, and another at Venice in 5 vols. 1721. B.'s life has been several times written. See Fuligatti, *Vita del Cardinal. Rob. Bellarmino* (Rome, 1624); Bartoli, *Della Vita di Rob. Cardinal. Bellarmino* (Rome, 1678); Frizon, *Vie du Cardinal Bellarmin* (Nancy, 1708).

Bellary, the chief town of a district of the same name in the province of Madras, British India, 270 miles N.W. of Madras, and 190 S.E. of Haidarabad. It is an important military station, and consists of extensive cantonments, and a native town with about 35,000 inhabitants. B. is overlooked by a fort, which

stands on a rock 450 feet high.—The district of B. has an area of 11,007 sq. miles, and a pop. (1872) of 1,668,006, of whom more than 1,500,000 were Hindus. It is the healthiest portion of Southern India, being sheltered by the Ghats from the S.W. monsoon, and being entirely free from the N.E. one, owing to its distance inland. The yearly rainfall ranges from about 12 to 26 inches. B. is traversed by the Madras and Bombay Railway.

Bell-Bird (*Arapunga alba*), a genus of Passerine birds included in the section *Dentirostres*, and in the sub-family of *Gymnoderina* or Fruit-Crows. The B.-B. is found in Guiana and other parts of S. America, and is so named from the notes of its voice mimicking the clear tones of a bell. Waterton says this bird's notes may be heard at a distance of three miles, and it is one of the few birds which sing during the heat of the day. A peculiar tubular fleshy appendage springs from the base of the bill, which is broad and depressed in shape. The males are of snow-white plumage, and about twelve inches in length.

Bell, Book, and Candle, a phrase used to describe a mode of the greater excommunication which seems to have prevailed in the Church of Rome as early as the 8th c. After reading the sentence of exclusion against the person excommunicated, not only from the table of the Lord, and from other privileges of Christian communion, as in the lesser excommunication, but from many social and political rights and privileges, the bishop and clergy extinguish their candles, shut the book from which the excommunication is read, and cause the church bell to be tolled as if for the death of the obstinate offender. See EXCOMMUNICATION.

Belle'-Alliance, a farm 13 miles S. of Brussels, where the French centre was stationed at the battle of Waterloo, June 18, 1815. Each of the contending nationalities has named this battle differently: the British, Waterloo; the French, Mont-Saint-Jean; and the Prussians, B.-A.

Bellegarde (the 'fair guard'), a hill-fortress in the French department of Pyrénées Orientales, commanding the pass into Spain over the Col de Portuis, on the road from Perpignan into Catalonia. It was first made formidable by Louis XIV., and has been several times taken and retaken in the Franco-Spanish wars.

Belle Isle, a small island about 15 miles N. of Newfoundland, and the same distance E. of Labrador, is known chiefly as giving the name to the strait which separates Labrador and Newfoundland.

Belleisle-en-Mer, the largest and most important island on the S. coast of Bretagne, is included in the French department of Morbihan, and situated 34 miles N.W. of the mouth of the Loire. Its greatest length from N.W. to S.E. is 12 miles, and its greatest breadth 7. The inhabitants, who are chiefly engaged in pilchard-fishing, numbered in 1872, 10,804. The chief town, *Le Palais*, fortified and situated on the coast, with a population of 5456, has steamboat communication with Nantes and L'Orient. B., which was known to the Romans as *Vindilis*, has some 'Druidical' remains. By the 11th c. *Vindilis* had changed into *Guedel*, and at a later period it received its present name. The island has belonged in turn to the Dukes of Bretagne, the Counts of Cornouailles, the monks of Quimperle, Cardinal de Retz, the finance minister Fouquet, whose grandson, Marshal Belleisle, finally sold it to the French crown.

Belleisle, Charles Louis Auguste Fouquet, Comte, afterwards Duc de, a French marshal and diplomatist, was born at Villefranche (Rouergne), 22d September 1684. He entered the army at an early age, distinguished himself at the siege of Lille (1708), took part in the Spanish campaign of 1719, and in 1732 had risen to the rank of Lieutenant-General. Under Marshal Berwick he captured Treves and Trarbach in 1734, and signalled himself at the siege of Philippsburg. The peace of 1735, by which Lothringen fell to France, was mainly B.'s work. Cardinal Fleury had boundless confidence in his capacity. Before the outbreak of the Austrian war of succession, B. visited the chief courts in Germany in the interest of the Bavarian elector, whom France desired to succeed to the imperial throne instead of Maria Theresa. Along with Broglie, at the head of a French army he invaded the Austrian territories, captured

Prague 26th November 1741, but, owing to the policy of Prussia, was forced to retreat to the Eger, 17th December 1742. In 1744, while on a diplomatic journey to Berlin, he was made prisoner at Elbingerode in Hanover, and sent to England, where he was detained for a year. Appointed commander-in-chief of the French army of Italy in 1746, he successfully defended the French frontier against the Austrians and Sardinians, and was in consequence made a Duke and Peer of France. In 1755 he was placed at the head of the war administration, and remained there till his death, 26th January 1761. B. was certainly a man of considerable gifts, but his reputation was more shining than his merit. Carlyle, in his *Friedrich* (vols. iii. and iv.), is grimly sarcastic upon this 'sun-god' with his 'effulgences' and 'wide-winged plans,' &c., but his estimate is in the main just.

Bell'enden (Ballantyne) John, the chief Scottish prose author of his day. The exact place and date of his birth is unknown; but he matriculated at St Andrews in 1508, and afterwards entered the Church. He was a favourite at the court of James V., and wrote a *Topography of Scotland, Epistles*, and poems. His chief work in verse was his *Prohem of the Cosmographie*, designed for the instruction of the youthful monarch. It was at the king's desire that B. undertook his principal work—the translation of Hector Boece's *Scotorum Historia* into the English dialect used in the Lowlands of Scotland. This was printed at Edinburgh in 1536—the very year of Boece's death—under the title *Hystory and Chroniklis of Scotland*. B.'s task was well executed; the translation, though a free one, is spirited, and even elegant. B. also rendered into the same dialect the first five books of Livy. These works gained high repute for their author; he was appointed by the king Archdeacon of Moray and Canon of Ross. B. became a Lord of Session in the reign of Mary; and was a zealous opponent of the Reformation. He died at Rome in 1550. A reprint of his translation of Boece was published at Edinburgh in 1821, and of the Five Books of Livy in 1822, both under the editorship of Mr Maitland.

Bellenden (Ballenden, Ballantyne, or Bannatyne), Sir John, of Auchinvoile, has been sometimes confounded with the preceding. He was secretary to the Earl of Angus, and alone stood by that noble when tried in 1528 for high treason. The Earl was banished, but restored in 1543, when B. was knighted, and became Lord of Session, Director of Chancery, and Justice-Clerk of Scotland. Unlike his cotemporary, the Archdeacon, B. attached himself to the Reformation party. He was mixed up in the intrigues of Queen Mary, Darnley, and Bothwell; but the belief that he was concerned in the Rizzio murder seems to have been unfounded. B. died in the year 1577.

Bellenden, William, a Scotchman by birth, was a Professor of Humanity in the University of Paris, and an advocate in the Parliament there during the reigns of Mary and James VI. of Scotland. He was also engaged in diplomacy. His *Ciceronis Princeps* (a compilation of rules of government from Cicero's writings), or *De Statu Principis*, was published in 1608; his *Ciceronis Consul, Senator, Senatusque Romanus*, or *De Statu Reipublice*, in 1612; his *De Statu Prisci Orbis* (an account of the progress of ancient nations in religion, government, &c., from before the flood), in 1615. These three books appeared again together as *Bellendenus de Statu*. A more important work was his posthumous *De Tribus Luminibus Romanorum*, in which the politics, morals, and science of Cicero, Seneca, and Pliny were to have been digested. The work is confined to Cicero. (See Dr Parr's edition, published 1787, and Parr's Works, by Johnson, vols. i. and iii.)

Bellerophon (slayer of Belleros), son of Glaucus, King of Corinth. Repairing to King Prætus at Argos to obtain purification from the murder of his brother, the wife of that monarch, Anteia, or according to Apollodorus, Sthenobœa, conceived a criminal passion for him, which B. refused to gratify. On this she accused him to Prætus of having attempted to violate her, and demanded that he should be slain. Unwilling to slay his guest, Prætus dismissed him to the court of Iobates, King of Lycia, with a sealed message requesting that monarch to have him despatched. Iobates accordingly sent B. to kill the Chimæra, a monster composed of a lion in front, a goat (hence its name, *Chimæra*) in the middle, and a dragon behind. This

he did by the aid of his winged horse Pegasus, which raised him beyond the monster's reach, when he killed it with his spear. He was next sent to contend with the Solymi and the Amazons, both of whom he defeated. On his return he destroyed an ambush of the bravest Lycians, and Prætus, now perceiving that B. was the son of a god, gave him his daughter in marriage, and as a dower the half of his kingdom. Three children, Isander, Hippolochus, and Laodameia, were born to him; but just when he had reached the pinnacle of happiness, the gods (according to Homer) deprived him of reason. Mars slew his son Isander, and Diana his daughter Laodameia. There are other incidents in the myth recorded by ancient writers. The story was a favourite one with Greek artists, and in recent times Mr Fellows discovered in Lycia sculptures representing B. on Pegasus, and conquering the Chimæra.

Bellerophon, an extinct or fossil genus of *Gastropodous* Mollusca, representing the family *Atlantida* (order *Heterop*) of that class. The shell is symmetrical and convoluted, the lying in one plane. The whorls are few, and smooth or st. tured. A dorsal ridge or keel exists on the convex or round margin of the shell. The aperture of the shell is wide, and notched or indented on its dorsal side. The Bellerophons— which *B. Argo* (Lower Silurian), *B. dilatatus* (U. Silurian), *B. Wenlockensis*, *B. expansus*, *B. bisulcatus*, and *B. subglobatus* (Devonian), may be taken as examples—range from the Lower Silurian to the Carboniferous formations. *Bellerophina*, found in the Upper Cretaceous rocks, is only doubtfully classified with the true Bellerophons.

Belles-Lettres. In French, the phrase *B.-L.*, when strictly used, embraces only 'Grammar, Oratory, and Poetry,' but both in France, and in the other countries that have adopted the term, its application is often extended so as to include æsthetics, and, within certain limits, criticism, or, generally, all the departments of literature bearing upon the emotions and the arts. The use of the term in English is co-ordinate with that of *polite literature*, a phrase which is no doubt vague as to its limits, but was obviously meant to embrace all kinds of literature that might be profitably read with a view to general culture rather than to special scholarship; such as poetry, history, fiction, criticism, &c. The diffusion of knowledge in modern times has necessarily widened to some extent the application of the term, which in fact is rather falling into disuse; but it is still held to exclude science, metaphysics, and theology, however brilliantly expounded.

Belle-ville, a suburb of Paris, in the arrondissement of Ménilmontant, within the military works recently erected. It has several manufactures, among others, of polished steel, varnished leather, cashmeres, &c. Paris has long derived its water-supply from springs at B., which is also noted as a great resort of pleasure-seekers. Recently it has acquired a sort of political notoriety. It is understood to be one of the headquarters of the Radical party in the metropolis, and its *ouvriers*, though displaying a singular absence of the national gallantry during the German siege of Paris, eagerly welcomed the bloody carnival of the Commune.

Belleville, capital of St Clair county, Illinois, fourteen miles S.E. of St Louis, possesses many manufactories and several good public buildings. Pop. 8146.

Belleville, the county town of Hastings, province of Ontario, Canada, on the Bay of Quinté, Lake Ontario, 48 miles W. of Kingston, and a station on the Grand Trunk Railway, has extensive timber trade, also several large foundries and manufactories. Pop. (1871) 7305.

Belley, a town in the French department of Ain, is now chiefly known for the excellent lithographic-stones found in its neighbourhood. It is the seat of a bishop, has a cathedral, a public library, a museum of antiquities, &c. Pop. (1872) 3534.

Bell-Flower. See CAMPANULA.

Belli'ni, a famous family of Italian painters, who are generally regarded as the founders of what is known as the Venetian school, inasmuch as they were the first to abandon that poverty and sharpness of outline which characterised the works of the earlier Venetians, and professed homage to that splendour of colour for which Giorgione and Titian, who were their pupils, became so deservedly famous.—Giacomo, or Jacopo B., the father, born in Venice, was one of the earliest painters in oil,

pointed for the Church of St John the Evangelist, Venice, and excelled in portraits. Only a single authentic work of his, a Madonna, has survived. He died about 1470.—**Gentile B.**, his eldest son, born 1421, died 1501, was employed with his brother Giovanni to decorate the council-chamber of the Venetian Senate. His 'Preaching of St Mark,' a work ranking among the finest of his time for colour and effect, is now in Milan.—**Giovanni B.**, born 1426, died 1516, was the most eminent artist of the family. His best works are altar-pieces in different churches in Venice, and a Madonna and Child, attended by angels, in the monastery of the Capuchins there. Giorgione and Titian were among his pupils, and carried to perfection the warm and brilliant style of their master.

Bellini, Vincenzo, an Italian composer, born at Catania, in Sicily, 3d November 1802, trained at the Conservatory of Naples, went to Paris in 1833, and died at Puteaux, near that city, 24th September 1835. He wrote scarcely anything but operatic music, his best-known works being *La Sonnambula*, *Norma*, and *I Puritani*. His style was to a great extent founded upon that of Rossini (who was ten years his senior), but with an exaggeration of that master's defects. His melodies are wanting in anything like vigour or originality, and his harmonies and accompaniments are generally thin and poor. See Pouglin's *Bellini* (1868).

Bellinzona, or **Bellenz**, a town in the canton of Tessin, Switzerland, on the left bank of the river Tessin, 12 miles N.E. of Ascona, and 8 from the head of the Lago Maggiore. It has considerable transit trade over the passes of St Gothard and St Bernard, and is periodically the seat of the cantonal government. The finest building in the whole canton is the Church of St Peter and Stephen, in B., partly of marble, and possessing good altar-pieces. The town has still several monasteries. In former times it was the scene of fierce and frequent conflicts between the Swiss and Italians. B. is protected from the overflows of the Tessin by a great dam more than 2400 feet long. The river is also here crossed by a granite bridge of ten arches, and upwards of 700 feet in length. Pop. (1870) 2501.

Bell's. See **DAISY**.

Bellmann, Karl Mikael, a popular Swedish lyrist, born at Stockholm, 24th February 1741, became court-secretary in 1775, and died 10th February 1795. The first effusions of his muse were religious, but he was soon drawn away into a dissolute career, and his later and more brilliant pieces are chiefly bacchanalian, idyllic, or humorous songs, for which he also furnished original melodies. The best specimens of his genius, which is of a rare order, are to be found in the collections prepared by himself: *Bachanaliske Ordenskapitellets Handbibliothek* (1783), *Fredman's Epistlar* (1790), and *Fredman's Sångar* (1791). Numerous editions of his *Samlade Skrifter* have been published in Sweden, of which the most splendid is that by Carlen (4 vols. Stock. 1861). A monument was erected to his memory at Stockholm, 26th July 1829, and ever since the anniversary of its erection has been kept as a popular holiday. B.'s German translator, Winterfeld (1856), has happily described him as 'The Swedish Anacreon.'

Bellona, the goddess of war (Lat. *bellum*) among the Romans, and the wife of Mars, before whose chariot she hurried. Her worship (see Mommsen's *History of Rome*, b. i. ch. 13) was one of the oldest and most sacred forms of the national religion. She is represented as armed with a bloody scourge, and as inspiring a warlike enthusiasm impossible to resist. In her temple in the Campus Martius the senate gave audience to foreign embassies and to generals claiming a triumph. Her priests (*Bellonarii*) in her worship used to cut themselves with knives, and to offer up, and even sometimes to drink, the blood thus shed. The act, which became latterly merely symbolical, was performed on the 24th of March, which hence was known as *dies sanguinis* (day of blood).

Bell of a Capital, in architecture, is the vase or corbel of a Corinthian or composite capital denuded of the foliage which usually surrounds it. It is also called the drum.

Bellot, Joseph René, a distinguished French naval officer, was born at Paris, May 18, 1826. He is specially celebrated as an explorer in the Arctic Seas, to which region he went as a volunteer in both the expeditions sent out in search of Sir John

Franklin's remains—first, with Captain Kennedy in the *Prince Albert*, when he discovered B. Strait (q. v.); and, second, with Captain Inglefield, in H.M.S. *Phenix*, with which he never returned, having fallen through a crack in the ice, March 21, 1853. His *Journal of a Voyage to the Polar Seas made in Search of Sir John Franklin in 1851-52*, was published with a memoir of his life at Paris in 1854 (Eng. transl. 1855).

Bellot Strait, discovered by Kennedy and B., and explored by M'Clintock, is the narrow passage, about twenty miles long, which separates N. Somerset from Boothia Felix, and joins Prince Regent's Inlet with Franklin Channel.

Bellows. See **BLOWING-MACHINES**.

Bellows-Fish. A popular name applied to those *Acanthopterus* fishes known as sea-snipes, &c., from the extended pipe-like form of the jaw-bones. The sea-snipe (*Centriscus scolopax*) exemplifies this group; this species being found in the Mediterranean Sea.

Belloy, Pierre Laurent Buyrette de, a dramatist and member of the French Academy, was born at St Flour, Auvergne, November 17, 1727. He was educated for the law at Paris, but a passion for the stage turned him aside from that profession. After pursuing his calling as a comedian for some time at St Petersburg, he returned to Paris in 1758, to see his tragedy *Titus* put on the stage. It was a failure. His next, *Zelmire*, had considerable success, but the play which brought about a brilliant epoch in the career of De B., was *Le Siège de Calais*, produced in 1765. Not to admire it was considered unpatriotic. *Gaston de Bayard* (1771) procured him membership of the French Academy. *Pierre le Cruel* (1772) was not a success when first put on the stage, but being revived after the author's death—which took place March 5, 1775—it took well, and has kept a good hold on the French stage. He died in comparatively straitened circumstances. Gaillard has published the *Œuvres de De B.* in 6 vols. 1779-87; and Firmin Didot *Œuvres Choies de De B.*, with a memoir of the author, 2 vols. Par. 1811.

Bell-Pepper, the fruit of *Capsicum grossum*, a native of India.

Bell-Rock, or **Inch Cape**, an old red sandstone reef, off the E. coast of Scotland, 12 miles S.E. of Arbroath, long a serious obstacle to the navigation of the Tay, and the cause of frequent shipwreck. It is 2000 feet long, 330 broad, and is partly uncovered during spring-tides. A lighthouse, like that of Eddystone, was built here (1807-11) by Robert Stevenson, engineer to the Commissioners of Northern Lighthouses, which cost over £60,000. It is 115 feet high, and has a revolving white and red light, visible at a distance of 14 miles. Two bells, of over half a ton each, are also employed during foggy weather. The tradition of the bell placed here by the Abbot of Arbroath, or Aberbrothwick, to warn sailors of the hidden danger, is well known through Southey's ballad of *The Inchcape Rock*.

Bells, as a nautical term, denotes a method of indicating the time of a watch on board ship. A long watch lasts four hours, a short watch, two. When the half-hour sandglass is run out, a bell is struck; the number of blows increasing by one each half-hour till the watch is over. Thus the B. reach eight in a long watch, and four in a dog-watch.

Bells have been employed in religious ceremonies from a very early age; and in this connection only they seem to have been in use among the ancient Egyptians and the Israelites (Exod. xxxviii. 3). The Greeks and Romans, however, applied them to domestic and camp purposes; and from Pliny we learn that each of the pinnacles decorating the monument of Porsenna was surmounted by B. They are said to have been introduced into Christian churches by Paulinus, Bishop of Nola in Campania, about the year 400 A.D. It was not, however, till 550 A.D. that they were first known in France; but after this date they were rapidly introduced into all parts of Christendom. About the year 600, Pope Sabinian ordered that B. should be rung every hour; and three centuries later Pope John IX. introduced them into all the churches as a defence against thunder and lightning. Up to the 13th c. the B. in use seem to have been merely small hand-B.; some have been preserved, and whether possessing the antiquity implied in their names or not, are unquestionably very ancient—e.g., St Patrick's Bell, St Ninian's Bell, and the four-sided bell of St Gall, Switzerland. During the 15th c., B. of several tons in weight began to be cast. The bell 'Jacqueline' of Paris,

cast in 1400, weighed over 6 tons; the bell at Cologne (1448) weighed 11 tons; the famous bell at Rouen (1501), 16 tons; and at more recent dates we have the Bruges bell (1680), 10½

Bell of Church at Luhnde, Hildesheim, 1278.

tons; the Paris bell (1680), 12½ tons; the Vienna bell (1711), 17½ tons; 'Great Peter' of York Minster (1845), 10½ tons; 'Great Tom' of Lincoln (1834), 5½ tons; 'Big Ben' of Westminster (1856), 15 tons 8½ cwt.; the Olmutz bell, 17½ tons; and the great bell at Peking, 53½ tons. The largest bell in the world, however, is the 'Monarch' of Moscow, being over 21 feet in height and diameter, and having a weight of 193 tons. It was cast in 1736, the value of the metal alone being at the lowest estimate £66,565; fell down and was injured in 1737 during a fire; remained buried to a certain extent till 1837, when it was raised, and it now forms the dome of a chapel.

Bell-metal is an alloy of copper with tin, zinc, or other metal. In England, the proportions in which the metals are mixed vary considerably; but generally the quantity of the copper present is between three and four times that of the tin. Other metals, such as zinc, iron, lead, &c., if present at all, are in much smaller quantity. Hand-B. are often made of brass, German silver, real silver, and gold.

The pitch of the note emitted by a bell depends on its size—the smaller the bell, the higher the pitch. The quality of tone depends much upon the material and the shape of the bell; and it is found that the greater quantity of metal for the same note produces a richer tone. As regards the proportional dimensions of a bell, different English bell-founders have different rules, derived from experience. The Germans, however, give the following numbers: taking the *sound-bow*, the thickest part, where the hammer strikes, as the unit; the diameter at mouth 15, the diameter at top 7½, height 12, and weight of clapper ¼ the weight of the bell. The *sound-bow* is usually made of wrought iron.

From their almost universal connection with religious rites, B. came to be looked upon as possessing a sacred character, and thus arose various superstitious notions regarding their efficacy in warding off diseases, misfortunes, and evil spirits, and in helping to hasten the souls of departing ones to their rest. Hence the custom of tolling the *passing-bell*, which was retained at the Reformation, owing perhaps to its solemn and tender associations; but the people were instructed that it was only intended to warn the living of the lot common to all mortals, and to invite them to pray for the dying. The custom still prevails, but the tolling now takes place usually during the funeral, and more as a mark of respect for the deceased. The baptism of B., which is still practised in Roman Catholic countries, and which is supposed to have originated in the 10th c., is another example of their sacredness.

The *curfew-bell* is said to have been introduced into England shortly after the Norman conquest, and the name at least is

French. On its ringing at eight o'clock in the evening, all fires and lights were to be extinguished under pain of a severe penalty. The term was retained long after the practice of putting out the lights had been abandoned, and is not even yet forgotten.

'The curfew tolls the knell of parting day.'

In the Netherlands the ringing of chimes is a very common practice. Indeed, in many parts the air is perpetually resonant with their light and silvery melody. The custom has also made great progress in England. Not only the larger towns, but almost every village church is provided with peals of B.; one of the most celebrated is the 'Bow-B.' of London. Eight B., forming the diatonic scale, give as many as 40,320 changes or permutations.

The hanging of B. in private dwelling-houses is a modern invention, and was not known in England till the time of Queen Anne. The most approved manner of arranging the wires is to carry them from the communicators up to the top of the house, and then bring them down again to their respective B. Electric B. have recently been introduced, and are likely to supersede all others. The circuit is completed by pressing a stud; a piece of soft iron is thus magnetised, and raises the hammer, which on falling strikes the bell. For detailed information regarding the history, nature, and applications of B., the reader may consult *Tintinnalogia, or the Art of Ringing*; *The Bell, its Origin, History, and Uses*, by Alfred Gatty; and E. B. Denison's *Lectures on Church Building, with some Practical Remarks on B. and Clocks*.

Bells, Blessing of, a ceremony as old as the 7th c., at which, according to the Roman rite, a bishop in cope and mitre, after washing the bell in salt and water, which had been previously blessed, anoints it outside with the oil of the sick, and with chrism inside. After being censed, the bell is considered blessed. According to the Parisian rite, in which the oil of catechumens is used, two persons, who stand as sponsors to the bell, pronounce aloud under whose invocation it is to be named, a circumstance which has led, by mistake, to the ceremony being called the 'baptism of B.'

Belluno, a city, province of B., N. of Italy, on the right bank of the river Piave; the seat of a bishop, has a fine cathedral, a rich library, numerous churches, two monasteries, a science and art academy, a good gymnasium, and a fair theatre; carries on silk manufactures, and has an active trade in timber. Marshal Victor took hence the title of Duc de B. Pop. (1871) 15,509.

Belomancy (Gr. *belos*, an arrow; *manteia*, divination), a mode of divining by means of arrows with written labels attached to them, practised by various Eastern nations. The arrows, which are either drawn from a bag or discharged from a bow, are supposed to indicate the future from the inscription on the first arrow found in either of these modes. See **AXINOMANCY**, and **DIVINING-ROD**.

Belon, **Pierre**, an eminent French naturalist, was born at Soulethière (Sarthe) in 1517, travelled in the East (1546-49), and was murdered in 1564 by robbers while botanising in the Bois de Bologne. He enriched the knowledge of his age by a great number of entirely new observations on the natural history of the countries which he visited; and his descriptions of their antiquities, &c., are still interesting. His principal works are, *Observations de plusieurs Singularités et Choses Memorables, trouvées en Grèce, Asie, Indes, Égypte, Arabie et autres Pays estranges, rédigées en trois Livres* (Par. 1553); *Histoire Naturelle des estranges Poissons Marins* (Par. 1551), and *Histoire de la Nature des Oyseaux* (Par. 1553), all of which contain many curious details, and may still be consulted by naturalists with profit.

Belone. See **GARFISH**.

Beloochistan, or **Beluchistan**, the south-eastern part of the plateau of Iran, partly corresponding to the ancient Gedrosia, lies between 24° 50' and 30° 20' N. lat., and between 57° 40' and 69° 18' E. long. It is bounded on the N. by Afghanistan, on the E. by Multan and Scinde, on the S. by the Arabian Sea, and on the W. by Persia. Average length, 600 miles; average breadth, 300 miles; area, from 150,000 to 180,000 sq. miles; pop. between one and two millions. B. is for the most part a rocky, dry, and barren highland, bounded in the E. by the Brahui mountains, and falling down to the sandy plains of the S. and W. in a succession of terraces. The only fertile districts are Candawā and Kelat in the N.E. The climate in the stretches of low desert is hot, in the valleys moist and warm, in the high-

lands sharp but healthy. The pastures are poor, hence cattle and horses are few; the ordinary draught animal being the dromedary. Where water is found there are copious tropical harvests; and in the more elevated regions the cereals and fruits of the temperate zone flourish. Copper, iron, lead, and anti-mony are found, and there are a few manufactures of carpets and tent-covers made of the hair of goats and camels; but the trade is trifling, and mainly in the hands of natives of India. B. is governed by the Khan of Kelat, who, having broken faith with the British in 1839, had his capital taken from him in 1840 and 1841 successively. The sirdars, or chiefs, partly hereditary and partly elected, are under a species of feudal government, and have to furnish a certain quota of troops and attend the court. They are the real governors of B., the authority of the Khan being more nominal than real, especially in the western portions of the country. The inhabitants in the N. and W. are the *Beluchees* proper (a mixture of Persians, Hindu, and Semitic races); in the E., *Brahuis* (a remnant of the original inhabitants, with a peculiar language); in the S.E., the *Lamri*, Sunnite Mohammedans, following a pastoral life. The first are robbers, the second and third peaceful and industrious. Besides these there are Hindus, Tajiks, Armenians, and Jews in the towns. The capital is Kelat (q. v.); the only seaport, Sommeance, in the S.E., on the Indian frontier.

Belpass'o, a town of Sicily, province of Catania, at the south base of Mount Etna, 8 miles N.W. of the town of Catania. Pop. (1871) 7620. The old town, which was called Mel Passo, was destroyed by an eruption in 1669, and below the present town there is an expanse of lava, offering a striking contrast to the richly cultivated country.

Bel'per (a corruption of Fr. *Beau-repaire*, 'beautiful retreat'), a well-built market-town of Derbyshire, England, situated on the Derwent, 7 miles N. from Derby, and a station on the North-Midland Railway. It has several notable buildings, among which the union workhouse is a splendid specimen of Elizabethan architecture. Cotton is manufactured extensively; also silk, hosiery, nails, and earthenware. The country is rich in coal, iron, and limestone. Pop. (1871) 8527.

Bel'sham, Thomas, a Unitarian divine, born at Bedford in April 1750, educated in Calvinistic principles, and head of the theological academy at Daventry till 1789, when he embraced Unitarian views. After a few years he succeeded Dr Priestley, and in 1805 was appointed successor to Dr Disney in Essex Street Chapel, London—a position he retained till his death in 1829. His theological writings embrace nearly all the doctrines and evidences of Christianity, but his views on the person of Christ are entirely humanitarian.

Belshazz'ar (mod. form *Balthasar*), the last king of Babylon, according to the writer of Daniel and the historian Xenophon, both of whom record substantially the same story, viz., that the city of Babylon was surprised and captured at night by Cyrus, the Persian, who put B. to death. On the other hand, Berosus (according to Josephus) and Herodotus diverge considerably in points from this account. Berosus calls the last king of Babylon Nabonnedus (*Nabu-nit* or *-nahit*, 'whom Nebo prospers'), and states that he was captured by Cyrus in the neighbouring city of Borsippus, and spent the remainder of his life a prisoner in Persia; while Herodotus says that the king of Babylon was called Labynetus, and adds, that though Cyrus took the city by surprise at last, it was only after a long siege. Sir Henry Rawlinson is thought by many to have solved the difficulty presented by these conflicting accounts, for in 1854 he deciphered certain inscriptions found in the ruins of Ur of the Chaldees, from which he ascertained that Nabonnedus had a son, Bel-shar-ezar, who was conjoint-ruler with his father; and he suggested that the son might have perished in the capital, while the father was captured in Borsippus.

Belt (Dan. *Bælt*, a 'belt' or girdle), the name of two straits between the Baltic and the Cattegat. The Great B. separates the Danish islands Zealand and Fiinen, and is about 70 miles long, and from 4 to 20 broad. The Little B. passes between Fiinen and Jutland, and is 10 miles broad. The Sound (q. v.) is preferred to both these channels on account of their dangerous shoals and currents.

Bel'tein, Bel'tan, Bal'tein, Bealtainn, &c., was a great festival among all the Celtic tribes of Europe, which seems to

have been a form of fire-worship, and some of the doings connected with which continued to be practised in Ireland, Scotland, and the Isle of Man down almost to the present generation. That there is, however, any etymological connection between the Celtic *Beal* and the Phœnician or Syrian *Baal* is improbable, though our knowledge is not such as to justify a dogmatic opinion. The great seasons for this nature-worship, one of the chief features of which was the kindling of huge fires, were the summer and winter solstices, and about the spring and autumn equinoxes. On midsummer-day, and especially the 1st of May, which in Irish is called *La Beal-tine*, and in the Highlands of Scotland *Beltein-day*, bonfires were kindled; the company danced round them and leaped over or through them, keeping up various ceremonies, which pointed to the fact that, in a remote antiquity, human sacrifices had actually been offered to the sun-god.

Of the ways in which the rites were observed in different parts there seems to have been an endless variety. The following is the description of how they were observed in Perthshire as given in Sinclair's *Stat. Acc.*—"Upon the 1st day of May, which is called *Multein-day*, all the boys in a township or hamlet meet on the moors. They cut a table in the green sod, of a round figure, by casting a trench in the ground of such circumference as to hold the whole company. They kindle a fire, and dress a repast of eggs and milk of the consistence of a custard. They knead a cake of oatmeal, which is toasted at the embers against a stone. After the custard is eaten, they divide the cake into so many portions, as similar as possible to one another in size and shape, as there are persons in the company. They daub one of these portions all over with charcoal until it be perfectly black. They put all the bits of cake into a bonnet. Every one blindfold draws out a portion. . . . Whoever draws the black bit is the *devoted* person who is to be sacrificed to Baal, whose favour they mean to implore in rendering the year productive of the sustenance of man and beast. There is little doubt of these inhuman sacrifices having been once offered in this country as well as in the East, although they now omit the act of sacrificing, and only compel the devoted person to leap three times through the flames, with which the ceremonies of this festival are closed." Rites very closely akin to the above were observed at midsummer; only the Church, with her usual policy, adopted the pagan festival, christened it St John's Day, and represented the fires, torches, &c., to be in commemoration of John the Baptist, who 'was a burning and a shining light' (John v. 35). See Brand's *Popular Antiquities*.

Belu'ga, the 'white whale' (*Beluga leucas*, or *Catodon*) of the northern seas, included, not in the genera of true *Cetacea*, or whales, but in the family of the *Delfiniæ*, or dolphins. The head of the B. is blunt-shaped, and not prolonged to form a beak. No dorsal fin exists, and there are nine teeth in each side of each jaw. These teeth disappear as the animal advances in age. This form rarely occurs in British seas. It is the only defined species of its genus—if we reckon the B. to constitute a genus of itself. The colour is white, and the body averages in length from 12 to 18 feet. These forms are gregarious in habits, and feed chiefly on fishes. The Greenlanders value its flesh as food, and manufacture oil from the blubber, and leather from the skin. Another form, accounted by some naturalists to be of a distinct species (*B. Kingii*), is found in southern seas. Two young ones are produced at a birth. A B. was captured in the Firth of Forth in 1815, and in the river Medway in 1846.

The name B. is also applied to a species of Sturgeon (q. v.) (*Acipenser* or *Sturio huso*) found in the Caspian and Black Seas, and which attains a length of 12 or 14 feet, and a weight of 1200 or even 3000 lbs.

Bel'us. See BAAL.

Belvedere (It. 'fine prospect'), the name originally given by the Italians to an erection on the top of a house for the purpose of enjoying a view of the surrounding country. It is also applied to a part of the Vatican which contains the famous statue of Apollo. The corresponding French term is *Bellevue*, which is given to any place of refreshment possessing summer-gardens.

Belvedere, or **Summer Cypress** (*Kochia scoparia*), an annual plant, a native of the middle and S. of Europe, and of temperate Asia, belonging to the natural order *Chenopodiaceæ*, long cultivated in our gardens as an ornamental annual.

Belvisia, or *Napoleonea*. See *BELVISIACEÆ*.

Belvisiaceæ, a natural order of plants closely allied to the mangrove order, or *Rhinophoraceæ* (q. v.), or to *Barringtoniaceæ* (q. v.), natives of tropical Africa. In addition to *Belvisia* (or *Napoleonea*), there is only the genus *Asteranthos* in the order, which comprises four species. The pulp of the fruits is edible, and the pericarp contains much tannin.

Belzoni, Giovanni Battista, an Italian traveller, was born at Padua, November 5, 1778, and educated at Rome for the priesthood, which he forsook on the capture of Rome by the French. After travelling through Holland, England, and Spain, for nearly fifteen years as an athletic performer, during which time he pursued in his leisure hours mechanical studies, he went to Egypt in 1815, where he executed an hydraulic machine for Mehemet Ali. He then directed his attention to exploration. In 1817 he opened the tomb of Psammetichus, and removed from it the splendid sarcophagus now in the British Museum. After opening the pyramid of Cephren, his greatest achievement, he spent some time in searching for the temple of Jupiter Ammon, and in the course of his investigations discovered the emerald-mines of Zubara and the ruins of Berenice. In 1821, he published at London his *Narrative of the Operations and Recent Discoveries, &c., in Egypt and Nubia*. B. died at Gato, December 3, 1823, on a journey to Timbuctu.

Bem, Joseph, a Hungarian patriot and soldier, was born at Tarnov, in Galicia, in 1795, and for many years made a livelihood by teaching in France. The Hungarian revolution of 1848 brought him into prominence, and his courage, generalship, and power of organising rapid movements becoming known, he was appointed commander of the Hungarian army in Transylvania. In this capacity he inflicted several severe defeats on the Austrians, and ultimately expelled both them and the Prussians from Transylvania. In the final stages of the gallant but hopeless war, B. showed great bravery, and when at last he found himself unable to defend Transylvania, he escaped into Turkey. There he became a Mohammedan, and entering the army, rose to the position of pasha. He died of fever, 10th December 1850, at Aleppo, whither he had gone to suppress a rising of Arabs against the Christian population. See Czecz, *B.'s Feldzug in Siebenbürgen* (1850).

Bembo, Pietro, an Italian scholar and ecclesiastic, born in Venice, May 20, 1470; studied Greek under Lascaris at Messina, and philosophy at Ferrara. He then returned to Venice, and was received into the famous society of scholars that met at the house of the publisher Manutius, for whom he edited Petrarch's Italian poetry (1501), and the *Terze Rime* of Dante (1502). From 1506 to 1512 he resided at the court of Urbino; then returning to Rome, he became secretary to Leo X. till the death of that Pope. Although a priest, he was something of a pagan in his manner of life, like not a few of the Renaissance scholars, and had a mistress who bore him three children. In 1539 Paul III. elevated him to the cardinalate, and gave him the bishoprics of Gubbio and Bergamo. He died January 18, 1547. His literary taste was very fastidious, and he subjected his writings to numerous revisions, but, like their author, they are not free from the licentiousness of the age. Of his *Rerum Veneticarum, Libri XII.* (Venice, 1551), an Italian version was published the following year. A complete edition of his works in prose and verse, which embrace dialogues, letters, sonnets, songs, &c., was published at Venice in 4 vols. 1729.

Bembridge Beds, a series of strata about 115 feet in thickness, belonging to the *Upper Eocene* formations of the Cainozoic period, and chiefly developed in the Isle of Wight. They include (beginning with the lowest beds)—Firstly, the *B. Limestone*, a pale yellow limestone, interstratified with clay or marl, and containing siliceous or cherty bands in some cases. The thickness of the first layer is from 20 to 25 feet. Secondly, the *Oyster bed*, consisting of a few feet in thickness of greenish sands containing the remains of oysters (*Ostrea Vectensis*), and of other marine molluscs. Thirdly, the *Non-fossiliferous mottilal clays*, alternating with fossil-bearing clays and marls, containing the lamellibranchiate molluscs *Cyrena pulchra*. Fourthly, *Marls and laminated grey clays*, containing *Melania turritissima*. Above this last series lie the *Blackband* and *Marls*, which form the lowest of the *Hampstead* series of beds, this series overlying the *B. strata*. In the *B. B.* the fossil remains of the extinct

mammalia *Anoplotherium* (q. v.) and *Palæotherium* (q. v.) are found, along with other less familiar fossil forms. The *B. B.* themselves rest upon the *St Helen's Sands*, or uppermost strata of the Osborne series, also developed in the Isle of Wight, and belonging to the *Middle Eocene* formations. All the fossils of these strata are of estuarine or of fluviomarine kind, and indicate the formation of these rocks from brackish or estuarine waters.

Ben, or **Beann**, the Gaelic word for a mountain-summit, or head. Another form is *Caann*. It enters into the composition of numerous names in the Highlands of Scotland—e.g., Ben Nevis, Ben Macduh, Ben Lomond, &c. The corresponding Cymric form is *Pen*, seen in *Pen-nine*, *Pen-rith*, *Pen-rhyn*, *Penmaen-mawr*, &c. In Ireland, according to Dr Joyce (*Irish Names and Places*, 1st ser., pp. 349, 350), B. is not applied to high hills, but to moderate heights; and its different application in Scotland suggests the possibility of its being a Pictish as well as a Scottish, i.e., Irish word, especially since Dr Skene (*The Four Ancient Books of Wales*, vol. i. ch. viii. and ix.) has shown the likelihood of the Pictish dialect being more allied to Gaelic than to Cymric.

Ben (Heb. 'son,' in composition 'son of'), forms the first syllable of many Old Testament proper names, as Benjamin (Gen. xxxv. 18). The plural, Beni, is found in several modern names, as Beni-Hassan. Among the Arabs, Beni (the sons of some one) is the designation of a tribe, just as the clans in the Highlands of Scotland are Mac-Donalds, Mac-Duffs, &c.

Ben, Oil of, a fluid fixed oil obtained from the seeds of the horse-radish tree (*Moringa pterygosperma*), a native of India and Arabia, the seeds of which are called *Ben nuts*. It is sometimes used by perfumers, painters, and watchmakers.

Benares, the chief city of a district and division of the same name, N.W. Province, British India, on the left bank of the Ganges, 421 miles N.W. of Calcutta, and 74 S.E. of Allahabad. It is the chief seat of Hinduism, the Rome of India, extends about 3 miles along the sacred river, and contains 1000 Hindu temples and over 30 mosques, including the splendid one of Aurangzebe. Broad flights of steps or *ghats* descend to the river, forming a magnificent terrace, which is used as a sort of market-place. B. is visited by vast numbers of pilgrims, mounting on special occasions, it is said, to 100,000. The streets are everywhere narrow, and the houses generally of a mean description. Sacred bulls and apes move at large, and are tended by the priests of Siva. B. (its Sanskrit name is *Vārāṇasī*) is a city of great antiquity; according to Hindu tradition, indeed, it is coeval with the world. In Sanskrit poetry, where it figures as the seat of a half-mythical race of rulers, it is called *Kāśī*—i.e., the splendid—and is celebrated as the oldest seat of Brahmanical learning. Long subject to the Rajput princes of Kanoj, it first fell under Mussulman domination in 1193, when it was conquered by the Ghuride Rut-bed-din. In 1529 it was seized by the first Great Mogul, Baber, and on the breaking up of the Mogul empire became the possession of the Nawab of Oude, whose grandson ceded it to the English in 1775. The Sanskrit College of B. was founded in 1792, and now embraces a modern department for literature, history, mathematics, political economy, and the English and Persian languages. B. is also a rich commercial centre, and is connected by railway with Calcutta, Bombay, and the Punjab. It has important manufactures of shawls, indigo, sugar, and cloth of gold and silver, and is the principal jewel-market in the whole of Asia. Pop. (1872) 175,188, including the British cantonments of Secrole (q. v.). The district of B. is watered by the Ganges, the Karamnasa, the Gumti, and minor rivers, and yields abundance of rice, opium, sugar, and indigo. Area, 996 sq. miles; pop. (1872) 794,039, mostly Hindus. B. district has a permanent settlement of the land-tax like Lower Bengal.

Benavente, a town of Spain, province of Zamora, 34 miles N. of the town of Zamora. It is surrounded by a mud wall, and commanded by a half-ruined castle, formerly the seat of the Counts of B. It was here that Moore's retreat may be said to have commenced; and the castle was gutted by Soult on his retreat from Oporto. Pop. about 2500.

Benbecula, a small island of the Hebrides, lying between N. and S. Uist, and included in the latter parish, Inverness-shire. It is low, boggy, and sandy, measuring 8 or 9 miles each way. Pop. (1871) 1563, engaged chiefly in fishing.

Benbow, John, an English rear-admiral, born in Shropshire in 1650. After distinguishing himself in the merchant-service, James II. gave him a commission, and William III. appointed him to an important command, and in a few years advanced him to the dignity of rear-admiral. A gallant exploit, rendered memorable by the bravery of B. and by the cowardice of his officers, an unusual occurrence in the British navy, was his last. On the 19th of August 1702, after a chase of several days, he came up with a French force under Admiral Du Casse. The brunt of the engagement, which lasted four days, fell on B.'s ship, his officers refusing to obey his signals. On the morning of the 24th his right leg was shattered by a chain-shot, but he continued the engagement till night. He then sailed to Jamaica, where he died on the 4th of November.

Bench signifies ordinarily the elevated part of a court-room in which judges sit to administer the law. The term is often applied to the judges themselves; thus we say, 'it was the opinion of the B.' So we speak of the U. and the bar.

Bench, King's or Queen's. See COURTS OF LAW; COURT OF JUDICATURE, SUPREME ACTS.

Bench'ers, the ruling bodies of the Inns of Court (q. v.), Lincoln's, Inner and Middle Temple, and Gray's Inns. They are commonly Queen's Counsel or distinguished barristers.

Bench-mark, a mark of any kind (in the Ordnance Survey an arrow) made upon a stone, a wall, or in any other suitable situation, to indicate the position of a station in a survey.

Bench Warrant is a warrant issued for prompt execution by justices sitting on the bench or in session.

Bencoolen (Dutch *Benckolen*, a corruption of the native *Bangkakulu*), is the name of a Dutch town on the S.W. coast of Sumatra, at the mouth of a river of the same name, built on piles of bamboo in a swampy and unhealthy district, though the town has a fine appearance from the sea, on account of an overhanging mountain called the 'Sugar-Loaf.' It carries on a trade with the ports on the Bay of Bengal in the produce of the district—pepper, rice, coffee, maize, sugar-cane, &c. It was founded in 1686 by the English, but ceded to the Dutch in 1824. Pop. about 12,000. It is the capital of a residency, with an area of 9567 sq. miles, and a pop. of 126,000.

Bend, in heraldry, one of the Honourable Ordinaries (q. v.), occupying, if plain, a fifth part of the shield in width; a third, if charged. It is formed by two parallel lines passing diagonally athwart the shield—from the dexter chief to the sinister base for the *B. dexter*, or simply the *B.*; from the sinister chief to the dexter base for the *B. sinister*. The diminutives of the *B.* are the *bendlet*, one-half of its breadth; and the *cotise*, a fourth. A cotise is sometimes borne couped at its extremities, and then it is called a *ribbon* or *riband*. The fact that a charge is placed diagonally on the shield is indicated by the words *in B.*, *per B.*, *bendy*, &c.

Bend, a nautical term denoting one of the many kinds of knot by which a rope is fastened to another rope, an anchor, cable, sail, &c.

Ben'demann, Eduard, one of the best known of the Düsseldorf school of painters, born at Berlin, 3d December 1811, studied at Düsseldorf under Schadow, exhibited his 'Ruth and Boaz,' a picture remarkable for grace and natural treatment of details, in 1830; his 'Captive Jews,' a work still more admired, in 1832; his 'Girls at a Fountain,' and 'Jeremiah at the Ruins of Jerusalem'—the latter won the gold medal of the Berlin Academy—respectively in 1833 and 1837. Appointed Professor of the Academy of Arts at Dresden in 1838, he was commissioned to decorate the royal palace there with frescoes, and these works are the finest efforts of his genius, which is exquisitely poetical. B. married the daughter of Schadow in 1838. Recently he has been much engaged in painting portraits, that of his wife being a masterpiece. He was appointed director of the Academy, Düsseldorf, in 1860.

Ben'der (Turk. a 'market' or 'harbour'; the Russian form is *Bendery*), formerly *Zeckin*, a fortified town in Bessarabia, Russia, on the right bank of the Dniester, 48 miles from its mouth. The origin of the town is unknown, but as early as the

12th c. the Genoese had an establishment here. The Russians stormed it in 1770; it was restored to the Turks in 1774; it was again captured by the Russians in 1809; and after being once more restored to the Turks, it was again taken in 1811 by the Russians, in whose possession it now remains. There is a mixed pop. of 22,448, employed in paper-mills, tanneries, iron-smithies, and a saltpetre-work. After his defeat at Poltava, Charles XII. of Sweden resided in the neighbourhood of B. from 1709 to 1712.

Ben'digo, a county and leading goldfield of Victoria, situated between 143° 50' and 144° 40' E. long., and 36° 10' and 46° 55' S. lat. Its area is about 1400 sq. miles. See SANDHURST.

Be'ne Vagi'enne (anc. *Augusta Bagiennorum*), an Italian town 18 miles N.E. of Coni, in the province of Cuneo, Piedmont. Many interesting remains of antiquity have been found in its neighbourhood. Pop. (1871) 6131.

Ben'edek, Ludwig von, an Austrian commander, was born at Oedenburg, in Hungary, in 1804. After a training at the Military Academy of Neustädt, he entered the Austrian army in 1822 as a cornet, and in 1843 had attained the rank of colonel. He showed considerable military ability in quelling an insurrection in Galicia; and in the Italian war of 1848-49 still more distinguished himself, contributing considerably to the victory of Novara. In the war of 1859, B. was almost the only Austrian commander that showed generalship, his division being the last to leave the field at Solferino. After acting for a time as governor of Hungary, he was appointed, with the title of marshal, to the chief command of the Austrian armies in the war with Prussia in 1866; but was utterly beaten at Sadowa, July 3, and was superseded by the Archduke Albrecht.

Benedetti, Vincenzo, a French diplomatist, was born at Bastia, Corsica, April 29, 1817. He was first chancellor of the French consulate in Alexandria; in 1848 consul at Palermo; on the establishment of the empire, secretary to the French embassy at Constantinople; and, after the Crimean war, director in the office of the Minister of Foreign Affairs. In 1861 he went as ambassador to Turin, and in 1866 arranged the armistice of Nikolsburg between the Austrians and Prussians. From this date he remained at Berlin as extraordinary ambassador till the outbreak of the Franco-Prussian war of 1870. During these years he carried on frequent conversations (if not negotiations) with Count von Bismarck, concerning the rectification of the frontiers of their respective countries, in which the subtle Italian was completely outwitted by the crafty Teuton, who got him to put upon paper proposals of a highly unscrupulous character. At Ems, in July 1870, B. demanded of the Prussian king, in the name of his master, not only the withdrawal of Prince von Hohenzollern from his candidature for the Spanish throne, but also a promise that this German candidature would never again be supported. King Wilhelm held it beneath his dignity to bind himself for the future. His refusal led to a declaration of war by the Emperor in less than a week, and before two months had passed France was utterly crushed, the Napoleonic dynasty overthrown, and a republic proclaimed. B. has written a vindication of his Prussian diplomacy, *Ma Mission en Prusse* (1871), which has not added to his reputation either for ability or honesty.

Benedi'cite, the song of the Three Children in the fiery furnace, a Christian hymn as ancient as the 4th c. It is sung in the morning service of the Church of England when the *Te Deum* is not used.

Ben'edict, one of the great saints of the early Church, and the founder of the first religious order of Western Christendom, wa. born at Nursia, in Central Italy, in 480. At the age of fourteen he was sent to Rome to school, but becoming disgusted with the dissipation of the place, and the sterile instruction of the ancient schools of literature and jurisprudence, he ran away and concealed himself in a cavern at Sublacum (Subiaco), 40 miles from Rome. Here he remained in concealment for three years, but his hiding-place was at last discovered, and a numerous auditory soon came to listen to his preaching, and his cavern for some time was a place of pilgrimage. Some of those who came to hear him placed themselves under his guidance, and from 520 to 527, there were formed about him 12 religious families, each composed of 12 monks under a head or abbot, who lived according to rules which they drew up for

themselves. His popularity, however, excited envy, and even led to plots against his life. In 529 he left Sublacum, and established himself at Monte Cassino, about 50 miles from Naples. Here he converted a body of pagan mountaineers, and turned their temple into a monastery. The rule he prescribed for his new society of monks shows that his aim was to have its members spend their life in prayers, reading, manual labour, and the instruction of youth. The fame of his piety soon spread through the peninsula, and though the land was then in the throes of the great struggle between the Ostrogoths and the generals of Justinian, Totila, King of the Ostrogoths, found time to visit the illustrious cœnobite. The interview between the Arian monarch and the Trinitarian monk was equally honourable to both. B. died in 543. What distinguished the cœnōbitic life of B. and his followers was the beautiful union of labour, religion, and learning. They worked in the field and the garden, prayed in their cells, taught the young the rudiments of sacred and profane knowledge, and transcribed works of piety and the masterpieces of the ancient literature. Before B.'s time the recluses of the West had wasted their lives in barren inactivity; but this rational reformer drew up a *regula vite* ('Rule of Life') which even yet excites in many respects the admiration of Christendom, and can still be praised, in the language of Gregory the Great, as *discretionis præcipua, sermone luculenta*. B., who did for the West what Antony (q. v.) and Pachomius (q. v.) had done in an earlier century for Egypt, and Basil (q. v.) for the East, was superior in genius, wisdom, and humanity to any of the three. We may be thankful that his earlier followers spread themselves with the spread of the Latin Church; for by their labours and their examples they everywhere gave the victorious barbarians lessons of order, economy, instruction, and refinement which powerfully aided to restore the civilisation of Europe. See BENEDICTINES.

Benedict, is also the name of fourteen popes, of whom the first seven flourished between the 6th and 10th centuries, and are historically insignificant. Of the remainder, the most notable are: 1. **B. VIII.**, who was born at Tusculum, of the family of Conti, and elected pope in 1012. After being driven from Rome by the antipope, Gregory, he was restored by the emperor, Heinrich II., in 1014, who confirmed the Church in all the rights and privileges originally conferred by Charlemagne. With the aid of the Pisans, B. took Sardinia from the Saracens, and induced Heinrich to march with an army to Italy to oppose the Greeks; he died in 1024. Four letters written by him were published at Paris in 1667.—2. **B. IX.**, a nephew of the preceding, was elected in 1033, at the age of ten, and was maintained on the throne by the power of the Emperor Konrad for nearly twelve years, but at last expelled for licentiousness in 1044. Three months after, he re-entered Rome, but proving still obnoxious to the citizens, he sold the papal chair to the antipope, John XX., and actually crowned him with his own hands. He again seized upon the pontifical power, when there were three equally unworthy popes alive. From these John Gratianus purchased the tiara, and became pope under the name of Gregory VI. At the Synod of Sutri, Heinrich III. deposed Gregory for simony, and Clement II. was elected. After his death in 1047, B. IX. was again elected, but was finally displaced in 1049, when he retired to a convent, where he is said to have lived an exemplary life till his death, the date of which is not known.—3. **B. XII.**, a native of Saverdun, in the county of Foix, was elected pope at Avignon, 13th December 1334, and held the office for eight years. Though living away from the capital of Christendom, B. was a strenuous reformer of ecclesiastical abuses. He compelled the clergy who had the cure of souls to reside in their parishes, prosecuted simoniacs, reformed religious orders, sought out and encouraged good priests, and set his face against nepotism. He loved the society of scholars, and his theological works attest his knowledge and his eloquence. B. died 25th April 1342.—4. **B. XIII.** belonged to the Orsini family. He was elected in 1724, and was a man of great simplicity of life and of high morality. He declared the bull *Unigenitus* a rule of faith, but better deserves remembrance for his apostolic virtues. His heart was in hospitals and prisons, among the poor, the wretched, and the lowly. His noble ambition was that Rome should be *de facto* as well as *de jure* the capital of the Christian world. A large number of names was added to the calendar of saints during his pontificate. The political sagacity of B. was not equal to his virtues, and he allowed his confidence to be abused by Cardinal Coscia.—5. **B.**

XIV., the son of Marcello Lambertini, a Roman senator of distinguished family, was born at Bologna, 31st March 1675, studied first theology, then canon and civil law. B. was made bishop of Ancona (1697), cardinal (1728), archbishop of Bologna (1731), and pope (1740). He took for his first minister Cardinal Valenti, and otherwise displayed a remarkable knowledge of men. Strangers visiting Rome were treated with the sincerest kindness; and Horace Walpole was so impressed with this, that he wrote a splendid eulogium of him. B. died 3d May 1758. The best edition of his works are those published at Rome, in 12 vols. 1747-51; and at Venice, in 16 vols. in 1777. See Fabroni's *Vita de Benedetto XIV.*, and *Vie du Pape Benoît XIV.* (Par. 1775, and again 1783).

Benedict Biscop, an English saint and churchman, who in the 7th c. worked with quiet energy for the ecclesiastical supremacy of Rome as against Iona. Born in 628 of noble family (according to Bede, who was his pupil, and has written his life), he was till the age of twenty-five a courtier of Oswin, king of Southern Northumbria. Then, in company with Wilfrith of York, he went to Rome, where he remained as a student for ten years. In 665 he became a monk at Lerins in Provence, and in 668 returned to England with Theodore of Tarsus, Archbishop-elect of Canterbury, to whom in a supreme degree the Church in England owed its advance from a missionary agency to an organisation for religious and literary culture. B. was chosen abbot of the monastery of St Augustine in Canterbury, and his life is simply one strenuous effort to introduce into England the graceful pomps and intellectual treasures of Roman Christendom. In all, he paid five visits to Italy, bringing back on each occasion a multitude of books, pictures, relics, palls, &c. He built the noble monastery at the mouth of the Wear, in his native Northumbria, and ruled it for years along with Ceolfrith and other coadjutors. Here Bede received his early education, and amassed those stores of learning which have made his name 'venerable' to all succeeding ages. We may also ascribe to B. the introduction of the Roman choral service into England, for it was he that brought over Abbot John, archchanter of St Peter's, Rome, to teach first in the monastery at Wearmouth, and afterwards in other parts of the island, 'the order and manner of singing and reading aloud, and committing to writing all that was requisite throughout the whole course of the year for the celebration of festivals' (*Hist. Eccl. Gent. Angl.*, lib. iv. c. xviii.). B. died 12th January 690. See Bede's *History of the Abbots of Wearmouth*.

Benedictines are monks who follow the rule (*regula vite*) of St Benedict, although that rule, as drawn up for his monastery at Monte Cassino in 529, has been greatly departed from, notwithstanding that he was the first to make monastic vows irrevocable, and a rule permanently binding. The order spread far and wide, probably owing to the rule being better adapted to Europeans than the Eastern asceticism which had previously prevailed. Besides their social worship and private meditations, seven hours of each day were devoted to labour, such as agriculture, gardening, and various mechanical trades. Hence, wherever they settled, they were of great advantage in cultivating and civilising the country. Further, their rule required them to read a portion of each day, and to provide for this, part of their labour was transcribing MSS.; by which means many of the most valuable literary remains of antiquity, both religious and secular, were preserved. Their learning, reputation for sanctity, and especially their education of the sons of many noble and even royal houses who were entrusted to their care, all brought wealth and power to the order. But after wealth came luxury, idleness, and vice; they became involved in civil and political affairs and the cabals of courts, especially in trying to advance the power of the popes. Among the branches of the order were the congregation of Clugny, founded about 927; of the Cistercians, 1098; of Monte Cassino, 1408; St Vanne, 1600; and St Maur, 1629. In 1354 the B. had 37,000(?) monasteries; in the 15th c., 15,107, of which 5000 only were left after the Reformation; at the present time there are about 800. The B. were also called the 'Black Monks,' from their dress, a black gown and hood. See *Annales Ordinis Sancti Benedicti*; the *Acta Sanctorum* (q. v.); Reynier's *Apostolatus Benedictinorum in Anglia* (Douai, 1626); the *Bullarium Cassinense* (Ven. 1650); Tarsin's *Histoire de la Congrégation de St Maur* (Par. 1770); *Cronica de la Orden de San Benito* (Salamanca, 1609-15, 7 vols.); *Regula Sancti Benedicti et Con-*

institutiones Congregationis Sancti Mauri (Par. 1770); Montalembert's *Mémoires de l'Occident depuis Saint Benoît jusqu'à Saint Bernard* (Par. 1860-67); and the Church Histories of Mosheim and Neander.

Benedict, Sir Julius, a musical composer, was born at Stuttgart, 24th December 1804, and studied music under Hummel at Weimar, and Weber at Dresden. He has been resident in London since 1836, where he is a popular pianoforte teacher and conductor. In 1871 he received the honour of knighthood. B.'s most important compositions are his oratorio of *St Peter*, written for the Birmingham Musical Festival (1870), the opera of the *Lily of Killarney* (1862), and a recently produced symphony in G minor. As conductor of the 'Monday Popular Concerts,' he has done much to elevate musical taste, and bring the finest chamber-music within reach of the people.

Benediction (Lat. *benedicere*, to speak well of), an invocation of the blessing of God on persons or things. The ceremony dates from the earliest times, and the blessing of their children by the patriarchs before their death, and of the people by the high-priest, are recorded respectively in Genesis and Numbers. Before parting with his disciples at Bethany, Christ blessed them with uplifted hands; in the Roman Catholic Church the bishop and the priest both bless the people, though each uses a different formula; and the blessing of the city and the world (*urbi et orbi*) by the pope on Easter Sunday is a most impressive spectacle. The B. is conferred by the bishop at the coronation of kings and queens, the confirmation of the dignitaries of the Church, and the consecration of churches, altars, &c., while the priest may pronounce it on church bells, priestly garments, churchyards, &c. The grace before meat is a continuation of the old B. of the table and the viands. There are two benedictions in the English liturgy; the service of the Scotch Church has only one.

Benedictus, a portion of the musical service at mass in the Roman Catholic Church. The music, with a translation of the words into English, has been introduced into the morning service of the Anglican Church.

Benefice. In the Church of England, vicarages, rectories, and other parochial charges are so called. Ecclesiastical dignities and offices—as canonries, deaneries, &c.—are called *cathedral preferments*.

Qualifications for holding a B. in the Church of England are—holy orders, presentation by patron, institution by bishop, induction, which proceeds on a mandate by the bishop to the archdeacon. The Act 23 and 24 Vict., cap. 142, makes improved provision for the union of benefices. Contiguous benefices may be united without regard to aggregate population or yearly value. Act 26 and 27 Vict., cap. 120, makes saleable the advowson of certain benefices in the gift of the Lord Chancellor, the proceeds to be applied to improve other small livings in his gift. See PLURALITIES.

Beneficiary, in England, means the holder of a benefice. In Scotch law, B. means one having an interest in real or personal estate under a trust or will. The analogous term in the law of England is *Cestui que trust* (q. v.). See TRUST, TRUSTEE.

Beneficium Inventarii, in Scotch law, was a privilege of an heir of heritage (real estate), who was doubtful if his inheritance was worth his predecessor's debts, for which it was liable, and for which he, the heir, became personally liable unless he protected himself by taking the B. I. Under it, he was allowed a year to frame and lodge an inventory of 'all lands, houses, and annual rents,' &c., to the value of which his liability became limited. But the privilege is now of little value, as a decree of special and general service now makes the heir liable only to the value of the heritage which comes to him.

Benefit or Friendly Societies. Societies are so called which are formed for the common good of the members, by each paying a stated sum periodically, while able to work, and receiving a periodical sum during sickness; and, in the event of a member's death, his funeral expenses are usually paid by the society, and sometimes a pension, after a certain age, is provided. There are, however, B. S. having great variety of scope. Some are established to facilitate the purchase of houses. As these are institutions of special and growing importance, we treat of them separately. See BUILDING SOCIETIES.

Here we shall only treat of those whose scope is as indicated above, or similar to that. The principle of which a B. S. tries to avail itself is that of the ascertainable certainty of the operation of the law of probability, when that operation can be noted over a sufficiently extensive field. See PROBABILITY, LAWS OF. Thus, as applicable to their purpose, while continuance of health and age at death are to an individual most uncertain, these events will occur we know in a multitude with nearly perfect regularity. But, unluckily, in the earlier days of B. S., there was no sufficient basis of observation and calculation on which to conduct their operations. To obtain sufficient statistics, and to work these statistics to bring out sound results with respect to sickness in different classes and at different ages, was a work of difficulty, requiring much time and science for its successful performance. The earlier societies, therefore, generally miscarried. One of their chief errors was not sufficiently taking into account—or wholly leaving out of account—the fact that liability to sickness, after a certain age, increases with increasing years. Another important element, with respect to which, until recent times, there were no trustworthy data, was the influence of occupation on health, and the effect of exposure to weather, as combined with hard and light labour. See VITAL STATISTICS. These important points have been ably investigated into and treated of by Mr A. G. Finlaison, in his *Report on F. S.*, with tables and returns, printed by order of the House of Commons, 16th August 1853; by Mr Neison, in his work on *Vital Statistics* (Lond. 1853), and by Mr H. Ratcliffe, in his *Observation of Rate of Mortality and Sickness existing among F. S.*, Manchester 1850.

By direction of Government, tables have been prepared by Mr John Field Pratt, late Registrar of F. S. in England, and by Dr Farr, actuary of the Registrar-General of England. So far, therefore, we may now consider that B. S. have trustworthy ground on which to conduct their business. The Legislature also has strenuously endeavoured (see next article) to promote the well-being of these societies; yet it is to be feared, so great are the difficulties involved in their successful constitution, that there are still great numbers in England either already insolvent or on the way to insolvency. The inefficiency of state control to prevent this unfortunate condition is pointed out by Mr Pratt in his report, where he says, that though the legality of the rules of the B. S. has been duly proved, 'it does not follow as a necessary consequence that the constitution of the society is based on good principles, or that the rates of payment are sufficient in amount to guarantee the promised benefits and allowances.'

Benefit or Friendly Societies, Laws regarding. Acts of Parliament respecting these societies were consolidated and amended by 18 and 19 Vict., c. 63. By that Act all previous statutes are repealed, with some reservation respecting societies instituted under any of them. Three registrars are appointed, one for England and one for Ireland (both to be barristers), and one (to be an advocate) for Scotland, all to be of not less than seven years' standing. The objects for which such societies may be established are set forth. These are mainly to ensure a limited sum to be paid to a member on the birth of a child, or to the family of a member on his death, and for the relief of those dependent on a member during his incapacity for work.

The funds of the society are to be invested according to the decision of the majority, in the savings banks, the public funds, with the Commissioners of the National Debt, or in such other securities as the majority shall direct, but not in land nor in houses (except for the purpose of holding their meetings), nor in personal securities.

Members are not allowed to belong to more than one such society. No member is to contract for an annuity exceeding £30, or for a sum payable on death or on any other contingency exceeding £200. No money is to be paid on an insurance on the death of a child under ten years of age for funeral expenses without a certificate, signed by a qualified medical practitioner, stating the probable cause of death. Provision is made against a trustee or officer paying any sum for funeral expenses above £6 for a child under five years, or £10 for a child between five and ten years. Where the rules of any B. S. direct disputes to be referred to justices, any justice in the neighbourhood of the society's place of business may act. In the event of a dissolution of a society, division of the funds may be referred to the registrar, whose award is final.

In England a secretary of state, and in Scotland the Lord Advocate, may authorise the formation of a B. S. under the Act for any suitable purpose, with the restriction above stated as to the amount of annuity or insurance to be contracted for.

Benefit of Clergy. This term is of very frequent occurrence in old expositions of criminal laws. The *Privilegium Clericale*, as it is called, shows the extraordinary influence and power of the clergy during the dark ages. Places consecrated to religious solemnities were held as sanctuaries, in which no criminal could be arrested. The clergy were not amenable to the criminal jurisdiction of a secular judge. The first of these immunities was abolished by 21 James I., c. 22. The second came down to our own time, not having been abolished till the passing of the Act 7 and 8 George IV., c. 28. Originally B. of C. was only accorded to those in holy orders, but subsequently the privilege was extended to every one who could read. When any one convicted of a felony, therefore, was about to receive sentence, a book was put into his hand, and if he could read he was branded on the hand and discharged; if he could not read, he was punished according to his crime. In the reign of Anne the reading test was abolished; and by the Act of George IV., above cited, B. of C. was done away with. Now every British subject, peer or commoner, layman or clergyman, is amenable to the same criminal procedure. The privilege of B. of C. never existed in the law of Scotland. An interesting historical account of its origin will be found in Blackstone, b. iv. c. 28.

Benéke, Friedrich Eduard, a German philosopher, born at Berlin, 17th February 1798. After studying at Halle and Berlin, he commenced to lecture on philosophy in the University of Berlin, but had to discontinue from the opposition of his views to those of Hegel. After Hegel's death in 1832, B. was appointed extraordinary professor. In March 1854, he committed suicide in the canal at Charlottenburg, but his body was not found till June 1856. His philosophy, founded on consciousness, and his method, the Deductive or Baconian, are allied to the British school of thought. B.'s *Lehrbuch der Psychologie als Naturwissenschaft* (2 vols. 1825-27), *System der Logik* (2 vols. 1842), *Erziehungs- und Unterrichtslehre* (1842), and *Pragmatische Psychologie* (2 vols. 1850), are among his most important works.

Benevento, the capital of a province of the same name, S. Italy, near the confluence of the Calore and Sabato, 32 miles N.E. of Naples, was one of the chief cities of Samnium, but came into the possession of the Romans about 274 B.C., and was an important city under the empire. In 571 A.D. the Lombards conquered B., and made it capital of a duchy embracing their entire southern possessions. The Normans took it in 1053 and bestowed it on the Pope, under whose direct dominion it came on the death of the feudatory prince in 1077. In 1806 it was taken by the French, and became a principality under Talleyrand, created Prince of B. by Napoleon; but in 1815 it was restored to the Pope, whose it remained till 1866, when it was annexed to the kingdom of Italy. It gives name to an archbishopric (founded in 969), and has 8 churches and 19 cloisters. It carries on a considerable trade in corn, and has some manufactures of gold and silver ware, leather, and parchment. But it is chiefly memorable for its relics of antiquity. Not only does it occupy the site, but in one sense it may even be said to be the ancient B. Almost every house is built out of the remains of Roman altars, monuments, columns, beams, &c. Perhaps the most splendid relic of the past is the Arch of Trajan (114 A.D.), which still serves as a gateway for the city, and bears the name of the *Porta aurea*. The inscription is still legible, and there are representations in bas-relief of scenes in the life of the emperor, and of the classic divinities. Pop. (1871) 20,133.

Benevolence. A kind of forced loan exacted by some of the kings of England from the people, was so called. The levying of a B. in the reign of Charles I. occasioned much excitement in the nation, and the Petition of Right (see RIGHT, PETITION OF) demanded that no tax shall be leviable in England without consent of Parliament. This was already a right of the nation under Magna Charta. It was further established by act of the Legislature in the reign of William and Mary, and the crown has not since called the right in question. To levy a tax is now exclu-

sively the privilege of the House of Commons. See under PARLIAMENT, *Supplies*.

Benfey, Theodor, one of the ablest philologists of Germany, was born at Nörten, 28th January 1809. He attended the gymnasium of Göttingen from 1816 to 1824, studied classical philology first at the university of the same city under the direction of Ottfried Müller and Dissen, and afterwards at Munich under Ast and Thiersch. From 1830 to 1834 he devoted himself at Frankfurt and Heidelberg to Sanskrit. In the latter of these years he was appointed a professor at Göttingen, where he has since remained. Excellent as are his *Ueber die Monatsnamen einiger alten Völker* (Berl. 1836), *Griechisches Wurzellexikon* (2 vols. Berl. 1839-42), *Ueber das Verhältniss der Egypt. Sprache zum Semit. Sprachstamm* (Leips. 1844), what has given him celebrity in the learned circles of Europe is his profound series of works on the Sanskrit language and literature: e.g., his edition of the Hymns of the *Samaveda* (with translation and glossary, Leips. 1848); the *Vollständige Grammatik der Sanskritsprache* (Leips. 1852); a *Chrestomathie* (with glossary, Leips. 1853-54); a *Kurze Grammatik der Sanskritsprache* (Leips. 1855); a *Practical Grammar of the Sanskrit Language* (in Eng. Berl. 1863; 2d ed. 1869); a translation of the *Pantschatantra* (2 vols. Leips. 1859), the original of the 'Seven Wise Masters,' famous during the middle ages in Western Europe; a *Sanskrit-English Dictionary* (1866); and a *Geschichte der Sprachwissenschaft* (Berl. 1869).

Bengal, Bay of, a portion of the Indian Ocean from Ceylon and Sumatra to the mouth of the Ganges. It receives several large rivers: the Saluen and Irrawady on the E., the Brahmaputra and Ganges on the N., the Mahanady, the Godavari, the Krishna, and the Kaveri on the W. The ports of any historical importance occur chiefly on the E. coast, such as Aracan, Negrais, Syriam, Martaban, Tavoy River, and King's Island. But since the conquest of Pegu in 1852 gave the British the entire coastline, the growing coasting trade has called into existence new ports, such as Moulmein (q. v.), Rangoon (q. v.), and Akyah (q. v.), on the E. or Burman side, Chittagong (q. v.) on the N.E., Morrellgunj and Port Canning on the N.W., and on the W. a whole series of roadsteads and harbours opened up by the British India Steam Navigation Company, which carries on a rich coasting traffic right round the bay and the whole peninsula of India, to the head of the Persian Gulf, Aden, and Zanzibar. The Nicobar and Andaman Islands lie in the S. part of the B. of B.

Bengal Presidency formerly denoted the whole of India N. of the Vindhya range, or of British India, except the Bombay and Madras presidencies. But, in fact, the term 'presidency' has ceased to have any save a historical or military meaning, India being now divided into 11 provinces. The only remaining trace of the three old presidencies is to be seen in the 'Bengal,' 'Bombay,' and 'Madras' armies, each of which is under a commander-in-chief of its own.

In 1765 the subah of B., Behar, and part of Orissa, was ceded by the Great Mogul to the E. India Company, and shortly thereafter the Presidency of Calcutta, which had been separated from that of Madras in 1707, was merged along with the above territories in the B. Presidency, the ruler of which was raised by Act of Parliament in 1773 to the rank of Governor-General of the Company's dominions. Many years of active annexation stretched the boundaries of B. from the Indus to the Irrawaddy, and from the Himalayas to the Deccan, but from 1854 to 1861 this vast territory was gradually divided into (1) the so-called N.W. Province; (2) the province of B. as it now exists; (3) the lieutenant-governorship of the Punjab; (4) the chief-commissionership of Oude; and (5) that of British Burmah.

Bengal, the largest and wealthiest province of British India, is bounded N. by Nepal, Sikkim, and Bhotan; E. by Assam; S. by the Bay of B.; S.W. by Gondwana or Central Provinces; and W. by the N.W. Province. Area (including Assam), 248,231 sq. miles; pop. (1872) 66,856,859, of whom 19,822, exclusive of the army, are British-born—a greater proportion than in any other part of India. Till 1874, B. comprised the divisions of Lower Bengal, Behar, Orissa, Chota, Nagpore, and Assam, with the adjacent hills; but in the February of that year Assam (with Cachar and Sylhet) were taken from the B. lieutenant-governorship to form the new chief-commissionership

of Assam, with Shillong for its summer, and Gowhaty for its administrative centre. Some two-thirds of the inhabitants of B. are agriculturists. The country, which is extremely flat throughout, is intersected by a multitude of streams, and is partly covered by dense forest and impenetrable jungle. Chief among the rivers are the Brahmaputra and Ganges, which unite about 100 miles from the sea, the former augmenting the volume of the latter, which has already been diverted into a multitude of streams to form the most wonderful delta in the world. In this bewildering network of rivers, the most important for navigation are the Hooghly of Calcutta, formed of the Bhagarutti, the Jellinghi, and the Sunderbuns or Sunderbans Passage. The level surface of the delta is in great part inundated during the rainy months (July and August), sometimes the districts flooded having an area of 100 miles. Great destruction is also caused by the streams when swollen changing their courses; but these dangers have been partially mitigated by the construction of dams and embankments of 2100 miles in extent. Above the delta the two great rivers have many tributaries; and so complete is the intercommunication of B., that almost no spot is 20 miles removed from a navigable stream. Some 30,000 boatmen are employed on the Lower Ganges alone. B. has an equable climate, the mean temperature at Calcutta for May 1871 being 84° 2'; for July, 83° 2'; for December, 69° 8'; and the annual rainfall varying from 50 to 85 inches. Over the maritime tracts of B. the monsoons prevail. The soil is richly alluvial, producing abundance of rice, various other grains, jute and rhea fibres, hemp, opium, indigo, silk, sugar, cotton, tobacco, coffee, tea, and the quinine-yielding chinchona. An immense tract of iron and coal is said to exist. There are various manufactures, of which perhaps cotton is the most important. Salt is manufactured in great quantities, but the industry has been abandoned by the Government in 1863, since which time it has nearly ceased. In 1872-73 the salt imported, chiefly from England, France, Madras, Bombay, and the Persian Gulf, was 247,782 tons, yielding £2,660,369 of duty. Calcutta is the capital of B. P., as it is the metropolis of all India; and among other cities of importance are Serampore, Moorshedabad, Dacca, Burdwan, Purneah, Hooghly, Midnapore, Bancorah, and Berhampore. The great public works of B. are the Orissa Canal (q. v.) and the East Indian and East B. Railway. There are fifteen colleges (ten government institutions and five private colleges aided) affiliated to the university, the chief of which are those of Calcutta, Hooghly, Dacca, Kishnaghur, Berhampore, and Patna. In 1873 they were attended by 1163 students. B. was conquered from the Moorshedabad viceroy of the Great Mogul by the E. India Company (1757) in a single battle gained against immensely superior numbers, and was formally ceded in 1765. Although prodigally fertile, B. is exposed to occasional failure of crops, and is therefore liable to such visitations of famine as happened in 1873. See Sir George Campbell's *Report on Administration of B. for 1871-72*; *Annals of Indian Administration for 1872-73*, edited by Dr George Smith (Serampore, 1874); *The Moral and Material Progress and Condition of India during 1872-73*, an official report, by Clement L. Markham (Lond. 1874); *Descriptive Ethnology of B.*, by Col. E. T. Dalton (Cal. 1874); Dr. Hunter's *Rural Life in B.* (1875), and *Stat. Acc. of B.* (20 vols. 1877).

Bengal Hemp, the fibre of *Crotalaria juncea*, called also Sunn, Sun, Shunum, Taag, &c., used in Bombay and Madras along with jute for making gunny bags. Jubbhupor hemp is obtained from *C. tenuifolia*, a variety probably of *C. juncea*.

Bengali, the name given both to the native of Bengal Proper (q. v.) and to the language which they use. The former are a mixture of the old indigenous Hindus and of the descendants of those Mohammedan conquerors who held the land for 300 years. The B. tongue is a descendant of the ancient Sanskrit, and is allied to Hindi, but is mixed with Arabic and Persian words traceable to the Mohammedan conquest. It is spoken by 30,000,000 of people, and has been used for literary purposes since the 16th c. B. literature, however, for the most part consists of translations from the ancient Sanskrit. See Long's *Descriptive Catalogue of B. Works* (1855). The best grammars are those of Haughton (1821) and Yates (1847); the best lexicons those of Haughton (1841) and Gordon (1837). See INDIA, LANGUAGES OF.

Bengal Kino, or **Butea Gum**, an astringent substance obtained from *Butea frondosa*, and resembling Kino (q. v.) in

its properties. In India it is used in tanning, in diarrhoea and similar diseases, &c.

Benga'zi (Arab. *Ben-Ghazi*), a seaport in the province of Barca, regency of Tripoli, lies on the E. coast of the Gulf of Sidra, on a sandhill which is separated from the mainland by a salt strand. The town has a dreary look from the sea, which is slowly eating away the barren soil. At the extremity of the tongue of land stands the castle of the governor, a large ruinous building. The only notable building in B. is a Franciscan monastery recently erected. The harbour of B. is fast filling up with sand, and can only be entered by small ships. The bazaars are still tolerably well provided, though the trade of B. has almost vanished since caravans have ceased to come from the S. The people are engaged in agriculture, and export some corn and cattle to Malta. England, France, and Italy have still consuls here. Pop. about 7000.

Bengel, Johann Albrecht, a German theologian, born at Winnenden, in Württemberg, 24th June 1687. He studied at Tübingen from 1703 to 1707; in the latter year he became curate of Metzingen, and in 1708 theological tutor in his college. In 1713 he was appointed teacher at Denkendorf; provost at Herbrechtingen (1741); consistorial councillor and prelate at Alpirsbach, Württemberg, where he died, 2d December 1752. B.'s fame rests mainly on his recension of the Greek text of the New Testament, which paved the way for the labours of later editors. Wesley's *Notes on the New Testament* are for the most part abridged from the *Novum Novi Testamenti* of B. (Tüb. 1742). His prophetic studies are *Kürze Offenbarung St. Johannis* (Stuttg. 1746, Reutl. 1850), and his *Ordo Temporum a Principio per Periodos Economicæ Divinæ* (Tüb. 1741, Stuttg. 1753), belong to that unfortunate department of religious literature the cultivation of which, in the long-run, is damaging both to the intellect and reputation of a scholar. See Burk, *B.'s Leben und Werke* (Stuttg. 1831), and *B.'s Literarischer Briefwechsel* (Stuttg. 1836).

Benguella, a country of Lower Guinea, Western Africa, extending from Cape Negro on the S. to the river Coanza on the N. It is hilly, well watered, rich in minerals, and abundant in the tropical and sub-tropical plants and animals common to the W. coast of Africa. The climate is unhealthy on the coast, but healthier in the interior. The inhabitants belong to the Congo race, and use the Bunda language. They are mostly fetish worshippers of a low order; but perhaps the slave-trade, still carried on by the Portuguese, who are the nominal masters of the country, has hindered their progress. The capital, **San Felipe de B.**, is situated on the coast, near the mouth of the Catumbella, in a beautiful but unhealthy vale, and has a pop. of 1500, of which three-fourths are free blacks, mostly converted to Catholicism, though still practising many heathen rites. The harbour is good, but not much frequented; and so utterly dull and lifeless is the place, that the Portuguese themselves call it 'Hell.' See Jams, *Die Portug. Besitzungen in Südwestafrika* (Hamb. 1845).

Be'ni, a river of Bolivia, S. America, 645 miles long, flowing through the provinces of Moxos and B., and forming with the Mamore the Madeira, one of the largest tributaries of the Amazon.

Benicarlo, a seaport town in the province of Castellon, Spain, on the Mediterranean, about 85 miles N.E. of Valencia by rail. It carries on a considerable export trade in full-bodied wines, which are mixed with claret and other French wines. Pop. 6060.

Be'ni Hassan, a village in Upper Egypt, situated on the right bank of the Nile, is chiefly noted for the fine grottos and catacombs in its neighbourhood, which were probably intended as sepulchres by the principal families of the ancient Hermopolis, which stood on the other side of the river. The number of grottos is about thirty, cut out of the calcareous rock of the district. On the walls are to be seen many interesting hieroglyphics and paintings.

Beni-Is'rael ('sons of Israel'), a remarkable race inhabiting the island of Bombay and adjoining coast, and numbering about 8000 or 10,000. In appearance they are a little fairer than the other natives of India of the same rank, and their physiognomy indicates a union of Jewish and Arabic blood. They are all circumcised, and receive the whole of the Old Testament Scriptures as of divine authority. They have been settled in India for

many centuries, and probably came thither from Arabia. See Dr Wilson in *Indian Antiquary* for November 1874.

Benin, a kingdom of Upper Guinea, Africa, bounded E. and N. by the Niger, S. by the Bight of B., and W. by Dahomey and Yoruba. The coast is low and level, but the land rises gradually to the Kong Mountains. B. is watered by numerous streams, and by some of the branches of the Niger. It is very fertile, and densely populated. Palm oil, salt, jasper, slaves, skins, &c., are exported in considerable quantities. The language of B. belongs to the many-membered family of languages spoken by the B. peoples or the negro tribes in and about the delta of the Niger, as far W. as Dahomey, and as far E. as Bonny. The capital, B., on the river B., a branch of the Niger, has a population of 15,000, and has still an active trade, though the abolition of slavery has diminished its prosperity.

Benin, Bight of, part of the Gulf of Guinea, on the W. coast of Africa, extending from Cape Formosa on the E. to Cape St Paul on the W., a distance of 370 miles. The shore is low, marshy, sandy, and intersected by numerous rivers. Palm oil and ivory are the chief articles of trade.

Beni-Souef, the chief town of a province of the same name in Central Egypt, and one of the principal places of trade in the country, on the left bank of the Nile, about 70 miles S. of Cairo, lies in a fertile region, and is the centre of business for the Fayûm valley. It has cotton-mills and alabaster quarries. In the neighbourhood a fair is held in spring, in honour of the saint Shilkani, which has greatly increased in popularity of late years, and now attracts large crowds. Mounds of rubbish, but no distinct ruins of an older town, are found all about the place. Pop. about 6000.

Benit'er (Fr. *benir*, to bless), or **Benatu'ra**, the vessel in which holy water is held in Roman Catholic churches. It is either movable, for use in processions, or fixed near the door, convenient for the people to dip their fingers in as they enter or leave the church.

Ben'jamin (Heb. 'son of the right hand,'—i.e., 'of good fortune') was the youngest of Jacob's sons (Gen. xxxv. 18), and the head of one of the tribes of Israel. When Jacob went down to Egypt the family of B. consisted of ten sons; at the first census in the wilderness the tribe numbered 35,400 men fit to bear arms; and at the second, 45,600. The territory of the tribe lay between Ephraim and Judah. Along with the latter tribe it formed the kingdom of Judah.

Ben'jamin of Tudela, a Spanish Jew who lived in the 12th c. If the title of his itinerary, which he wrote in Hebrew, could be believed, he travelled (1159-73) through Europe, Palestine, Mesopotamia, the Indies, Ethiopia, and Egypt. His citation of authorities and geographical errors show, however, that a great deal of his materials must have been gathered from hearsay, if he ever travelled at all. B.'s work has been often printed, and translated into Latin, English, Dutch, and French. The latest edition, that of Asher (Lond. 1841), contains a vocalised text, and an English version with learned notes.

Benjamin-Tree. See BENZOIN.

Ben Lawers (Gael. *Beinn Laubhair*, 'the resounding' or 'noisy mountain,' perhaps so called from its stormy situation or roaring cataracts), the highest mountain of Perthshire, some 32 miles W.N.W. of Perth, overhanging Loch Tay, and commanding a splendid prospect. It is 3935 feet high, and rises so gently that its ascent can be made on horseback. On its summit are found the small gentian, round-headed cotton-grass, and other Alpine plants.

Ben Led'i (commonly read in Gaelic as *Beinn-le-Dia*, 'hill of God,' but more correctly *Bein-Shleibhte* or *Shleibhtean*, the 'mountain of mountains,' or the 'mountain girl with sloping hills'), a mountain in the S.W. of Perthshire, near Loch Katrine, and 4 miles W.N.W. of Callander. It is 2836 feet high, and is beautifully situated at the entrance to the Trossachs (q. v.).

Ben Lo'mond (Gael. *Beinn Loman* or *Leamhan*, 'the mount of the elm,' probably so called from the 'elms' that grew about its base; the name *Leamhan* (Eng. *Leven*) is also given to the river that flows out of the loch), a mountain in the N.W. of Stirlingshire, on the E. side of Loch Lomond, some 27 miles

W.N.W. of Stirling, forming the southern extremity of the Grampian range, and reaching a height of 3192 feet. Its N. side is precipitous, but on the S.E. it rises gradually. B. is clad with vegetation to the summit. It is formed chiefly of mica slate, but quartz, greenstone, and felspar-porphry also occur. The view from the top in clear weather is remarkable for its singular beauty and extent, ranging from the fertile Lothians, the winding Forth, and the Castle of Edinburgh on the E., to the Atlantic, the Isles of Arran and Bute, and the Irish coast on the S.

Ben Macdhu'i (Gael. *Beinn Macduibhe*, 'the mountain of the son of darkness,' or the 'dark mountain'; others, less probably, read it *Beinn Muic Duibhe*, 'mountain of the black sow'), one of a group of mountains, forming a spur of the Grampians, in the S.W. of Aberdeenshire, and, next to Ben Nevis, the highest peak in Great Britain, being 4296 feet high.

Bennett, James Gordon, one of the most successful journalists in the United States, and founder of the *New York Herald*, was born at Newmill, Keith, Scotland, about the year 1800. He studied with a view to the priesthood at a Roman Catholic seminary at Aberdeen, but gave up this aim, and came to America in the year 1819. B. first went to Halifax, N.S., where he taught a school; and afterwards became a proof-reader in Boston. In 1822 he was engaged on a newspaper in Charleston, S.C. He soon returned to the North, engaged in newspaper-work in New York, and sometimes lectured. His earlier attempts were not always successful, but at length he found his career when he started the *New York Herald*, the first number of which appeared May 5, 1835. The paper soon attracted notice by its lively reports of the money and stock market, its startling personalities, sensational descriptions, and fresh news; and it ultimately yielded a large fortune to its adventurous editor and owner, who died June 2, 1872.

Bennett, Sir William Sterndale, a well-known English musician, the son of a Sheffield organist, was born in 1816. He studied at the Royal Academy of Music in London, and later on made the acquaintance at Dusseldorf of Mendelssohn, to whose inspiration his works show that he owed much. He died 1st February 1875. B.'s compositions are numerous—including overtures, concertos, sonatas, &c.—but although pleasing in themselves, have scarcely sufficient originality to become permanently popular.

Ben Ne'vis (Gael. *Beinn Nìomhais*, 'the bright or clear mountain,' so called perhaps from the snow that lies long on its top, or from the light colour of the rocks that form its summit), a mountain in the S. of Inverness-shire, the loftiest in Great Britain, having a height of 4406 feet. It consists at the base of granite and gneiss, and in its upper part, which is entirely destitute of vegetation, of fine brown porphyry. B. is steep, rugged, and difficult of ascent, and snow often rests on its top or lurks in its clefts throughout the year. *Nìomhais* is an Aryan word, the root occurring in Gr. *nip-to*, to wash; Gael. *nìg*, to wash; Lat. *niv-is*, snow. The river Nevis, which flows round the southern base of the Ben, is remarkable for the clearness of its waters.

Benn'gsen, Levin August Theophil, Count von, a celebrated Russian general, born at Brunswick, February 10, 1745. After spending some time in the Hanoverian service, he entered the Russian army in 1773, fought under Rumänzov against the Turks (1787), and in 1791 was intrusted by the Empress Catherine with the execution of her designs against Poland. Having fallen into disgrace with the Emperor Paul, he became one of the leaders in the conspiracy against that monarch, and his presence of mind contributed much to its success (1801). Intrusted with the command of the Russian army of the N. in 1805, he obtained in 1806 a slight advantage over Napoleon at Pultusk, commanded at Eylau (1807), led the Russian centre at Borodino (1812), and defeated Murat at Woronowa on the 18th October following. A difference with Kutusov made him retire from the Russian service for a short time, but in 1813 he commanded the Russian reserves in Saxony, and fought bravely at Leipsic, where the Emperor Alexander created him Count on the field. In 1818 B. retired to his paternal estate of Banteln in Hanover, and died there, October 3, 1826. B. wrote a work *On the Knowledge Indispensable to a Cavalry Officer* (Riga, 1794 and 1803).

Ben-Huta. See BEN, OIL OF.

Ben-Ehydding, a celebrated hydropathic institution, beautifully situated on an eminence on the right bank of the Wharf, 16 miles N.W. from Leeds, Yorkshire. The building was erected in 1846, and has considerable accommodation and extensive grounds. Under its late director, Dr M'Leod, who died in January 1875, this establishment acquired a great name.

Ben'ahie, or **Ban'shee** (Irish Gael. *bán* or *bean*, a woman, and *sihe*, a fairy; but this derivation is doubtful), in the superstition of Ireland and the Scotch Highlands, is a female fairy, who wails and shrieks when a death is about to take place in any family whose interests are dear to her.

Bent Grass (*Agrostis*), a genus of grasses, more than 170 species of which are distributed over the world. In Britain there are several species, some of which are called *Bents* in some parts of the country, a name, however, given by others more especially to the crested dogtail (*Cynosurus cristatus*). These are: *Agrostis alba*, forming a large portion of our natural pastures, and having several agricultural varieties, one of which, the Florn grass (*A. stolonifera*), is a useful grass for moist grounds; *A. canina*, of heaths and moorlands; *A. setacea*, and *A. Spica-venti* (dog-It.), an annual grass, sown in grain. Herd grass (*A. dispar*), a native of the United States, was at one time cultivated in Britain, but is at the present time more highly esteemed in France than in this country.

Bentham, Jeremy, the real founder of the Utilitarian school of philosophy, and an eminent writer on jurisprudence and legislation, was born at London, 15th February 1748. He was educated at Westminster School, and Queen's College, Oxford, where he graduated B.A. at the age of sixteen, and M.A. at twenty. He studied at Lincoln's Inn for the bar at the request of his father, and was 'called' in 1772, but practised only for a short time. 'I found it more to my taste,' he says, 'to endeavour to put an end to these abuses (i.e., in the Court of Chancery) than to profit by them.' When a boy, he had been nicknamed 'the philosopher,' from his tendency to speculation, and he now devoted himself to the criticism of ethics and legislation. His first work, *A Fragment of Government*, which was an ingenious criticism of Blackstone's *Commentaries*, was published in 1776, and brought him into notice. It was followed by his *Principles of Morals and Legislation* in 1780; his *Defence of Usury* in 1787; his *Introduction to the Principles of Morals and Legislation* in 1789 (new ed., Clar. Press, 1876); *Discourses on Civil and Penal Legislation* in 1802; *A Treatise on Judicial Evidence* in 1813; and *The Book of Fallacies* in 1824. M. Dumont, who translated several of his works into French, has done more than any one else to popularise his master's theories. B.'s father dying in 1792, he succeeded to property to the value of from £500 to £600 a year, and lived in competence till his death, at Westminster, 6th June 1832. His works have been collected and edited by Dr Bowring and Dr Hill Burton. The last has also given to the world *Benthamiana* (Lond. 1838), containing a memoir of B., an essay on his writings, and the passages setting forth most of his leading doctrines. B.'s views have had a great deal of influence on the present time. Although he did not invent, he was the first to popularise, the theory of the 'greatest good of the greatest number,' which is at the foundation of Utilitarianism. It is easy to criticise B. severely as a thinker, and still more as a writer. He was somewhat impatient, not a little eccentric, and latterly prolix and vain; but he gave incontestable evidence of power by creating a school of philosophy, and by educating disciples who surpassed their master. Utilitarianism as a system may not be destined to finally triumph, but it has at least secured the service of distinguished names—Mill, Romilly, Dumont, Burton, &c.

Benthamia, a genus of plants of the natural order *Cornaceæ* (q. v.), named in honour of George Bentham, one species of which, *B. frugifera*, of Nepaul, has ripened its fruits in the S. of England.

Bent'inck, the name of an historical family, which, as early as the 14th c., was settled in Gelderland, and was afterwards transplanted to England and Oldenburg. The elder or English branch was founded by Jan Willem van B. (born 1648),

third son of Hendrik B. of Diessenhan, in Overysel. From his boyhood Johann was a friend and favourite of William of Orange, was repeatedly employed by him in affairs of state, and in 1689 was raised to the English peerage as Baron of Cirencester, Viscount Woodstock, and Earl of Portland. His eldest son, Henry B., obtained in 1716 the title of Duke of Portland and Marquis of Litchfield, and in 1721 was appointed Governor of Jamaica, where he died, 14th July 1726. His son and heir, William B., born 1st March 1708, married Margaret Cavendish, sole daughter of the Earl of Oxford, and heiress of the Duke of Newcastle.—**William Henry Cavendish B.**, eldest son of the preceding, born 4th April 1738, succeeded to the dukedom 1st May 1762. During the North American war he steadily adhered to the opposition. In 1783 he became first Lord of the Treasury, but on the 27th December of the same year had to give way to the Pitt administration, and remained in opposition till 1792, when he began to support the Government against the French Revolution. In 1794 he was appointed Home Secretary, and held this office till Pitt's resignation in 1801. On the dissolution of the Whig ministry in 1807, he was again placed, in spite of his great age and mediocre abilities, at the head of the Government, and died prime minister, 30th October 1809.—**William Henry Cavendish B.**, second son of the preceding, born 4th September 1774, entered the army, rose rapidly, and in 1803 was appointed Governor of Madras. Recalled some years later, he was first employed in diplomatic service, and subsequently placed at the head of an English brigade in Spain. Later, he was sent to Sicily as commander-in-chief of the English auxiliary forces, and plenipotentiary to the court of King Ferdinand, where his high-handed conduct so offended the haughty Queen Caroline, that in 1811 she went to Vienna to conclude an alliance with her mortal enemy Napoleon. B. now interfered decisively in the affairs of the island, and drew up, in 1812, a constitution for the Sicilians, which was abandoned after the fall of Napoleon. In 1827 he was appointed Governor-General of India, and signalled his administration by establishing the overland route, forbidding the burning of widows, reorganising the finances, and establishing the liberty of the press. To this day his name is venerated by the Hindus. He died at Paris, 17th June 1839.—**William Henry Cavendish Scott B.**, eldest brother of the preceding, and fourth Duke of Portland born 24th June 1768, was made president of the Privy Council in 1827, and died 27th March 1854. By his marriage with a daughter of General Scott, a sister-in-law of George Canning, he had four sons, of whom, owing to the death of the eldest in 1824, the second, **William John Cavendish Scott B.**, born 17th September 1800, succeeded to the ducal dignity, and still (1875) survives.—**William George Frederick Cavendish B.**, better known as **Lord George B.**, and once famous as a Conservative leader, was the brother of the foregoing, and was born 27th February 1802. After being in the army for some time, he entered Parliament in 1826 as member for Lynn-Regis. He voted for the principle of the Reform Bill, but ultimately became a member of the Conservative party which acknowledged Sir Robert Peel as its head. When Peel, however, became an advocate of free trade, B., along with Mr Disraeli and others, separated from him, and formed themselves into the Protectionist party. Of this party B. became the leader in the House of Commons, and the speeches which he delivered against the Peel Government were believed to have contributed greatly to its overthrow in 1846. He died suddenly of heart-disease, 21st September 1848. His biography as a politician has been written by Mr Disraeli, his successor in the leadership of the Conservative party in the House of Commons. Among the measures which B. supported during his parliamentary career were those for the emancipation of the Roman Catholics and the removal of the civil disabilities of the Jews. B. was much attached to the turf, but was also strongly opposed to the dishonest practices frequently associated with it. See Disraeli's *Lord George B., a Political Biography* (Lond. 1851). The younger or Oldenburg branch does not possess any historical importance, and has only attracted notice from a wearisome lawsuit among its members regarding the ownership of property.

Bentley, Richard, 'by far the greatest scholar that England has ever produced,' born at Oulton, near Wakefield, January 27, 1662. In 1676 he entered St John's College, Cambridge, as

a subsear, and took the degree of B.A. in 1680. After acting for a year as head-master of Spalding Grammar School, he became tutor to the son of Dean (afterwards Bishop) Stillingfleet, and in 1689 he removed with his pupil to Oxford, where both were members of Wadham College. B.'s first publication was a Latin letter to Dr Mill (1691), containing notes on his edition of the *Chronicle of Malala* or *Malelas*. In 1692 and 1694 he was chosen to preach the Boyle Lecture on the Evidences of Natural and Revealed Religion. During his long and active literary labours B. prepared notes and emendations to the texts of Callimachus, Horace, Terence, Phædrus, Aristophanes, Manilius, Homer, &c., some of which were published by himself, while not a few were contributed to enrich the editions issued by other scholars. Some of his most ambitious schemes, particularly his famous proposal to restore the text of the New Testament to its condition at the time of the Council of Nice, were never accomplished. The Phalaris controversy and his protracted college quarrel were the most prominent events in B.'s life. Sir W. Temple, in his *Essay on Ancient and Modern Learning*, had declared the Letters of Phalaris to be the best Letters in the world. Boyle issued an edition of the Letters, the preface of which contained a reflection on the courtesy of B. as King's Librarian. B. took his revenge by appending to Wotton's *Reflections* an attack on the genuineness of the Letters. Boyle, aided chiefly by Atterbury, issued a Reply; and in answer to this Reply there appeared, in 1699, B.'s famous *Dissertation*, the wit, learning, and sagacity of which secured its author's enduring fame. In 1700 he was appointed Master of Trinity College, Cambridge, next year Archdeacon of Ely, and chaplain both to William and Mary. His college reforms provoked the hostility of the Fellows, and a feud commenced, of which it may suffice to say that it issued in a legal process which lasted for twenty-six years, and during which B. repeatedly displayed the arrogance, and even ferocity, by which his character was disfigured. He died July 14, 1742. His works, in three volumes, have been edited by the Rev. Alex. Dyce. See *Life of B.* (2 vols. 1831) by Dr James Henry Monk, and De Quincey's biographical and critical essay.

Ben'turong, or **Binturong** (*Arctictis*), a genus of carnivorous mammalia intermediate in position between the Civets (q. v.) and Racoons (q. v.), and inhabiting India and the E. Archipelago. They are nocturnal animals, and possess long, hairy, prehensile tails. Two species are known.

Ben'ue, or **Bin'ue**, at one time also erroneously called *Tchadda*, because it was supposed to have a connection with the great lake of Sudan, a large river of Central Africa, forming the principal eastern tributary of the Niger, which it joins about 250 miles above the mouth of that river. Dr Barth regards it as the best means by which to communicate with the interior, seeing that the tract of land separating the basins of the B. and the Shari, which flows into Lake Tchad, is a flat alluvial region not more than 20 miles in breadth. Its sources are, however, still unknown, although several expeditions have been undertaken with a view to reach these, of which the most important are those of 1833 (Laird, Allen, and Oldfield), 1851 (Dr H. Barth), by far the most fruitful in results, and 1854 (Baikie), in which the steamship *Pleiad* penetrated as far as Gurowa, and its boats still further to Dulti, about 280 miles from the mouth of the B. This expedition ascertained that the name Tchadda was unknown to the natives. The expeditions of Vogel in 1855, of Baikie in 1857, and of Dr Nachtigal in 1872, did not add much to our previous knowledge.

Benyov'sky, **Moritz August**, Count of, born at Verbowa, Hungary, in 1741. He entered the Austrian army at the age of fourteen, served in the Seven Years' War, where his courage and capacity were conspicuous, and afterwards made several voyages from Dantzic to Hamburg and Plymouth. In 1767 he joined the Polish Confederation, and as general of cavalry contributed much to gain several victories over the Russians. Taken prisoner in 1769, he was banished to Kamtschatka, whence he contrived to escape in May 1771, with ninety-six companions, and arrived in September of the same year at Macao in China, the fugitives having suffered incredible hardships on the passage. From Macao he sailed for France on the 14th of January, arriving there in August 1772. The French Government proposed to him the founding of a colony in Madagascar. Reaching that island, 14th February 1774, he was in 1776 elected king by the chiefs.

Being at last driven from the island, he entered the Austrian service. On the 25th of December 1783, he made an unsuccessful proposal to the British Government to found a colony in Madagascar. Receiving private aid, however, both in England and America, he sailed from Baltimore, U.S., for Madagascar, arriving there 7th July 1785, but was killed, May 23, 1786, by a party of French soldiers sent from the Isle of France. B. was a man of singular intrepidity, love of adventure, and knowledge of character, who, on a wider field and with larger resources, might have made for himself a distinguished place in history. B. wrote in French *Voyages et Mémoires* (Par. 2 vols. 1791). The year before, an English translation of this was published at London by Nicholson.

Benzer'ta, **Lakes of**, the ancient *Hipponeitis Palus* and *Sisara Palus*, distant from Tunis 30 miles N.W., the former salt and the latter fresh. The fisheries are let by the Bey of Tunis for £4000 per annum. They are close upon each other, and connected by a channel.

Benzo'ic Acid is a white crystalline substance, having the formula $C_7H_5O_2$ or C_6H_5-COOH , and the properties of a monobasic acid. It was discovered at the commencement of the 17th c.; and was first obtained by subliming gum benzoin, from which circumstance it received the name of *flowers of benzoin* or *benjamin*. It is contained in gum *tragacanth storax*, *Peru* and *Tolu balsam*, in *Botany Bay resin*, &c. It is prepared commercially either by the sublimation of benzoin, or from the urine of the Herbovera, which contains *Hippuric Acid* (q. v.). On allowing the urine (generally that of oxen) to putrefy, the hippuric acid is resolved into B. A. and other products. The urine, after putrefaction, is neutralised with milk of lime, filtered, evaporated to small bulk, and treated with hydrochloric acid; the B. A. is then precipitated, and may be purified by sublimation. B. A., when quite pure, has no smell, but it is usually contaminated with a minute quantity of some substance, which gives it a pleasant aromatic odour. It is readily soluble in alcohol and ether, and also, though to a less extent, in water. When heated, it melts, and sublimes at about 145° C. If further heated, it boils, and may be distilled unchanged at 239° C. It combines with bases to form crystalline salts—benzoates—which are for the greater part soluble in water. Neither the salts nor the acid itself have any practical importance. Taken internally, B. A. becomes converted into hippuric acid, which is excreted in the urine.

Benzoin, in chemistry, is the camphor of bitter almond oil, which deposits after the commercial essential oil has been kept for some time. The pure essential oil can be entirely converted into B. by the action of a dilute alcoholic solution of cyanide of potassium.

Benzoin (Gum), or **Gum Benjamin**, a fragrant resinous exudation from a tall tree (*Styrax Benzoin*) found growing in Siam and the islands of the E. Indian Archipelago. The pleasant odour of B. becomes powerful and distinct on heating, and when it is melted by heat it gives off a vapour composed of B. acid. B. is a light-brown resin, mottled with patches of white somewhat opalescent matter, but in inferior varieties the white patches are small or altogether wanting. It burns with a dull smoky flame, evolving a pleasant resinous odour, and it is very largely used as incense in religious rites and for preparing perfumer's pastilles, as well as for varnishes. B. contains, in addition to a volatile oil, three different kinds of resin and *Benzoic acid*. In commerce two varieties of the substance are recognised—Siam B. and Sumatra B., the last of which is the purest and most valuable.

Benzol', or **Benzine'**, is a liquid hydrocarbon, having the composition represented by the formula C_6H_6 . It was discovered by Faraday amongst the products of the compression of oil gas, and was called by him *bicarburet of hydrogen*. It is now prepared in large quantities from coal tar. The tar is subjected to a preliminary distillation, and the portion passing from 60°–200° C. collected by itself (*light oil*). The light oil is then treated with sulphuric acid to remove nitrogen bases, and after washing with water and a dilute solution of caustic soda, is again distilled—the liquid passing between 80°–200° C. forming the B. of commerce. Pure B. is obtained from the commercial article by repeatedly subjecting it to the action of a freezing-mixture: the B.

crystallises out, leaving the impurities in the liquid condition. It may also be obtained pure by distilling a mixture of benzoic acid and lime—

B. is a volatile liquid, lighter than water (sp. gr. '899), and possesses a peculiar aromatic odour. It boils at 80° C., and solidifies to a crystalline mass a little below 0° C. It combines with Nordhausen sulphuric acid to form *B. sulphuric acid*, $\text{C}_6\text{H}_5\text{SO}_3\text{H}$. It is readily acted upon by bromine and chlorine, part of its hydrogen becoming replaced by these elements. Nitric acid acts upon it to form *Nitro-B.* or *essence of mirbane* (artificial oil of bitter almonds), $\text{C}_6\text{H}_5(\text{NO}_2)$. **B.** has become of immense importance as the source of Aniline, and Aniline Colours (q. v.). It is an excellent solvent of fats, resins, sulphur, phosphorus, some of the alkaloids, &c., and is much used for removing greasestains. It is very combustible.

The study of **B.** and its compounds has developed a new field in theoretical chemistry, and is at present largely occupying the attention of scientific chemists. Compounds derived from **B.** are known as *aromatic substances*, on account of their occurrence in most aromatic bodies.

Beowulf, the oldest heroic poem in the Germanic languages, and one of the earliest relics of English literature, was originally composed (according to Mr Kemble), about the time of the Teutonic invasions of England, though the extant version is probably not of earlier date than the 7th c. Mr Thorpe (*Beowulf*, 1855), believes that the present version was paraphrased from 'an heroic Saga composed in the S.W. of Sweden, in the old common language of the N., and probably brought to this country during the sway of the Danish dynasty.' Mr Arnold (*Beowulf*, 1876) argues strongly in favour of its English origin, and assigns it to the 8th c. Mr Oliphant (*Standard English*, 1873, chap. i.) says—'*B.* is to us English what the *Iliad* was to the Greeks. The old epic, written on the mainland, sets before us the doughty deeds of an Englishman before his tribe had come to Britain. The notion that the poem is Pagan in spirit will not stand the test of a close scrutiny. Throughout there is the most ample recognition of a righteous and overruling God, and the whole of the wild creations of Norse mythology are derived from Cain, the first murderer. The scene is laid mainly in Denmark, but the writer displays no familiarity with local colouring, and would scarcely have written as he did had he been a Dane. The poem consists of 6357 lines, and, besides its philological value, is interesting from its wild energy and picturesque glimpses of the old northern hero-life. It tells how **B.**, nephew of the king of the Geatas (Goths of S. Sweden), sails in a 'foamy-necked' ship over the 'swan-path' to Hrothgar, king of Denmark, whose residence, named Heort, is ravaged by 'a grim stranger, Grendel, a mighty hunter in the marshes.' **B.** tells the king he will watch for Grendel by night alone. Grendel enters the hall, and, as he is impervious to steel, **B.** tears his arm from the shoulder, and drives him into fenland. The conqueror is rewarded with praises and gifts; but Grendel's mother devours a friend of the king's by night, and changes joy to lamentation. This female monster dwells in a ghostly land, which is powerfully described. **B.** determines to seek her; 'better 'tis,' he says, 'for every one that he his friend avenge, than that he greatly mourn. Each of us must an end await of this world's life: let him who can work high deeds ere death.' He plunges beneath a gloomy flood, passes hideous monsters, and meets and slays 'the she-wolf of the abyss, the mighty sea-woman.' He is afterwards made king of the Geatas; rules for fifty years; is slain in fight with a fiery dragon, and is buried on a headland overlooking the sea, in accordance with his request that they should raise him a mound 'at the sea's naze, that seafarers afterwards may call it **B.**'s Mount, those who their foamy barks over the mist of floods drive from afar.' The Geatas lamented his fall, bewailing him as the mildest and kindest of kings and men.

B. describes a heroic age curiously similar to the heroic age described in Homer. It brings before us the feast in the mead-hall, with the chief and his health-sharers, the customs of the banquet, the rude beginnings of courtly ceremony, the boastful talk, reliance upon strength of hand, and the practical spirit of

adventure that seeks peril as a commercial speculation—for **B.** is undisguisedly a tradesman in his sword' (*Morley's English Literature*). **B.** is the valiant, rough hero whom Christianity and chivalry are to soften and transform into the ideal knight-errant. He is noble and generous, and undergoes incredible dangers for the sake of his fellow-men. So superhuman are his exploits, that Mr Kemble is uncertain whether to regard him as a historical or mythical personage, although inclined to identify him with a Norse god of agriculture, as the Saxons had a harvest-month named Beo. Mr Thorpe is disposed to regard **B.** as a contraction of Beadowulf ('wolf of battle' or 'slaughter'), although it may, in the earliest version, have appeared in the form Biae or Bave. But whatever disputes there may be as to the origin of **B.**, there can be none as to the power of the poem. It is pervaded by a sombre melancholy, totally unlike the sunny, changing animation of Homer. Though composed by a Christian *Scop*, it is still the work of a man who sympathised with the old traditions of his Pagan sires. The adventures and exploits of the hero are invested with all the picturesque surroundings of Norse superstitions. There is only one MS. of **B.** extant, executed, according to Mr. Thorne, in the first half of the 11th c. See Kemble's *B.* (1833, 2d ed. 1837); Kemble's *Translation of B.* (Pickering, 1837); Thorpe's *B., Text and Translation* (Oxford, 1855); Arnold's *Text and Translation* (Lond. 1876); and the German editions by C. W. M. Grein (2 vols. Göttingen, 1857-59), and Moritz Heyne (Paderborn, 1863, new ed. 1873).

Beipur, a thriving seaport on the W. coast of India, in the district of Malabar, province of Madras, 6 miles S. of Calicut. Iron ore is found in the vicinity, and there is a considerable trade in timber. **B.** is the terminus of a railway across the peninsula from Madras. Pop. about 6000.

Bequeath, to bestow personal property on any one by testament. In so disposing of real estate the proper term to use is *devise*. In Scotch law also, **B.** is only applied to movable (personal) estate. See LEGACY, WILL.

Bequest is a legacy of personal property. See LEGACY, WILL.

Béranger, Pierre Jean de, called by Thiers the French Horace, and certainly after Napoleon the most popular Frenchman of this century, was born at Paris, 19th August 1780. During the Revolution he lived at Péronne, where his aunt kept an inn, and where he was taught in one of the national schools conducted on Rousseau's principles. Here he was taught history, geography, and composition, but no Latin. After helping his father for a few years in a doubtful financial business, he adopted literature as a profession. Passing over his *Hermaphrodites*, and various religious effusions, his *Meditation* and *Pèlerinage*, all of which were composed between the ages of sixteen and twenty-two, and are unripe, imitative, and mediocre, we may note the first flashes of original genius in those incomparable *chansons* with which he solaced his early poverty in Paris. Till 1803 he was, indeed, very poor; but in *Les Guux* and *Roger Bon Temps* we see the gaiety and courage of his nature. From M. Lucien Bonaparte he got employment (1805) on Landon's *Annales du Musée*, and an *honorarium* from the Institute, which he afterwards generously gave to De Beauchamps. In 1809 he became a clerk to the university at £80 salary, where he remained till 1821. By 1813 his *Petit Homme Gris* and *Roi d'Yvetot* were well known; he joined a literary society called the 'Caveau.' His first book of songs appeared in 1815, after which he is known as the poet of the Opposition. Though a sincere republican, **B.** expressed frank admiration for the Emperor; and his disgust at some political conversions, and the irreverent expressions in his poem *Le Bon Dieu*, involved him in a prosecution, resulting in fine and imprisonment. He was defended by the elder Dupin. In 1825 and 1828 he published more songs, and shortly before the revolution of July was again imprisoned and heavily fined, the society 'Aide-toi' subscribing a large part of the fine. **B.** was intimate with Manuel, Lafitte, Thiers, and Dupont, and also with Hugo, Sainte-Beuve, Lamennais, and Chateaubriand. He steadily resisted the advice of his friends to enter political life, and even declined to put himself in nomination for the Academy, on the ground that election would compromise the independence of a *chansonnier*. After 1833 he wrote little, but in 1848 he was against his will elected by 200,000 votes member of the Constituent Assembly

for the department of the Seine. He declined to act. He died at Paris, 16th July 1857. B.'s fearless praise of liberty under the Empire, and of the Emperor under the Restoration; his keen sense of national glory, and of the joys of wine and grisettes; his vivid expression of the freedom and gaiety possible for the poor; above all, his exquisite versification, have made him a classic. His character and philosophy may be seen in two expressions: 'It is wealth to have few wants and many friends.' 'Those who are not selfish must be economical.' France has his songs by heart, and may read in them her own strength and weakness. They are irresistibly charming, but inspire no heroism. Editions of his works are innumerable. One of the finest is the *Œuvres complètes de P. J. de B.* (Par. 1835-36; new ed. 1857). See also *Ma Biographie* (Par. 1857), *Correspondance de B.* (4 vols. Par. 1859-60), and Jules Janin's *B. et son Temps* (Par. 1866).

Berar', formerly a Mahratta state, now under the British government of India, lies to the N. of the Nizam's territory; also known as the Hyderabad Assigned Districts. It is a fertile, well-watered region, and has been called 'the garden of India.' The chief natural product is cotton. In 1853 it was annexed by British rule, and consists now of an eastern and western division of the same name. The chief town is Ellichpore (q. v.). Area, 16,960 sq. miles; pop. (1871) 2,231,565.

Berat', an Albanian town of some importance, situated on the Beratina (ancient *Apsus*), about 92 miles S. of Scutari. Pop. estimated at 9000. B. gives the name to a Greek archbishopric.

Berbera, one of the most important trading stations in E. Africa, is situated on the N. coast of Somālī, 100 miles S. of Aden, at the head of a deep and finely sheltered bay. The harbour is the largest and best on the Somālī coast. It belongs to a Somālī people who dwell in the interior, and are rich in camels, oxen, and sheep. Two tribes of this people, the *Ajdi-Junes* and the *Ajdi-Achmed*, have the privilege of establishing a market here once a year, though not of directly buying and selling. They act as protectors, landlords, negotiators, interpreters, &c. In October they come down from the interior in small caravans, with all requisites for erecting bazaars and magazines; and by the end of November, when the N.E. monsoon favours sailing from Arabia, Persia, India, and E. Africa, thousands of buyers and sellers come from the ports of the Red Sea, from Aden, Muscat, Bassorah, Bombay, Zanzibar, &c., and a great scene of bartering begins. In March the barques gradually leave the bay, and early in April the last of the Somālī are gone, and the harbour and bay are left to solitude till the next season. Among the exports are hides, ostrich feathers, gum-arabic, drugs—especially myrrh, odoriferous resins, coffee, senna, wax, honey, &c. The principal imports are rice, maize, dates, cotton goods, iron, tin, zinc, copper, &c.

Berberida'ceæ, or Barberry order, a natural order of Dicotyledonous plants, herbs, or shrubs, with watery juice. 'Leaves alternate, compound or divided, usually without stipules. Flowers perfect: calyx of three to nine sepals, imbricated in one to several rows, often coloured. Petals as many as the sepals, and in two sets, or twice as many, often with a pore, spur, or glandular appendage at the base. Stamens equal in number to the petals, and opposite them, or rarely more numerous. Anthers extrorse, the cells commonly opening by an uplifted valve. Carpels solitary, often gibbous or oblique, forming a one-celled pod or berry in fruit. Seeds one, two, three in number, embryo (often minute) surrounded by a fleshy or horny endosperm' (Gray). Found in the temperate parts of Europe, America, Asia, and in the mountainous parts of India. There are about 110 species, and 12 genera, most of which have acid (owing to the presence of oxalic acid), astringent, and bitter properties. The *Mahonias* are beautiful flowering-plants of our gardens; a decoction of the roots of one of them (*M. aquifolia*), of N.W. America, is used by the natives and backwoodsmen of that region as a bitter tonic and in venereal diseases. The fruits of some are eaten, while the stem roots of others furnish a yellow dye. A large shrubby form (*M.* or *Berberis Balfouriana*) was discovered in Vancouver Island, and introduced into this country by Dr Brown in 1864. The Blue Cohosh (q. v.) and the Mandrake of America (*Podophyllum peltatum*) belong to this order. The latter plant has drastic properties.

Berbers, the name generally given to the indigenous pop. of N. and N.-W. Africa. They occupy a vast region, stretching from the eastern edge of the Libyan Desert, as far W. as the Atlantic, and from the negro states of Sudan to the shores of the Mediterranean. Whatever differences have been made in their fortunes by the course of history, under whatever different names they have come to be known, they are essentially one race, and conform to the same type, not only in language, but also in colour, features, and figure. Recent ethnographers and philologists have proposed to call them the *Hamitic*, or, with Herodotus, the *Libyic* race, in opposition to the *Ethiopic*, or black population of Africa. Unquestionably they are of the same stock as those nations of antiquity known as Mauri or Mauretanians, Numidians, Getulians, Phazanians, Nasamoneans, the Lybians of the Syrtes region, of Cyrenaica, of Marmarica, and of the desert oases of Augila and Ammonium. The Arab invasion and conquest in the 7th c. was probably the most powerful external influence that ever affected the B. It introduced among them a new language (Arabic), and a new religion (Mohammedanism), both of which have permanently established themselves, yet the native language of the B. is still in use, and their ancient characteristics have not disappeared. The most important of the Berber peoples are—1. The *Amazirghi* or *Amasigh*, properly *Masigh*, about 2½ millions in number, who inhabit northern Morocco, the whole of the Rif (where they were formerly dreaded for their piracy), and the northern part of the Atlas range as far as the province of Tedla. They are for the most part independent of the sultans of Morocco, and live either under hereditary princes of their own race, or in small republican communities. They breed cattle, dwell in villages, and occasionally (like Highland caterans) make predatory excursions into the more fertile plains in their neighbourhood. The Amazirghi are, in general, of a somewhat fair complexion; slender, but handsome in body; and brave, but revengeful in disposition. They are sworn enemies of all Europeans. 2. The *Shilluh* or *Shellah*, in southern Morocco, about 1½ millions in number, who occupy partly the great plain along the Omm-er-Rebiah and Tensift, and partly the southern Atlas, to its farthest spurs towards the Atlantic. They follow industrial and agricultural occupations, trade in European manufactures, and live in large towns and villages. In complexion they are darker than the Amazirghi, and are powerfully built, but possess a higher culture. Offshoots both from the Amazirghi and Shilluh have become nomads, and wander about in Bedouin (q. v.) fashion along the great level wastes south of the Atlas, such as the plain of Taflelt (q. v.), which is even named after the Amazirghi tribe of the Filālī. 3. The *Kabyles* (q. v.), in Algeria and Tunis, whose number is officially stated to be about 960,000. 4. The B. of Sahara, who inhabit the various oases scattered over that immense region. The most notable tribes are the Beni-Mezâb or Mozabites, the B. of Gadames, of Sokna on the frontiers of Fezzan, of Augila, of Ammonium, but above all, of the wide-spread and far-ruling nation of the Imosharh or Tuareg. These Imosharh, the purest, i.e., the most unmixed, of all the B., occupy the western oases between Ghadames, Tuât, Bilma, and the Niger, and have almost exclusive control of the great caravan trade between the Sudan and the seaports of the Mediterranean. See Barth's *Travels in Central Africa* (vol. i.); and Hanoteau's grammatical works on the Berber languages of the Kabyles and the Tuareg.

Berbice', the eastern division of British Guiana, S. America, has an area of 750 sq. miles, and a pop. of 30,000, of whom over 400 are whites. It is watered by a river of the same name, which is navigable for upwards of 150 miles. The chief products are sugar, coffee, and cotton. Near the mouth of the river B. stands New Amsterdam, the chief town and seaport, with considerable exports of rum, sugar, raw cotton, and timber.

Berce'to, a town of Italy, province of Parma, and 26 miles S.W. of the city of Parma, on the edge of the Apennines (*Lo Cisa Pass*), with a fine Gothic church, and a pop. of 3000.

Berch'ta (old High Ger. *Perahta*, 'shining,' 'white'), a spiritual being regarding whom there are stories in S. Germany and Switzerland similar to those about Hulda ('gracious,' 'benign') in N. Germany. Originally, beyond doubt, a heathen goddess, an embodiment of the kindly power of Nature, she sank with the spread of Christianity into a bugbear for frightening children. Frau B. was also, in particular, a severe taskmistress of spinners, and queen of the crickets, represented with a long iron

ness and very big foot. The *Perchten* springs and brooks in Salzburg and the Tyrol, probably also the *Bachtelag* in Switzerland, are probably memorials of the fact that B. was once an object of worship. The name B. has in modern times become *Bertha*.

Berchtesgaden, a market-village of Bavaria, on the Ache or Alpe. It is near the Austrian frontier, a little to the E. of which, at Frauenreuth, are the government saltworks, worked since the year 1174, and yielding annually about 7500 tons of salt. Pop. 1900.

Berçoy, a place on the outskirts of Paris, within the fortifications, formerly a separate town, now part of the capital, has numerous distilleries and sugar-refineries, with manufactures of chemical products, but is best known as the chief depôt of the wines and brandies intended for the capital.

Berdianak, a Russian seaport town, government of Taurida, on the N. of the Sea of Azov, is a place of great commercial activity, with mines of salt and coal in its neighbourhood. In 1828 it was an insignificant village, but, by the efforts of Prince Voronov, was raised to a town, and has since continued to prosper. Pop. (1867) 12,465.

Berditchev, or **Berdy Ozew**, an important trading town of Russia, government of Kiev, on the Gnilopjat, 92 miles W.S.W. of Kiev, and not far from the borders of Volhynia, to which historically it belongs. It is the private property of Prince Radzivil. B. has manufactures of tobacco, silks, perfumes, tallow candles, oil, wax, leather, &c., and is besides the centre of the S. Russian trade with Germany. B. has two weekly and five annual markets, the most important being held on the 12th June and 15th August, when the chief articles of trade are furs, silks, glass, ironware, woodwork, salt, fish, corn, sugar, cattle, and horses. Pop. (1867) 52,787, among whom are a considerable number of Jews.

Bereana, so named from those inhabitants of Berea mentioned honourably in Acts xvii. 11; known also as Barclayans, from their founder, the Rev. John Barclay (1734-98); an unimportant Christian sect in Scotland, whose doctrines, in the main Calvinistic, embrace such peculiarities as that unbelief is the unpardonable sin, that saving faith is accompanied by assurance, and that the Bible alone reveals to us the existence and character of God.

Berengar I., King of Italy, was the son of Eberhard, Duke of Friuli, and of Gisela, daughter of the Emperor Ludwig the Pious. When the various Frankish kingdoms agreed to depose Charles the Fat, and choose each a ruler for itself, B. was crowned King of Italy at Pavia in 888; but he never had a secure hold over the country, and his career is nothing but a record of sanguinary struggles. By the aid of Arnulf, the King of the Germans, or E. Franks, whom he acknowledged as his 'overlord,' B. was finally victorious over a formidable competitor, Guido, Duke of Spoleto. Guido dying in 894, his son Lambert wrested from B. a share in the sovereignty of N. Italy, and retained it till his assassination in 898. Meanwhile, the Magyars ravaged the N. and the Arabs the S. of Italy, and the Italian nobles, enraged with B. for not chastising the enemy, called in Ludwig, King of Lower Burgundy, who was crowned at Rome in 901. Four years later his nobles again revolted, and invited Rudolf of Burgundy to help them, who inflicted so decisive a defeat on B., 29th July 923, that the latter was driven to solicit the aid of the Magyars. This brought upon him the hatred of all Italy, and he was assassinated in the following year. B. left by his first wife, Bertha, two daughters, Gisela and Bertha, of whom the first married the Marquis Adalbert of Ivrea.

Berengar II., son of the Marquis Adalbert, and grandson of B. I., married Willa, niece of Hugo (Count of Provence), then King of Italy, in 934. Threatened by Hugo for having conspired against him, he took refuge at the court of the Emperor Otho I., whence he returned to Italy with an army in 945. In 950 he assumed the title of king, the interval being occupied by the rule, less real than nominal, of Lothar, the son of Hugo, whose death Willa is supposed to have compassed by poison. As a security for his power, he wished Adelheid, the widow of Lothar, to marry his son Adalbert, his associate in the regal power. She implored the protection of the Emperor Otho, who married her himself, and, in 952, reduced B. to the condition of a feudatory of the empire. But he soon took up arms again,

and the emperor was forced in 955 to send an army against him under his son Ludolf, who conquered B., but too generously gave him back both his crown and freedom. In 957 Ludolf died, it is said, of poison administered by Willa; and now B.'s tyranny became so odious that Otho himself was forced to come to Italy (961) and put him down. In 964 he was compelled by famine to surrender the mountain fortress in which he had taken refuge; and being sent as a prisoner to Bamberg, in Bavaria, he died there in 966.

Berenga'rius, a famous schoolman, was born at Tours in 998, became a canon of the Cathedral of Tours (1030), Archdeacon of Angers (1040), and died in 1088. He rendered himself famous by his opposition to the Romish doctrine of Transubstantiation, which had been formulated, and, as B. affirmed, introduced into the Church, by Paschasius Radbertus in the 9th c. He was induced, under successive popes, to sign three different statements of belief regarding the Eucharist, more or less of the nature of recantations. As far as his own opinion can be gathered from his controversy with Lanfranc, he denied the doctrine of Transubstantiation, but held as nearly as possible the Lutheran doctrine of Consubstantiation. For a long time nothing was known of B.'s writings save some letters, but in 1770 Lessing discovered at Wolfenbüttel the MS. of his reply to Lanfranc on the Eucharist controversy, which was, however, first published by the brothers Vischer, under the title *B. Turonensis de Sacra Cæna adversus Lanfrancum Liber Posterior* (Berl. 1834).

Berenice, the name of several celebrated Egyptian and Jewish princesses. *Egyptian*.—1. B., second wife of Ptolemy Soter, celebrated by Plutarch as the first in virtue and wisdom of Ptolemy's wives.—2. B., daughter of Ptolemy Philadelphus, and wife of Antiochus II., of Syria, by whom she was put away. B. was then murdered by the partisans of Laodice, the former wife of Antiochus.—3. B., daughter of Magas, King of Cyrene, and wife of Ptolemy Euergetes. She dedicated her hair in the temple of Venus for her husband's safe return from Syria. It was removed, it is said, to form a constellation, and was celebrated by Callimachus in a poem, which was translated by Catullus. B. was put to death by her son, Ptolemy Philopator.—4. B., daughter of Ptolemy Lathyrus, and wife of Alexander II., grandson of Ptolemy Physcon. She was murdered by her husband nineteen days after marriage.—5. B., daughter of Ptolemy Auletes, and eldest sister of Cleopatra, filled the throne from her father's expulsion, B.C. 58, till his restoration, B.C. 55, when she was put to death. She was the wife successively of Seleucus and Archelaus. *Jewish*.—1. B., daughter of Costobarus and Salome, was married first to Aristobulus, and afterwards to Theudion.—2. B., daughter of Agrippa I., was thrice married: to Marcus, son of Alexander the Alabarch; to her uncle Herod, King of Chalcis; and to Polemon, King of Cilicia, whom, however, she soon deserted to return to her brother Agrippa. After the capture of Jerusalem, she went to Rome, where the indignation of the people alone prevented Titus from raising her to his throne.

Berenice (mod. *Sakdyt-el-Kubli*), an ancient Egyptian town on the Red Sea, built by Ptolemy Philadelphus; once a great emporium of trade with the East, but now interesting only for its ruins, the chief of which is the small sandstone Temple of Serapis, containing sculptured figures in basso-relievo, and hieroglyphics. In the vicinity of B. are emerald-mines. B. was also the name of four other ancient towns, the most noteworthy being *B. Panchryson* (the 'all-golden'), also on the coast of the Red Sea. Here the Egyptians found their great supplies of gold, employing prisoners and criminals in the extensive mines.

Beresford, William Carr, Viscount, one of the most eminent of the lieutenants of the Duke of Wellington, was an illegitimate son of George De la Poer, first Marquis of Waterford, born 2d October 1768. He entered the army in 1785, served with distinction in various parts of the world, and in 1808 joined the British army in Portugal. He fought at the battle of Corunna under Sir John Moore, and, after covering the embarkation of the troops, returned with them to England. In 1809, B. was appointed commander of the Portuguese army, succeeded in restoring discipline to it, and was rewarded with the honour of Marshal of Portugal. The skill with which he rapidly transformed swarms of rude peasants into active and intelligent soldiers was never surpassed. Under Wellington he played a brilliant

part, winning the battle of Albuera, May 16, 1811. He was severely wounded at the battle of Salamanca, took Bordeaux, February 27, 1814, and was present at the battle of Toulouse. B. was created in 1814 Baron, and in 1823 Viscount B. From January 1828 to November 1830 he was Master-General of the Ordnance under the Wellington administration. Many Spanish and Portuguese titles were conferred upon him. He died without issue, at Bedgebury Park, Kent, 8th January 1854.

Beresina, or **Berezi'na**, a river of Russia rising in the government of Minsk, which, after flowing in a south-easterly direction for about 240 miles, joins the Dnieper. It is connected with the Duna by the B. canal. Borissoev, about 170 miles from its junction with the Dnieper, is the scene of the disastrous passage of the retreating French army under Napoleon, on November 27, 1812.

Berez'na, a town in the government of Tchernigov, Russia, on the Desna, 24 miles E.N.E. of the town of Tchernigov. It contains several churches, and has some trade. Pop. 9678.

Berezov, or **Beresof** ('the place of birch-trees'), a town in the government of Tobolsk, Siberia, on the Sosva, a tributary of the Obi. It lies in the midst of wide cold wastes, but has an important trade in skins and furs, and a great annual fair. Prince Menshikoff and Count Ostermann both suffered punishment and died here during the 18th c. Pop. 1570. There is another B. in the eastern government of Perm, Russia, near which are many gold-mines.

Berg, formerly a duchy of Germany, was a distinct state as early as the 12th c., but first became an independent duchy in the 14th c. After many changes of dynasty it came into the possession of Bavaria, who ceded it to France in 1806. Napoleon I. enlarged it, raised it to a grand-duchy, and conferred it first on Murat, and then on the Crown Prince of Holland. At the peace of 1815 it was given to Prussia. B. now forms part of the circles of Arnsberg, Cologne, and Düsseldorf, in Rhenish Prussia.

Berg, in German, Dutch, Frisian, and Swedish, signifies a 'hill,' and this sense the word retains, under all its forms, in the other Teutonic dialects: *Bjerg* in Dan., *Bearg* in Icel. and Norway, *Barg* in Low Ger., and *Borw* or *Borg* in Old Eng., also mean a hill. But a hill is a natural 'defence' or 'protection,' and so the word came to acquire the secondary meaning of a mound, rampart, fortification, or refuge, in which sense it survives in mod. Eng. under the form of 'Barrow' (q. v.). The Ger. *Burg* and the Old Eng. *Burh* (mod. 'borough,' 'bury,' and 'burgh') are only modifications of the original form to denote particular applications of the idea of 'defence.' A *burg*, or *burh*, is simply a 'protected' place, walled, stockaded, or otherwise defended, as distinguished from an open and defenceless hamlet.

Berga, a town in the province of Barcelona, Spain, near the Lobregat, 52 miles N.W. of Barcelona. It is commanded by a castle with a strong battery. The trade consists in the produce of the neighbouring country; cotton fabrics are also manufactured. Pop. 6333.

Bergama, the ancient *Pergamos* (q. v.), situated about 40 miles N. of Smyrna, in the vilayet of Aidin, Asiatic Turkey, on the Bakur-Chai, has numerous and splendid remains of its former greatness—temples, palaces, amphitheatres, aqueducts, &c. Pop. about 15,000.

Bergamo, an ancient and important town in the N. of Italy, province of B., is charmingly situated on several small eminences, the highest of which is crowned by a castle, between the rivers Brembo and Sexio, 29 miles N.E. of Milan. Pop. (1872) 37,363. B. is the seat of a bishop, and has an academy of painting and sculpture, a museum, a lyceum, a public library of 50,000 vols., and considerable manufactures of silk, cotton, and iron, besides a large trade in grindstones made in the neighbourhood. Among its numerous churches the Santa Maria Maggiore, the old Arian church San Alessandro della Croce, San Bartolomeo, San Andrea, Santa Maria del Sepolcro, and Santa Grata, are distinguished by their age, their beauty, and their pictures. The great fair or festival of San Bartolomeo is held in August, in the suburb of San Leonardo, in a large stone building erected for the purpose, and containing 600 stalls or booths, where business is done valued at more than a million sterling. B., anciently Bergamum, was a Roman *municipium*, was destroyed by the Huns in the 5th c.,

gave name to a Lombard duchy, accepted the protectorate of the Venetian republic in 1427, and remained in this relation till the conquest of Italy by Napoleon at the close of the 18th c. It is the birthplace of Bernardo Tasso, the father of Torquato, and of Tiraboschi, the historian of Italian literature.—The province of B., mountainous in the N., but belonging in the S. to the fruitful plain of Lombardy, has an area of 928 sq. miles, and a pop. (1872) of 368,152. The inhabitants, who are noted for the rudeness of their dialect, have the reputation of being fat and good-natured, but cunning.

Bergamot, the fruit of *Citrus bergamia*, an ally of the common orange, cultivated in the S. of Europe. From its rind is obtained the B.-oil which is very largely employed in cheap perfumery and as a flavouring essence in cookery. B.-oil is a yellow essential oil, with a strong citrine odour, obtained by expression. It thickens considerably with age, and deposits a solid white substance called B.-camphor.

Ber'gedorf, a town and territory between the Elbe and the Bille, belonging to Hamburg, Germany. The territory formerly belonged to both Hamburg and Lübeck, but in 1867 the latter town resigned its share in the government to Hamburg for 200,000 thalers. Pop. of town (1872) 3600, chiefly engaged in husbandry and cattle and poultry rearing. Pop. of territory, part of which is known by the name of Vierländer ('Four Lands'), 12,510.

Ber'gen, the capital of a province or stift of the same name, and, next to Christiania, the chief trading town of Norway, situated on the Vaagen, a deep inlet of the sea. It is strongly fortified, and has a capital harbour, which is, however, somewhat difficult of access. It is the see of a bishop, and the principal building is the cathedral; but there are various other handsome churches, municipal and charitable institutes, besides an inferior law court and public libraries. There is a naval squadron stationed here, and the chief industry is the herring trade; the export in this item alone amounting to some 200,000 tons annually. B. also exports great quantities of dried fish, cod-liver oil, skins, and feathers. The imports are for the most part brandy, wine, corn, cotton, woollens, coffee, and sugar. Pop. (1875) 34,384, including the suburbs of *Sandviken* and *Skudviken*. The town was founded by Olaf Kyrre in 1069, and during the middle ages was the most important Hanse town in Norway. The earliest foreign treaty ever made by England was entered into with B. in 1217. In 1348 the black pestilence broke out in B., whence it spread throughout the kingdom, and it has frequently reappeared in the town.—The province of B. has an area of 9628 sq. miles, and a pop. (1875) of 238,854. It extends along the coast, and has much fishing and cattle-rearing.

Bergen-op-Zoom, a town and fortress in N. Brabant, Holland, on the small river Zoom, where it enters the E. branch of the Scheldt, and 17 miles N.N.W. of Antwerp. Its defences are strengthened by its being situated on an elevation surrounded by marshes and sands, which are covered by the tide at high water. It was a stronghold of the Netherlands in their war with Spain, and withstood successfully many formidable attacks; and after the works were added to by Cohorn it was deemed impregnable. It was taken, however, twice by the French; first in 1747, and again in 1794; but the British, who, under Sir Thomas Graham, attempted to surprise it on the night of March 8, 1814, were repulsed with immense loss. The French gave it up under the treaty of Paris. The principal trade is in anchovies, and earthenware is manufactured. Pop. 9139.

Ber'gerac, a town of France, department of Dordogne, in a fertile plain on the right bank of the Dordogne, 26 miles S.S.W. of Périgueux. It is ill-built, with narrow winding streets. Over the Dordogne is a bridge of five arches. The chief manufactures are liqueurs, chemical stuffs, paper, serges, hosiery, and earthenware. Several brandy-distilleries, tanneries, iron-foundries, and smelting-furnaces are in the neighbourhood, and the department is noted for its wines. B. owes its origin to the Abbey of St Martin, founded in 1080; was originally a strong fortress, and played an important part both in the English and Huguenot wars. Louis XIII. demolished the fortifications in 1621. Pop. (1872) 8024.

Berghaus, **Heinrich Karl Wilhelm**, a celebrated geographer, was born at Kieve, in Rhenish Prussia, May 3, 1797.

educated at Münster, and held the chair of Mathematics in the Berlin Architectural Academy from 1824 to 1855. His chief cartographical works are *Atlas von Asien* (1833-43), the famous *Physikal. Atlas* (90 plates, Gotha, 1838-48; 2d ed. 1849-51), and a *Sammlung hydrogr.-physikal. Karten der Preuss. Seefahrer* (Berl. 1840-48). The principal of his many important geographical writings are his *Allgem. Länder- und Völkerkunde* (Stuttg. 6 vols. 1837-41); *Die Völker des Erdballs* (Brün. and Leips. 2 vols. 1845-47); *Deutschland seit hundert Jahren* (Leips. 5 vols. 1859-62); *Was man von der Erde weiss* (Berl. 4 vols. 1856-60); and *Briefwechsel mit A. von Humboldt* (Leips. 3 vols. 1863).—**Hermann B.**, a nephew of the former, born 16th November 1828, is also well known as a geographical engineer, having published a *Karte des Oesthaler Gletschergebiets* (Gotha, 1861), a *Weltkarte in Mercator's Projektion* (Gotha, 1859), and together with Von Stülpnagel the splendid *Chart of the World* (8 plates, Lond. 1863).

Berghem, or Berchem, Nikolaas, a famous Dutch painter and engraver, was born at Haarlem, 1624, and died there 18th February 1683. His works, chiefly landscapes with cattle, are very numerous, a result both of his own industry and of the avareice of his wife, who kept him close at his easel. The striking qualities of his works, the excellence of which has carried them into all the good collections of Europe, are exquisite taste, and a quality of rich, truthful, and harmonious colour, which time has not been able to sensibly deteriorate. B.'s larger works have been sold in Paris for 24,000 fr. His etchings are much sought after.

Bergk, Theodor, a German philologist, was born at Leipsic, 22d May 1812, studied under Beck, Hermann, and Dindorff, and after many changes of residence, finally settled as professor at Bonn in 1869. B.'s services to the criticism and elucidation of the Greek poets are of great value. His chief works are the *Poeta Lyrici Græci* (Leips. 1843; new ed. 3 vols. 1853-67); *Commentationes de Reliquiis Comædiæ Atticæ Antiquæ* (Leips. 1838); his edition of *Aristophanes* (2 vols. Leips. 1852; 2d ed. 1857), and of *Sophocles* (Leips. 1857); but he has also executed numerous smaller works displaying fine scholarship and familiarity with all contemporary research.

Bergler, Joseph, a German painter, born at Salzburg in 1793, studied in Italy, and exhibited his 'Betrayal of Samson' at Parma, from the academy of which it obtained the first prize. He was appointed director of the academy at Prague in 1800, and died there in 1829. Besides a number of fine altar-pieces, B. executed numerous designs and pictures illustrative of events in the history of Bohemia.

Bergman, Torbern Olof, an eminent Swedish chemist, was born at Katharinberg, in the province of West Gothland, 20th March 1735. He distinguished himself at Upsala University, where, in 1767, he became Chemistry Professor. Friedrich the Great invited him to Berlin in 1776, but the love of his native land kept him at home. He died in his prime at Medevi, 8th July 1784. Most of his dissertations are collected into six volumes, entitled *Opuscula Torberni B. Physica et Chemica* (Upsala, 1779-94; Ger. by Tabort, Frankf. 1782-99).

Bergmehl, or 'Mountain-Meal', a whitish powder, occurring in various recent geological formations, and composed chiefly of the remains of the stinty or siliceous coverings of *Diatomaceæ* (q. v.), or low vegetable organisms. The name 'B.' is derived from the Swedish habit of mixing this deposit with bread and other kinds of food, under the idea that it is nutritious. Deposits of this substance occur in N. Wales, in Ireland, in Mull and in the Hebrides in Britain, and in Norway and Sweden. Probably the remains of *Foraminifera* (q. v.) are also mixed up with those of diatoms. Analyses of B. show that it contains a certain proportion of organic matter—3 or 4 per cent.

Bergues, a fortified town of France in the department of the Nord, about 5 miles S.E. of Dunkirk, with which it is connected by a canal. There are manufactories of soap and tobacco, also sugar and salt refineries. B. is an old town, and has the ruins of a once magnificent abbey, built by Baldwin IV. Pop. (1872) 5774.

Bergyll, or 'Norway-Haddock' (*Sebastes Norvegicus*), a genus of Teleostean fishes, of the family *Triglada*, which group is also represented by the gurnards, &c. This fish somewhat

resembles a perch in general form, and possesses the head-plates covered with scales. One long dorsal fin, having its anterior half spinous, exists. The eyes are large, and the teeth small and very numerous. The B. inhabits the northern seas, and occurs on the eastern coasts of Britain. It is coloured red, and is lightest in colour on the under parts. Its average length is 1½ or 2 feet. Its flesh is nutritious, the Greenlanders eating it in both the fresh and dried states.

Berhampore, a town of British India, province of Bengal, district of Moorshedabad, on the left bank of the Bhagirathi, a branch of the Ganges, 118 miles N. of Calcutta. It is the seat of a government establishment, and one of the chief British military stations in India, with a college and several churches and hospitals. B. enjoys as healthy a climate as any place in Bengal, great improvement having been lately effected in its sanitary arrangements. At the time of the mutiny this was one of the first places where disaffection showed itself, but before any decided action took place the native troops were disarmed. Pop. (1872) 27,110.—B. is also the name of a town and military station in the province of Madras, district of Ganjam, situated in a wide plain, 525 miles N.E. of Madras, and 325 S.W. of Calcutta. Pop. 20,000.

Beriberi, or Bad Sickness of Ceylon, is a name given to a serious disease, unknown in this country, but not unfrequent in Ceylon and India. The name B. is a reduplication of a word signifying *weakness*, and means great weakness. B. is characterised by great prostration, poverty of the blood, numbness of the surface of the body, and general dropsy, not only in the limbs, but into most cavities of the body. The disease often breaks out among troops and convicts. It is generally a fatal disease. Treatment consists in warm clothing, good diet, purgatives, and diuretics. It is stated that a residence of eight or twelve months is necessary before the disease manifests itself.

Berie, a town of British India, province of the Punjab, executive district of Rohtuk, 36 miles W. by N. of Delhi. Pop. (1871) 9723.

Berja, a town of Spain, in the province of Andalusia, 22 miles W. of Almeira, situated on the S. slope of the Sierra de Gador, the lead-mines of which employ most of the inhabitants. There is also some trade in wine and oil, and considerable linen, leather, and hardware manufactures. Pop. 8000.

Berkeley, a small borough-town in Gloucestershire, on the Avon, a mile and a half E. of its junction with the Severn. The Vale of B., in which the town lies, is a rich pasturage, and noted for its milk and cheese (the famous 'Double Gloucester'). Dr Jenner, the discoverer of vaccination, was born and is buried in B. B. Castle, to the S.E. of the town, was the scene of the murder of Edward II. Pop. (1871) 1161.

Berkeley, George, Bishop of Cloyne, and one of the most illustrious metaphysicians of the 18th c., was the eldest son of William B., and born on the 12th March 1684, at Kilcrin, near Thomastown, Kilkenny, Ireland. He was educated at Trinity College, Dublin, where he made the acquaintance of Swift. In 1713 he went to London, and became the esteemed friend of Addison, Pope, and the other wits and literary men of the day. When the Duke of Grafton was made Lord-Lieutenant of Ireland, B. became one of his chaplains, and in 1724 was promoted to the Deanery of Derry. In 1728 he sailed to America to establish in the Bermudas a missionary college for the conversion of the Indians, but not being supported by the government of Sir Robert Walpole, the scheme failed, and he returned to England, to become in 1734 Bishop of Cloyne. The duties of his diocese he discharged with zeal, and twice refused to give up his see. In 1752 B. removed to Oxford with his son—he had married in 1728 Anna Elvert, the daughter of the Right Hon. John Forster, Speaker of the Irish House of Commons—and on the 14th of January 1754, he was seized while reading with palsy of the heart, and died almost instantaneously. Besides being one of the most energetic churchmen and amiable men of his day, to whom justly 'every virtue under heaven' was ascribed, B. was one of the subtlest thinkers that Great Britain has produced. In a series of works mainly intended to rebut materialism, scepticism, and atheism, of which the most important are his *Treatise concerning the Principles of Human Knowledge*, published in 1710, and *Three Dialogues between Hylas and Philonous*, published in 1713, he advocated

absolute idealism, and denied the existence of the external world. This philosophy, laughed at when first promulgated, is now looked upon as one of the most complete schemes of metaphysics ever given to the world, although it is undeniable that it paved the way for the scepticism of Hume. Among B.'s other works are his *Theory of Vision* (1709), intended to demonstrate the dependence of our perceptions of distance, magnitude, &c., on the sense of touch; and two books on the virtues of tar-water. Various editions of his works have been published. The latest, and incomparably the best, is that by Professor Fraser of Edinburgh, who has also written his *Life* (1874). The language used by Mr G. H. Lewes when speaking of B. is simply just: 'There are few men of whom England has better reason to be proud than of George B., Bishop of Cloyne. To extraordinary merits as a writer and thinker he united the most exquisite purity and generosity of character, and it is still a moot-point whether he was greater in head or in heart.'

Berkeley Sound, an inlet on the N.E. of E. Falkland Island, much frequented by trading vessels on account of its good harbour.

Berkhamstead, Great, or St Peter's, a market-town of Hertfordshire, 22 miles W. of Hertford, and 28 miles N.W. of London, on the North-Western Railway. It lies in a valley, on the Bulborne, and on the Grand Junction Canal, and has some trade in timber, malt, and coals. There are also manufactures of chemicals, straw-plait, and fancy wooden wares. B. was a residence of the kings of Mercia, and was the place where the English nobles and prelates obtained from William the Conqueror an oath that he would govern according to the laws of Edward the Confessor. William gave the manor of B. to his half-brother the Earl of Moreton, who built on it a strong castle. The property, however, was seized by the crown in the reign of Henry I., and was conferred by Edward III. on his son, the Black Prince, when he created him Duke of Cornwall. It has since belonged to the Princes of Wales. The free grammar-school of B., founded in the reign of Edward, is still in existence. There are several other charitable foundations. The poet Cowper was born here. Pop. (1871) 3940.—**B. Little**, a beautiful village, four miles S.W. of Hertford, with a pop. (1871) of 408.

Berkshire, one of the most picturesque counties of England, lies between Hampshire and the Thames, and has an area of 752 sq. miles, and a pop. (1871) of 196,475. It is intersected by a tract of chalk-hills or downs, and is formed in the N. of coral-rag, in the S. of tertiary, and of chalk and greensand in the centre. The chalk range is a continuation of the Chilterns, and rises to a height of 893 feet in White Horse Hill, so called from a rude outline of an immense horse on its chalky side. The rich vale of Kennet lies S. of this range, and is watered by the stream of the same name. Along the entire N. boundary, a course, with windings, of 100 miles long, flows the Thames, receiving as tributaries the Kennet, Ock, and Leddon. In the E. of the county is Windsor Castle (q. v.), with its famous forest and park. The chief crops of B. are barley, oats, and wheat, and in 1873, 370,317 acres were under tillage. There is much pasture, and an extensive trade in dairy produce, including 'Double Gloucester' and 'pine-apple' cheese. The breeding of horses, cattle, swine, and other live-stock is carried on; but there are no important manufactures. Two canals and the Great Western Railway are the chief means of transit. Three members of Parliament are returned by B., besides two by the county town, Reading, and one each by Abingdon, Wallingford, and Windsor. B., originally *Beorocscyre*, 'bare-oakshire,' so called (according to Bosworth) from the polled oak in Windsor forest where public meetings were held, is a county rich in British, Roman, and English antiquities, has many fine churches, and several old castles.

Berleng's, the name of some twelve barren islets off the coast of Estremadura, Portugal, 8 miles N.W. of Carvoeira. Berlenga, by far the largest, is fortified, and gives name to the group.

Berlichingen, Götz von, born at Jaxthausen, near Hornberg, Würtemberg, in 1480. He was one of the many petty feudal lords in Suabia, who, holding their fiefs direct from the Emperor Maximilian, were entitled to *Faustrecht* (club-law), or

the privilege of private feuds, as if they were important sovereigns. Götz was present at the Diet of Worms (7th August 1495), when the Imperial Council formally abolished this right. Nevertheless, he always acted on the principle that on a just cause he was entitled to declare hostilities: as he did against Nürnberg in 1513. At the siege of Landshut he lost his right hand, which was supplied by an iron one. He was opposed to the Suabian league, and his friendship for Ulrich of Würtemberg made him an object of hostility to the Emperor, who twice put him under ban. When in 1525-26 the Suabian peasants rose to demand freedom from certain taxes, and a free choice of clergy, Götz put himself at their head. He was in consequence imprisoned at Augsburg and Jaxthausen for a number of years; but after the dissolution of the Suabian league he served under Karl V. against the Turks (1541), and against the French (1544). He died at his castle of Hornberg, 23d July 1562. Götz seems to have been a simple, brave, frank soldier, with the vices and prejudices of his class and time. He left an account of himself, first published in 1731 (best edition, Busching and Der Hagen, Breslau, 1813), which gives an interesting glimpse of contemporary life. The brilliant drama of this name by Göthe, Gerstenberg's *Ugolino*, and Klinger's *Sturm und Drang*, have been called typical works of the revolutionary literary movement in Germany known by that name. The B. family still exists in the two lines of Jaxthausen and Rossach, to the latter of which Götz belonged, the representative of the former having been his brother, **Hans von B.** (born 1476, died 1553). To the B.-Rossach line belongs **Friedrich Wolfgang G. von B.**, born 26th June 1826, a major in the Austrian army, and a member of the Upper Chamber of Würtemberg. In 1859 he was raised to the rank of a count, and has written *Urkundliche Geschichte des Ritters G. von B. und seiner Familie* (Leips. 1861).

Berlin is the capital of the Prussian monarchy and of the German empire, the chief residence of the Emperor, and one of the finest cities of Europe. It is situated near the centre of the province of Brandenburg, on both sides of the Spree, an affluent of the Havel, occupies a flat sandy plain, badly adapted for sanitary purposes, covering an area of some 22½ sq. miles, and is divided into 16 quarters, of which *Alt-B.*, on the right bank of the Spree, and *Alt-Köln*, on an island, are the oldest, while *Aeusserer Friedrichsstadt* has been built since 1838. The Spree, which cuts B. into two almost equal parts, and is connected by a canal with the Oder, is here some 200 feet wide, and has a slow current. The city is built mainly on a regular plan, and comprises some 596 streets and squares, and some 33,963 buildings, of which over 700 are public buildings, 80 being churches and chapels. Among the principal streets are Unter den Linden, 3605 feet long, and 155 broad, which leads from the Schlossbrücke to the Brandenburg Gate, and contains two double rows of lindentrees; Friedrichsstrasse, 8755 feet long, and having scarcely one foot of slope throughout; Wilhelmsstrasse, stretching away to the new Luisen Gate, with a length of 8652 feet, and Königsstrasse, noted for its trade and traffic. Of the squares, the most celebrated are the Opernplatz, containing an equestrian statue of Friedrich the Great by Rauch (1851); the Lustgarten (1828), one side of which is occupied by the museum; Wilhelmsplatz, with statues of Schwerin, Winterfeld, Seidlitz, Keith, Ziethen, and Leopold of Dessau; Belle-Allianzplatz, in the centre of which is the Victoria column (1843); the Gensdarmenplatz, the largest of the squares; and Leipzigerplatz, the site of the Brandenburg monument. There are several beautiful bridges, as Friedrichsbrücke, 235 feet long, having eight arches; Schlossbrücke, ornamented with eight marble groups of statuary emblematic of war; the Kurfürstenbrücke, built 1692-95, and the Alsenbrücke, built in 1864. A few of the most important buildings are the royal castle, a massive quadrangular building; the Emperor's palace; the palaces of Prince Ludwig, of the Queen of the Netherlands, Prince Karl, the Crown Prince, and Prince Albrecht, and the royal château of Monbijou; the royal armoury and guardhouse, on the model of a Roman castrum; the school of artillery and engineering; the university (formerly Prince Heinrich's palace), containing a large museum; the royal library (710,000 vols. and 15,500 MSS.); the Academy of Science and Art; the Academy of Music; the Royal School of Architecture; the chemical laboratory; the exchange; the mint; the state printing-office; the old museum, built by Schinkel in 1828; the colossal new museum (since 1843), with the fine portico frescoes of Kaulbach; the

national gallery; and the new town-house, opened in 1870. Some of the churches are as old as the 13th c., as the Nikolai or Hauptkirche, the Marien, and the Kloster; among the more modern are the Catholic St Michael's, the Protestant St Thomas's, St Hedwig's Kirche (the Rotunda), the new Synagogue, and the beautiful Dominican Klosterkirche in Moabit, erected in 1869. Notable among the monuments with which B. abounds are the Brandenburg Gate, 82 feet high and 200 wide, built in imitation of the Athenian Propylæa, crowned by a figure of Victory; the colossal equestrian statue of Friedrich the Great by Rauch (1851); the national war-trophy in the Invalids' Park (1854); and the column of victory in the Königsplatz, in commemoration of the recent campaign in France, unveiled 2d September 1873. The chief places of amusement are the opera-house (1843) for 1800 persons; the new theatre (rebuilt by Schinkel, 1817) for 1500; the Luisen theatre, formerly the palace of Princess Amalie; some eighteen other theatres; Kroll's famous 'établissements' (1852) for 5000 visitors; the new circus, and the well-known Orphicum. The Thiergarten, in the W. of the city, is the chief public park, but there are also the garden of Bellevue, and the botanical garden of the Academy.

In education B. has long held the place of honour among Continental cities. Its institutions comprise (1873) 10 gymnasia, with 5333 scholars, 54 real and higher schools, 91 public and 96 private elementary and middle schools, 59 infant schools, asylums for the deaf, dumb, and blind, and numerous technical colleges. The B. university was founded in 1810, and in 1870 had 3500 students. It has gained a high reputation, having numbered among its professors such names as Fichte, Hegel, Schelling, Savigny, Neander, Bekker, Böckh, Buttman, Strauss, Mommsen, Virchow, and Ranke. The famous Science Academy of B. was founded in 1700, and the Academy of Art in 1699, the former being now allied with the new astronomical observatory. B. has also a celebrated military academy for officers, and several departmental military schools. The city is rich in charitable institutions, of which the principal is the medical hospital called La Charité, now incorporated with the Clinical Institute, and receiving on an average 10,000 patients yearly. There are also the Bethany Hospital, founded 1847, with accommodation for 350 persons; Hedwig's Hospital, established in 1852; also some sixteen other hospitals and houses for the convalescent, nine orphanages, twelve soup-kitchens, and two asylums for the homeless.

Despite its inland position, B. has become one of the leading commercial and industrial cities of Europe. Its communication with the sea has been improved by the construction of several canals (the latest in 1858); and it is now the great railway centre of N. Germany, having (1875) no fewer than seven railway stations. The leading industries are iron-casting (ten imperial foundries) and engine-building, which is almost entirely in the hands of Messrs Borsig, Egel, and Wöhlert, of European fame, who have here seventy-five works. There are also important manufactures of silks, woollens, cottons, ribbons, tapestry, paper, tobacco, sugar, leather goods, scientific and musical instruments, jewellery, and fancy ware. A large quantity of spirits is made, and there are over fourteen large breweries—*Weiss beer* being the favourite drink of the population. There are also here royal porcelain factories. The beautiful cast-ironwork of B. is called 'B.-jewellery.'

Not only in trade and industry, but in political life and intellectual progress, B. is eminently the metropolis of the empire. As the seat of government and the residence of the court, it attracts inhabitants from all parts of Europe, and it almost justifies the name given it by the proud Berliners, 'the Paris of the future,' if not in point of architectural grace, at least as a centre of fashion and of brilliant society. For many years its increase has been steady, and at the same time so rapid as to recall the sudden growth of an American 'lightning' city. From being a town of 20,000 inhabitants in 1688, it had increased to 188,000 in 1817; to 311,000 in 1840; to 436,000 in 1851; and to 524,945 in 1861. In August 1875, its population was 968,634, including 21,448 soldiers, and of this number there were 732,617 Protestants, 51,722 Catholics, and 36,015 Jews. In 1878 the total pop. was 1,034,854. The newspapers and journals of B. embraced in 1872 some 36 of an official, 46 of a political and social, 24 of an ecclesiastical and religious, 207 of an artistic, scientific, and commercial, and 18 of a comic character.

The oldest parts of the city are the divisions Köln and B., originally two fishing-villages, the first having risen to some im-

portance under the Markgraf Albrecht II. (1206-20). In 1442 the Elector Friedrich II. built his *burg* ('castle') on the site of the present royal palace, and under Johann 'Cicero,' towards the end of the 15th c. B. became the residence of the Hohen-zollern princes. The town was improved, beautified, and enlarged by the great Elector Friedrich Wilhelm, and then by his son Friedrich II., afterwards Friedrich I., first King of Prussia. To Friedrich the Great, in the 18th c., is due its symmetry of plan and many of its finest ornaments. An Austro-Russian force occupied B. from the 9th to the 13th of October 1760. It was again taken by Napoleon in 1806, and acknowledged French supremacy till the failure of the expedition to Moscow in 1812. In the present century a new epoch in the architecture of B. has been marked by the genius of Schinkel, who has contributed so much to the stateliness and harmony of the modern city. See Spiker, *B. und seine Umgebungen im 19. Jahrh.* (Berl. 1833); Fidicin, *Geschichte der Stadt B.* (Berl. 1841); Streckluse, *B., seit 500 Jahren* (Berl. 1864); Kapp, *B. für Einheimische und Fremde* (Berl. 1869); *Betrachtungen über die Volksscala in B.* (1871); and *B. und seine Bauten* (2 vols. Berl. 1877).

Berlioz, Louis Hector, the leader of the romantic school of music in France, was born at La Côte-Saint-André (Isère), 11th December 1803, studied composition under Reicha, and later (1826) under Lesueur at the Paris Conservatoire, resided in Italy for eighteen months, became librarian of the Conservatoire in 1839, and a member of the Academy in 1856, and died at Paris, 9th March 1869. As a critic in the *Gazette Musicale de Paris* and the *Journal des Débats*, he exercised much influence. He was the composer of a number of orchestral works, as the *Overtures for the Carnaval Romain*, the *Corsaire*, the opera of *Benvenuto-Cellini*, and the *Flight into Egypt*, &c., in which he strove to express poetic ideas by musical sounds. In his attempts to do this he sometimes was led into extravagances which were rather the result of his ideas having outreached his capacity for executing them than of any extravagance in the ideas themselves. Besides these, he produced numerous symphonies. His books on the orchestra and on orchestration are very valuable, the principal being his *Traité d'Instrumentation et d'Orchestration Modernes* (1844). See B.'s *Mémoires* (Par. 1870; new ed. 1878).

Bermundsey, a parish in the county of Surrey, forming a S.E. suburb of London, possesses extensive tanworks, wool stores, and wharves. It also carries on shipbuilding, rope and sail making, and has manufactures of brushes, corks, glue, parchment, vellum, &c. Pop. (1871) 80,429. The name B., in Old Eng. *Burmundesea*, the 'Isle of Burmund' (perhaps *burh-mund*, the fortress?), points to a time when the Thames 'spread its sluggish waters over a broad lagoon, which was dotted with marshy islands.'

Bermudas, or Sommers's Isles, a group of small islands in the N. Atlantic, about 600 miles from Cape Hatteras in N. Carolina, in lat. 32° 20' N., long. 64° 50' W. They belong to Britain, and number in all about 300, only 15 or 16 of which, however, are inhabited; area of group about 12,000 acres; pop. (1871) 12,121, exclusive of the military and their families. They take the name B. from the Spaniard Bermudez, who first discovered them in 1527, and the name Sommers's Isles from Sir George Sommers, whose shipwreck here in 1609 led to their colonisation from Virginia four years later. They are 'the still-vest Bermoothes' of Shakespeare's *Tempest*, and their beauty has been celebrated by Waller in his *Battles of the Summer Islands*. Their situation renders them a valuable possession; they constitute a natural fortress; and their numerous bays afford ample protection to shipping. Hence they have been converted into the British naval station in W. Indian waters. Both politically and commercially their importance can scarcely be over-estimated, and towards the close of the first American war Washington contemplated their capture and conversion into a station for American men-of-war, with a view to cripple the British W. Indian trade. The four principal islands are those of Bermuda, St George's, Ireland, and Somerset. St George's Isle is the military station of the B.; its harbour has recently been greatly improved; a sandbank in front of it has been lowered by blasting, and an extensive breakwater has been built to protect it. The climate is genial and salubrious, and there is an almost perpetual spring. A refreshing sea-breeze modifies the heat, and the only climatic inconveniences are occasional hurricanes, and an excess of humidity during a S. wind.

The principal products are potatoes, garden-vegetables, maize, and tobacco. Fish are plentiful, and the fisheries constitute a valuable industry. Convicts are still conveyed to the B., and are employed on harbour work or on the fortifications. A mail steamer plies regularly between B. and Halifax, Nova Scotia. The islands have a representative constitution, there being a governor, a council of nine, and an assembly of thirty-six members. The military expenditure for 1872-73 was £196,273. The exports are few, and the imports consist chiefly of breadstuffs from the United States, and of manufactured goods from England. Hamilton, in Bermuda Island, is the capital. See *Memorials of the Discovery and Early Settlement of the B. or Somers Islands, 1515-1685*, by Major-General J. F. Lefroy (vol. i. Lond. 1877).

Bern, the second largest canton of Switzerland. Except a small portion on the N.W., where it touches France, B. is entirely surrounded by Swiss territory. In the N. and N.W. the canton is hilly; in the S. is the famous Bernese Oberland, some of whose summits (the Finsteraarhorn, the Schreckhorn, and Wetterhorn, and the Jungfrau) are the loftiest of the Bernese Alps. Enclosed by the mountains are beautiful and fertile valleys, Hasli, Grindelwald, Lauterbrunnen, &c., which produce corn, wine, and fruits. In these valleys, as well as on the more elevated Alpine pastures, numerous cattle are fed, and 150,000 cwts. of cheese are manufactured annually. The Aar and its tributaries rise in the Oberland, where also are situated Lakes Brienz and Thun. Watchmaking and wood-carving are the chief mechanical industries. The minerals are iron, lead, copper, marble, granite, and freestone. Area, 1870 sq. miles; pop. (1870) 506,465, of whom 436,304 were Protestants. On the decline of the Roman power, B. passed successively into the hands of the Alemanni, the Burgundians, and the Franks. In the 11th c. it became part of the German empire; at the end of the 12th c. Duke Berthold of Zähringen fortified the capital, which was in 1218 raised by the Emperor Friedrich II. to the rank of an imperial city, after which the population rapidly increased. Rudolf of Hapsburg was compelled to raise the siege of B. in 1288. The fame thus acquired was enhanced by the victory at Laupen, 21st June 1339, over an army of knights and burghers jealous of its growing power. After joining the Swiss Confederation (1353), B. increased its territory considerably both by purchase and conquest. It now sends 25 members to the National Council.

Bern (in French, *Berne*), capital of the canton of the same name in Switzerland, in 1848 declared to be the political capital of the republic, and since 1849 the permanent seat of the government. It is situated on a peninsula formed by the Aar, which encompasses it on three sides, and has an elevation of fully 1700 feet above the level of the sea. The city is regularly built, and the houses on each side of the two principal streets rest on arcades which form covered walks. There is a magnificent bridge over the Aar; the cathedral, founded in 1421, has a tower upwards of 200 feet in height, and numerous interesting sculptures and tablets; there are many fine public edifices, including a library containing 40,000 volumes, and a museum; while sculptured fountains and fine public promenades, which command splendid views of the Bernese Alps, enhance the amenity of the city and its environs. Other buildings are the church of the Holy Ghost, the church of the Dominicans, the Roman Catholic church, the mint, the palatial hospital, and the richly-endowed workhouse. The University of B., opened in 1834, has some 30 professors, 20 *privat-docenten*, and an average of 200 students. In May 1871 there were 250 students. There are also a gymnasium, a veterinary school, and a school of design. A school of art was founded in 1871. B. has considerable trade in the produce of the district, and there are frequent industrial and agricultural shows. The manufactures, which are of no great importance, include watches, clocks, mathematical instruments, toys, gunpowder, leather, and paper. Cotton-spinning has been recently introduced. Pop. (1870) 36,002, of whom 32,705 are Protestants, 2664 Catholics, and 853 belong to other Christian sects, or are Jews. B. is the old Suabian word for bear, and is said to have been given to the town at its foundation in 1191 by Berthold V., because he had killed a bear there. The arms of the city are bears, and some of these animals are still maintained by a special fund in the bear-ditch (*Bärengraben*). B. was made a free imperial city in May 1218 by the Emperor Frederick II. The corporation is possessed of so much valuable property that

no taxes are levied for municipal purposes, and there is a surplus sufficient to provide the citizens with fuel. B. is the birthplace of the eminent physiologist Haller, of whom there is a statue in the botanic garden. See Durheim's *Historisch-topogr. Beschreibung der Stadt B.* (Bern, 1859), and Wattenwyl's *Geschichte der Stadt und Landschaft B.* (Schaff. 1867).

Bernadotte. See KARL XIV.

Bernalda, a town in the province of Potenza, S. Italy, on the Basente, 31 miles W. of Taranto, and 15 miles inland from the line of railway. Pop. about 6000.

Bernard, Claude, a French physiologist, was born at St Julien near Villefranche, July 12, 1813, in early life went to Paris with a tragedy, and there began the study of medicine. At the Collège de France he was Magendie's assistant; he took his doctor's diploma in 1843; was called to the chair of General Physiology, just then instituted by the Faculty of Sciences, in 1854; and in the same year succeeded Magendie as Professor of Experimental Physiology in the Collège de France. His reputation dates from his *Recherches sur les Usages du Pancréas*, in the *Comptes Rendus de l'Académie des Sciences* (1856), and perhaps his most original and valuable contribution to physiology is *La Fonction Glycogénique du Foie* (1856), which contains the results of many years' investigation of the liver and its relation to the heart and nerves. In his *Leçons de Physiologie Expérimentale, appliquée à la Médecine* (2 vols. 1855-56), he raised many forgotten questions as to the functions of animal organisation, and he has since given a new bent to the study of experimental physiology by his numerous discoveries. Among his other writings are *Mémoire sur la Chaleur Animale* (1856), *Les Effets des Substances Toxiques et Médicamenteuses* (1857), *La Physiologie du Système Nerveux* (2 vols. 1858), *Expériences Physiologiques sur la Nutrition et le Développement* (1860), *Introduction à l'Étude de la Médecine Expérimentale* (1865), *Leçons sur les Propriétés des Tissus Vivants* (1865). He was made a member of the Academy of Medicine in 1861, grand officer of the Legion of Honour in 1862, president of the Society of Biology in 1868, and member of the Academy in 1869. He died in Paris, February 10, 1878.

Bernard, Great Saint, a mountain of the Vallais, in the Pennine Alps, 12,353 feet high, crossed at an altitude of 8648 feet by the famous pass between Martigny and Aosta, over which Napoleon led his troops into Italy, May 1800. Near the summit of the pass stands the noble hospice which was founded by Bernard de Menthon, a nobleman of Savoy, in 962, originally for the purpose of assisting the pilgrims to Rome, and which has been of incalculable service in rescuing travellers from all forms of Alpine danger. It is a massive stone edifice, with extensive accommodation, receiving on an average 9000 travellers annually. There is snow here for nine months in the year; the mean winter temperature is 15° F., that of summer 48° F. The institution is now chiefly supported by voluntary subscription. It is in the care of fifteen monks of St Augustine, whose lives, from the age of twelve to thirty-three, are devoted to the humane work, in which they are ably seconded by the faithful race of St B. Dogs (q. v.).—**Little Saint B.** is a height of the Graian Alps, 7195 feet high, and has also a pass, most probably that crossed by Hannibal. There is another hospice here.

Bernard, Saint, the most influential churchman of the 12th c., was born in 1091 at the Château de Fontaine, near Dijon. His father, whose name was Tescelin, was descended from the Comtes de Châtillon; his mother, Aleth, or Elizabeth, was a daughter of the Comte de Montbard. Sent to Châtillon to study, he astonished his masters by the rapidity of his progress. At the age of twenty-two he resolved to embrace the monastic life, and so irresistible was the eloquence with which he urged his resolution against the remonstrances of his family and friends, that his five brothers, his uncle Gaudry, and more than twenty other proselytes, followed him to Cîteaux in 1114. Four abbeyes, daughters of Cîteaux, were all founded about this period: La Ferté in 1113, Pontigny in 1114, Morimond and Clairvaux in 1115. Clairvaux was a desolate and savage valley. Here the young Cistercians built with their own hands their first religious abodes. At the age of twenty-four B. was chosen abbot of the modest community. The rigour of his austerities proved too much for the strength of his constitution, and on his recovery from a serious illness, he began gradually to interest himself in the general policy of the Church. Before long the solitary recluse,

by his exquisite art, impassioned rhetoric, exalted piety, and strenuous orthodoxy, made himself one of the greatest potentates in Europe. In 1125 he was active in mitigating the miseries of a national famine; in 1128 he vehemently defended the Bishop of Paris and the Archbishop of Sens against Louis le Gros; was conspicuous in the same year at the Council of Troyes, where the order of Knights Templars was forced to accept a monastic rule, and again, in 1129, took part in the deposition of the Bishop of Verdun. The death of Pope Honorius II., in 1130, provoked a discord among the cardinals, which spread through the Church itself. Two popes were chosen as his successor, Innocent II. and Anaclete, the former of whom had to seek refuge in France, while the latter remained in Rome, where his party was dominant. The great prelates and seigneurs assembled at Étampes declared (under the direction of B.) in favour of Innocent. Louis le Gros received him as head of the Church at Saint-Benoît-sur-Loire, while B. hastened to Normandy and Liège to secure the support of the English monarch and the German emperor. In both journeys he was more than successful. In 1131 B. paid his first visit to Italy. Pisa, Genoa, Milan, vied with each other in the depth of their homage and the splendour of their offers. The austere saint, who was equally proud of his power and his poverty, refused all ecclesiastical honours, but he could not hinder his return to Clairvaux from assuming the character of a triumphal procession. As he marched over the Alps into the valleys of Burgundy, the peasants of the mountain-villages and the inhabitants of the cities poured forth to 'do him reverence.' But active work was indispensable to B. While a larger monastery was being built for the reception of his disciples, he travelled through the S.-W. of France in company with Geoffroi, Bishop of Chartres and legate of the Holy See, detached Guillaume Duc d'Aquitaine from the party of Anaclete, and secured the re-establishment in their sees of those bishops who had been expelled for their fidelity to the legitimate pope. In 1137 B. was again summoned to Italy to sustain the still uncertain cause of Innocent. Once more his eloquence proved victorious. The Pisan cardinal, who was one of the warmest partisans of Anaclete, yielded to the ascendancy of B.'s genius, and denied the anti-pope, who soon after died of chagrin. It was in vain that the schismatics elected another in the room of Anaclete. The new anti-pope felt his impotence, hastened to the presence of the saint, and left in his hands the insignia of office. On his return to France B. came into collision with one whose gifts were certainly not less than his own. Abelard (q. v.), the tender humanist, who 'loved not wisely but too well,' had incurred the charge of heresy by his vindication of the rights of reason. A council was held in 1140, and by the influence of B. Abelard was condemned without even being heard. It is the least noble incident in B.'s career. But time brings about its revenges. The faulty Abelard is still remembered with affectionate pity by mankind, while the immaculate saint whose fame once filled the world only maintains a cold existence in the page of history. In 1145, a pupil of Clairvaux was chosen pope, under the name of Eugenius III., and henceforth B. exercised sovereign power in the Church. 'They say,' he wrote to Eugenius, 'that I am more pope than you.' Meanwhile an embassy of Christians from Armenia came to the court of Rome to explain the miserable state of the Eastern Churches. The Saracens, masters of Edessa, threatened Antioch and Jerusalem. Another crusade was necessary. Louis VII. of France undertook to lead it. Conrad of Germany joined him. All the resources of B.'s eloquence were employed to inflame the religious enthusiasm of the two nations. In 1147, an innumerable host marched to the East, and was utterly destroyed in the desiles of Asia Minor. When news of the disaster reached Europe, in 1149, B. suffered severe reproaches, and it may be doubted if he ever felt the same man again. But he was energetic to the end. His last act at least was apostolical. At the request of the Archbishop of Trèves, he went to Lorraine to appease the quarrels between the burghers and the nobles. Soon after his return to Clairvaux, he died, 20th August 1153. B. was canonised by Pope Alexander III. in 1174. His labours as a churchman may be conceived when we state that he caused to be founded or enlarged 72 monasteries—viz., 35 in France, 11 in Spain, 10 in Britain, 6 in Flanders, 4 in Italy, 2 in Germany, 2 in Sweden, 1 in Hungary, and 1 in Denmark. His writings are numerous. They consist of 440 epistles, 340 sermons, and 12 theological and moral treatises. They are admirable in passages, full of grace and natural dignity, but they do

not bear out his reputation for oratory; his ideas are often subtle without being profound, and his mystical interpretations of Scripture are unfitted to secure the respect of the modern world. The best edition is that of Mabillon (2 vols. Par. 1690, latest ed. 1839-40). During the last three centuries numerous lives of B. have been composed, among which may be mentioned, Chieré, *Vie de S. B.* (Par. 1601); Gros, *Vita S. Bernardi* (Par. 1645); Gulielmus a Sancto Theodorico, *Vita S. Bernardi* (Par. 1690); Bourgoing de Villefore, *Vie de S. B.* (Par. 1704); Clemencet, *Histoire Littéraire de S. B. et de Pierre le Vénérable* (Par. 1774); Neander, *Der Heilige Bernhard und sein Zeitalter* (Berl. 1813); and Ellendorf, *Der Heilige Bernhard und die Hierarchie seiner Zeit* (Essen. 1837).

Bernard Dog, St., a breed of dogs deriving their name from the Hospice of St B., where they have long been bred and trained for the purpose of seeking out travellers who are in danger of perishing in the snow. These dogs have been variously described as arising by breeding from the Alpine shepherd's dogs, from a Spanish breed, and from Danish hounds. Two breeds are known—one of a white colour, spotted with black, and covered by rough hair; the other with smooth, close hair, of grey or blackish colour. The latter breed is the most valued, and furnishes by far the greater number of these dogs in the present day. The head is massive, and the ears long, like those of spaniels. These dogs possess a remarkably acute scent, and when they discover a benumbed traveller they scratch away the snow, and by barking, call attention to the spot. A flask of brandy or other spirit is hung round the neck of each dog. Very many remarkable achievements, in which a display of instinct approaching to reason in its nature has been exerted, are related as having been performed by these dogs.

Bernardin, Saint, of Siena, an Italian theologian and preacher, was born at Massa-Carrara, 8th September 1380. He belonged to the illustrious Sienese family of Albizzeschi. B. first distinguished himself by his zeal and courage during the destructive Italian plague of 1400. In 1404 he withdrew into solitude, joined the Franciscans, was sent to the Holy Land, and on his return preached with success for fourteen years, refusing repeatedly the offer of a bishopric. In 1438 he was appointed vicar-general of the order for Italy. At his death in 1444 the 'Fratres de Observantia,' an order of which he was the founder, possessed upwards of 300 monasteries. B. was canonised in 1450, his festival being on the 20th of May. His works were published at Venice in 1591, at Paris in 1636, and again at Venice in 1745.

Bernardines. See CISTERCIANS.

Bernay (the Roman *Bernauium*), a town in the French department of Eure, on the Charentonne, 43 miles W. by N. of Evreux. It has manufactures of woollens, linens, paper, &c., also tanneries, and is noted for its great annual horse-fair. B. has an abbey of the year 1000, reconstructed in the 17th c., and now serving as the *Hôtel de Ville*. The town is often mentioned in works of the middle ages. Pop. (1872) 5695.

Bernburg, a town in the duchy of Anhalt, Germany, on the river Saale, 85 miles S.W. of Berlin, with which it is connected by railway. It has a castle situated on a steep sandstone rock, and its chief manufactures are paper, porcelain, starch, spirits, sugar, and tin-ware. There is also some trade in agricultural produce, and in fruit. Pop. (1875) 16,929, including the suburb of Waldau.

Bernhard, Duke of Weimar, a famous German general in the Thirty Years' War, was the youngest son of Johann III., Duke of Saxe-Weimar, and was born 6th August 1604. He first distinguished himself, under the Markgraf of Baden, at the battle of Wimpfen in 1622; in the year following at Stadtlonn, under Christian of Brunswick; and subsequently in the Dutch service, then the best military school in Europe. He next took service under Christian IV. of Denmark, but returned to Weimar in 1628. In 1631 he joined Gustavus Adolphus against the Imperialists, signalled himself at Werben (28th July 1631), and at the storming of Marienberg; conquered Mannheim at the close of 1631, and several other towns early in 1632. He completed the victory of Lützen (6th November 1632) after the fall of Gustavus, and expelled the Imperialists from Saxony. B.'s subsequent career is crowded with vallant deeds, and he sustained

in a high degree the reputation of the Germans for military prowess. In 1633 Bamberg, Kronach, Höchstädt and Eichstätt, and Regensburg (the key of the Danube), fell into his hands. His defeat at Nördlingen (27th August 1634) paralysed him for a time, and forced him to seek a French alliance, which he concluded with Richelieu 17th October 1635. In 1636 he conquered Elsass-Zabern, in 1637 was victorious over Duke Karl of Lorraine, in 1638 captured Seckingen, Lauffenburg, and Waldshut, and was victorious at Rheinfelden and other places. In the midst of his triumphs he was cut off at Neuberg on the Rhine, 8th July 1639, not without a suspicion of his having been poisoned at the instigation of France, who began to see that B. was a thorough German, who wanted to strengthen and unify his country. See Röse, *Herrzog B. der Grosse, von Sachsen-Weimar* (2 vols. Weim. 1828-29).

Ber'ni, Francesco, an Italian comic poet, after whom Italian burlesque poetry has been named *Versi Berneschi*, or *Poesia Bernesca*, was born at Lamporecchio, in Tuscany, about 1490. After acting for seven years as secretary to Ghiberti, Bishop of Verona, he repaired to Florence, where he was made a canon, and died there, 26th July 1536. His *Opere Burlesche* (2 vols. Flor. 1548) were republished in London, in 2 vols. (1721-24), with notes by Salvini, and are reprinted in the *Classici Italiani* (Mil. 1866). His recast of Boiardo's *Orlando Innamorato* is preferred by his countrymen to the original. It has been frequently reprinted. A critical edition by Molini and Valariani appeared at Florence in 2 vols. (1827-28). For purity of diction and breadth of humour, B. has few equals.

Ber'nier, François, a French physician and traveller, was born at Angers about 1620, studied at Montpellier, and subsequently visited Syria, Egypt, Arabia, and India, where he resided twelve years, eight of which he was physician to Aurungzebe. His chief works are, *Voyages de M. B., contenant la Description des Etats du Grand Mogol, &c.* (begun in 1670, published as one work, Amst. 1699); *Mémoire sur le Quittisme des Indes* (1688); *Sentiment de M. Descartes* (1684); *Abrégé de la Philosophie de Gassendi* (Lyon, 8 vols. 1678, augmented by 7 vols. 1684). B. (the *joli philosophe* of St Evremond) died at Paris, September 22, 1688.

Ber'ni'na, a peak of the Rhaetian division of the Middle Alps, attains a height of 13,291 feet, with a glacier on its northern slope almost rivalling the Mer de Glace in size. To the W. of the mountain is the B. Pass (7655 feet high), over which a carriage-road leads past two small lakes, between which lies the watershed of the Inn and Adda basins.

Berni'ni, Giovanni Lorenzo, sculptor, architect, and painter, spoken of among his contemporaries as the *Cavalier B.*, and the modern *Michael Angelo*, the most fortunate of all artists in securing, during his lifetime, the amplest admiration and rewards, was born at Naples, 1598. When only eighteen he exhibited his 'Apollo and Daphne,' and became famous. Pope Urban VIII. employed him to execute the baldacchino of St Peter's, and his chief architectural work is the colossal colonnade in front of the entrance. He also decorated the pillars sustaining the dome with statues and niches, and when cracks showed themselves in the cupolas, his enemies laid them to his account. His answer to this slur upon his architectural knowledge was building the Barberini Palace with its magnificent spiral staircase. In 1665 he went to Paris on the invitation of Louis XIV., travelling with the retinue and circumstance of a prince. At Paris B. executed the bust of the king and other works, and won much honour and more wealth. He returned laden with gifts to Rome, and died there, November 28, 1680, worth about £100,000.

Bernoulli, a celebrated family of mathematicians in the 17th and 18th centuries. They were descended from a **Jakob B.**, originally of Antwerp, who was forced by the oppression of the Duke of Alva to take refuge in France, where he died in 1583. A grandson of Jakob, bearing the same name, settled at Basel in 1622, and died there in 1634. The B. family here attained a high position in the little state, and held various important public offices.—**Nikolaus**, eldest son of the Jakob who died in 1634, was a prosperous merchant, and became a member of the great council of the city. He died in 1708, leaving eleven children, of whom the fifth and the tenth were the most famous.—**Jakob B.**,

fifth son of Nikolaus, was born December 27, 1654, at Basel, where he subsequently became professor of mathematics. He greatly extended the discoveries of Leibnitz, and was the founder of the integral calculus. He died August 16, 1705. His works were published in a collected form at Geneva in 2 vols. 1744.—**Johann**, tenth son, who succeeded his brother at Basel, was born July 27, 1667, and died January 1, 1748. His works were also published in a collected form at London and Geneva in 1744. The brothers were unquestionably the greatest pure mathematicians of the age, and had pushed their investigations so far as to outstrip even Leibnitz.—**Nikolaus B.**, the eldest son of the last, was born January 27, 1695; but had just time to show that he possessed the talents of his family when he died at St Petersburg, July 26, 1726.—**Daniel B.**, brother of the last (born February 9, 1700, died March 17, 1782), was the first to decompose motion of any kind into that of rotation and translation, and to investigate fluid motion solely from mathematical considerations. His works are numerous, treating of a great variety of subjects—vibration, sound, navigation, *vis viva*, &c.—**Johann B.** (born May 8, 1710, died July 17, 1790), brother of Daniel, and his two sons, **Johann** and **Jakob**, had also great mathematical talents, and their memoirs are to be found in the scientific publications of that period.—**Nikolaus B.**, (born 1687, died 1759), a nephew of the two first Bernoullis, was professor of mathematics and law at Padua, and some of his writings are found amongst those of Johann, his uncle. He is best known for his investigations into the conditions of integrability of differential expressions.

Bern'stein, Georg Heinrich, a German orientalist, born 12th January 1787, at Kospeda, near Jena, at the university of which he studied theology, philosophy, and the languages of the East. In 1812 he was appointed professor-extraordinary of oriental languages at Berlin, regular professor in 1821, and called to a chair at Breslau in 1843. In 1816 he published at Leipzig an Arabic poem of Szaft-Eddin, and he made valuable contributions to Syriac lexicography in Kirsch's *Chrestomathia Syriaca* (2 vols. Leips. 1832-37). The materials for his contributions to Syriac lexicography were collected at Leyden, Oxford, and Cambridge. Other works of B.'s are, *De Initii et Originibus Religionum in Oriente dispersarum* (Berl. 1817), the *Hilopadesa* (Leips. 1823), and *Arabische Grammatik und Chrestomathie* (Göt. 1817). He died 7th April 1860.

Beroö. A genus of Cœlenterate animals, included in the highest order of that sub-kingdom, the order *Ctenophora*. The body is spherical or globular in shape, and consists of a clear gelatinous mass, provided externally with *ctenophores* or comb-like bands or masses of *cilia*, by means of which locomotion is subserved. These *ctenophores* are disposed meridionally around the body. A digestive system, consisting of a stomach-sac and a series of canals, exists; the function of the latter being to distribute the nutritive products throughout the body. The genus B. is different from *Cydippe* or *Pleurobrachia*, which possess two tentacles. *B. fulgens* (so named from its phosphorescent light), *B. cucumis* and *B. borealis* are familiar species.

Berosus, a priest at Babylon in the reign of Antiochus II. (B.C. 261-246), who wrote in Greek a history of Babylonia, only fragments of which are extant in Josephus, Eusebius, Syncellus, and the Christian Fathers. He states that the materials for his work were derived from the archives in the Temple of Belus, and recent discoveries have proved the accuracy of his statement. See Richter's *Berosi Chaldaeorum Historia quæ supersunt* (Leips. 1825).

Berre, Etang de, a lagoon in the department Bouches-du-Rhône, France, 12 miles long and 8 broad, lies about 10 miles N.W. of Marseille, and is connected by a short channel with the sea. It has extensive saltworks, and on its N. shore stands the town of B., with some trade in salt, olive oil, almonds, and figs, and a pop. (1872) of 1358.

Berry, a term applied to the fruit of various plants. It is properly a fruit with one or more locuments, generally many-seeded, indehiscent, and pulpy. The attachment of the seeds to the placenta is lost at maturity, and they are scattered in the substance of the pulp. The gooseberry, the whortleberry, the fruit of the vine, &c., are examples. The term *uva* (applied specially to the fruit of the vine) is synonymous and unnecessary. Brown's *Manual*, p. 491.

Berry, or **Berri**, one of the old midland French provinces (now forming the departments of Indre and Cher). It took its name from the Gallic *Bituriges*. Under the Frankish counts it became a hereditary fief; viscounts ruled it from 917 to 1100; later it was purchased by Philippe I. of France. It was often an appanage of, and has given a title to, the French princes; was raised to a duchy in 1360, and was several times—e.g. in 1465—united with the crown. The inhabitants are called *Berrichons* or *Beruyers*.

Berry, Charles Ferdinand, Duc de, second son of Charles X., born 24th January 1778, 'emigrated' with his father, and fought under Condé against the republican army at Thionville. After the peace of Leoben he retired to Nursia, and latterly to England. In 1814 he returned to France, and in 1816 married Caroline, eldest daughter of Francisco, afterwards King of the Two Sicilies. The Duke was murdered by Louvel, 13th February 1820. His posthumous son, Henri, Duc de Bordeaux, Comte de Chambord, has frequently proclaimed himself Henri V., and is the hope of the Legitimists, or Bourbon party, his uncle, Duc d'Angoulême, eldest son of Charles X., having died in 1844 without issue. Mme. la Duchesse de Berri, who was the great ornament of Louis XVIII.'s court, and behaved nobly in the revolution of 1830, excited a foolish insurrection in La Vendée in 1832, which was promptly suppressed, the Duchess being confined for some time at Blaye. See Chateaubriand's *Mémoires du Duc de B.* (Par. 1820), and Alissan de Chazet's *Éloge historique du Duc de B.* (Par. 1820).

Berryer, Pierre Antoine (son of Pierre Nicolas B., one of the 'hommes de loi' of the first republic, and the defender of Marshal Ney) was born at Paris, 4th January 1790. Educated at Juilly, he joined the bar in 1811. A Legitimist in politics, he made his reputation in defending Generals Cambronne and Daballe, the newspapers *Drapeau Blanc* and *La Quotidienne*, and the Abbé de la Mennais against government prosecutions. Elected deputy for Puy in 1829, he opposed the address of the 221, which precipitated the revolution of July, supported the hereditary peerage, and in 1832 was suspected (unjustly) of complicity in the Vendean demonstration of the Duchess of Berry. In 1842 he sat for Marseilles, and in 1848 became a member of the council of President Bonaparte, but protested against the *coup d'état*. He became *bâtonnier* of the bar in 1852, and died 29th November 1868. In spite of his Legitimist principles (shown in his two pilgrimages to the Comte de Chambord) he supported the right of free association, and the reduction of the journal duty, and defended Louis Napoleon for the Boulogne expedition, and De Montalembert for an alleged libel in the *Correspondant*. In 1868 he defended the independence of the bench in the debate on the new press-law. He assisted in the revision of the code of 1814. It has been said that in B. Mirabeau revived. His name is also known in the struggle between the independence of the bar and the influence of the 'ministère public.'

Bersaglieri, the name given to a corps of Italian sharpshooters, which was organised early in the reign of the present king of Italy by General Della Marmora. They first obtained a reputation in the Crimean war (Sardinia being one of the Allies that fought against Russia), distinguishing themselves by their dash and bravery at the battle of Tchernaya. They were also of the greatest service in the wars which resulted in the unification of Italy, and from their activity have been much employed in putting down brigandage in the Two Sicilies, although complete success has not yet crowned all their efforts.

Berserk'er (Icel. *ber*, 'bare,' and *serker*, 'shirt; Low Sc. 'sark,' of mail), according to the Norse myth, was the grandson of the eight-handed Starkader and of the beautiful Alfhilde. B. was the dreaded hero of battle; he fought without mail or helmet, protected only by the terror which his fury inspired. His twelve sons shared the paternal rage for conflict.

Bertall, Charles Albert d'Arnoux, a French caricaturist, was born in Paris, December 18, 1820. It was intended by his parents that he should receive the training of the École Polytechnique, but at an early age he abandoned himself to the study of art, and became the pupil of Drolling, and the protégé of Balzac. The author of *La Comédie Humaine* suggested his pseudonym of B., a kind of anagram of Albert, and frequently provided his ready pencil with subjects. B. first ap-

peared as a designer on wood in 1843, and latterly devoted himself exclusively to this branch of art, having since shown marvellous rapidity of production and an inexhaustible fancy. He contributed 3600 drawings to the *Romans Populaires Illustrés*, and among his principal works are *Les Omnibus*, a comic review; *Le Diable à Paris*; *Petites Misères de la Vie Conjugale*; *La Physiologie du Gout*; *Paris en l'An 3000*; *Bibliothèque des Enfants*; besides numberless illustrations in the *Journal pour Rire*, *La Semaine*, *L'Illustration*, &c. In 1874 appeared *La Comédie de Notre Temps*, perhaps his cleverest work, in which the artist most effectively exposes the shams and abuses of modern society. While B.'s drawings are often finished and delicate, his crudest sketch exhibits a vigorous touch, and the stamp of a sarcastic originality.

Berth, or **Birth**, is a nautical term, describing the space occupied by a ship at anchor, including a small width of water all around her; the messing or sleeping-room of a sailor; and also the crib allotted to third-class passengers in ships.

Bertha (Old Ger. *Berhta*, q. v.), is the name of several noble ladies of the Teutonic race in early times. Two may be noted:—1. **St B.**, daughter of Charibert, King of the Franks, who, in A.D. 560, married Æthelberht, King of Kent, was the means of his conversion to Christianity, and the consequent spread of the gospel among the English conquerors of Britain.—2. **B.**, a housewife of renown, represented on seals and monuments of her time as sitting on the throne spinning, was daughter of Burkhard, Duke of the Alemanni, wife of Rudolf II., King of Burgundy beyond the Jura, and after his death regent for her infant son Konrad. She subsequently married Hugo, King of Italy, and died towards the end of the 10th c.

Berthier, Louis Alexandre, Prince of Neufchatel and Wagram, Marshal, born at Versailles, 20th November 1753, entered the French army, and served under La Fayette in his American campaign against Cornwallis. After the Revolution he became major-general of the National Guard of Versailles, a general of division in the Italian army of 1795-96, and subsequently chief of the staff, in which capacity he accompanied Napoleon in all his campaigns down to 1814, riding with him in the carriage, taking notes of instructions. He gave important help in establishing the Consulate, and became Minister of War (*vice De Crancy*) in 1799. When Talleyrand and Fouché also took office, under the senatus-consulte of 1804, B. became grand huntsman. He organised the government of Piedmont. His activity at Lobau and Wagram procured him one of his honours. In 1810 he was Napoleon's proxy at his marriage with Maria Louisa. In 1814 he presented the French marshals to Louis XVIII. at Compiègne, and was made a peer and captain of the guards. Remorse at his desertion of the Emperor caused him to commit suicide at Bamberg on 1st July 1815. He has left *Relation des Campagnes du Général Bonaparte en Égypte et en Syrie* (Par. 1800), and *Relation de la Bataille de Marengo* (Par. 1806). His *Mémoires* were published in 1826.

Berthol'tia (*B. lanceolata* or *indica*), a genus of Composite plants, natives of India and Senegambia, the leaves of which are astringent, and used as substitutes for senna.

Bertholl'et, Claude Louis, Comte de, a celebrated French chemist, was born at Tailloire, in Savoy, 9th November 1748. He graduated as doctor of medicine at Turin in 1768, but removed in 1772 to Paris, where he became in 1794 a professor in the Normal School. Two years later he was entrusted with the transportation of artistic masterpieces from Italy to France, accompanied Napoleon, who subsequently made him a count and a grand officer of the Legion of Honour, to Egypt, where he accomplished valuable scientific work, and, after the restoration, was nominated a peer by Louis XVIII. B. died at Arcueil, near Paris, November 6, 1822. Of his numerous discoveries and improvements, we may specially mention his discovery of the composition of ammonia, his proposal for using chlorine as a bleaching agent, his means for purifying saltpetre for gunpowder manufacture, and his methods of smelting iron and converting it into steel. His most important works are his *Éléments de l'Art de la Teinture* (1791), his *Méthode de Nomenclature Chimique* (1787), and his *Essai de Statistique Chimique* (1803).

Bertholletia. See BRAZIL NUTS.

Berlin, Louis François, founder of the influential French journal the *Journal des Débats*, was born in Paris, December 14, 1766. He took to writing for the press in 1793, and in 1799 founded the journal with which his name will always be associated. It was originally royalist in principles, and in consequence both it and its editor were subjected to much annoyance during the days of the first empire, B. being on one occasion banished to Elba. After the fall of Bonaparte, the *Débats* became a liberal monarchical journal, independent, however, of government. B. continued to edit it till his death, 13th September 1841.—**Louis Marie Armand B.**, son of the preceding, was born in Paris in 1801, and succeeded his father in the editorship of the *Débats*, to which he had contributed from an early age. He died January 11, 1854. Both father and son were intimate with Chateaubriand, and the latter acted as his secretary when he was ambassador to England.

Bertino'ro, a town in the province of Forlì, N. Italy, and a station on the railway, near the river Ronco, 40 miles S.E. of Bologna. It is the see of a bishop, was formerly a fief of the Malatesta family, and has a cathedral and various convents and churches. Pop. 6388.

Bertrand, Henri Gratien, Count, born at Chateauroux (Indre), 28th March 1773, joined the National Guard in 1792, and served as an engineer under Napoleon in Egypt, where he became a general of brigade. At Austerlitz, Friedland, Aspern, Wagram, and in the Russian campaign he distinguished himself. Napoleon made him adjutant, and also Count of Illiria. B. decided the battle of Lützen, and covered the retreat from Leipsic. He remained with the Emperor at Elba, Waterloo, and St Helena, and in 1830, the sentence of death against him having been cancelled by Charles X., he returned to France, where he became a deputy, and commandant of the Polytechnic School. B. died 31st January 1844. After his death his sons published the *Campagnes d'Égypte et de Syrie, Mémoires pour servir à l'histoire de Napoléon, dictés par lui-même à Saint Hélène au Général B.* (Par. 2 vols. 1847).

Bervic, or Bal'vay, Charles Clément, an eminent engraver, born at Paris, 23d May 1756. The sole incidents in his career are the records of his artistic work. After some less successful efforts, he established his reputation in 1790 by his full-length engraving of Louis XVI., after Callet's portrait. His masterpiece, however, is his engraving of the Laocöon. B. died 23d March 1822. The correctness of his drawing, and the clearness and brilliancy of his manipulation, give his works a high value.

Berwick, James Fitz-James, Duke of, natural son of James II. of England, by Arabella Churchill, sister of the Duke of Marlborough, was born 21st August 1670. He made his first campaign in Hungary, under Karl of Lorraine. In 1689 he accompanied his father to Ireland, in his expedition against William of Orange, and was severely wounded. In 1692 he entered the French service, and fought under Marshals Luxembourg and Villeroi. In 1704 he commanded the French army in Spain, whence he set out to crush the Camisards, or Waldenses, in the S.E. of France, who were heroically struggling for liberty of conscience. In 1705 he took the place of Feuillade at the head of the French troops in Savoy, and conquered Nice, 4th January 1706. For this he was created a marshal of France. In 1707 he was again sent to Spain, where he gained the famous victory of Almanza, which re-established the rule of Philip V., who made him Duke of Liria and Xerica. From this date till 1719 he distinguished himself in Spain, Flanders, and France. In fact, he finished the war of the Spanish Succession by the capture of Barcelona, 11th September 1714. In 1733, after a protracted period of inactivity, he took the command of an army that was to cross the Rhine, and was killed by a cannon-shot at the siege of Philippsburg, 12th June 1734. His military capacity was undoubted, and his defence of Dauphiné was a strategic triumph. French critics place him on a level with Catinat and Villars. His *Mémoires*, in 2 vols. 8vo, were published in 1778 by his grandson, after having been revised by the Abbé Hook.

Berwick, North, a watering-place and seaport at the mouth of the Firth of Forth, in Haddingtonshire, 22 miles E.N.E. of Edinburgh by railway. It lies on a fine bay, has many hand-

some villas, splendid golfing links (recently much enlarged), and spacious hotels. Along with Haddington, Dunbar, Jedburgh, and Lauder, B. returns a member to Parliament. Pop. (1871) burgh 881, parish 2373. The most interesting objects in the parish are the Bass Rock, Tantallon Castle, and N. B. Law, a conspicuous cone-shaped hill, 940 feet high.

Berwick-on-Tweed, a seaport at the mouth of the Tweed, 58 miles S.S.E. of Edinburgh, constitutes, with its liberties, a county of itself, belonging neither to England nor Scotland, and in Acts affecting the United Kingdom is introduced separately as 'the good town of B.-upon-T.' But in the census and other parliamentary returns it is treated as belonging to Northumberland. Its origin is ascribed to the Anglian kings of Northumbria, but there are no authentic records before the reign of Alexander I., when it was an important seaport. For centuries it was an object of contention between the English and the Scots, but was finally ceded to Edward IV. in 1482. In 1551 it was erected into a free town, independent of both countries; but its importance as a frontier-town ceased when James VI. succeeded to the English crown. B. is pleasantly situated on the N. bank of the Tweed. The old fortifications partly remain. A stone bridge of fifteen arches, completed about 1634, and the North-Eastern Railway bridge, connect B. with Tweedmouth on the S. side of the river. Principal industry, fishing, and there is an inconsiderable shipping trade, the imports being timber, manures, and iron, and the exports salmon, corn, and coals. Pop. (1871) 13,282.

Berwickshire, the most eastern border-county of Scotland, in the basin of the Tweed, bounded N. by Haddington, S. and S.E. by Roxburgh and Northumberland, E. by the North Sea and Berwick-on-Tweed, and W. by Roxburgh and Midlothian. Area, 464 sq. miles; pop. (1871) 36,486. In the N. are the Lammermoors, where the surface is generally hilly and barren, but the districts of the Merse in the S., and Lauderdale in the W., are as productive as any part of Scotland. Agriculture is in a very advanced state, and the principal crops are wheat and oats. The geological formation of B. is silurian in the N., Devonian in the W., and carboniferous limestone in the S.E., the only minerals being coal and ironstone. The coast-line, stretching fr. Lamberton to St Abb's Head, a distance of over 9 miles, is precipitous, and has only two bays, Coldingham and Edgemouth. Coldingham Priory, Dryburgh Abbey, Hume Castle, Fast Castle, and some remains of Roman camps and British barrows, are the chief objects of interest. The county town is Greenlaw, but it is surpassed in importance by Dunse. Under the jurisdiction of school-boards there are 46 day-schools, with 4500 pupils, while there are also 30 private schools, attended by some 2000. B. returns one member to Parliament.

Beryl, a mineral closely allied to the emerald, from which it only differs in the absence of the rich green colour which characterises the precious emerald. The colour of the B. varies, in some cases it being almost colourless and transparent, while other varieties possess various shades of light blue, green, or greenish yellow. The clearer pale tints of blue and green are known as aquamarines or precious beryls. The B. crystallises in regular six-sided prisms, and some specimens of great size exist, one found in New Hampshire, U.S., weighing 2900 lbs.

Berzelius, Johan Jacob, Friherre af, was born at Westerlösa, near Linköping, in East Gothland, Sweden, 20th August 1779, studied medicine at the University of Upsala, but soon devoted himself almost exclusively to chemistry. After holding some minor offices, he was appointed, in 1807, Professor of Medicine and Pharmacy at Stockholm. In the same year he took part in founding the Swedish Society of Physicians; in 1808 was chosen a member, in 1810 president, and in 1818 perpetual secretary of the Academy of Sciences, Stockholm. Raised to the rank of a noble in the last of these years by King Karl Johan, B. took some part in parliamentary affairs, but the whole energy of his genius was really given to the service of science. The result was something approaching a revolution in chemistry. Its whole present form rests in a measure on the discoveries and views of B., although the rapid advances of the science has detected errors and imperfections in his work. He discovered the elements selenium and thorium, and was the first to exhibit, in the metallic form, calcium, barium, and strontium, and to isolate silicon and zirconium.

He gave a new, or, at least, a completely different nomenclature and classification of chemical combinations, which has since been universally accepted, and engaged in laborious analytical researches to confirm and extend the atomic theory. His electrochemical theories and experiments are also of great importance. B.'s chief works are *Afhandlingar i Fysik, Kemi och Mineralogio* (6 vols. Stockh. 1806-18), the *Foreläsningar i Djurkemien* (2 vols. Stockh. 1806-8), and the *Öfversigt om Djurkemien Framsteg* (Stockh. 1812). But his great work is his *Lärobok i Kemien* (3 vols. Stockh. 1808-18, 2d ed. 1817-30), which has been translated into French by Jourdan, with improvements and additions by the author (Par. 1829), into German by Blöde, Palmstedt, and Wöhler (4 vols. Dresd. and Leips. 1825-31, 5th ed. 10 vols. 1843-47), into English, and also into Dutch, Italian, and other languages. As secretary of the Academy of Sciences, he published yearly the *Årsberättelser om Framstegen i Fysik och Kemi* (Stockh. 1820-47). B. died 7th August 1848.

Besançon, formerly the capital of Franche-Comté, now of the department of Doubs, France, on the river Doubs, 45 miles E. of Dijon, a very old and strongly fortified town. It is well-built, the most remarkable edifices being the cathedral, the palace, built by Cardinal Granvella, and the public library, containing 80,000 volumes and some valuable manuscripts. The chief manufactures are of watches, hosiery, carpets, agricultural implements, iron and copper wares, porcelain, liqueurs, and beer; and there is a considerable trade in wine, brandy, iron, and coal. Pop. (1872) 33,158. B. is the *Vesontio*, *Besontium*, or *Visontium* of the Romans, was in existence in Caesar's time, and has had an unbroken municipal existence since the 1st c. Along with Franche Comté, it was annexed to the German empire in the 12th c. The Emperor Friedrich I. held a diet here from 1162 to 1178, and made it a free imperial city. Cardinal Granvella, minister of the Emperor Karl V., who, as archbishop of B., was a German prince, founded here a university which lasted to the French Revolution. It first became a French town in 1679. B. has numerous memorials of its Roman period.

Besants, or **Bezants**, Byzantine gold coins, of varying weight and value, introduced by the Crusaders into England, where they were current from the 10th c. till the time of Edward III. There were also silver B.

Bessarabia, a southern frontier government of Russia, lying between the Dniester, the Danube, and the Black Sea, and bounded on the W. by Moldavia. It belonged to Turkey from 1484 till 1812, when it was ceded to Russia by the treaty of Bucharest. As one of the results of the Crimean war, about 1000 sq. miles of B. were restored to the Porte in 1856, but were recovered by Russia at the close of the Russo-Turkish War of 1877. The country is traversed in the N. by spurs of the Carpathian mountains, and in the S. forms a vast steppe, where the soil is rich but poorly cultivated, yielding wheat, barley, millet, and some hemp, flax, tobacco, fruit, and wine. Cattle and sheep are reared in large numbers, and much salt is procured from the lakes. Kischinev is the capital. Area, 13,472 sq. miles; pop. 1,026,346.

Bessarion, **Joannes**, born at Trebizond in 1389 (according to Michael Apostolios), or in 1395 (according to Bandini), entered the order of St Basil, and spent twenty-one years in a monastery in the Peloponnesus. He was made Bishop of Nicæa by the Greek Emperor Joannes Palæologus, whom he accompanied to the Council of Ferrara (1438), and at first eloquently maintained the doctrines of the Greek Church; but being gained over to the Latin side, he was ultimately the principal cause of the union agreed on. He soon after joined the Latin communion, was made a bishop, a cardinal, papal legate at Bologna, and was twice near being made pope. On his death at Ravenna, November 9, 1472, B. left his library, consisting of 600 Gr. MSS., to the city of Venice. B. is perhaps most famous for his attempt to reunite the Eastern and Western Churches, but this liberal policy was only a consequence of his free study of the civilised literature of ancient Greece. He was one of the great promoters of the new learning, and wherever he dwelt, his palace became a rendezvous for the disciples of science and the lovers of art. B. himself wrote a good deal, chiefly vindications of his master, Plato; e.g., his *Contra Calumniatorem Platonis* (Rome, 1469), and translations from the Greek authors; the *Memorabilia* of

Xenophon, the *Metaphysics* of Aristotle, and the *Characters* of Theophrastus. See Vart's *Le Cardinal B.* (Lond. 1879).

Bessèges, a town in the centre of a coal and iron mining district, in the French department of Gard, situated on the Ceze, 11½ miles N. from Alais, with which it is connected by a railway. Pop. (1872) 8036.

Bessel, **Friedrich Wilhelm**, a distinguished modern astronomer, was born at Minden, July 22, 1784. His first important publication was in 1810, being some researches on the orbit of the great comet of 1807. For this he received the Lalande medal of the Academy of Sciences; and in the same year he superintended the erection and fitting up of the Königsberg Observatory, where, after three years of most patient and arduous observation, he obtained the annual parallax of 61 Cigni. In 1840 he indicated the existence of Neptune before its discovery by Leverrier and Adams. B. died March 17, 1846. His best-known systematic works are the *Fundamenta Astronomiæ deducta ex Observationibus*, J. Bradley (Königsb. 1818); *Tabula Regiomontana Reductionum Observationum ab An. 1750 usque ad An. 1830 computata* (Königsb. 1830); *Astronom. Untersuchungen* (1841-42); and his *Populäre Vorlesungen über wissenschaftl. Gegenstände* (pub. by Schumacher 1848). The *Abhandlungen* are now (November 1875) being published by Dr Engelmann, formerly of Leipsic Observatory, in 3 vols. See B.'s *Briefwechsel mit Olbers* (ed. by Erman, 2 vols. 1852).

Bess'emer, **Henry**, engineer and inventor, was born in Hertfordshire in 1813, and is chiefly known in connection with the celebrated process for making steel which bears his name—a process which has effected an entire revolution in the steel trade. This important invention is described in the following article. Mr B. has distinguished himself by many other inventions and scientific improvements. In 1875 considerable attention was attracted by what was known as the B.-saloon steamer, which was designed to counteract the unpleasant motion of the sea by means of a swinging cabin, to be kept in position by an ingenious arrangement of machinery. But after several experiments in the English Channel with a large steamer built for the purpose, the invention has apparently failed. In 1871 Mr B. was appointed president of the Iron and Steel Institute.

Bess'emer Steel is steel made direct from cast-iron by a process patented in 1855, and subsequently, by Mr Henry B. This process, as now worked, is briefly as follows:—The pig-iron is remelted in a cupola, and poured into a large vessel called a converter, lined with firebrick, and capable of revolving upon horizontal trunnions. The converter is then turned up, and air at a high pressure is blown upwards through the liquid metal. Most of the silicon is first burnt out, a dull flame appearing at the mouth of the converter; presently the carbon begins to burn (combining with the oxygen of the blast), and the flame increases to a dense, white, roaring blaze, accompanied by most violent ebullition. This continues until the decarburisation is complete, when the flame suddenly contracts. The converter is then turned down, and a measured quantity (about 6 or 8 per cent.) of *spiegeleisen* (iron containing about 10 per cent. of manganese) is run into it. This is sufficient to add the required amount of carbon for the steel, and after the occurrence of a further short 'flaming reaction,' the liquid steel is run out into ladles, and thence into moulds.

The use of *spiegeleisen* was patented by Mr Robert Mushet in 1856, but the patent was subsequently allowed to lapse. It is, however, of the greatest importance in the B. process, not only for the reason mentioned, but also because the manganese combines with the oxygen left in the iron by the passage through it of such a large body of air, which would otherwise have a most deleterious effect on the quality of the steel produced.

In Sweden and Germany, where manganiferous ores are frequently used, the decarburising of the liquid metal is generally stopped short at the required point, and the steel run off;—the exact instant at which the point for turning down the converter is reached being determined by the spectroscope. This beautiful application of the principles of spectrum analysis is, we believe, due to Professor Roscoe. The remelting of the pig in a cupola is also frequently dispensed with abroad.

A great drawback to the B. process is that it does not eliminate in any sensible degree either sulphur or phosphorus, if these most injurious materials are present in the pig-iron. It can

therefore only be employed with pure irons, a great limitation to its usefulness. See **STEEL**.

Bessenova, a large Austrian village in the Woiwodina, situated on the Aranka, 128 miles S.E. by S. of Pesth. Pop. 7896.

Bessières, Jean Baptiste, Duke of Istria, born at Priessac, near Cahors, August 6, 1768, served as a common soldier first in the guard of Louis XVI., and afterwards in the army of the Pyrenees. He fought in the battles of Roveredo and Rivoli, was made (1798) general of brigade of the expedition to Egypt, and later, as general of division, secured the victory of Marengo by a sharp cavalry attack. At the battles of Austerlitz, Jena, Eylau, and Friedland, B. greatly distinguished himself, rising to the rank of marshal in 1804, and being made Duke of Istria in 1807. During the war in Spain (1808) he was appointed by Napoleon to the command of the reserve cavalry, a post which he had also held in the Austrian campaign (1805); and while again serving in Spain he was made governor of Old Castile, and commanded the guards in 1812. B. went through the horrors of the Russian campaign, showing skill and courage at every step of the retreat from Moscow. He fell while reconnoitring the Rippach, before the battle of Lützen, May 1, 1813. B. died poor, and his son received, by the bequest of Napoleon, a sum of £4000.

Bes'tiaires (Fr., from Lat. *Bestiaria*), the name given to a class of books very popular during the middle ages. They were the text-books of the zoology of that period, describing animals fabled as well as real, and generally illustrated with rude drawings. Symbolism was the science most prominent in the B.; they indicated in the brute creation types of various forms of good and evil in man—an idea still prevalent. The grotesque forms and faces carved on churches of the middle ages are expressions of this symbolism. The word B. is also used (like the Lat. *Bestiarii*) to denote persons who fought with wild beasts in the circus.

Bestus'chew, Alexander, a poet and novelist of Russia, well known under the pseudonym *Kosack Martinski*, born in 1795, was in early life master of the horse to the Duke of Wurtemberg, and was one of the conspirators (Dekabrists) of 1825. He was banished to Siberia (Yakutsk), but subsequently served in the army of the Caucasus, and was killed in a fight near Jekaterinodar, June 1837. Together with Kylejew, his brilliant friend, B. established the first Russian almanack, *The Polar Star* (St Petersburg, 1823). His chief works are *Mullah-Nur*, a wild tale, and *Ammalath-Beg*, a romance of the camp and field. His collected works were published in St Petersburg in 12 vols., 1839-40 (Ger. transl. Leips. 1845, 4 vols.). An interesting volume of his *Letters* was issued in 1860. B. had three brothers, Nikolas, Mikail, and Pieter, all of whom were exiled to Siberia on account of the military revolt of 1825.

Betan'zos (the ancient *Brigantium Flavium*), a town of Spain, province of Coruña, 15 miles S.E. of the city of Coruña. It has manufactures of linen, leather, and earthenware. Pop. under 5000.

Betel, or **Betel-Nuts**, the fruit of a tall graceful palm-tree, *Areca Catechu*, a native of the East Indian Archipelago, but cultivated in most tropical parts of the East. The tree is held in very high esteem in the East, and from its Malay name, *Pinang*, arises that of the British possession Penang. The fruit is about the size of a small chestnut, and exceedingly hard, so that it takes a fine polish when cut or turned. These properties, together with its pretty white and brown mottled structure, make it useful for button-making, to which it is sometimes applied in Western countries. But the great use of B.-nuts is for chewing, a practice universal in oriental countries. A small piece of the B.-nut is wrapped up with an equal proportion of lime within a leaf of the B.-pepper, *Chavica B.*, and rubbed against the teeth. The mixture is thereafter chewed a little, and placed between the gums and the lips, when a copious exudation of saliva of a brick-red colour takes place. A little tobacco is added to the chew when such a luxury can be afforded. The habit is very destructive to the teeth, and the appearance presented in chewing B. is very repulsive, but it is a passion among all classes in China and the Indian Archipelago. The B.-nut contains chiefly catechu, tannic and gallic acids, and a red colouring substance. A variety of *Catechu* (q. v.) is prepared from it.

Bet'elgeuse, a star of the first magnitude in the right shoulder of Orion, forming with Procyon and Sirius a magnificent sub-equilateral triangle.

Betel-Pepper, or **Betel-Pawn**, various species of pepper, such as *Chavica Betel*, *C. Siraboa*, and *C. Malamiri*, extensively cultivated for the purpose of wrapping round the B.-nuts (see *supra*).

Beth'any (Heb. 'house of dates'), a village 1½ miles from Jerusalem on the road to Jericho. B. never came into notice till the time of Christ, who made it his headquarters in Judæa, very much what Capernaum was in Galilee. It is now a wretched hamlet of about 20 families, called El-Azariyeh ('the place of Lazarus').

Beth'el (Heb. 'house of God'), the name given by Jacob to a place originally called Luz, of which there are two different accounts, Gen. xxviii. and xxxv. It appears, however (Gen. xii. 8), to have had the name of B. in the time of Abraham. The city found on the spot at the invasion of Canaan became a boundary town between Ephraim and Benjamin (Josh. xviii. 22).

Bethesda, **Pool of** (Syr. 'house of mercy,' or Heb. 'place of the flowing'—of water), according to the Gospel of John (v. 1-9), a pool with five 'porches' near the sheep-gate of Jerusalem, the water of which had miraculous healing power. The place now pointed out for it is close to the gate of St Stephen.

Bethlehem (Heb. 'house of bread'), a place second in interest only to Jerusalem itself in the sacred narrative, from being the birthplace of David and of Jesus, is about six miles from the latter city, and is now a village (*Beit Lahm*) of about 3000 inhabitants, who gain a livelihood chiefly by the manufacture of wine, and relics for pilgrims. The principal building is the convent of the Nativity, built by the Empress Helena, 327, beneath the church of which is a grotto, said to be the place where the Saviour was born, the 'manger' (a marble trough) in which he was laid also being there. Those who feel surprise at the idea of a cavern being pointed out as the place, ought to remember that in the gospel narrative there is no mention of a *stable*, which has been created by the imagination of poets and painters.—2. A city in the tribe of Zebulun (Josh. xix. 15), about six miles S. of Nazareth, now a miserable village.—3. A town in Pennsylvania, U.S., at the point where the Mannakissy flows into the Lehigh, 51 miles N. of Philadelphia. It is the chief settlement of the Moravian brethren in N. America, and was founded in 1741. B. is the seat of a bishop, has a fine church, some manufactures and tanneries, and a pop. of 4512. The three separate establishments of the Moravians for youths, maidens, and widows are distinguished by an almost monastic severity of life. In the excellent boarding-schools connected with these, the children of other religious denominations are received.

Bethlehemites, an order of monks at Cambridge in the 13th c.; also an order founded in Guatemala in 1673. The followers of Huss were styled B., after Bethlehem Chapel, in Prague, where Huss preached.

Beth'nal Green, a parish in the E. of London, Middlesex, with a pop. (1871) of 120,104. It is largely occupied by silk-weavers, who carry on their occupation at home. Between 1840-50 no fewer than ten churches were erected and endowed in the parish, chiefly by the efforts of Bishop Bloomfield. The charitable foundations are numerous, and the Baroness Burdett-Coutts has made the parish a theatre of her active and intelligent philanthropy. Within its limits are the Victoria Park, and the East London Museum, a branch of South Kensington Museum, opened by the Prince of Wales, June 24, 1872. B. has a place in English literature through the simple but touching ballad, *The Blind Beggar of B. G.*

Beth Root, or **Birth Root**, the root of the purple *Trillium erectum*, used in the United States as an astringent, tonic, and antiseptic. It is used especially in menorrhagia.

Bethsai'da (Syr. the 'house of fish'), the name of two places on the Lake of Galilee: one on the W. side, the native town of Philip, Andrew, and Peter (John i. 44); the other on the E. side (comp. Matt. xiv. 13, Mark vi. 31-45, and Luke ix. 10-17), a village which was rebuilt by Philip the Tetrarch and called *Julias*.

Beth'shemesh (Heb. 'house of the sun').—1. A city within the territory of Dan (mod. *Ain es-Sheims*), but belonging to the

priests of Judah, chiefly celebrated as the place to which the Philistines brought the ark from Ekron (1 Sam. vi.).—2. A town of Issachar; and 3. of Naphtali (Josh. xix.).—4. A city of Egypt, mentioned Jer. xliii. 13, the same as On (Gen. xli. 45).

Bethlan-Gabor (*i.e.*, Gabriel B.), born in 1580, of an ancient Protestant family in Upper Hungary and Transylvania, became king of Transylvania in 1613 on the death of Gabriel Bathori. See BATHORI. The Ottoman influence was exerted in his favour. When in 1619 the Bohemians revolted under Friedrich, the Elector Palatine, against Ferdinand II., B. invaded Hungary, took Kaschau (about 30 miles N. of Tokay), and, after repeatedly defeating Dampierre and Count Bucquoy, was crowned king of Hungary, Dalmatia, Croatia, and Slavonia at Presburg, 25th August 1620. Even Vienna was threatened, a junction having been effected between the Bohemian and Transylvanian armies. In spite of the desertion of the Elector by the Protestant Union at the Pacification of Ulm, and the advances made at Presburg by the French ambassador, Angoulême, B. despatched a body of troops which took part in the battle of Prague (8th November 1620). Shortly after he again attacked Austria, Count Thion and many Bohemians serving in his army: Dampierre was killed at Presburg, Bucquoy at Neuhausel; and although Count Mansfield was the only enemy of Austria in the N., Ferdinand was compelled by the treaty of Nikolsburg to cede seven eastern provinces of Hungary, and some territories in Silesia, B. renouncing the crown of Hungary, and becoming prince of the empire. B.'s marriage with Katharina of Brandenburg induced him for some time, with Mansfield and Weimar, to support the Protestant cause in the Thirty Years' War. The Sultan, Morad III., intended to make B. ruler over Moldavia and Wallachia. Sir Thomas Roe's mission to Constantinople had reference to the relations of B. and the Sultan, which the Protestant princes looked on with suspicion. B. died 15th November 1629. Whatever may be thought of his policy, B. contributed to the independence and progress in learning of his country: he founded the Reformed College at Enyed.—**Johann and Wolfgang B.**, both chancellors of Transylvania, belong to the same family, and have left Latin histories of their country for the periods 1620-63 and 1526-1609, the latter of which was published by Benkő, under the title *Wolfgangi de B. Historia de Rebus Transylvanicis* (6 vols. Hermannst, 1792).

Bethune, a fortified town of France, department of Pas-de-Calais, on the river Brette, the *Canaux de B.*, and the *Chemin de Fer du Nord*. Pop. (1872) 4204. It has linen and woollen manufactures, and a considerable trade in corn, wine, brandy, and cheese. The town sprang up round the strong castle of the lords of B., was a considerable place in the 12th c., went by marriage to the Counts of Flanders, then had counts of its own, who became extinct in the 17th c.

The family of B. is very old. It traces its origin to a Robert Faissaux de B. of the 10th c., one of whose descendants, François de B., Baron de Rosny, embraced Calvinism, and was taken prisoner at the battle of Jarnac. Two lines were founded by his two sons, of whom one was the famous **Maximilien de B.**, Duc de Sully (q. v.). Both became extinct in the beginning of the present century. But other branches of the B. family still flourish in France.

Betjuans. See BECHUANS.

Béton. See CONCRETE.

Betroth'ment is an engagement to marry. In England, should either man or woman secede from their engagement, the aggrieved one has ground for an action for damage. In Scotland it is so also; but in that country B. with certain consequences may constitute marriage. See MARRIAGE, PROMISE.

Bett'erton, Thomas, actor, born at Westminster in 1635, began to perform in 1659 at the Cockpit, Drury Lane. He was introduced by the Laureate, Davenant, to the favour of Charles II., who sent him to Paris to study the French stage. His chief parts were Hamlet; Valentine, in Congreve's *Love for Love*; Alvarez, in Vanbrugh's *Mistake*, &c. His wife (*née* Sanderson) played Lady Macbeth very well, and is described by Cibber as 'at once tremendous and delightful.' A description of B.'s benefit in 1709 (he had previously lost most of his savings) is given in *Tatler*, No. 1. B. died 28th April 1710. He wrote *The Amorous Widow*, and *Barnaby Brittle*, an adaptation of the former; besides a tragedy entitled *The Unjust Judge, or Appius*

and *Virginia*. It was during B.'s connection with the Duke's Theatre (Lincoln's Inn Fields) that *Macbeth* and the *Tempest* were produced as semi-operas with Matthew Lock's music. This stimulated the development of moving scenery.

Bett'ing or Wa'gering is, on an extensive scale, especially an English custom. It mainly prevails in England with regard to horse-racing, on which it may truly be said that the highest and the lowest in the land are engaged in betting. Of recent years an uneasy feeling seems to have been gaining ground in British society that its favourite amusement is not wholly in accordance with morality, and that all outward signs of its prevalence ought therefore to be suppressed. This feeling has led to the passing of an Act of Parliament for the suppression of B.-houses. Any such establishment is declared to be a common nuisance, and the owner is liable to a penalty of £100. The Act, which now extends to Scotland, makes various minor provisions for the suppression of B. and W.

Bet'ula, and Betula'cæ. See AMENTA'CEÆ and BIRCH.

Bet'wah, a broad but shallow river of India, rising in the Vindhya mountains, in the Bhopal territory, passes the towns of Bileah and Jhansi on its way to the Jumna, which it joins about 200 miles above the junction of the latter with the Ganges, after a course of about 340 miles.

Beukelzoon, Willem, a native of Biervliet, Flemish Zealand, who lived in the 14th c., and invented an improved method of salting and preserving fish. The invention is assigned to the year 1386, and is said to have greatly helped to develop the Dutch fisheries. B. died probably in 1397. The Emperor Karl V. and his sister Maria paid a grateful visit to his grave. The derivation of the word 'pickle' (Dut. *pekkel*) from Beukel is fantastic. That B. is not yet forgotten is evidenced by the fact that his praise was sung as late as 1827 by B. G. Camberlyn in a Latin poem, *De Beukelingi Genio*.

Beust, Friedrich Ferdinand, Count von, a German statesman, born at Dresden, 13th January 1809, after the usual diplomatic training, became Saxon minister at Munich (1833), at London (1846), at Berlin (1848), in 1849 minister for foreign affairs at Dresden (in which capacity he called in Prussian troops to suppress a popular rising), and subsequently minister for the interior under the tolerant and constitutional rule of King Johann. When the Schleswig-Holstein question came before the Bund, B. supported the nationalisation of the Duchies, and represented the Bund at the London Conference. Chiefly through his influence, Saxony joined in the revolution of the Bund against Prussia, 14th June 1866, and sent an army to co-operate with the Austrians in the Bohemian war. In this way Saxony narrowly escaped political annihilation, and B., dismissed from Dresden at the demand of Prussia, entered the service of Austria, where he became prime minister, and in 1867 adjusted with Deak the question of the Hungarian constitution. In 1871 B. became Austro-Hungarian Minister at London, and in 1878 at Paris. B. has a brother, **Friedrich Konstantin, Freiherr von B.** (born 1806), who is head of the mining-schools of Saxony, and has written on geology.

Beuthen, a Polish-speaking town in the government of Oppeln, Prussian Silesia, 50 miles S.E. of Oppeln. Pop. (1871) 17,946, engaged to a considerable extent in the manufacture of woollens and earthenware.

Bevel, in building construction, a sloping surface.

Beveland, Noord (N.) and Zuid (S.), two islands in the estuary of the Scheldt, in the Dutch province of Zeeland, constituting with the small island of Wolfaartsdijk the district of B., of which the area is 120 sq. miles, and the pop. 23,000. Zuid B., or *Land van ter Goes*, is the larger and more fertile, producing corn, madder, fruit, and vegetables. Area, 25 sq. miles; pop. 23,000. Its chief town, Goes or Tergoes (pop. 5205), has a trade in corn and hops, and some shipbuilding. Noord B., or *Land of Kortgene*, is low and marshy, but much improvement has been effected by embankments and drainage. Area, 18 sq. miles; pop. 5300.

Bevelled Gear. See GEARING.

Bevel-Wheel, a wheel (generally furnished with teeth), of which the 'pitch surface' is the frustum of a cone. B.-wheels are used to communicate rotation between shafts which lie in the same plane, but are not parallel.

Beveridge, William, a distinguished theologian and orien-

talist, was born at Barrow in Leicestershire, in 1636-37. He was educated at Cambridge, and such was his devotion to the study of oriental languages, that he was able to publish a Latin treatise on them at the age of twenty. B. declined in 1691 the bishopric of Bath and Wells, but accepted that of St Asaph in 1704. He died 5th March 1708, leaving the most of his property to the Society for the Promotion of Christian Knowledge. His works, which were voluminous, were published in 1824, under the editorship of the Rev. T. H. Horne.

Beverland, Adrian, a learned Dutchman, was born at Middleburg in Zeeland, in 1653 or 1654, and studied for the bar. In 1678 he published his *Peccatum Originale*, which for its obscenity was burnt at the Hague, and caused his expulsion from Leyden and Utrecht. Two years later his *De Stolata Virginitatis Jure Lucubratio*, of which two French imitations were published, procured for him still greater odium, and he passed over to England, where he received countenance from Isaac Vossius, who admired his learning. His income was not great, but he spent it chiefly in the purchase of scarce books, obscene drawings, &c. In 1689 he repudiated his earlier writings, and destroyed all the copies he could recover. It is said that his treatise *De Fornicatione Cavenda Admonitis sive Adhortatio ad Pudicitiam et Castitatem* (Lond. 1698) was composed as an atonement for his previous literary wickedness. He died insane in 1712. His collection of licentious engravings, on which he had written illustrative passages from the ancient poets, was destroyed before his death.

Beverley, the chief town of the E. Riding of Yorkshire, 10 miles N.N.W. of Hull, connected with the river Hull by a canal, and a station on the N. Eastern Railway, has large manufactures of implements of husbandry, machinery, and beer, and a trade in corn, coal, leather, and cattle. B. grew up around a priory, founded in the beginning of the 8th c., and was called from a neighbouring morass *Beverlac*—i.e., *lake of beavers*. The minster of B., or collegiate church of St John, founded in the 13th c., is one of the finest Gothic structures in the kingdom. B. returned two members to Parliament from the time of Elizabeth till 1870, when it was disfranchised under the new Reform Act on account of corrupt electioneering practices. Pop. (1871) 10,218.

Beverloo, in the province of Belgian Limbourg, 12 miles N.W. of Hasselt, in the Campine, is noted for its permanent military camp, the Belgian Aldershot.

Beverwyk (Du. *Beverwijk*), a very clean town in North Holland, on the IJ, about 7 miles N. of Haarlem, with a pop. of 2500. Near it the Prince of Orange, Stadtholder, and afterwards William III. of England, had a country residence.

Bewdley, a market-town in Worcestershire, beautifully situated (hence its original name, *Beaulieu*) on the western bank of the Severn, 13 miles N. by W. from Worcester. Pop. (1871) 3021; of parliamentary borough, 7614.

Bewick, Thomas, the first great English wood-engraver, born in 1753, at Cherryburn, near Newcastle-on-Tyne, was apprenticed to his art in Newcastle (1767), and made such rapid progress that in 1775 one of his illustrations of Gay's *Fables*—the cut known as the 'Old Hound'—won the first prize for wood-engraving from the Society of Arts. In 1790 appeared the *General History of Quadrupeds*, with illustrations by B. and his brother John, who was an engraver and draughtsman of scarcely inferior genius. Goldsmith's *Traveller* and *Deserted Village*, Parnell's *Hermits* and Somerville's *Chase*, were illustrated by the brothers; but in 1797, after the death of John, the first volume of the *History of British Birds* appeared with cuts designed and engraved by B. exclusively, and was followed in 1804 by a second volume. Each of the cuts in B.'s greater works is in itself a poem or story, abounding in incident, and full of pathos or humour, and excelling as a work of art in its extreme simplicity of execution. There is no line without a thought. Among his latest works is *The Fables of Aesop and Others*, and his *chef-d'œuvre* is believed to be his cut of the Chillingham Park bull. B. died November 8, 1828. His technique, which consists of engraving white lines on a black ground, has been revived with great effect in late years by a school of French artists headed by Gustave Doré. In July 1875, Jane and Isabella, daughters of Thomas B., living at Gateshead, signified their intention of bequeathing a complete collection of the proofs, drawings, &c., of their father and uncle to the British Museum.

Bez, a small Swiss town, canton of Vaud (Ger. *Waadst*), on the Avençon, a tributary of the Rhone, 12 miles from Lake Geneva. There are hot mineral and salt springs in the vicinity. Pop. (1870) 3860. It is a station on the Swiss-Italian Railway.

Bexar, San Antonio de, a thriving town in county Bexar, Texas, on the San Antonio river, and the scene of the slaughter of Colonel Crockett and his men by the Mexicans. Pop. (1870) 12,256.

Beyerland, or **Beijerland**, an island of S. Holland, separated from the mainland by the Old Maas and the Holland Diep. Old B. is a thriving village on the island, with a population of about 4000.

Bey or **Beg**, a Turkish title of dignity, meaning 'lord,' which, when strictly applied, denotes the governor of a district or subdivision of a province, who bears a horse-tail as the sign of his rank. The higher title of *beglerbeg* (more correctly *beilerbeg*, 'lord of lords') is restricted to the governors of provinces, who have three horse-tails to mark their superior dignity. But generally the word B. is of wide enough import to comprehend the English titles prince, lord, general, captain.

Beyrout, or **Beirut**, the most important haven and commercial town of Syria, on a promontory at the base of Lebanon, 55 miles N.E. of Damascus. It is the Syrian entrepôt for European merchandise, having regular steamer communication fortnightly with Liverpool, and weekly with Marseille, and direct postal and telegraphic connection. The town has greatly improved of late years, the chief public work being the European system of waterworks, completed in 1875, bringing a supply of excellent water from the Bahr-el-Kelb or Dog River, a distance of 9 miles. Various roads have been laid down, and £10,000 has been (1875) granted for the erection of a harbour for coasting craft. There are extensive factories in the vicinity, producing 'Syrian silk,' now almost as much admired as that of India. The coal deposits of Lebanon are being utilised for this industry. In 1873 the imports amounted to £1,323,152; exports, £668,568. The former are chiefly cotton yarns, Manchester prints, Birmingham and Sheffield cutlery, petroleum from the United States, &c.; the latter, raw silk, dried cocoons, wool, olive oil, tobacco, fruits, horses and cattle. For the last fifteen years the general trade has not perceptibly increased, but since the opening of the Suez Canal a direct Eastern trade has sprung up in indigo, spices, and Mocha coffee. The stationary state of trade is ascribed to the obstructive Turkish imposts and regulations. Pop. (1873) 80,000, mostly Christians. B. is the Old Testament Berothai or Berothah, and the Roman Berytus, which was captured by the Christians under Baldwin I. of Jerusalem. It subsequently belonged to the Saracens, to the Seljuks, and finally to the Turks. B. sympathised with the Pasha of Egypt, and was bombarded and taken by the English fleet under Sir C. Napier (1840-41), when it was restored to Turkey.

Be'ze (Fr. *Theodore de Bèze*, or rather *Besze*), was born 24th June 1519, at Vezelay, in Burgundy. Before he was ten years old he was sent to Orleans to study under Wolmar, a German Hellenist, and one of the first by whom the ideas of the Reformation were introduced into France. Under him B. acquired an excellent knowledge of the ancient languages, and also an acquaintance with the Scriptures. But the good impression of the lessons and the example of this good man, to which B. bore testimony thirty years after, was for the time smothered by the passions of youth. Surrounded in Paris with all that could mislead, rich, amiable, and full of spirit, he abandoned himself to enjoyment; published (1548) a volume of erotic poetry (*Juvenilia*); and contracted a marriage he dared not reveal, because, being intended by his friends for the Church, he was already drawing the revenues of several benefices. His conscience was roused by a severe illness, and on his recovery he went with his wife to Geneva (1548), abandoning 'at the same time,' in his own words, 'country, parents, friends, to follow Christ.' Soon after he became Professor of Greek at Lausanne, where he wrote his treatise *De Hereticis a Civili Magistratu Punien-dis* (Par. 1554), in defence of the burning of Servetus the year before, and in 1559 became pastor and Professor of Theology at Geneva. There he was associated with Calvin, who was ever after his guide and master, and to whom he became very much what Melancthon was to Luther. In the famous theological conferences held at Poissy and St Germain in 1561 and 1562,

B. signalled himself by the eloquence and zeal with which he maintained the Calvinistic dogmas, and made a very favourable impression on the French court. On the death of Calvin in 1564, B. stepped into his place, and was henceforth regarded, till his death, 13th October 1605, as the chief of the Reformers in Geneva as well as in France. The most important of his works, which were extremely numerous, are a translation of the New Testament into Latin, and a *History of the Reformed Churches of France*, to the year 1562 (Gen. 1580). B. naturally presents himself to our minds as a theologian; but he was essentially a scholar and a wit by nature, and but for the sins of his early years, which drove him into a penitential career, he would in all probability have been a brilliant luminary of French literature. See Bolzec, *Histoire de la Vie, Mœurs et Deportement de Théod. de Bèze* (Par. 1577); Fay, *De Vita et Obitu Theod. Bæze Venedii* (Gen. 1606); Schlosser, *Leben des Theod. Bæze* (Heidelb. 1809); Baum, *Theod. Bæze, nach handschriftlichem Quellen* (Leips. 1843).

Bezant, or **Besant**, in heraldry, a small circular piece, either *or* (gold), which may have derived its name from the Byzantine coins which the Crusaders fixed upon their shields as heraldic devices; or *argent* (silver), which is called a *plata*, from the Spanish *plata*. When the shield or any charge is strewn with the former, it is styled *bezanty* or *besantie*, with the latter, *platte*. Similar figures, in neither metal, but in colour, are called *roundles*.

Bezdan, an Austrian market-town, in the Woiwodina, situated about 2 miles E. of the Danube, and 10 miles W.N.W. of Zombor. Pop. 7782.

Beziers (anc. *Beterra*), a town of France, department of Hérault, not far from the junction of the Orbe and the Canal du Midi, and a station on the railway from Bordeaux to Cette, about 108 miles E. of Marseille. The situation is so beautiful that it has given rise to the proverb, *Si Deus in terris, vellet habitare Beterris* ('If God were to dwell on earth, it would be in Beterris'). The cathedral is a fine specimen of Gothic architecture. Soap, leather, glass, woollens, gloves, &c., are among the manufactures. Brandy is also extensively distilled. Pop. (1872) 27,533. B. is the *Beterra* of the Gallic Sectosages, was a Roman colony and a station of the Seventh Legion, whence its name *Beterra Septimanarum*, and has, among other remains of antiquity, the ruins of an amphitheatre. It shared the changes that affected Gaul during the dissolution of the Roman empire, was for a time the residence of the Frankish Counts of Septimania, and later on, in the wars of the Albigenses, was the scene of a horrible tragedy and crime, 22d July 1209. Stormed by a horde of 'Catholic Crusaders,' under the leadership of the Legate Milo and the Cistercian Abbot Arnold, 7000 of its inhabitants were burnt in the Church of the Madeleine, and 20,000 were massacred.

Bezoars, concretions formed in the stomach of various mammals, which, at one period, had an enormous reputation in medicine. They are still highly prized in Persia. Oriental or Persian B. are found in the goat; occidental B. are taken from the llamas of Peru; and German B. occur in the chamois.

Bhad'lee, a name applied in India to a species of millet (*Panicum pilosum*).

Bhadrinath, a town of Garhwal, Kumaun division (*Himalayan Tract*) of the N.W. Province of India, on the right bank of the Vishnugunga, an affluent of the Aluknunda, in the centre of a narrow valley, 10,204 feet above the sea-level. Its importance is due entirely to its temple, which is resorted to annually by numerous pilgrims, as many as 50,000 collecting on the grand periodic festivals, which recur at intervals of twelve years. The Brahmans and the other attendants on the temple abandon the town during winter, from the intensity of the cold.

Bhagavad-Gītā ('Revelations of the God') is the title given to a philosophical poem belonging perhaps to the brilliant age when Vikramāditya ruled in Northern India at Ujjayini (mod. *Ujain*), which is conjectured to have been about the middle of the 1st c. B.C. There are, however, no external data by which the time of its composition can be really fixed; and it is only by a consideration of the style, the general character of the teaching, and the drift of particular passages, that scholars have been led to assign it to a period when Buddhism was still prevalent in

India. The B.-G. is one of the so-called 'episodes' of the Mahābhārata (q. v.), and some MSS. insert it in its 'proper' place in that poem; but in point of fact it has only a superficial connection with the great Indian epic. The main theme of the Mahābhārata is the strife between the Kurus and Pāndavas (kinsmen) for the sovereignty of Hastināpura (Delhi?), while in the B.-G. the circumstance of the strife is only introduced to furnish a framework for the dialogues which follow. The hostile armies are assembled on the 'sacred plain'; the trumpets sound the onset; Arjuna (a Pāndava prince), who is eager for the fray, has the god Krishna for his charioteer; but when the latter points out the numerous kinsmen and friends that are marshalled against him, horror suddenly seizes the prince, and throwing down his bow, he declares that not 'for the sovereignty of the triple world' would he imbrue his hands in his kinsmen's blood. To this Krishna replies with the arguments which form the didactic and philosophical doctrines of the work. In the end Arjuna is convinced that he may fight. 'My delusion is destroyed, and by thy favour, divine one, I have recovered my senses: I remain free from doubt, and will do thy bidding.' The B.-G. contains 18 chapters and 700 shlokas. According to its last English translator (Thomson), 'The whole work has been divided into three parts, each of six chapters. The first has been considered the purely practical portion, containing the principal doctrines for the practice of Yoga (spiritual devotion) generally, and more particularly for its adoption in the routine of everyday life, and may be said to follow Patanjali's rather than any other school. The second portion is purely theological, and displays the theories of the Theistic Sāṅkhya school, which we presume to have pre-existed. The third is the speculative or metaphysical portion, and follows more closely in the footsteps of Kapila and the pure Sāṅkhya.' The work is essentially eclectic and conciliatory; but on the whole, in the ethical and practical section, it vindicates the worship of the deity by actions (*Karma*) rather than by monastic devotion (*Jñanayoga*). 'A' the end of nearly every chapter Arjuna is exhorted to arise and fight; and the great dogma seems to be, that however bad or obnoxious one's own duty may be, it is better than that of 'another.' The B.-G. was first brought before the notice of the European world by the English translation of Sir Charles Wilkins (Lond. 1785), which was turned into French by M. Parraud (Par. 1787). The first edition of the Sanskrit text appeared at Calcutta in 1808, under the care of the Brahman Bābu-Rāma. The best editions of it are those of A. W. von Schlegel (Bonn, 1823), accompanied with a very literal translation and notes; and of Christian Lassen (Bonn, 1846). A Greek translation by Demetrios Galanos (Athens, 1846) is highly commended. The latest English version is that of Cockburn Thomson (Hert. 1855), with an introduction on Indian philosophy.

Bhagulpore (*Bhāgalpūr*), on the right bank of the Ganges, the chief town of a district of the same name, province of Bengal, British India, about 260 miles by rail N.W. of Calcutta. Pop. (1872) 69,678. There are many ruins in the neighbourhood of prehistoric antiquity, and modern shrines of the various religions. The *district* of B. has an area of 4327 sq. miles, with a pop. of 1,826,290. In 1876-77 the registered exports were valued at £521,000, including oil-seeds, wheat, rice, and indigo; the imports at £403,000, chiefly piece-goods, salt, and sugar.

Bhamo, a town of Burmah, on the left bank of the Irrawaddy, 200 miles N.N.E. of Mandalay (q. v.), contains over a thousand houses built on piles a few feet above the ground, for the advantage of free circulation of air, and has 5000 inhabitants. B. and its district are governed by a Woon who acts as king, and pays subsidy to the King of Burmah. The town is fast rising into importance, owing to its being the gate to the Shan States of Western China. Steamers have recently commenced to run between Rangoon and B., and large quantities of salt and piece-goods are sent thither in return for the products of Western China. A British resident is now established at B. for the protection of our commerce; and if the projected railway between B. and Talifu, in the basin of the Yangtse, be carried out, B. must become a great emporium of trade.

Bhang, the Eastern name for hemp, but now frequently applied to the intoxicating preparation made from it. See HEMP.

Bhanpura. See BAMPURA.

Bhargaoon, a town in the district of Khandesh, northern division of the province of Bombay, British India, with a pop. (1872) of 6153.

Bhartrihari, a famous Indian proverbialist, of whose life nothing is really known; but, according to the legend which has survived, he was a brother of the brilliant monarch Vikramaditya, who is supposed to have reigned about the middle of the 1st c. B.C. Originally a rake, he repented of his sins in his riper years, and closed his career as a hermit. The collection that goes by his name is believed to be in reality an anthology of the gathered beauty and wisdom of various men and various ages, which, with Eastern looseness in matters of fact, has been ascribed to one whose name had become conspicuous in the half-mythic traditions of the past. There are in all some 300 apophthegms, which contain many fine touches of natural description, sentiment, religious and philosophical reflections upon God, the soul, life, and immortality. An edition of B.'s sayings was published by Böhlen (Berl. 1833), to which he added *variae lectiones* (Berl. 1850), with a German translation in verse (Hamb. 1835). B. was the first Indian author known in Europe, two-thirds of B.'s collection having been translated more than two centuries ago by a German missionary, Abraham Roger, in his *Offene Thüre zum verborgenen Heidenthume* ('Open Gates to Hidden Heathenism,' Nurnb. 1653). Herder has given imitations of them in his *Zerstreuten Blättern*.

Bhatgong', a town of India, in the independent state of Nepal, about 9 miles from Khatmandu, the capital of the country. It has a fine palace, and a pop. of 12,000, chiefly Brahmans.

Bha'vani-Kudar, a town in the district of Coimbatore, province of Madras, India, 58 miles N.E. of the city of Coimbatore, is noted for its temples of Vishnu and Siva.

Bhawulpur, the capital of a native (feudatory) state of the same name in India, under the government of the Punjab, on the S. of the Punjab, is situated on the Ghara, which falls into the Chenab a little farther down. Pop. about 20,000. The immediate neighbourhood of the town is very fertile, as also the strip of land skirting the Ghara and Indus. The principal products of manufacture are scarfs, chintzes, turbans, &c. Area of state, 15,000 sq. miles; pop. (1868) 474,791.

Bheels, a Dravidic race inhabiting part of the region between the Tapti and the Nerbudda. They are believed to be a relic of the Indian aborigines driven from the plains into the wilder hill regions by the victorious advance of the Aryan Rajputs. Many of them are still in a very savage and degraded state, and can hardly be considered as anything else than caterans. They were long a source of great trouble to the British Government, as they used to burst out of their mountain jungles and commit horrible atrocities. At length, in 1828, a British force was sent against them; but, although they were subdued, it was soon felt that some permanent force was required to maintain order among them. At last, in the year 1840, a Bheel corps was raised (into which the wilder spirits were drafted), to keep order among the B. themselves, and to protect them from the grasping extortions of native kamdars; and since then a great improvement has taken place. The *Bheel Agency* comprises the seven small feudatory states of Dhar, Jabuah, Ali Rajpur, Johut, Kuttivara, Ruttonmal, and Mutwarh, with parts of Scindia and Holkar's territory, and forms a division of the Central India States. 'The inhabitants are almost entirely B. and Bheelalas; the latter descended from Rajput fathers and Bheel mothers, who, year by year, settle down to husbandry and peaceful habits. Occasionally, however, stung by some act of injustice or oppression, a chief, gathering his tribe around him, retires to the hills and jungles and breaks out into wild outlawry.' This relapse was exemplified in 1872-73 by Jugtia, the head of the Dussana B., who went 'out' with most of his tribe, and has not yet come 'in.' See *Annals of Indian Administration* for 1872-73.

Bhel or **Bael**. See **ÆGLE**.

Bhewndy, or **Bhiwan'di**, a town in the district of Tanna, province of Bombay, British India. Pop. (1872) 11,970.

Bhingarh', a town in the district of Ahmednuggur, province of Bombay, British India. Pop. (1872) 5752.

Bhojpur, a town near the Ganges, in the district of Rai Bareli, province of Oude, British India, about 50 miles S. of Lucknow. Pop. 9000.

Bhoj, a fortified city of India, capital of Cutch, 35 miles N. of the Gulf of Cutch, possesses numerous fine temples and other public buildings. It is famous for its gold and silver manufactures. Pop. 20,000.

Bho'pal, one of the states in Central India, bordered W. by the Nerbudda River, has an area of 8200 sq. miles, and a pop. (1875) of 769,200. Revenue, £268,000; army, 3000 men and 57 guns. The dynasty, of Afghan origin, was founded in the reign of Aurunzib. The present (1879) ruler, a lady named Shah Jehan, has emulated the example of her mother in loyalty to the British and capacity for personal administration. The capital, also called B., about 176 miles N.W. of Nagpore, is surrounded by a dilapidated wall about 2 miles in length. Pop. 20,000.

Bhosawal', a town in the district of Khandesh, province of Bombay, 203 miles N.E. of Bombay city, lies near the left bank of the Tapti, and is a station on the Bombay and Benares Railway. Pop. (1872) 6804.

Bho'tan, or **Bhu'tan**, an independent state of India, N.E. of Bengal, on the S. slope of the Himalayas, with an area estimated at 10,000 sq. miles, and a pop. of 20,000. It is inhabited by a race (*Bhōts*, or *Bhutias*) who speak the Tibet dialect. Their spiritual head is styled Dharm Rajah, their temporal ruler, Deb Rajah. In religion they are Buddhists. Polygamy and polyandry are practised. The products are rice, maize, millet, musk, &c. Trade along the frontier is conducted at annual fairs. In 1876-77 the total exports into Bengal and Assam were valued at £20,000; the imports at £10,000. The capital is Tassisdun (q. v.).

Bhowan', or **Bhuwain**, a town in the district of Mozuffernuggur (Meerut), N.W. Province, British India, 55 miles W. of Delhi. It came into the possession of the British in 1809. Pop. (1872) 8481.

Bhu'ji, or **Bhujji**, a small feudatory state of India on the Upper Sutlege, in the province of the Punjab. It is not more than 20 miles in length and 7 in breadth, has a pop. of some 20,000, and is governed by a chief who pays a small tribute to the Viceroy of India.

Bhurtpore, the capital of the Jât state of the same name in Rajputana, India, 30 miles W. of Agra, with which it has been connected by railway since 1872, and 100 S. of Delhi. It was founded by a freebooter named Birj, who (1799) built an almost inaccessible fort here, in which his descendant, Runjit Singh, sheltered Holkar after the battle of Dit in 1803. The latter act brought about the memorable siege of B. by Lord Lake, which ended, after the failure of four assaults, in its surrender, when Runjit Singh received back his dominions on paying an indemnity of £220,000, April 17, 1805. In 1826 there was a second siege, owing to a disputed succession, and the fort was stormed and afterwards dismantled by Lord Combermere. Pop. about 6000. The territory of B. produces good crops of grain, cotton, and sugar, but is scant of water. It has a very hot climate. Area, 1974 sq. miles; pop. (1871) 743,710. The Maharaja has been granted the right to adopt a successor, has a revenue of £242,000, and pays no tribute. The present ruler is proverbially a thrifty economist, and very careful of his money. The army and other establishments are all regularly paid at the end of the month, and the ryots are not subjected to any sort of exaction or extortion. See *Annals of Indian Administration* for 1872-73.

Biafra, **Bight of**, a portion of the Gulf of Guinea, extending from Cape Formosa to Cape Lopez, a coast distance of more than 800 miles. The northern shores, as far E. as the Old Calabar river, are flat and low; but to the S. of Rio del Rey, the Cameroon mountains rise to a considerable height. The chief rivers emptying into the B. are the Niger (in part), the Calabar rivers the Rio del Rey, the Cameroon, and Gaboon, at the mouth of which last is George's Town, or Naango, the chief resort of European traders.

Bialystok, the Polish name of the now Russian Bjalostok, a town in the government of Grodno, Western Russia, on the river Bial, 95 miles to the N.E. of Warsaw by rail. It has manufac-

tures of leather, soap, woollens, &c. The town has a fine castle, with a magnificent garden and park, laid out at great expense by Count Branicki. Pop. (1867) 16,985. The province has a pop. of 265,944.

Biana, a town in the Rajput territory of Bhurtpore, India, 23 miles S.W. of Bhurtpore. It was formerly fortified; and the numerous ruins of temples and buildings in its neighbourhood attest its former greatness. In its vicinity is the *Bhim Lat*, or 'Staff of Bhim,' a stone pillar, visible at a great distance.

Biancavilla, a town in the province of Catania, Sicily, on the S.W. of Mount Ætna, 14 miles N.W. of the town of Catania. It trades in silk, cotton, and cereals. Pop. (1872) 9328.

Bianchini, Francesco, an Italian astronomer and antiquarian, was born at Verona, December 13, 1662, studied at Padua, and then proceeded to Rome. He was employed by Clement XI. to reform the calendar; and he undertook the task of drawing a meridian line from the Adriatic to the Mediterranean. His most famous work is his *Storia Universale* (Rome 1694); but his edition of the work of Anastasius, *De Vitis Romanarum Pontificum*, completed by his nephew Giuseppe B. (4 vols. Rome 1718-34), is also highly valued. B. died at Rome, March 2, 1729.

Biard, Auguste-François, a French genre-painter, was born at Lyon, 27th June 1800, studied at the school of design there, and was appointed in 1827 draughtsman on board a corvette, in which he visited various countries on the Mediterranean. Later (1839) he visited Greenland and Spitzbergen; in 1859, Mexico, and in 1865 undertook a pictorial journey round the world, sketching numberless portraits, groups, &c. His 'Attack of Brigands' was purchased by the Duchess de Berry, and his 'Les Comédiens Ambulants' (now in the Luxembourg) by the Government. His greatest successes, perhaps, have been in rendering burlesque groups, of which his 'Sequel of a Masquerade,' 'Family Concert,' and 'Good Gendarme' are favourable. B. belongs to no school, if it be not to that of nature, the facts of which he delineates with great freedom, and in open contempt of the unities.

Biarritz, a celebrated bathing-place in the Basses-Pyrénées, France, 5 miles S.W. of Bayonne, is much frequented by the French nobility, by Spaniards and Englishmen, and was formerly an autumn residence of the imperial family. Pop. (1872) 3164.

Bias, of Priene in Ionia, was one of the seven wise men of Greece, and flourished about 570 B.C. The 'wise men' earned their fame by uttering pithy maxims of practical wisdom; and several of those of B. are recorded by Diogenes Laertius. 'We should love men as if they might one day hate us.' 'The most difficult thing is to bear a change to the worse.' 'Do not praise an unworthy man on account of his riches.' 'Take wisdom as your supplies for travelling from youth to age, for it is the most secure of all possessions.' B. died suddenly after successfully pleading a cause before the judges.

Bib, Pout, or Whiting Pout (*Morrhua lusca*), a Teleostean fish belonging to the *Gadida* or cod family. It averages a foot in length, and possesses a remarkably deep body for its size. The back is arched; and the skin of the eyes and head being of a loose texture, the fish can inflate these parts at will. A dark spot exists at the pectoral fins, as in the whittings. The B. occurs very generally on the British coasts, and on those of Norway, Sweden, Greenland, and elsewhere. The Scotch name of this fish is the *Brassy*. It is esteemed as a marketable fish in London, and is said to be of finest flavour in October, November, and December.

Biberach, a fortified town of Würtemberg, circle of the Danube, at the point where the river B. joins the Riss, a station on the Würtemberg Railway, and situated on the Ulm-Ravensburg highroad, 23 miles S.S.W. of Ulm, with manufactures of toys, leather, paper, linen, cotton, lace, &c. It has also an important fruit-market. Its High Church is a fine building, originally of the year 1100, but much altered at a later date. The mineral waters of Jordansbad are in the vicinity. The inhabitants are noted not only for their industry, but their taste for art, and reckon many painters in their roll of burgesses. B. became an imperial free town in the time of Friedrich II. Moreau defeated the Austrians at B. in 1796, and again in 1800. Pop. (1875) 7376.

Bible, The, is the name given to the collective volume of the sacred writings recognised by Christians.

I. *The Name*.—The special object of all the designations which have been given to these writings has been to distinguish them as *holy writings* in a special sense, or as 'the writings' *par excellence*. The most ancient designation of the Jewish sacred writings is in the Book of Daniel (ix. 2), 'the books;' the Greek rendering of which (*ai bibloi*, or *ta biblia*), used by the Alexandrian Jews, occurs in the prologue to Ecclesiasticus, as well as in 2 Tim. iv. 13. Other and later names were *the writing*, or *the writings*, *the reading*, *the reading-book*, and hence 'the Book.' At a later time, when the sacred writings of Christianity had come into existence, these names were also transferred to them in the Christian Church, so that both collections were comprehended under the title 'Scripture,' 'Holy Scripture,' or 'Holy Scriptures,' the 'Sacred Letters.' The Greek title, *ta biblia*, employed by Chrysostom for the entire collection (in the Latin Church, 'Biblia') as a neuter plural, came to be used in Low Latin as a feminine singular, 'Biblia;' from which has arisen the use of B. as a singular noun in all modern European languages.

Of the whole collection, the part properly Jewish, and originally written in Hebrew, receives the name of the Old Testament, as distinguished from the New Testament, or the Christian Scriptures proper, which were originally written in Greek. St Paul (2 Cor. iii. 14) applied the name of the Old Covenant (A. V. Testament) to the whole scheme of the Jewish revelation—that is, God's covenant with the children of Israel under the mediation of Moses, in relation to the New Covenant under the mediation of the Messiah (Jer. xxxi. 31). In course of time, the titles Old and New Covenant were applied by metonymy to the writings relating to these, and the Greek word which meant sometimes 'covenant' and sometimes 'testament' was by the translators of the old Latin version always translated by the word *testamentum*, and the word has come into almost universal use as the title of the two parts of the B.

II. *The Old Testament*.—1. *The Contents*.—The Canon (q. v.) of the Hebrew Scriptures is exactly the same as that of the English B., but differently arranged. The arrangement is as follows:—1. 'The Law,' the five so-called Books of Moses, or the Pentateuch. 2. 'The Prophets,' subdivided into—(1) The former prophets (referring merely to their place in the canon)—viz., Joshua, Judges, 1st and 2d Samuel, 1st and 2d Kings; and (2) The latter prophets, including (a) the greater prophets (referring merely to the bulk of their extant writings), Isaiah, Jeremiah, Ezekiel, and (b) the twelve minor prophets—from Hosea to Malachi. 3. The (remaining) 'Books,' arranged thus:—(1) The Psalms, Proverbs, and Job; (2) The Song of Songs, Ruth, Lamentations, Ecclesiasticus, Esther; (3) Daniel, Ezra, Nehemiah, 1st and 2d Chronicles.

2. *History of the Canon*.—(A.) Among the Jews of Palestine. The groundwork of the Old Testament canon is confessedly the five 'Books of Moses,' or 'the Pentateuch' (q. v.). All that can be known with any degree of certainty regarding it is, that canonical authority was attached to it after the discovery of the Book of the Law (probably Deut. iv. 44-xxvi. and xxviii.) in the eighteenth year of Josiah, thirty-six years before the destruction of Jerusalem. It is at any rate certain that since the time of Ezra the Pentateuch has remained unaltered as the Book of the Law. As to the other books, in the Second Book of Maccabees (ii. 13) there is mention of the 'writings and commentaries of Neemias, and how he, founding a library, gathered together the acts (? books) of the kings, and the prophets, and of David.' The letter (from the Jews in Palestine to those in Egypt) in which this passage occurs is not authentic, but there is no reason for doubting the accuracy of the statement as it stands; so that there is evidently a reference to—(1) historical writings relating to the reigns of the kings of Israel and Judah; (2) prophetic writings—i.e., containing predictions of prophets; (3) certain writings of David, probably the Psalms, and not the Books of Samuel. As the order here indicated is that which prevails in the Hebrew canon, and from what is known independently of the origin of the various books, there is good ground for assuming—(1) that the books referred to as 'the (books) of the kings,' were the Books of Samuel and Kings; (2) that those 'of the prophets' were the prophetic writings now found in the second division of the canon; and (3) that the collection of Psalms was by this time brought to a close.

Further, since the object of Nehemiah in forming this collection was doubtless to include such books as would give a continuous history, from the point at which the Pentateuch left off down to the Babylonian captivity, we may also suppose that the Books of Joshua and Judges were admitted into the collection. Very probably the Book of Ruth, which supplied information about the forefathers of David, the ancestor of the kings of Judah, was at the same time admitted into the series of the historical books—a supposition which is rendered the more probable by the fact that by the 1st c. it was classed along with Judges as one book. Except the Book of Lamentations, which may be assumed, for similar reasons, to have had its place after the prophecies of Jeremiah, it cannot be decided whether any other of the books (besides those already mentioned—Psalms and Ruth) now in the third division of the canon were then admitted into Nehemiah's collection. Evidently this could be done only with those then in existence, and this can be asserted with certainty only of the Books of Job, Proverbs, and the Song of Solomon. The books composed after the time of Ezra and Nehemiah—Daniel, Esther, Ezra, Nehemiah, and Chronicles—are none of them placed in their chronological position among the books collected by Nehemiah; they are all placed after the Psalms and the other poetical books in the Hebrew canon—that is, showing the high authority to which that collection must have attained. Some of the books in the third division of the canon were not received into the number of the sacred writings without opposition—*e.g.*, Esther and the three attributed to Solomon—and a considerable time elapsed before the canon was considered as finally completed. But several centuries before the time of Christ, a feeling seems to have prevailed among the Jews of Palestine that the Spirit of God no longer operated upon men in such a way as to produce works deserving to be reckoned Holy Scripture. Thus no work was received into the canon which was known to have been composed later than 100 years after the captivity. The Books of Daniel and Ecclesiastes were so received only because they were regarded as the writings of Daniel and Solomon.

(B.) Among the Hellenistic Jews, there seems reason for believing that the canon remained unsettled for a longer time, and that no marked distinction was made between the books which composed the Hebrew canon and several others of a later date. It is at any rate certain, that among the Jews of Alexandria, at the time of Christ, the limits of the canon had not been fixed. In the LXX., which was almost entirely used among them, several of the books of the Hebrew canon received considerable additions, and there were also several books not in the Hebrew canon at all. These additions form what is now called the Apocrypha (q. v.).

(C.) In the Christian Church, the books of the Old Testament were used from the first in the same way as by the Jews, as Holy Scriptures. It was but few, however, of the Christian writers who were acquainted with the Hebrew language; and by far the most of them knew the Old Testament only as it existed in the LXX. It thus happened that they often quoted as Holy Scripture passages from books not included in the Hebrew canon. This was continually pointed out by Jewish writers in their disputes with Christians, and the distinction was in general after the 4th c. observed in the Eastern and Greek Church, in which there was a tendency to reject from the canon also the Book of Esther. In the Latin Church, although there are catalogues belonging to the latter half of the 4th c. in which a distinction is made, the Apocrypha came to be generally regarded as belonging to the canon, along with the books of the Hebrew canon; so that these books were included in the ancient Latin translation made from the LXX.—the so-called Itala—and at a later time in the Vulgate, although the latter was made from the Hebrew. At the Reformation the Protestant Churches adhered strictly to the Hebrew canon.

3. *Translations.*—Of translations of the Hebrew text of the Old Testament, the first was that of the Septuagint (q. v.), made at Alexandria, where it was regarded as an authentic and even inspired version of the sacred books. By the Jews of Palestine it was regarded from the first with the most intense dislike. It was, besides, convicted of many inaccuracies, and a more literal translation into Greek, for the benefit of Jews unacquainted with Hebrew, was made by Aquila (q. v.), besides others by Theodotion (q. v.), Symmachus (q. v.), &c. In the Christian Church the LXX. had a higher and more lasting authority, being regarded by many as equally inspired with the Hebrew text; an authority

which it retains in the Greek Church to this day. The consequence of this was, that when a need arose for a translation of the Holy Scriptures into the vulgar tongue of any country, the Old Testament was translated from the LXX. This was especially the case with the Ethiopian, Egyptian, Armenian, Georgian, and Slavic translations. In the Latin Church, when Jerome (d. 420) made a fresh Latin translation direct from the Hebrew, it gave great offence at first, on account of the manifold variations from the LXX. and the translations made from it; but in course of time Jerome's version gained ground, and the LXX. lost its former importance. At the end of the 5th c. it was used similarly to the translations made from the LXX., and from the 7th c. it has been accepted as the current text (*vulgata editio*), is what is known in modern times as the Vulgate (q. v.), and has been directly or indirectly the parent of all the vernacular translations of Western Europe, with the exception of the Gothic, which was made from the Greek.

The English B.—To pass over the translation of fragments of the Old and New Testaments into Old English by Cadmon, Bede, Ælfred, Ælfric, &c., the first literal prose translation in English of a portion of the B. was made by Richard Rolle (died 1349). Another version was made about the same time, comprising the Gospels of Mark and Luke and all the Epistles of Paul; and another, in the Northern dialect, containing the Dominical Gospels for the year. Meanwhile the people were forbidden by the Church to possess any of the books of the B., except perhaps the psalter and the breviary, but especially to have any of these books translated into the vulgar tongue. It was in the face of this opposition of the Church that Wicliffe made his translation, which was finished in 1380. The revival of learning in the 15th c., and the invention of printing at the same time, afforded facilities for the translation and diffusion of the Scriptures previously unknown. Wicliffe's translation was made from the Vulgate, as he knew nothing of either Greek or Hebrew; but the reformers of the 16th c. were able to study the Scriptures in the original languages, while the printing-press multiplied the number of copies in a manner that was impossible before the invention of printing, although England was long in availing herself of the help of that useful art. The first part of the English B. printed was the 'seven penitential psalms,' in 1505. The whole of the New Testament was translated and published about 1526 by W. Tyndale, who also translated in 1529 the Pentateuch, the first English version direct from the Hebrew, and in the following year the Book of Jonah. The first complete English B. was printed by Miles Coverdale, a friend of Tyndale's, in 1535. Soon after there was published, under the sanction of the king (Henry VIII.), a new B., which bore on its title-page the name of Thomas Matthews, but the real editor of which was John Rogers, a friend of Tyndale's, whose version it closely resembles. In 1539 was published the great B., which was simply a revision of Matthews', with the omission of the prologues and notes, which savoured too much of heresy for the taste of the clergy. Next year (1540) there was published a new edition, with the translation in great part recast, and a preface by Cranmer, from which it got the name of Cranmer's B., though it is often confounded with the edition of 1539. A reprint of the 1540 edition was issued next year, bearing the names of the Bishops of Durham and Rochester. During the persecution under Mary, the English exiles at Geneva completed a new translation of the New Testament in 1557, and of the Old Testament in 1560, which sometimes goes by the name of the 'Breeches B.,' from the rendering of Genesis iii. 7 (authorised version, 'aprons'). Under Elizabeth new editions of Cranmer's B. were issued in 1562, 1566, and 1568; but it was felt to be very defective, and the Geneva B. satisfied none but the Puritan party. Accordingly Parker, Archbishop of Canterbury, set agoing a new translation, which was published in 1568, and got the name of the Bishop's B. New editions were issued in 1569 and in 1572, but it never became popular. As the Protestant exiles at Geneva in the reign of Mary had done, so the Popish exiles at Rheims in this reign produced a new version from the Vulgate: the New Testament in 1582, the Old Testament some years later. It was printed at Douay in 1609, and is hence called the Douay B. In 1604 James I. set agoing an entirely new translation, for which all the previous ones were to be utilised, that one being followed in every case which came nearest to the meaning of the original text. The work was intrusted to the most talented and learned men in the kingdom,

to the number of forty-seven, who were divided into companies, with a portion of the B. to each company; and was completed by the end of 1607. But with the time occupied in its revision, printing, &c., it was not issued till 1611: It is the version still in use. A company of translators are engaged at present (1879) preparing a revised translation; but the accuracy of King James's B. is apparent from the fact that its defects, after the lapse of two centuries and a half, are comparatively so few. See Dr. Eadie, *The English Bible: an External and Critical History of the various English Translations of Scripture* (1876).

III. *The New Testament*.—It is asserted by the conservative school of divines that the books of the New Testament were composed and the canon completed during the latter half of the 1st c. Some modern critics, on the other hand, assert that some of them—e.g., the Gospel of John and the Second Epistle of Peter—were not composed till about the middle of the 2d c. But granting that the books composing the canon were all written in the 1st c., it is at any rate certain that they were not at first all received as equally authoritative, and that the limits of the canon were not authoritatively fixed till the latter half of the 4th c. The earliest authoritative compositions received into the canon were undoubtedly the Epistles of Paul, written about 55. In the course of the 2d c. our four Gospels were received. By the middle of the 3d c. the four Gospels, Acts, thirteen Epistles of Paul, of Hebrews (by some regarded as the work of Paul, by others not), 1st Peter, and 1st John had been admitted into the canon. Regarding 2d and 3d John, 2d Peter, James, Jude, and the Apocalypse, there was still great difference of opinion. But besides these there existed, during the 2d and 3d centuries, a considerable number of what are now called apocryphal writings, for the most part childish fables about the life of Jesus and the apostles. Many of these, however, were then decidedly popular, and there was as great difference of opinion about excluding certain of them from the canon, as about including certain books now in it. Thus Origen included the Epistles of Barnabas, Clement, and the Shepherd of Hermas in his list of canonical books. The historian Eusebius gives a very exact statement of the views regarding the canon prevailing up to his own time (beginning of 4th c.). He divides the Scriptures into three classes: the recognised, the controverted, and the spurious. In the first class he places the four Gospels, Acts, the Epistles of Paul (which he elsewhere calls fourteen—i.e., including that to the Hebrews), of 1st Peter, and 1st John. In the second the Epistles of James, Jude, 2d Peter, and 2d and 3d John. Regarding the Book of the Revelation there was difference of opinion; the controversy regarding it having been connected with the millenarian controversy. The third class he divided into (1) spurious but harmless, or even instructive—e.g., the Acts of Paul, the Shepherd of Hermas, the Apocalypse of Peter, the Epistle of Barnabas, the Apostolic Constitutions; and (2) those which were also *absurd and impious*—e.g., the Gospels of Peter, Thomas, Matthias, the Acts of Andrew, of John, &c. The fixing of the canon, which was thus so far accomplished by this arrangement, was brought still nearer completion by the Councils of Laodicea, of Hippo, and of Carthage (the third). By the 59th canon of the Council of Laodicea (360–364), it was enacted that no uncanonical books should be used in the churches; and by the 60th that the twenty-six canonical books should be so used—i.e., all the books of our canon except the Apocalypse. By the Council of Carthage (397), the Apocalypse (of John) was included in the list of canonical books; and from this time the New Testament canon may be said to have been definitely settled.

Till the invention of printing, the New Testament, like the Old, was preserved in MSS., of which, considering the labour of transcribing, there were great numbers—one of the good things which we owe to the leisure of the monks; and, as the material employed was parchment, many of them are still in existence. The three oldest of these are the Sinaitic MS., so called because discovered by Dr Tischendorf in a convent at Mount Sinai in 1854 and 1859, now in the possession of the Emperor of Russia, and believed to be as old as the middle of the 4th c.; the Vatican MS., in the Vatican Library at Rome, believed to be as old as about the middle of the 4th c.; the Alexandrine MS., in the British Museum, so called because presented to Charles I. in 1628 by the Patriarch of Constantinople, formerly of Alexandria, and believed to have been written about the middle of the 5th c. The three contain both the Old and New Testaments. The history of the New Testa-

ment, after the invention of printing, is merged in that of the Old Testament, as given above.

The books on the subject of this article are exceedingly numerous. We can note only the most famous and useful. In English, there are Hartwell Horne's *Introduction to the Critical Study and Knowledge of the Holy Scriptures* (4 vols. Lond. 1856); Stowe's *Origin and History of the Books of the Bible* (Hartf. 1867); Dr Samuel Davidson's *Introduction to the Old Testament* (3 vols. Lond. 1862–63); and an *Introduction to the Study of the New Testament* (2 vols. Lond. 1868); Canon Westcott's *General Survey of the Canon of the New Testament* (4th ed. 1875), and Westcott's *Bible in the Church, and History of the English Bible*. The best book on the MSS. of the New Testament is Scrivener's *Plain Introduction to the Criticism of the New Testament* (2d ed. Camb. 1874); and a popular account of the subject is given in *The Words of the New Testament*, by Drs Milligan and Roberts (Edinb. 1873).

In German, the best introductions to the Old and New Testament are by De Wette, Fr. Bleek, and Reuss. Hilgenfeld has just published an introduction to the New Testament, giving the opinions of the Tübingen School (Leips. 1875).

Bible, Prohibition of the, is a practice of the Church of Rome, arising from her doctrine regarding the rule of faith. Protestants hold that the B. is sufficiently clear to be understood, under the guidance of the Holy Spirit, by the people to whom it is addressed; and that they are entitled and bound to judge for themselves what is its true meaning. Roman Catholics, on the other hand, teach that the Scriptures are so obscure that they need a visible, present, and infallible interpreter; and that the people, being incompetent to understand them, are bound to believe whatever doctrines the Church declares 'to be true and divine.' From this doctrine it follows that the use of the B. by the people is discountenanced by the Church of Rome. Accordingly, although it was never done by any general council, prohibitions have been repeatedly issued by popes—e.g., by Gregory VII., who ordained (1080) Latin to be the sole language of worship; and by Innocent III., Clement XI., and Pius IV., who prohibited the reading of the B. without permission from a priest. The consequence is, that the B. is practically inaccessible to the mass of the people in Roman Catholic countries.

Bible Society, an association having for its object the circulation of the Scriptures. An association had been founded at Halle in Germany by Charles Hildebrand for the purpose of printing Bibles, which was carried on for many years with unwearied activity; and by the end of the 18th c. had issued as many as 3,000,000 copies of the B. in German. The Religious Tract Society also, founded in 1799, though not properly confined to the dissemination of the Scriptures, has always made that a very prominent part of its labours. The first association known by the title of B. S. took its rise in England in 1780. It was intended solely for the benefit of soldiers and sailors, the movement being suggested by the idea of their frequent exposure to danger. The society was supported by 'voluntary, individual subscriptions, and collections at different places of worship;' and within two years they had distributed more than 11,000 Bibles among different regiments and ships' crews (one of the first to be supplied having been the Royal George), and expended upwards of £1500. The same society exists at the present day, under the title of the 'Naval and Military B. S.' Ten years later (1792), a number of persons in London formed themselves into an association called the 'French B. S.,' their object being to supply French Bibles to those who wanted them in France. But the attempt proved abortive amid the tumult of the French Revolution.

The greatest of all the associations of the kind is the 'British and Foreign B. S.,' which was started at the beginning of this c. Founded in 1804, chiefly in consequence of the desire of Thomas Charles of Bala to procure a supply of Welsh Bibles from the Religious Tract Society, in forty-eight years upwards of 700,000 had been printed and circulated in Wales. The constitution of the society is, that it exists only to spread among all nations the written Word of God, 'without note or comment,' of the Old and New Testaments, and the canonical books only. The income of the society is derived from collections, donations, legacies, &c. Its labours consist in circulating copies of the authorised version of the English B. in Great Britain and the British Possessions, and also copies in Gaelic and the other

Celtic dialects in Great Britain; and in printing and circulating translations prepared by missionaries in various countries. Of above 200 translations of the Bible which have been made into different languages and dialects, above 150 have been printed more or less directly in connection with the British and Foreign B. S. Its relations with the Continent of Europe also have always been of the most liberal nature. During the first ten years of its existence, forty-eight different societies, formed mostly in imitation of itself, in Germany, Hungary, Sweden, and Switzerland, in Finland, Denmark, Iceland, Courland, and Russia, had received from it 99,000 Bibles and 127,000 New Testaments. Up to the present time it has printed in the various languages of Europe above 9,000,000 copies. According to the report just issued for 1874-75, the receipts for the year amounted to £222,062, and the expenditure to £217,390. The issue of Bibles, Testaments, &c., was 2,619,427; since the establishment of the society, 74,000,000.

The auxiliary and branch societies connected with the preceding are too numerous to name. There are in Scotland two societies, which seem to be two branches of one founded in 1809—the 'National B. S. of Scotland,' and the 'Scottish B. S.' The American B. S., which is only second in importance to the British and Foreign, was founded at New York in 1817. The most important in Germany is the Prussian Central in Berlin, founded in 1814. The Russian B. S., which was founded at St Petersburg in 1813, was abolished by a ukase of Nicholas in 1826, although its place has since been so far filled by a Protestant one, which does not interfere with the members of the Greek Church.

Biblia Pau'perum ('Bible of the poor'), the name given to a picture-book forming a system of scriptural symbolism or typology, and representing, in from 40 to 50 plates, the principal incidents in the salvation of the human race by Jesus Christ, with brief elucidations and verses from the prophets, in Latin. A larger work of the same kind, with an expanded text in rhyme, was known as the *Speculum Humana Salvationis* ('Mirror of Human Salvation'). Before the Reformation, both were immensely popular with the preaching friars for homiletic purposes; and to laymen and clergy were often the sole source of their biblical knowledge. The Franciscans, Carthusians, and other orders, who called themselves *Pauperes Christi* ('Christ's poor'), made great use of the first work, hence its name B. P. MSS. of both are numerous, and reach as far back as the 13th c. They exercised a great influence on ecclesiastical art, being frequently copied in the sculptures, frescoes, glass-paintings, and altar-pieces of the middle ages, and were probably the very first works printed in the 15th c. by the xylographic system of Holland and the movable types of Germany.

Biblical Antiquities, or Archaeology, is the science which describes the political constitution, geography, manners, customs, laws, &c., of the nations mentioned in the Bible, as well as the usages of the Apostolic Church, for the purpose of elucidating the text of Scripture. The sources of B. A. are the Bible itself; the Apocrypha and Talmud; the writings of Josephus, Philo, Jewish rabbis, and Christian fathers; of Greek, Roman, and Arabic authors, and of travellers who have visited the countries mentioned. A prolific field has recently been discovered in the imperishable terra-cotta libraries of the Assyrian kings at Nineveh.

Bibliography, from the Gr. *bibliographia*, meant originally the transcribing of books, and *bibliographos* was a copyist. The term, however, now signifies the history and description of books, including notices of the materials of which they are composed, of the times when they were printed, of the presses from which they were issued, of their subsequent good or ill fortune, of the authors whose names they bore, of the classes into which they have been or may be arranged, and comprehends, indeed, information of every kind respecting them. The history of books in their earliest form, and of the materials composing them, is contained in the *Origin and Progress of the Art of Writing*, by Humphreys; and the origin and progress of the art of printing are narrated and illustrated in Meerman's *Origines Typographicae*, and in *Annales Typographici ab Artis Inventae Origine*, by Maittaire. Ames's *Typographical Antiquities* (1785-90) gives an account of the establishment of the art in England, and contains memoirs of our early printers. The

prompt appearance of the *Éditions Principes* of the classics is an admirable illustration of the rapid diffusion and development of the art throughout Europe. Within twenty years after its discovery, editions of nearly all the Latin classics had been printed. The first Greek book (the *Grammar* of Constantine Lascaris) was printed at Milan in 1476; and in 1494 the famous Aldus issued the first of a series of upwards of sixty Greek works, completed before his death in 1515. The compilation of a universal biographical dictionary was attempted by Conrad Gesner in his *Bibliotheca Universalis* (Zurich, 1545), which was, however, confined to Hebrew, Greek, and Latin books. The *B. Britannica* of Watt (Edinb. 1824) was designed by him to be a universal catalogue of the authors with whom this country is acquainted. Special or particular bibliographical dictionaries are many in number and various in character. Rare books are arranged and described in the *B. Curieuse, ou Catalogue Raisonné de Livres Rares* of David Clement (1750-56); and to this department also belong the *Manuel du Libraire et de l'Amateur des Livres* of Brunet (the 5th ed. 1860-65, now out of print), and the *Tresor des Livres Rares et Précieux* of Graesse (1859-60). Bohn's edition of Lowndes' *Bibliographer's Manual* (1857-64) contains an account of the rare, curious, and useful books of Great Britain. Some bibliographical works treat specially of the literature of particular countries, as, for example, the *Critical Dictionary of English Literature and British and American Authors*, by Allibone (1859-71); *La France Littéraire* (1827-39), by Querard; and its continuations by Louandre and Bourgueldt, and by Lorenz (1867-71); the *B. Hispana Vetus* and *B. Hispana Nova* of Antonio (1783-88); *Handbuch der Deutschen Literatur*, by Ersch, with supp.; *Allgemeines Bücher Lexicon* (1812-56), by Heinsius. Special works also are confined to the literature of the classical languages, such as those of Dibdin and Moss, and the useful handbook, *Guide to the Choice of Classical Books*, by Mayor. Renouard's *Annales de l'Imprimerie des Alde* (1834), and *Annales de l'Imprimerie des Estiennes* (1837-38), are specimens of works that treat of the books issued from particular presses. The extensive and curious class of books published anonymously, or under feigned names, has long enchained the interest of bibliographers. The best book in this department is the *Dictionnaire des Ouvrages Anonymes et Pseudonymes* of Barbier (1822-27). There appeared in 1868 the *Handbook of Fictitious Names* by Olphar Hamst (Ralph Thomas), being a guide to authors, chiefly in the lighter literature of the 19th c., who have written under assumed names, and to literary forgers, impostors, plagiarists, and imitators. The prospectus has been issued of the *Anonymous and Pseudonymous Literature of Great Britain* by the late Mr Samuel Halkett, continued by Mr Jamieson, his successor in the keepership of the Advocates' Library, and the Rev. John Laing, librarian of the New College, Edinburgh. The following works may be mentioned in addition as of interest to the student of this subject: *Bibliographie Instructive* (1768) of De Bure; the *Bibliographical Dictionary* of Dr Adam Clarke; Peignot's *Manuel Bibliographique*; Horne's *Introduction to the Study of B.*; and Egbert's *Bibliographical Dictionary* (translated from the German, 4 vols. 1837). See also Edwards' *Memoirs of Libraries* (Lond. 1859).

Bibliomanacy (Gr. *biblion*, *manteia*), a species of divination, which consisted of opening the Bible at hazard, selecting the first passage on which the eye fell, and deriving from its contents, or even its sound, fanciful indications of future events. B. was very prevalent for many centuries, and was prohibited by several Councils of the Church under pain of excommunication.

Bibliomaneia, literally book-madness, a compound from the Greek, expressive of the passion or irresistible desire for rare and curious books, still prevalent, but which reached its acme during the 18th c. The bibliomaneia values a book, not for its intrinsic excellence, but for some accident—as its rarity, its being on large paper, or on vellum (a tall copy, and a large paper copy are not the same), the press from which it issued, or the name of the binder. A defect, as the omission of *not* from the seventh commandment, in one impression of the English Bible gave a fictitious value to that impression; and the *Breches Bible*, so called from its rendering of Genesis iii. 7, is a favourite with the bibliomane—so named by Isaac D'Israeli in his *Curiosities of Literature*, in his rendering of a passage of Jean Joseph Rive: 'A bibliomane is an indiscriminate accumulator, who

blunders faster than he buys, cock-brained and purge-heavy.' In Dibdin's *Bibliomania*, it is more than hinted that bibliomaniacs never read books. Jonathan Oldbuck, in the *Antiquary*, is a happy mixture of the bibliomane and the bibliophile—the latter of whom reads as well as collects. The Elzevir and Foulis editions of the classics were long highly prized, and still are so, though in a less degree. In the Elzevir *Cæsar* of 1635, the number of the 149th page is misprinted 153; hence it acquired a factitious value, and imitations are detected by being unfortunately accurate in their paging at this critical place. Ridiculous prices have sometimes been paid for rare works. The first dated edition of the *Decameron* was purchased at the sale of the Duke of Roxburghe's library in 1812 by the Marquis of Blandford for £2260. The Roxburghe Club was hereupon established for the reprint of rare works, and was followed by the Bannatyne, Maitland, and Spalding Clubs in Scotland, the Camden, Percy, and other societies in England, and the Celtic Society in Ireland. A very charming book on the subject is Dr John Hill Burton's *Book-Hunter* (Edinb. 1862), in which affection, mockery, and criticism are pretty fairly blended.

Bioce, a name given to two pigments, a blue and a green, both of which are, however, prepared from carbonates of copper. They may either be made from the native carbonates, or be artificially prepared; and in the latter case they usually receive the names *mountain blue* and *mountain green* respectively.

Biiceps, a muscle on the front of the arm. It arises by two heads (hence its name). The long head arises within the capsule of the shoulder-joint, 'from the upper border of the glenoid ligament,' and passes over the head of the Humerus (q. v.). The short head arises from the coracoid process of the scapula or shoulder-blade. These two heads unite to form the B. It is inserted into the tuberosity of the Radius (q. v.). From the tendon of insertion, a fibrous expansion is given off from its inner side, which passes downwards and blends with the fascia of the fore-arm. The chief action of the B. is to flex the elbow-joint. It also helps to raise the arm at the shoulder, and to turn the palm of the hand upward.

Bioêtre, an old castle to the S. of Paris, just beyond the fortifications, used as a military hospital until the erection of the Hôtel des Invalides, afterwards as a lunatic asylum and prison, now as a refuge for the aged poor, with 2750 beds. It was originally built in the reign of Charles V., and destroyed in 1634, but was rebuilt by Louis XIII.

Biêhat, Marie François Xavier, one of the most celebrated of French physicians and anatomists, was born at Thoir-ette (Jura), November 11, 1771. He passed the first years of his medical study under the direction of his father, who was also a physician. After spending two years at Lyon, he repaired to Paris in 1793, and attended at the Hôtel-Dieu the clinical lectures of Desault, who being soon attracted by the superior intelligence evinced by B., took him as his assistant in his surgical practice and in preparing his lectures and works. After the death of his patron in 1795, B. showed his gratitude by publishing in 1797 two volumes entitled *Œuvres Chirurgicales de Desault*, setting forth the great surgeon's doctrines and methods of treatment. He then devoted himself to lecturing on anatomy, physiology, and surgery; and established with several of his friends *La Société Médicale d'Emulation*, through the medium of which he gave to the world many highly original and important memoirs, notably those on the tissues of the human body. He was nominated a physician of the Hôtel-Dieu in 1799, and died July 22, 1802, his premature death being hastened in great part by his incessant labours. B.'s three great works are the *Traité des Membranes* (Par. 1798), in which he classifies the different kinds of tissues, maintaining that all are merely differentiated forms of the same elementary tissue; the *Recherches Physiologiques sur la Vie et la Mort* (Par. 1800), a work rich in new discoveries and original ideas, in which he defines life to be the 'sum-total of the functions which resist death'; and the *Traité d'Anatomie générale* (2 vols, Par. 1801), in which he summarises his now generally received principles, applying them in the same systematic manner to the various departments of biology. See Bilon's *Éloge historique de B.* (Par. 1802).

Bick'erstaff, Isaac, a writer of English comedies, which had a considerable although evanescent popularity in the 18th c., was born in Ireland, 1735, and died about 1800. Of his per-

sonal history little is known, except that he was page to Lord Chesterfield, and was at one time an officer of marines, but was dismissed the service. His plays, of which *Love in a Village* (1762), the *Maid of the Mill* (1765), and *Lionel and Clarissa* (1768), are genuine specimens of comic opera, and several of his comedies and farces, of which he wrote twenty-two, were produced under Garrick's management, and were long deservedly popular. The name B. is also known as a *nom de plume* used by Swift and Steele.

Bick'ersteth, Rev. Edward, an active clergyman and missionary of the Church of England, was born at Kirkby Lonsdale, Westmoreland, March 19, 1786. After being a post-office clerk in London, and a solicitor in Norwich, he took such an interest in religion, that having been admitted to orders (1815), he went to Africa as a missionary. Returning after successfully organising missions there, he became secretary to the Church Missionary Society. He discharged the duties of this office with great energy and success till 1830, when he retired, on accepting the rectory of Wotton, in Hertfordshire. B., who died February 28, 1850, wrote several religious books, and took an energetic part as an 'Evangelical,' against Tractarianism and the endowment of Maynooth. See Birk's *Memoir of B.* (2 vols. Lond. 1815). His son, **Rev. Edward Henry B.** (born at Islington, 1825), is favourably known as a religious author and editor; and his brother, **Henry B.** (born 18th June 1783, died 18th April 1851), rose to distinction as a lawyer, and when promoted to the bench took the title of Lord Langdale.

Bicycle, the recent development of the *velocipede*, and the most popular of all modern athletic machines. It is a lightly-built vehicle, of from 30 to 60 lbs. weight, chiefly formed of iron and steel, and consisting mainly of two wheels (hence its name, from *bis*, twice, and *kyklos*, a circle), and of a simple but strong connecting frame. The front or 'driving' wheel is usually about twice the size of the other, and has a diameter averaging from 42 to 60 inches. The frame consists (1) of a 'backbone,' connecting the two parts of the B., supported at its lower extremity on the axle of the smaller wheel; (2) an erect bar, upwards of two-thirds forked to admit the driving-wheel, on the axle of which it rests; (3) a strong steel spring, placed over the backbone and supporting the 'saddle.' The erect bar rises from the axle of the driving-wheel to the upper end of the backbone, through an aperture in which it passes, having a free cylindrical motion, and terminates in a cross handle. This handle is the means of controlling the exact direction of the driving-wheel and therefore of the machine. Motion is given to the B. by the rider, seated in the saddle, pressing with his feet on revolving treadles attached by a crank to the axle of the driving-wheel; and when once set a-going, such is the lightness of the machine, it is capable of receiving great acceleration of impetus. The pace of an ordinary bicyclist is from 9 to 11 miles an hour, or about 60 miles a day, while that of a trained rider is 14 miles an hour, or about 90 miles a day. D. Stanton, of Brompton, ran 106 miles in 7 hours 58 min. 54½ sec. at Lilliebridge, W. Brompton, October 19, 1874.

The most striking qualities of the B. as a means of locomotion are, perhaps, its 'staying' power and its capacity of sustained balance. In long distances the B. is found to surpass the horse, a fact the less surprising when it is taken into account that the muscles called into play, those of the back and legs, are the strongest in the human body. More singular is it that the B. should preserve a perfectly steady balance on so narrow a base as the felloe of the wheels (one inch), and its power in this respect affords the physicist a fine illustration of the stability due to motion.

The earliest velocipede on record is a crude machine invented by Blanchard, the aéronaut, and described in the *Journal de Paris*, July 27, 1779. It was followed by that of Joseph Nicéphore Niepce, the famous French inventor, in 1818, and in the same year by the notorious 'dandy-horse' or 'Draisena,' a machine called a velocipede, which Baron von Drais of Mannheim patented in Paris and London, and which is described in *Ackermann's Repository* for February 1819. The present B. certainly embodies the main idea of Drais, but its improved form is due to an unknown Frenchman, whose work is supposed to have been produced about 1861. In 1866-67 the B. began to be popular in England, and the taste for it was confirmed by the races at the Crystal Palace, May 26, 1869. Many feats have

since been done on the B., the most remarkable, perhaps, being the journey of M. A. Laumailié from Paris to Vienna, via Strasburg, Munich, Linz, &c., October 12-23, 1875. In 1874 there were some 50 B.-clubs in Britain, and in the same year 102 racing matches, amateur and professional, took place. See Steinmann's *Velocipede* (1870), and *The B.*, by A. Howard (Lond. 1874).

Bidasso's, a river of Spain, which rises in the province of Navarra, and enters the Bay of Biscay near Fuenterrabia, forming the point of termination in the W. of the boundary between Spain and France. It is 55 miles long, and at its mouth lies the island where the treaty of the Pyrenees was concluded, November 7, 1659. The B. was the scene of several bloody conflicts during the Peninsular campaign, the most important of which was the victory of the Allies over the French, whom they forced to retire from the siege of San Sebastian with a loss of 16,000 men, August 31, 1813.

Biddle, John, who may be considered the father of English Unitarianism, was born at Wootton-under-Edge, Gloucestershire, 14th January 1615. He was educated at Oxford, and after graduation became master of Gloucester Free School, and performed his duties as such with great ability. Having, however, embraced and given utterance to opinions impugning the doctrines of the Trinity, he was expelled from his post, and ordered by the Puritan Parliament to be imprisoned for four years. Liberated by Cromwell's General Oblivion Act of 1654, he became pastor of an independent congregation; but a fresh publication of heresy once more exposed him to the wrath of a triumphant orthodoxy, and the Protector was driven to order him to be banished to one of the Scilly Isles (1655). When his term of punishment expired, he returned to London, to be again, however, apprehended after the restoration of Charles II., fined £100, and thrown into prison, where he died, of fever, September 22, 1662. His adherents were first known as Biddellians, then as Socinians, and finally as Unitarians.

Biddle, Nicholas, a celebrated American financier, born at Philadelphia, 8th January 1786. From 1819 to 1823 he was a director, and from 1823 to 1839 president, of the United States Bank. Under his guidance the affairs of the bank, previously disordered, soon became prosperous; but President Jackson, suspecting that the resources of the bank were employed for political purposes, refused to renew its charter; and, ceasing to be a national institution, it became insolvent in 1841, very much in consequence of the rash counsels of B., who died February 27, 1844. He wrote the *Commercial Digest*, a work published with the sanction of Congress, edited the *Philadelphia Portfolio*, and was a public speaker and essayist of considerable mark.

Bideford ('by the ford'), a seaport of Devonshire, on the Torridge, near where it enters the estuary of the Taw in the Bristol Channel, 34 miles N. of Plymouth. It has manufactures of sails, ropes, leather, and hardware, and exports naval stores, oak-bark, and iron. B. is accessible to vessels of 500 tons, and the river is here crossed by a bridge of 24 arches. In 1874 there were 109 vessels, of 7029 tons, belonging to B.; and in 1873, 729 vessels, of 38,007 tons, cleared the port. Pop. (1871) 6969.

Bidpai, also **Pilpai**, is the name popularly given to the unknown author of a collection of fables and stories which, in numerous translations and various forms, have for centuries been familiar both to the East and the West. Recent researches lead to the conclusion that its ultimate source is the ancient Indian work *Pantschatantra* (Sanskrit text, Kosegarten, 2 vols. Bonn, 1848-59; Ger. Benfey, 2 vols. Leips. 1859), which professes to be the composition of a certain Vishnuçarman, but has apparently received its present shape in the 2d c. B.C. under Buddhist influences. The *Pantschatantra* spread over all India in recensions differing more or less from each other, and in versions of all kinds passed into the languages of the N. and S. Indian races. The French translation of the work by Dubois (Par. 1826) is based on versions in Tamil, Telugu, and Canarese. In India itself the matter of the *Pantschatantra* was quite freely handled, as is proved by the manner in which it is epitomised in the *Kathasaritsagara* and the *Hitopadesa* (Sanskrit text, by Lassen and Schlegel, Bonn, 1829; by Johnson, Hertf. 1847; Eng. vers. by Wilkins and Jones; Ger. by Max Müller, Leips. 1844). The *Hitopadesa* in turn became a fertile source of translations into all Indian tongues.

It is not difficult, and it is very interesting, to trace the course of the old Sanskrit collection westward. First of all, under the Persian king Nushirvan, or Chosroes the Great (531-579), it was translated into Pehlevi by his physician Barsaye, under the title of *Kalila and Dimnah* (from two jackals that are prominent in the first fable). This Persian version is no longer extant. Together with the rest of the old native literature it was destroyed by the Arabs after the country became Mohammedan. The *Pantschatantra* was next turned into Arabic in the reign of the Kalif Almansur (754-775) by Abdallah Ibn-Almokaffa, who in his introduction gives the name B. to the author, and says that he was the chief of the Indian philosophers. This Arabic version not only became the common property of the whole Moslem world, but was the vehicle through which the *Pantschatantra* found its way into Christendom. The Arabic text was published by Silvestre de Sacy (Par. 1816), and has been republished at Cairo (1836), Delhi (1850), &c. There is a German translation by Wolff (2 vols. Stuttg. 1837). Ibn-Almokaffa's version has given rise to many imitative works among Arabian and Arabico-Persian poets, which it is not necessary to specify. But it may be here noted, that with the spread of Mohammedanism a knowledge of the *Kalila and Dimnah* was carried to the Afghans and Malays; while Buddhist missionaries from India at an early but uncertain date had made the substance of the original *Pantschatantra* familiar to Tibet, Mongolia, and China.

The Arabic *Kalila and Dimnah* reached Europe in three ways:—1. Through the Greek translation of Symeon Seth, *Kytila and Dimne*, executed about 1080 (published in an incomplete form by Stark, Berl. 1697; Athens, 1851), which was again turned into Latin by Possinus, and into Italian by an unknown author (Ferrara, 1583). 2. Through the Hebrew translation of Rabbi Joel, composed about 1250, which was put into a Latin dress between 1263 and 1278 by Joannes of Capua, under the title *Directorium Humanae Vite*; alias, *Parabole Antiquorum Sapientium* (first printed in 1480). The *Directorium* in turn became the basis of a German version of the first half of the 14th c. by Duke Eberhard of Württemberg, which appeared at Ulm in 1485. 3. Through the Spanish translation, executed in 1251, in the reign of Alfonso X. This also was turned into Latin by Raymond of Béziers, a learned physician in the service of Queen Juana of Navarra, wife of Philip. le Bel. Partly from the version of Joannes of Capua, and partly from that of Raymond, come all the later mediæval and modern translations; the Spanish (Burgos, 1498), Italian (Flor. 1548), French (Lyon, 1556), English (Lond. 1570), Dutch (Amst. 1623), Danish (Copenh. 1618), Swedish (Stockh. 1743), German (latest, Leips. 1802; Eisen. 1803). See Loiseleur des Longchamps' *Essai sur les Fables Indiennes* (Par. 1838), and above all, Benfey's version of the *Pantschatantra* (Leips. 1859).

Biebrich, a village in the German province of Nassau, situated on the Rhine, possesses a splendid palace, the residence of the Dukes of Wiesbaden. Pop., with Mosbach (1871), 6642.

Biel, **Bel**, **Bialo**, are forms of a Slavonic word signifying 'white,' and entering into the composition of innumerable names of persons and places in the various Slavonic regions of Europe, such as Eastern Germany, Poland, Austria, Russia, Servia, &c. Several instances have already occurred in this work, and more will immediately follow. We may recall two conspicuous examples—*Beli-Tsar* (Gr. *Belisarios*), 'the white prince,' and *Belgrade*, 'the white fortress.'

Biel (Fr. *Bienne*), an old town in the Swiss canton of Bern, picturesquely situated at the base of the Jura, to the N. of Lake B., near the mouth of the Suze or Schüss, with manufactures of printed cottons, watches, leather, cigars, and iron-wire. It was founded in the 11th or 12th c., early came under the rule of the Bishops of Basel, but allied itself with the Swiss confederacy in 1352, and thereby diminished the power of its ecclesiastical overlords. It was united to France in 1798, but restored on the peace of 1815. The inhabitants of B. speak German, but there is also a French patois. Pop. (1870) 8113. See Blösch's *Geschichte der Stadt B.* (Biel, 1855-56).—**B. Lake** is about 10 miles long and 3 broad, is 1419 feet above the sea, and has a depth of 300 feet. It contains the island of St Pierre, where Rousseau resided in 1765; receives the surplus waters of Lake Neuchâtel by the Thiele, and then discharges its own waters by the same river; flows N.W. and joins the Aar, at the distance from Lake B. of 5 miles.

Biela's Comet, discovered by Biela, an Austrian officer, February 28, 1826, has a period of 6-61 years. It appeared, according to prediction, in the years 1832, 1839, 1845, and 1852. In the years 1859 and 1866 it was not observed as expected, but reappeared in 1872 at a time of meteoric display.

Bielfeld, the chief town of a district of the same name, province of Westphalia, Prussia, on the Lutter, 52 miles S.W. of Hanover, with which it is connected by rail. It is one of the chief places in Germany for flax-spinning and linen manufacture, and among its other industrial products are silk, velvet, tobacco, glass, asphalt, cement, machinery, cast-iron wares, and leather. The old walls and ditch of B. have been converted into promenades. On the outskirts of the town is the castle of Sparrenberg, built by the family of Ravensberg in 1545, and now used as a prison. Pop. (1875) 26,574.

Bielew, a town of Russia, government of Tula, on the Oka, 150 miles S.S.W. of Moscow. It has 19 churches and 2 monasteries. The chief manufactures are soap, leather, oil, and sailcloth. But the most important industry of the inhabitants is a pedlar-trade with the poor and a sutler-trade with the soldiers. In the remotest parts of the vast empire, Siberia, Caucasus, Georgia, &c., numbers of the Bielevese are to be found engaged in lucrative huckstering. Pop. (1867) 8123. The Empress Elizabeth, widow of Alexander I., died here May 1826, on her return from Taganrog to St Petersburg.

Bielitz (Pol. *Bielsk*, 'white town'), a town in Austrian Silesia, at the N.W. foot of the Carpathians, on the Biala, opposite the Galician town of Biala, with an extensive woollen and kerseymere trade. It has 18 wool factories, with manufactures of linen, machinery, carriages, &c., and is a great emporium for the salt produce of Galicia. The old castle of the Princes Sulkowsky, to whom B. belongs, is situated here. Pop. (1869) 10,721.

Biella, the capital of province Novara, N. Italy, at the junction of the Cervo and Aurenza, 39 miles N.E. of Turin by rail, with manufactures of woollens, hats, paper, &c. It is the seat of a bishop, and has many churches. Pop. 8362. Near it is the village of Oropa, with its famous monastery *Madonna del Monte*.

Bielo-Ozero (the 'white lake,' so called from its white clay basin), belongs to the government of Nevgorod, Russia, and is 25 miles long by 20 broad. The Sheksna river conveys its waters to the Volga; and the Onega, Sukona, and Dwina are connected with it by canals.—**B. Ozerish**, on the southern shore, is a small town of 4467 inhabitants (1867), and trades in cattle, corn, pitch, and candles.

Biel'opol, an active trading town in the government of Kharkov, Russia, 106 miles N.W. of the city of Kharkov. Pop. (1867) 10,500.

Bielschöhle, a singular cavern in the Harz Mountains, on the right bank of the Bode, near Rübeland, Duchy of Brunswick. It was discovered in 1762, and consists of eleven compartments, abounding in curiously formed stalactites.

Bielak, a town of western Russia, government of Wilna, 23 miles S. of the town of Bialystok, lies in a very fertile district, watered by the Narev and Nurzek. Pop. (1867) 3985.

Bienne. See **BIEL**.

Bienn'ials, plants which do not flower the first season of their growth, but flower, bear fruit, and die away the second season, such as the turnip, carrot, wallflower, parsley, &c. Under exceptional circumstances of early sowing, heat, &c., plants which are naturally B. will flower and fruit during the first season. In such cases they become annuals, and die the same season. Brown's *Manual*, p. 295.

Biervliet, a fortified town on an islet of the same name, belongs to the province of Zeeland, Netherlands, and lies 16 miles N. of Ghent. In 1377 the islet of B. was formed by an inundation, which separated it from the mainland and which submerged

19 villages. William Beukelzoon (q. v.), the inventor of herring-curing, was born here. Pop. about 5000.

Biesbosch (i.e., 'rush-bed'), a 'coast-lake' of morass in Holland, near the mouth of the Maas, having an area of some 60 sq. miles, containing numberless small islands, and communicating with the German Ocean by the Hollandsdiep and Haringsvliet. It was formed (November 18, 1421) by the Maas in flood forcing a direct course towards the sea, on which occasion 72 villages, with 100,000 persons, were swept away. The B. is now crossed by the railway from Rotterdam to Antwerp.

Biffin. See **APPLE**.

Biga, properly *Bigæ*, the Latin name for a chariot and pair, the two horses being yoked abreast. The chariot was two-wheeled, open behind, and sloping gradually upwards to the front, which was closed in. The occupant and the driver both stood.

Bigamy is the crime of going through the marriage ceremony during the legal subsistence of a marriage previously entered into. The crime is equal in degree on the part of a man and of a woman. By 24 and 25 Vict., c. 100, if any person, being married, shall feign to marry another person during the life of the former husband or wife, whether the feigned marriage shall have taken place in England, Ireland, or elsewhere, he or she shall be guilty of *felony*, and subject to penal servitude. But the penalty shall not be incurred on account of any second marriage contracted out of England or Ireland by any one not being a subject of her Majesty; nor by any person marrying a second time whose husband or wife shall have been continually absent for seven years, and not known to have been living within that time; nor by any person who at the time of such second marriage shall have been divorced; or by any person whose former marriage shall have been declared void by the sentence of a court of competent jurisdiction. Strictly speaking, no one of course can remarry during the subsistence of a previous marriage. He or she can but go through the form or ceremony of so doing. The essence of the crime consists in the fraud involved; but even where there is no fraudulent intention, and the crime is committed through legal ignorance, it is nevertheless one which the law severely punishes, and properly so, because the ignorance of the offender will not mitigate the injury to the victim. Nice questions have arisen between the law of England and that of Scotland regarding B., as they have done on many other points relating to marriage. It was decided in England, in the celebrated case of *Lolley*, that a decree of divorce by a Scotch court in favour of a born Englishman domiciled in Scotland was not operative in England. Lolley and his wife had domiciled themselves in Scotland for the purpose of obtaining a divorce, which being got, the former returned to England, where he remarried. He was at once indicted for B., found guilty, and sentenced to seven years transportation. A good deal of difference of opinion existed among eminent English lawyers as to the soundness of this decision. It was, however, generally held to be sound; which being so, it is not for us to question the fact. The decision was given in 1812. It is very doubtful if it would now be sustained, especially having regard to the exception in the Act above quoted, which provides that the penalty shall not apply to any one who at the time of remarrying shall have been divorced. Not only the bigamist, but every one advising, aiding, or abetting the offender, is held equally guilty with the offender himself. Accessories before and after the fact are also severely punishable.

Bigg. See **BARLEY**.

Big horn (*Ovis montana*), a species of sheep, the only species indigenous to the New World, inhabiting the Rocky Mountains from their termination in latitude 68° to 40°. The males of this species possess horns of enormous size, and hence the popular name of these animals, which collect in flocks numbering from five to thirty individuals. They are wild and untamable in habits.

Big Horn River, the largest tributary of the Yellowstone, which again is the greatest affluent of the Missouri, rises near Fremont's Peak in the Rocky Mountains, and waters Wyoming and Montana for a course of 400 miles, part of which is navigable.

Bight, a noun derived from the old English verb *bigan*, to 'bow' or 'bend,' and still in use among sailors to denote a coil of a rope. It is also applied in geography (though here also the term is doubtless of nautical origin) to denote a bay of the sea, as the B. of Benin, the B. of Biafra, &c., on the W. coast of Africa. B. and bay (originally *biga*) are essentially the same word. Another form is the Lowland Sc. *bucht*.

Bignonia'ceæ, the trumpet-flower order, a natural order of Dicotyledonous plants, mostly trees, or climbing or twining shrubby plants, with large and showy flowers, and opposite, simple, or most pinnately-compound leaves. The order has about 46 genera and 460 species, most of which are tropical plants. With the exception of being cultivated for their beautiful flowers, the order is of little importance. From the leaves of *Bignonia chica* the S. American Indians make *chica* for painting their bodies and arrows. In India an oil is obtained from the wood of *B. xylocarpa*. The woods of several species are used in Brazil and Jamaica—e.g., *B. leucoxydon*, which is sometimes sold as ebony. The trumpet creepers (*Tecoma*) are often astringent, and the roots of *Jacaranda Bahamensis* is employed as an anthelmintic in Panama.

Big Sandy Creek, a navigable river of the United States, rises in the Pallachians, and flows N. for some distance in two branches, forming the boundary between Kentucky and Virginia, and joining the Ohio after a course of 150 miles.

Bihac, a strongly fortified town in the N.W. angle of Turkish Croatia, on the Unna, near the Austrian military frontier. It was often besieged during the Turkish wars. Pop. (1869) 4000.

Bijanaghur ('city of triumph'), a ruined city of India, province of Madras, on the Jumbudra, 40 miles N.W. of Bellary. It was for two centuries the capital of a Hindu sovereignty, and has remains of granite palaces and temples. In 1564 it was plundered and destroyed by the Mohammedans of the Deccan.

Bijawur, a town and mediatised state in the Bundelkhand, Central India. The town is in a mountainous tract, 140 miles S.W. of Allahabad. Pop. estimated at 6000. The state has an area of 920 sq. miles, a pop. of 90,000, and a revenue of £35,000. It is bound to maintain a force of 100 cavalry and 1300 infantry.

Bijnur, a town and district in the Rohilkhand division, N.W. Province, British India. The town is on the left bank of the Ganges, 75 miles S.W. of Delhi, with a pop. in 1872 of 12,566. The district has an area of 1884 sq. miles, and a pop. (1872) of 737,152. Its produce consists chiefly of cotton, wheat, and sugar-cane.

Bikanir, the capital of the Rajput state of the same name, India, 240 miles W.S.W. of Delhi. Pop. (1874) 35,768, chiefly Jain traders and Brahmans. The town has a handsome appearance, many of the houses having beautiful carved façades. In the centre is the fort and palace, strongly fortified. There are manufactures of blankets, &c. The potters and stonecutters of B. are celebrated. The state was founded by Bika Singh, a son of the Jodhpur chief, in the 16th c., and is still independent, the treaty of friendship with the British Government, March 9, 1818, exacting no tribute, but securing the freedom of transit for the trade with Central Asia, which now, however, goes by the Multan route. B. rose to importance as a principality of the Mogul Empire, and received privileges and additional territory from the Emperor Akbar. At the time of the Mutiny, Sirdar Singh, the present ruler, fought against the rebels of Hansi and Hisar, and protected European fugitives, for which services he received a grant of 41 villages. The present (1875) minister of state is Pundit Munphul, C.S.I., the celebrated Central Asian traveller. The revenue of B. is £60,000. Area, 17,676 sq. miles; pop. (1874) about 300,000. See Malletson's *Native States of India* (Lond. 1875).

Bikh. See ACONITUM.

Bil'ander, or **Bilandre**, a kind of merchant-ship not often seen now. It has two masts, and is distinguished by the shape and arrangement of its mainsail.

Bilbao (Basque, 'Under the hill'), a Spanish seaport, and capital of the province of Biscay, on the Nervion, 8 miles above

Portugaleta, situated at its mouth, and 45 miles W. of San Sebastian. It is connected by railway with Tudela, in the valley of the Ebro. The new town lies picturesquely along terraced slopes on the right bank of the river, and is connected with the older part (*B. la Vieja*) on the left bank by a stone, a chain, and an iron bridge. It has fine promenades, good churches, a theatre, and a school of navigation. B. is an important commercial centre, and is the principal port of N. Spain, the larger vessels anchoring at Portugaleta, where there are large shipbuilding yards. B. itself has extensive iron foundries, with manufactures of sailcloth, glass, paper, leather, hats, earthenware. Its great export is wool; but it also sends to Central and Northern Europe chestnuts, oil, wine, &c. On the other hand, a large part of Northern Spain is supplied with foreign productions, machinery, hardware, cotton and woollen goods, colonial produce, &c., through the port of B. Pop. 18,800. B. was founded in 1300, under the name of *Belvaio*, by a knight of Castile, Don Pedro Lopez de Haro; rose rapidly, but suffered severely in the French wars. It was taken by the French 19th July 1795, and again, 26th September and 1st November 1808. During the Carlist struggles it has often been besieged; the latest instance was a most destructive bombardment in the spring of 1875, when it was relieved (May 2) by the army of the north under Generals Serrano and Concha.

Bilberry. See WHORTLEBERRY.

Bil'bilis, a Celtiberian city of Spain, the birthplace of the poet Martial, and famous in Roman times for its steel blades, tempered in the water of the Salo. Its site is at Bambola, near the modern town of Calatayud, which is built in great part out of the ruins of B.

Bilboes (from Bilbao, where they were first fabricated), long bars of iron, with shackles sliding on them, into which are inserted the ankles of sailors who have been sentenced to be put in irons.

Bil'cock. See RAIL.

Bil'derdijk, Willem, a once famous Dutch author, born at Amsterdam, 7th September 1756, studied law and philology at Leyden and cultivated poetry while practising as an advocate at the H.-gde. During the French occupation he was for some time in Brunswick and England, lecturing in the latter place vehemently against the French language. Louis Bonaparte, King of Holland, took him into favour in 1806, and made him a president of the new Institute at Amsterdam. On the re-union of Holland to France, B. lost this support, but on the deliverance of his country (1814) he recovered his position at the Institute. He died at Haarlem, 18th December 1831. B. was remarkable in poetry for the skill of his imitations and translations of the Greek idyllists, of Sophocles, Dante, Corneille, Delille, Chaucer. He even tried an epic, *De Ondergang der eerste Wereld* ('The Destruction of the First World'). He was a patriotic adherent of the house of Orange, savagely criticising both German and French literature, and vindicating the rhyming capabilities of his own language. Among his most important didactic poems are *Buiten Leven* (Amst. 1803); *De Ziekten der Geleerden* ('The Maladies of Scholars,' Amst. 1807); and *De Mensch* (1808). He also wrote in prose a treatise on geology, based on De Saussure, a history of Holland in 10 vols., and several essays on grammar and philology. In old age his mind was embittered and half upset. Thus the *Echo from the Rock* (1824) is a tirade against most modern improvements. A collected edition of his poems (*Dichtwerken*), in 16 vols., was published at Haarlem, 1857-60. His second wife, Katharine Wilhelmine B., nee Schweickhardt (born 1777, died 1830), was also a poetess of considerable merit. See Da Costa, *Overzicht van het Leven en de Werken van B.* (Amst. 1844), and *B. en da Costa* (Amst. 1862).

Bile is a greenish-yellow fluid, somewhat viscid, especially that portion of it contained in the gall-bladder. It has a bitter taste, a peculiar nauseous smell, and an alkaline reaction. It is heavier than water, its specific gravity being from 1026 to 1030; water being 1000. It is secreted in the cells of the liver, and flows along the hepatic duct till its union with the cystic duct, the duct leading to the Gall-bladder (q. v.), and then along the 'common B.-duct,' and is poured into the upper part of the small intestine. The common B.-duct in man enters the bowel

obliquely about three or four inches below the stomach. This duct is somewhat constricted at its opening into the Duodenum (q. v.), and when this opening is closed by contraction of the muscular coats of the bowel or otherwise, the B. flows along the cystic duct into the gall-bladder, and is there stored up. The B. is constantly being secreted by the liver, but in much greater quantity during meals. Berzelius gives the chemical composition of the B. as follows in 1000 parts:—

Water,	904.4
Biliary fat and colouring matter,	80.0
Mucus,	3.0
Earthy salts,	12.6

B. contains two acids, glyco-cholic and tauro-cholic. The latter contains sulphur. These two acids are in combination with sodium and potassium, and so form a soap, giving to B. its saponaceous character. Five colouring matters have been detected in B. The most important of these are bilirubin and biliverdin. The former is the chief pigment contained in human B., and is of a pure red colour. The latter is the chief colouring matter in the B. of herbivorous animals, and is of a green colour. By means of the action of nitric acid on these pigments, we are enabled to detect the presence of B. in urine and other substances. The fatty portion of B. is composed to a great extent of Cholestrine (q. v.) united with fatty acids. Iron and copper are both found in B. The quantity of B. secreted has been variously estimated, but it is generally believed that in man it is fully 3 lbs. daily.

The functions of B. are most important. The elements of B. are secreted from the blood by the liver, and the blood is thus purified of certain constituents which would render it deleterious. The B., after being poured into the bowel, assists in the process of digestion. How it does this is still a matter of doubt, but it is believed to assist in turning the chyme into chyle. It is poured into the alimentary canal in greater quantity during the process of digestion than during fasting. A portion of B. is carried along the alimentary canal, and is excreted with the feces. This is specially noticeable in the case of the colouring matter of B. The greater portion of B. is re-absorbed into the blood, and passes off in the lungs as carbonic acid and water, on account of the carbon and hydrogen of the B. uniting with oxygen. B. has the property of arresting the process of digestion, and on account of this property, when B. by regurgitation or otherwise finds its way into the stomach, it materially interferes with digestion, producing nausea, vomiting, and that condition of the system termed biliousness.

When B. is secreted in greater amount than can be poured into the bowel, or when through obstruction of the common B.-duct it is prevented from entering into the bowel, it is again re-absorbed into the blood, and produces that disease called jaundice (q. v.), in which the skin and conjunctiva assume a yellow colour, due to the colouring matter of the B. By the solidification of the cholestrine gall-stones are formed, and the passage of these along the B.-ducts gives rise to acute pain. See GALL-STONES.

Bilge, that portion of the bottom of a ship contiguous to the keel and on both sides of it. A ship when aground usually rests on the keel and one B.

Bilge'ways, timbers used for launching a ship. See LAUNCH.

Biliary Calculus. See CALCULUS.

Bilim'ba. See CARAMBOLA.

Bilin', a small town in Bohemia, on the river Biela, about 3 miles from the baths of Teplitz, is chiefly celebrated for its acid springs, and for the remarkable precipitous mountain, called Březina-Berg, in its vicinity. B. has a trade in Glauber-salts, magnesia, cloth, coal, beetroot, sugar, and fruit. Pop. 4300.

Bilious Fever. See TYPHOID FEVER.

Bill, the term applied in zoology to the beak of birds. The B. consists of an upper and a lower *mandible*, which consist essentially of prolongations of the facial bones. The *inter-maxillary bones* constitute the chief portion of the edge of the upper jaw, whilst the upper jaw itself in birds is formed by the *premaxilla*, or front portion of the *maxillary* bone. The lower

jaw, or *mandible* proper, consists, in birds, of numerous separate pieces, which become ossified together in the adult to form a single bone. No teeth are developed in the jaws of any bird, although the horny membranes which invest the jaws may present processes analogous, but not homologous, with dental structures. The *form* of the B. varies greatly throughout the class of birds, and is adapted to the different habits of the included members. Thus, in the birds of prey (*Raptorus*), the B. is arched, and of powerful make; in the parrots it is curved, and adapted for aiding these birds in climbing, and in the cracking of hard fruits, &c.; in the insect-eaters (e.g., goatsuckers, swallows, &c.) the B. is short, and the gape wide, and provided with bristles adapted for the detention of the insect-prey which these birds pursue on the wing; in many swimming-birds the B. is broad, and provided with sensitive *lamina* or plates, fitted for straining the food from among the mud in which these birds grope; whilst many other adaptations of the structure of the beak to the wants of its possessors might be cited, and are referred to under the articles relating to the different birds. The term *cere* is applied to the sensitive portion at the base of the upper mandible, which may be naked or feathered, and in which the nostrils frequently open. This cere has been supposed to be of use as an organ of touch. The B. is also used by birds to *preen* or dress their feathers with the secretion of the *urophygium*, or *oil-gland*, of the tail; the great mobility of the neck of birds giving to the B. many of the characters of a hand.

Bill, a term applied to an account, and to various kinds of formal writings connected with state, legal, and mercantile affairs and procedure. See the following articles under this word:—

B. of Adventure is a writing given by a merchant, declaring that goods shipped by him belong to some one else, to whom he undertakes to account for the results of the adventure.

B. of Attainder, and **B. of Pains and Penalties**, are bills or measures proposed to be enacted by the Legislature, criminally condemnatory of an individual. The Legislature being legally omnipotent, it has frequently in the history of England passed a B. of A. against an individual, on evidence which would have been quite inadequate to establish guilt in a court of justice. Instances have even occurred of persons being so attainted without their being heard in their defence. Under the Tudors, this method of procuring condemnation of men who had become obnoxious to the monarch, or who were suspected of treason, was frequently had recourse to. It rarely was so under the Stuarts; but a noteworthy instance, in their time, was the B. of A. in the reign of Charles I. by whose enactment the Earl of Strafford was beheaded in 1641. In 1820 the trial of Queen Caroline before the House of Lords took place under a B. of P. and P. Like other bills, those in question can only become law by the unanimous judgment of the Crown, the Lords, and the Commons. See ATTAINDER.

B. in Chancery, or **B. of Complaint**, is the written statement of a plaintiff in the Court of Chancery, under which he seeks equitable redress. The somewhat analogous term in Scotch law is *Condescence* (q. v.). The B. of C. sets forth the circumstances of the case. It must be signed by counsel. It must not contain any matter impertinent. It must be printed, and duly served on the defendant. The B. may be dismissed by *demurrer*—that is, by the court finding that, even if the averments be true, the plaintiff is not entitled to relief from the court. Otherwise, an answer is ordered, and the case proceeds.

B. of Costs is the attorney or solicitor's account against his client. These bills are submitted to the Masters of the respective courts, who make such deductions as they think reasonable, and the remaining charges are certified and called the *Master's allocation*. In Scotland, the solicitor's B. of C., there called *expenses*, is taxable by the Auditor of the Court of Session (q. v.). See COSTS, EXPENSES. In some kinds of transactions in England and in Scotland the law-agent is paid by commission—that is, by a percentage on the value of a transaction. This mode of payment is adopted in the case of loans and sales. In 1873 in England, the council of the Incorporated Law Society drew up a scale of these charges, according to which 2 per cent. is allowed on a loan up to £2000, and for each £1000 thereafter up to £15,000, 1 per cent., after which $\frac{1}{2}$ per cent. On a sale, the charge is 3 per cent. up to £1000, between which and £5000 it is 2 per cent.; between £5000 and £50,000 it is 1 per cent., thereafter $\frac{1}{2}$ per cent.

B., True.—In criminal law, a B. signifies the indictment of the accused before the grand jury. (See JURY, GRAND.) The jury either 'ignore the B.'—i.e., acquit the prisoner—or find 'a T. B.' against him. In the latter case, he is tried before a petty jury, whose verdict determines his guilt or innocence. See JURY, TRIAL BY.

B. of Exceptions is a statement of objections as ground of appeal (see APPEAL) to the ruling of a judge in a civil case. Counsel can oblige a judge publicly to seal a B. of E., stating the point on which he is supposed to err.

B. of Exchange is a mercantile instrument generally written on a broad, short piece of paper, by which one person orders or requests another to pay a certain sum of money to him, to a third person, or to 'the order' of either, at a specified time. The place of payment is also sometimes specified.

The convenience afforded in commerce by the B. of E. is easily understood. It is valuable especially in two ways,—First, as facilitating transactions on credit; second, as saving time, expense, and risk in transmitting or carrying money. Thus, A supplies goods to B, for which A wishes to be immediately paid; B, on the other hand, wishes credit for four months; so that he may have retailed his goods before paying for them. A then draws a B. on B for the value of the goods, to be paid 'four months after date.' The B. is negotiable; and A gets the value of it, less four months' interest, from his banker or other capitalist; and thus debtor and creditor are accommodated. Again, AM in London owes BN in Glasgow £100, and CP in Glasgow owes AM £100. AM, instead of paying his debt to BN by sending coin or bank notes from London to Glasgow, writes as follows on a piece of duly stamped paper:—

£100.
(Stamp).

London, 1st June 1875.

One month after date ('on demand,' or 'at sight') pay to Mr BN, merchant in Glasgow, or order, one hundred pounds for value received. AM.

Mr CP, Merchant, Glasgow.

He transmits this piece of paper to BN of Glasgow, who receives the amount from CP; who thus discharges his debt to AM of London. Such a simple transaction as this, which we give to show the principle of a B. of E., becomes complicated to suit the convenience of commerce; and as it becomes so, questions arise of the greatest legal nicety.

We have supposed BN to receive payment from CP, but unless the B. be payable 'on demand' or 'at sight,' it will seldom happen that the drawer's creditor receives direct payment from the drawer's debtor. In our first illustration of the convenience of bills, we have shown how this happens. A, we have said, gets the value, less four months' interest, from his banker, or other capitalist. A is then said to have *discounted* his B. In so doing he *endorses* it, that is, he writes his name on the back; by doing which he becomes legally bound for the amount to the discount—*or* endorsee, as he is called—who, when the B. becomes due, is entitled to require payment either from A, the drawer, or from B, the drawee or acceptor. This endorsee may again endorse and discount with some one else, who in his turn becomes the endorsee, and so on; the holder, when payment becomes due, having all the endorsees as securities, as well as the drawer of the B. He who makes or draws the B. is the drawer; he to whom it is addressed is before acceptance the drawee, after acceptance, the acceptor; the person in whose favour it is drawn is the payee, and if he endorses, he is then the endorser, and the person to whom he transfers it is the endorsee. Whoever possesses the B. is the holder.

A B. is either *foreign* or *inland*. It is foreign when the address of drawer or drawee is abroad; it is inland when both reside in the United Kingdom or Channel Islands. A *good* B. must be payable *at all events*. It must not be payable out of a particular fund. It must be drawn for money only; and not stipulate for the performance of any act. It must be duly stamped. Omission of date may render it void. To be negotiable, it must be payable to 'A, or order,' or 'to bearer.'

Acceptance is an engagement to pay the B. It is done by the drawee writing 'accepted' on it, and then signing. It may be inferred in England from collateral circumstances, but not so in Scotland. See ACCEPTANCE. It may also be conditional or partial; for instance, to pay £200 instead of £150. The holder of a B. of E. must present it for payment at the proper

time and place; and his failure to do so, or to give notice of non-payment by the acceptor, exonerates the drawer and endorsers. When a B. becomes due, it is said to *mature*. This is not generally till three days after the date on which it bears to be due. These three days are called 'days of grace.' If not then paid, the holder may proceed to recover by law. This is now done by a speedy process, under the Act 18 and 19 Vict., c. 67. The Act does not extend to Ireland, nor to Scotland, where the payment of a B. may be enforced by a very summary process. Against the drawee and acceptor this process must, however, be begun by protest (i.e., notarial evidence of demand duly made), not later than the last day of grace. Against the acceptor, the protest may be made and recorded any time within six months after the B. has matured. As there are now various mercantile journals which publish the recorded protests of bills of exchange in Scotland, and the similar procedure in England and Ireland, procedure is almost certainly fatal to the mercantile credit of the obligant against whom the protest is made. The holder must, therefore, be very careful not to take this extreme measure without being sure that he is legally entitled to do so. The mere fact that A is a holder of a B. on which B is an obligant, may not justify A in recording protest against B. It may really be that on an accounting A is debtor to B, in which case the protested B. might be held as paid; or there may be many other reasons why the summary procedure would not be held as justified; in which case B. might have ground for an action for damages, so leading A into the expense and trouble of a jury trial. If B thinks himself wronged, his remedy is by writ of summons; in Scotland by note of suspension (see SUSPENSION) in the B. Chamber (q. v.). Suspension is, however, seldom granted without the defender being required to give security for the amount expressed in the B. Even though the note contain an allegation of forgery, security may probably be required. See FORGERY.

By writing the words 'without recourse' after his signature, the endorser of a B. may free himself of liability to the endorsee.

Accommodation B. is a B. drawn for a fictitious debt, for the purpose of raising money by discounting it. A owes B nothing, but he accepts A's B. drawn on him at four months for £100. B discounts this with his banker, and so gets the loan of £100, less the discount, for four months. B probably returns the favour to A; and when the relative obligations fall due, if not convenient to pay them, they are met by drawing fresh bills, which, to avoid exciting suspicion, may be discounted with another bank, or through some different channel from the first. This fraudulent system, fostered by over-speculative banks, has sometimes in our great mercantile towns been carried to an extent that has led to general commercial disaster. There have been many plans for suppressing the system by law, but it has been found impossible to do so, without undue interference with lawful transactions.

Promissory Note is a written obligation by one person to pay a certain sum of money on demand, at sight, or at a specified time after the date of the note, to another, or his order, or to the bearer. It is usually in this form,—

£100.

London, 1st June 1875.

On demand. } I promise to pay AB one hundred pounds for value received.
At sight. }
months after date. } CD.

The note requires to be duly stamped. It has all the privileges of the other forms of B. of E., and it is under the same rules and laws. See BANK, BANKING, BANK-NOTES, FORGERY.

I. O. U.—These letters are sometimes used for forming an obligation to pay. They are legal evidence of debt; but unless followed by a promise to pay on a particular day, they do not constitute a promissory note.

B., Exchequer. See EXCHEQUER BILL.

B. of Health is a certificate from the consul, or other proper officer, given to the master of a ship on sailing from a port suspected of infectious disease. A *clean* B. certifies that at time of sailing no such disease was known to be there. A *suspected* B. indicates that there were credible rumours that such disease had appeared. A *foul* B. implies that it actually had appeared.

B. of Indemnity. See (under ACT) *Act of Indemnity*.

B. of Lading.—This is a very important mercantile document. It is an acknowledgment by the master of the shipment of goods,

which it enumerates, on board his ship; and is a written evidence of the agreement for their carriage and delivery, according to the order or consignment of the shipper. It differs from a Charter-party (q. v.) inasmuch as the charter-party only states the terms and conditions of the freightage or carriage; while the B. of L. usually states the quantity, condition, and marks of the merchandise, the names of the shipper, consignee, and master, and the place of departure and destination.

A B. of L. is transferable by endorsement of the shipper; and his endorsement and delivery of the B. for value conveys the absolute right to the goods shipped to the endorsee. Endorsement is either *general* or *special*. The former does not name the consignee, but gives a general direction to the master to deliver the goods to the holder of the B. of L., on their reaching the place of consignment. *Special* endorsement names the consignee. 18 and 19 Vict., c. 111, enlarges the rights and liabilities of the endorser or consignee of a B. of L. See STOPPAGE IN TRANSITU.

Bills of Mortality are abstracts from parish registers showing the deaths periodically. They generally include, also, periodical lists of the births and marriages. It was on the data afforded by these that Sir W. Petter, Dr Halley, Pascal, Dewit, and others founded their calculations respecting the laws of mortality (see MORTALITY, LAW OF, and LIFE, MEAN DURATION OF); but the data were inadequate, both, probably, from being inaccurate, and from not being sufficiently extensive. The London B. of M. were first used in 1562, and from 1603 they have been kept regularly. They are of little value, from the superior data now afforded for practical purposes by the returns of our Registrars-General. See REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES.

B. in Parliament. See PARLIAMENT.

B. of Rights. See RIGHTS OF THE PEOPLE.

B. of Sale.—This is a contract under hand and seal, by which a man transfers the interest he has in goods to another. The deed is binding against him who executes it, whether granted for adequate value or not; but it may be fraudulent and void against creditors. It may be an Act of Bankruptcy (q. v.). But a B. of S. for adequate consideration, granted with the knowledge and consent of creditors, is valid against them, though unaccompanied by possession. The most important use of a B. of S. is in the transfer of property in ships, which, being held in shares, cannot generally be delivered over on each change of ownership.

The Act 17 and 18 Vict., c. 36, is framed with the view of preventing frauds on creditors by secret B. of S. of personal chattels. In Scotland a valid title to personal chattels can hardly be given so as to defeat creditors without giving possession to the buyer. See DELIVERY. Certainly the landlord's Hypothec (q. v.) cannot otherwise be superseded.

B. of Sight is a writing taken at the custom-house descriptive of a package consigned to a merchant, on his making oath that he is ignorant of its contents. In virtue of the B. of S. the package will be landed and examined in presence of the importer and officers of the customs. A perfect entry must then be made, and duties paid according to contents.

B. of Store is a licence granted by the custom-house to merchants to carry provisions and stores required for a voyage free of duty.

B. of Victualling.—A list of victuals and stores required on a long voyage is made up by the master of a ship on leaving a British port, and submitted to the custom-house authorities. On their approval, stores are shipped accordingly. A list is then made out of all stores on board, which, being signed by the customs, constitutes the B. of V.

B.-Broker, one whose business it is to buy inland and foreign bills on speculation. This business is to be distinguished from that of one who discounts bills. See BILL OF EXCHANGE.

B.-Chamber is a department of the Court of Session (q. v.) in Scotland, analogous to that of Judges' Chambers (q. v.) in England. The business of the B.-C. consists in the disposal of all matters in whose initial stage judicial authority is required; such as an application for interdict. The court of the B.-C. is held by one of the Lords Ordinary, called the 'Lord Ordinary on the bills.' During the session the duty is taken, by the junior Lord Ordinary. During vacation it is taken by the six judges of the court who are not criminal judges.

Billardiera, a genus of climbing Australian plants of the natural order Pittosporaceae (q. v.), colonially known as 'apple-

berry trees.' Though possessing a resinous aroma and sour taste, and containing many hard seeds, the fruit of *B. mutabilis* is eaten. *B. longiflora* is cultivated as a greenhouse plant in Britain for the sake of its profusion of flowers and blue berries. The genus is named after Labillardiere, a French botanist attached to D'Entrecasteaux's expedition.

Billaud-Varenne, Jean Nicolas, 'the execrable citizen,' born at Rochelle, 23d April 1756. B. studied in the Oratory, and was for some years Prefect of study at Juilly College. Coming to Paris in 1785, he became an advocate, and in 1789 published an anonymous essay on the despotism of French ministers (*Despotisme des Ministres de France*). Vice-president of the Jacobin Club, he called for 'primary' assemblies of the people in every district; urged the destruction of the king, as a member of the Committee of Public Safety and of the Convention; assisted Danton at the September massacres; took the king's letter to General Dumouriez, and drew up the indictment of the king. In 1793 he denounced both the executive council and the Girondists, and turned against Robespierre, whom he succeeded as president. Accused in his turn as a Terrorist by Lecointre and Legendre in 1794, he was ultimately banished to Cayenne with Barere, Vadier, D'Herbois, &c. The last years of his life were spent in Hayti. He died at Port-au-Prince, 3d June 1819. Other books by B. are *Le Dernier Coup* (Lond. 1789), *Le Peintre Politique* (1789), *Acéphalocratie* (1791), or federal government. He excelled in savage attack.

Billbergia (*B. tinctoria*), a beautifully-flowered genus of Bromeliaceae (q. v.), from the roots of which a colouring material is got in Brazil.

Bill'et, in architecture, is a Norman ornament formed by notching out a moulding, generally a round one, so that it resembles a row of separate billets of wood. In heraldry, B. is a small oblong figure, which may be of any tincture. Whether it represents a brick or a love-letter has been a matter of heraldic dispute.

Bill'eting, a term applied to the feeding and lodging of soldiers when not in camp or barrack. In towns unprovided with barracks this burden is sorely felt, and has always given rise to dissatisfaction and complaint. Prior to 1689 there was no ascertained system for the lodging and maintenance of soldiers in such towns, and there was room for the exercise of caprice and oppression, an unsatisfactory state of matters, which the Mutiny Act of that year attempted to remedy. It intrusted the B. of soldiers on the inhabitants to the discretion of the chief magistrate, whose local knowledge enabled him to distribute the burden with approximate fairness. No change was made by Parliament till 1745, when the burden of B. soldiers was restricted to certain traders, a relief not extended to Scotland till 1857. In 1858 a committee of the House of Commons reported on the hardships and inequalities of the system; but practically the provisions of the Act of 1745 are still in force, with only slight modifications.

All keepers of inns, livery-stables, alehouses, victualling-houses, retail wine-sellers, and dram-sellers are obliged to receive the soldiers billeted on them; but they can claim relief, by complaint to a justice, on proving that, in comparison with their neighbours, the number so billeted is unduly large. By 5 Will. IV., c. 6, persons holding canteens, distillers, shopkeepers whose principal dealing is not in spirits, keepers of taverns only, being free of the Vintners' Company in London, are exempt from receiving the military; and in and near London there are special regulations affecting the B. of the Guards. The person on whom soldiers are quartered must furnish each with one hot meal per day, consisting of meat, bread, and vegetables, with two pints of small beer, vinegar, and salt, for which tenpence is allowed; and innkeepers must provide the military, when stationary, with fire, candles, vinegar, salt, and cooking utensils, for a halfpenny a day. The regulation allowance for hay and straw for a horse is tenpence. These disbursements are made by the regimental paymaster. The term B. is derived from Fr. *billet*, a diminutive of the Low Lat. *billa*, Class. Lat. *bulia*, a small piece of paper or ticket, prepared according to the rules of the Act, one of which is delivered to each soldier, and is his warrant for claiming food and lodging.

Billiards (Fr. *billard*, from *bille*, a ball, hence *billarder*, to strike a ball twice; Ital. *bigliardo* or *trucco*), a beautiful and

scientific game, played with ivory balls on a specially constructed table, and supposed to be of either Italian or French invention. From France, at all events, it found its way to England, where it was known in the 16th c., as appears from a passage in Shakespeare's *Antony and Cleopatra*, act ii. sc. v., in which B. is represented as a pastime of the amorous queen of Egypt (1). Little is known of the progress of B. in England, but it is only in comparatively recent years, and after great improvements in the game itself, that it has come to be so universally popular.

Billiards.

The modern billiard-table is rectangular in shape, stands 3 feet high, is generally about 12 feet long, by 6 feet $1\frac{1}{2}$ inches wide, and usually costs from £80 to £150, though a very good table may be had for less even than the lower of these sums. The first-class table is made of mahogany, and has an entire weight of from 20 to 25 cwt. It has a perfectly level surface, formed of the finest slate of Bangor or Penrhyn, and covered with green cloth; and is surrounded by a ledge, the inner sides of which, called 'cushions,' are padded with 'native' or vulcanised india-rubber to make the balls rebound. With good cushions, a ball struck moderately hard will traverse the table three or four times; on 'fast' tables, as many as eight passages may be made. Round the table, at each corner and at the centre point of each of its longer sides, are placed the six holes or pockets, with nets to catch the balls. About 2 feet 5 inches from one end, a line is drawn across the table, the space within which is known as 'baulk,' and from the centre of this line is described a semicircle, 18 inches in diameter, from within which the play begins. At the other end of the table, 15 inches from the cushion, a spot indicates where the red ball is to be placed at the beginning of the game. The cue is a straight rod of lance, ash, box, or Brazil wood, about 5 feet long, tapering towards the extremity, which is tipped with leather, and which requires to be chalked occasionally in playing. The regular billiard-ball is made of the finest African ivory, is perfectly spherical, and is $2\frac{1}{4}$ inches in diameter. One of the balls is red, having been dyed with vermillion; the other two are white, distinguished from each other by one having a small black spot. Among the other accessories of the game, not calling for special description, are the long cues, butts, rests, maces, and the marking-board, in its improved form a miracle of ingenuity.

In playing, the cue is held in the right hand, and is steadied, at about a foot from the tip, on a 'bridge' formed by the thumb and forefinger of the left hand, which rests on the table. In the ordinary billiard game the objects of the player are twofold: first, to 'cannon'—i.e., to touch both of the other balls with his own at one stroke; second, to make a 'hazard,' by either holing his adversary's ball or the red one, or by pocketing his own, off either of the other balls. The former is called a 'winning,' and the latter a 'losing' hazard; but these terms, derived from the old game at B., no longer apply in their strict sense, as is seen from the fact that the winning hazard now is the less advantageous. The 'points' of the game are, 2 for a cannon, 2 for a white hazard, 3 for a red hazard, 1 'away' (or to the adversary) for a miss, and 3 'away' for a 'cob' (coup)—i.e., going into a pocket or off the table without striking another ball. A game was formerly limited to 21, but now oftener extends to 50, 63, 84, 100, or 1000. Two, three, or four persons may play at the billiard game; two or four being the usual number. The common game in France, and indeed all over the Continent, consists altogether of cannons, and is played on a table without pockets.

There are many other games played on the billiard-table, of which the chief is the somewhat mercenary 'pool,' a game con-

sisting entirely of winning hazard. It thus closely resembles the old game of B. before the introduction of the red ball, and can be played by as many as fourteen persons (formerly limited to twelve), each contributing his stake to the 'pool.' The players receive each a ball, and start with three chances, or 'lives,' and every time a ball is holed, the owner of the ball pays a sum previously agreed upon to the player, and loses a 'life'; when this happens three times he retires from the game. The person who first loses all his lives can 'star,'—i.e., purchase the smallest number of lives still existing, by renewing his stake to the pool; if he does not, the privilege extends in rotation to the other players, excepting always the last two. He who keeps his ball longest on the table wins the pool. The game is to hole the ball of the previous player, and, when successful, to play at the nearest ball. The balls are easily distinguished by being of various colours. The 'pyramid' game, which is also popular, is played with fifteen red balls and one white, the red balls being placed together, in the form of a triangle or pyramid, at spot, and the game being to hole them, subject to the special rules.

Captain Crawley has called B. an excellent form of 'indoor athletics,' but it is something more. The principal qualifications of the expert player at B. are the power of dynamical calculation, presence of mind, a steady hand, and a sure eye. He has to estimate the 'strength' of his stroke, and the elasticity of the cushions, to follow instinctively the angles of incidence and reflection, to allow exactly for the disturbing influence of the 'side' imparted by striking his ball in a particular spot, and to be able to leave the three balls near any given position after a variety of impacts and rebounds. Amongst the best players in England of late years may be mentioned the late Earl of Eglinton, Colonel Munday, Mr Roberts (senior), 'young' Roberts, Mr William Cook, and Mr Bennett. Mr Cook was champion for many years, and astonished his admirers by a score of '752 up' in a match with Bennett at St James's Hall in 1871. Mr Roberts, junior, has at various times performed such wonders with his red winning-hazard at the lower end of the table, that his name is identified with the particular stroke. The best billiard-tables are made by the celebrated firm of Messrs Burrourghes & Watts, London, and by Messrs Morison & Co. of Edinburgh. See Moley, *Unterricht im Billardspiel* (Leips. 1841); Coriolis, *Théorie Mécanique des Effets de Jeu de Billard* (Par. 1835), and the well-known works of Captain Crawley (Lond. 1866) and Joseph Bennett (1873).

Billig, a noble family of Old Saxony, and from 961 to 1106 the ruling dynasty in the Duchy of Saxony, which under it attained great territorial strength and independence. The first Duke was **Hermann B.**, originally perhaps a simple gentleman, but raised by the Emperor, Otto I., through a succession of dignities to the governorship of Saxony. B. was celebrated in his time for his valour, boldness, sense of justice, and loyalty. He died at Quedlinburg, 27th March 973. His successors in regular order were Bernhard I., died 9th February 1011; Bernhard II., died 29th June 1059; Ordulf, died 28th March 1071; and Magnus, died 23d August 1106, with whom the male line became extinct, when the Duchy reverted to the emperors. The first traditions of the Billings are mythical rather than historical, but it is not improbable that the name was originally that of an old Teutonic clan or tribe, some of whose members may have been among the Low German adventurers who conquered Britain and made it England. The conjecture, if accepted, would historically explain such names as Billingsgate, Billingshurst, Billington, Billingley, &c.—viz., the homes or settlements of the Billings.

Billingsgate, the old port of London, was opened in 1588 as a landing-place for provisions, made a free market in 1699, and is now a wharf and wholesale fish-market. Salmon and eels are sold here by weight, other fish by tale, oysters and small shell-fish by measure. The market opens daily at 5 A.M., and mackerel are allowed to be sold on Sunday. The market was extended and improved in 1849, and a new one was erected in 1852. From the unsophisticated language of the dealers in this market, B. has come to be synonymous with ribaldry or foul language.

Billington, **Elizabeth** (né Weichsel), born in London, 1769, was one of the most beautiful women and charming singers of her day. Her voice was a soprano, of wonderful compass and quality. After singing with extraordinary success in the chief cities of Italy, Milan, Venice, Leghorn, Genoa, Padua,

Florence, and Naples, she returned to London, where she was so popular, that in 1801 she received from Covent Garden and Drury Lane theatres the (for that time) extraordinary salary of £4000 for six months,—to sing at the two houses alternately. One regrets to add that her private life was a succession of scandals. B. withdrew from the stage in 1809, and died at her villa near Venice, 25th August 1818.

Billiton, one of the Dutch islands in the E. Indies, to the S.W. of Borneo, from which it is separated by Carameta or B. Passage. It exports iron and timber. Area, 1150 sq. miles; pop. 15,000.

Billom, an old town in the department of Puy-de-Dôme, France, 65 miles W. of Lyon, with some manufactures of earthenware, thread, cloth, serge, and embroidered work. It was formerly a place of importance, and had a university, founded in 1455, but abolished on the suppression of the Jesuits in 1764. Its church of Saint Cerneuf, and the ruins of some old castles, are noticeable. Pop. (1872) 3531.

Billon, a French word, traceable as far back as the 13th c., but of uncertain derivation, used in coinage to denote an alloy of silver and copper, in which the latter predominates. Examples of B. are the Prussian 2½ *groschen*, the N. German *silver* or *new groschen*, the S. German 6 or 3 *kreuzer pieces*, and, speaking generally, most small silver coins. In France the word is more frequently applied to small copper coins.

Bilma, a town in E. Sahara, Africa, the capital of the Tibbu country, on the caravan route between Fezzan and Bornu, with considerable salt trade. It lies 900 feet above the level of the sea, and has a pop. of about 6000.

Bil'aa, or **Bhil'aa**, a strongly fortified town in Bhopal, a feudatory state, Central India, situated on the Betwa, 188 miles S. of Gwalior. Since 1230 B. has changed hands between the Hindus and Moslems several times, and finally became a part of the Mogul empire under Akbar in 1570. Pop. about 30,000. The town is remarkable for its Buddhist monuments, the *B. topes*. In its vicinity is produced the finest tobacco in all India.

Bil'ston, a town in S. Staffordshire, included in the parliamentary borough of Wolverhampton, from which it lies 3 miles to the S.E. It is a great centre of the hardware and lacquer trade, and has extensive iron foundries and smelting-works. There are numerous iron and coal mines in the vicinity. Pop. (1871) 24,188.

Bi'ma, a seaport situated in a deep bay on the N. coast of Sumbawa, one of the Sunda islands, E. of Java. It is the capital of a state of the same name, exports horses, timber, rice, wax, and pistachio nuts, and has a pop. of about 5000.

Bi'mah, or **Bhimah**, a tributary of the Kistnah, rises in the Western Ghâts, in the district of Poona, province of Bombay, at an elevation of more than 3000 feet above the sea-level, and after a S.E. course of fully 300 miles, exclusive of windings, joins the Kistnah, in the southern part of the Nizam's dominions.

Bim'ana, Cuvier's name for the highest order of *Mammalia*, represented by the human species only. This term was applied in contradistinction to the name *Quadrumanus*, which Cuvier gave to the order including the monkeys, apes, and lemurs. The B. thus possessed but two 'hands,' whilst the feet of the monkeys, being also capable of being used as hands, entitled these latter forms to be termed *Quadrumanous*, or 'four-handed.' This arrangement is not strictly correct, as the feet of apes more nearly resemble the feet than the hands of man; and the more approved arrangement is to classify man and the *Quadrumanus* in one order—the *Primates*—and to subdivide this order into distinct subdivisions.

Binary Theory. The B. T. was introduced into chemical science by Dulong, to account for the constitution and properties of *salts* and *acids*. It regards both these classes of substances from a common standpoint, viewing them as compounds of *two* distinct groups or radicals (whence the name of the theory). Acids are compounds of hydrogen and an element, or group of elements, called a *salt radical*; thus—

H(Cl) Hydrochloric acid.
H₂(SO₄) Sulphuric acid.
H₃(PO₄) Phosphoric acid.

Salts are compounds of *metals* and *salt radicals*,—

Na(Cl) Chloride of sodium (common salt).
Na₂(SO₄) Sulphate of soda.
Na₃(PO₄) Normal phosphate of soda.

The chief objection to this theory is that many of the *salt radicals* cannot be isolated. It should be remembered, however, that chemists are unanimous in believing in the existence of many radicals which are only known in a state of combination.

Bin-Bir-Kiliss'i (Arab. the 'thousand and one churches'), a ruined city of great antiquity in the vilayet of Konia, Asia Minor, 40 miles S.E. of Konia (Iconium), supposed to be *Lystra*, contains the remains of about 40 Byzantine churches, from which it takes its hyperbolic name. Some ruins a few miles to the E. are supposed to mark the site of Derbe.

Bin'che, a walled town of Belgium, in the province of Hainaut, on the Haine, 9½ miles S.E. of Mons, carries on considerable trade in lace, paper, coal, &c.; and has manufactures of leather, cutlery, glass, &c. Pop. about 5500.

Bindraban' (*Brindaban*), a town in the district of Muttra, N.W. Provinces, British India, on the Jumna, 92 miles S. of Delhi, and 40 N.W. of Agra, has an immense number of red stone temples, chiefly dedicated to Krishna. It is much visited by pilgrims, and has ghâts or flights of steps extending for about a mile along the bank of the river. Pop. (1872) 21,500, nearly all Hindus.

Bindweed. See CONVULVULUS.

Bindwrong. See BENTWRONG.

Bing'en (the *Bingium* of Tacitus, and probably the *Vincum* of the Antonine Itinerary), a town in the Grand-Duchy of Hesse-Darmstadt, at the confluence of the Nahe with the Rhine. Pop. (1871) 5936, mostly Roman Catholics. The district is noted for the culture of the vine, and the exquisite Rudesheimer is produced in the neighbourhood. There are manufactures of tobacco, glue, starch, and leather, besides a brisk retail and river trade. The *Bingerloch*, formerly a dangerous rapid in the Rhine, lay below the town; but blasting operations carried on by the Prussian Government in 1834 have entirely removed the danger to the navigation of the river. A tower, the *Mäuseturm*, in the middle of the Rhine, erected, probably about the year 1000, by Willigis, Archbishop of Mainz, as a defence for the district, is celebrated in legend as the scene of the destruction by rats of the hard-hearted Bishop Hatto in 969, the subject of one of Southey's best-known ballads. Restored in 1856, the tower now serves as a beacon, warning ships, by means of a flag, if the Bingerloch is clear. Opposite to B. lies Bingerbrück, a place which has been created by the Rhein-Nahe and the Rhenish Railway, and which is connected with B. both by a stone and an iron bridge. East of the town is the *Rochusberg*, with its church of St Roch (Fr. *Roche*), built in 1666, and restored in 1814.

Bingley, a town in the W. Riding of Yorkshire, 32 miles W.S.W. of York, on a rising ground between the river Aire on the W., and the Leeds and Liverpool Canal on the E. It has manufactures of yarn and paper, and a trade in malt, and is a station on the Midland Railway. Pop. (1871) 6890.

Binn'acle, formerly *bittacle*, a corruption of the Fr. *habitable*, an abode, is the name given on board ship to the case or box containing the compass, and is so situated as to be easy of reference to the steersman.

Binn'ey, Rev. Thomas, D.D., a popular Independent preacher and theologian, was born at Newcastle-upon-Tyne in 1798. He first officiated as a minister in Newport, Isle of Wight, and removed in 1829 to London to the pastorate of the 'King's Weigh-house Chapel,' in Eastcheap. There he laboured with great success (his pulpit eloquence drawing to his church crowds, especially of intelligent young men), and with only one interval of two years, spent in Australia, till he retired, January 1871. B. wrote several religious works, of which *How to Make the Best of Both Worlds* is the most notable, and he was an ardent, although not illiberal, controversialist on the side of Nonconformity. He was the first to introduce chanting into the service of Independent congregations. B. also received from the United States

the degree of D.D., and from the University of Aberdeen that of LL.D. He died February 26, 1874.

Binomial (Lat. *bis*, twice; *nomen* a name), in mathematics, is an algebraical expression consisting of two terms united by the sign either of addition or subtraction, such as $(a + b)$. The B. theorem, discovered and fully stated by Newton, gives the law of expansion of $(a + b)^n$, where n may be any number, integral or fractional, positive or negative.

Binondo, a town in Luzon, one of the Philippine Islands, on the river Pasig, connected by Manila with a stone bridge, 411 feet long. Pop. about 29,000.

Bintang, an island in the E. Indies, at the extremity of the Malay Archipelago, 40 miles S.E. of Singapore. It belongs to the Dutch, and exports much gum, rice, and pepper. Area, 468 sq. miles; pop. about 10,000.

Biobío, the largest river in Chili, rises in the Andes, and flows into the Pacific at Concepcion. It is 180 miles long, and 2 broad at its mouth, and is navigable for small craft almost to its source.

Biography is a species of prose narrative, of which the subject is the life of an individual man or woman. The ideal B. would, therefore, exhibit the gradual development of character, the influence of such external conditions as education, social position, &c., which modify the inherited tendencies, and the extent to which the character has vanquished or has succumbed to these conditions. For these purposes a description of contemporary social life and history would be requisite. We must know among whom the hero lived, what they thought and felt, before we can fix his position as a guide or protector, or even correctly ascertain the strength of his genius by measuring the resistance he overcame, or the forces which helped him. Whether the life be successful or not, whether the character turn out beautiful or disgusting, B. is eminently the field for didactic conclusion, illustrated in the most powerful and picturesque manner. In the hands of many writers, B. becomes more a romance of reality or a series of striking pictures. This is, of course, a legitimate form of art, but it is often accepted in lieu of a scientific estimate of the influence of individual upon general life, which writers of the romantic class are apt to exaggerate. It is also in this last species of B. that the greatest faults are committed, the minutest contemporary circumstances being considered worthy of insertion and discussion, however remote and indirect their connection with the subject. Pure B. is also found in the autobiography, where the author happens to be a man of modesty and common-sense. Goethe and Mill, for instance, although of utterly dissimilar genius, both succeed in throwing a truthful light upon the inner life, but there are so many opportunities for colouring the past with the regrets or the new aspirations of the present, that autobiography is not chiefly valuable as history, which is rather to be found in the diaries and memoirs which record genuine impressions and reflections made on the spot. Quite apart from B. proper stand the historical collections which, professing to give the lives of individual men, use these chiefly as the links in a consecutive history of a period. Such were Tillemont's *Mémoires pour servir à l'Histoire Ecclesiastique de 6 premières Siècles de l'Eglise*. Much of the *Encyclopædia Metropolitana* was written on the principle laid down by Coleridge in the introduction, that the subject of history being the 'nature of man' (not the nature of society), it might be best represented in B. chronologically arranged. In particular departments of history—e.g., international relations or great constitutional controversies—the B. of a statesman or a warrior, a Barneveldt or a Frederick the Great, may be very complete; but it is now generally recognised that history, as the basis of social science, deals with larger questions and greater forces than B. describes. A more useful form of B. is where, as in Vasari's *Lives of Painters, Sculptors and Architects* (Flor. 1550), Johnson's *Lives of the English Poets* (1781), Lewes' *Biographical History of Philosophy* (1846), the development of a particular art, science, or speculation is traced in a chronological series of lives, or some general conclusions are attempted to be drawn from the successive failures or successes in these lives. A similar plan, only dogmatic, not scientific, in its spirit, is seen in the *Acta Sanctorum* of the Bollandists (1629-1846). Dictionaries of B., although for the most part confining themselves to the B. of the ancients, to facts, and avoiding

criticism and didactics, are extremely useful. Moreri's *Le Grand Dict. Hist. et Crit.* (1673) may be said to be the first of this class. In modern times the French *Biographie Universelle* and the German *Conversations-Lexikon* are the most important. Another class of books, which glance at eminent lives merely to point a moral, can hardly be called B. Such is Fuller's well-known *Worthies*. Although the word B. is said not to be older than the 17th c., the thing was well known in the ancient world. The narratives in the Old Testament concerning the patriarchs and kings do not take a distinct biographical shape, and those of the synoptical Gospels bear little signs of conscious literary effort. But Plutarch's *Lives of Illustrious Men* (which separately describe, and then compare, a Greek and a Roman warrior or statesman), is a biographical work of high merit. Tacitus' *Sketch of Agricola* is an excellent study of character, and Philostratus' *Life of Apollonius of Tyana* (the false Christ of the 2d c.) is very ingenious, though for the most part incredible. Although of late a vast number of biographies has issued from the press, good lives of many most eminent men are sadly wanted.

Biology (Gr. *bios*, life; *logos*, a discourse). This name has been applied to indicate that department of science which, in the fullest sense, deals with the structure, functions, and distribution of living beings. It thus comprehends the two sciences of *Zoology* (animals) and *Botany* (plants). General B. exhibits a division into (a) *Morphology* (or the science of form), (b) *Physiology* (the science of function), and (c) *Distribution* (the science by means of which the habitat, in time present or past, of any living being is ascertained). To these three divisions some add a fourth, the science of *Etiology*, through which the derivation of any living being may be investigated, in view of recent theories respecting the evolution or descent of living beings, through the modification of pre-existing forms. The following table indicates the method of B., or the mode in which the perfect study of any living being—animal or plant—must be carried out:—

B. (Science of living beings) includes—	1. Morphology, science of form.	a. Anatomy. b. Development. c. Taxonomy or Classification.
	2. Physiology, science of function.	a. Function of nutrition. b. " reproduction. c. " innervation.
	3. Distribution.	a. In space (geographical). b. In time (geological).
	4. Etiology.	Questions of descent.

Bioplasm, a term originated by Dr Lionel Beale, which has been used synonymously with *Protoplasm* (q. v.) to indicate the albuminous substance of which the bodies of all living beings are principally composed, and which exists in its simplest and most primary form in the Protozoa or lowest animals, and *Protophyta* or lowest plants. The name *Sarcodæ* is also used to indicate this substance. See also ALBUMEN.

Bi'on, a Greek idyllic poet, who flourished in the 3d c. before Christ, was a native of Smyrna, and a contemporary of Theocritus. From the elegy written on his death by his friend and brother bard Moschus, we learn that he spent the last part of his life in Sicily, and perished by poison. The most important of his extant writings is a *Lament for Adonis* (edited by Ahrens, Leips. 1854). His other pieces are merely fragments, but are distinguished by delicacy of expression, purity of feeling, and a simple and natural delineation of pastoral life. They have often been printed and translated with the poems of Theocritus. Separate editions of B. in modern times have been published by Jacobs (Gotha, 1795), Wakefield (Lond. 1795), and, along with Moschus, by Hermann (Leips. 1848). Good translations into German have been executed by Voss (1808) and Mörike (1869).

Biörn'eborg, a seaport of Finland, on the Gulf of Bothnia, 76 miles N.N.W. of Abo, with an export trade in timber and pitch. Pop. (1876) 7346.

Bi'ot, Jean Baptiste, a distinguished French physicist, was born at Paris, 21st April 1774, educated at the College of Louis le Grand and the Ecole Polytechnique, and in 1800 became Professor of Natural Philosophy at the College de France. In 1808 he became a member of the Académie des Sciences, and took part in the first balloon ascent of M. Gay Lussac. He accompanied M. Arago (q. v.) to Spain to measure a degree of the meridian, and reported the result to the Institute. B. subsequently undertook many other scientific voyages, and made

numerous important discoveries in optics, especially in the polarisation of light. He died at Paris, February 3, 1862. Among his writings are *Traité Élémentaire d'Astronomie Physique* (Par. 1805, 3d ed. 1841-57); *Traité de Physique expérimentale et mathématique* (Par. 1816); *Précis élémentaire de Physique expérimentale* (Par. 1817); *Recherches sur l'Ancienne Astronomie Chinoise* (Par. 1840); and *Études sur l'Astronomie Indienne* (Par. 1862).

Biped, literally 'two-footed,' a term applied to such animals as walk on two legs, and generally applied to man and to birds, to indicate their *mode of progression*, rather than the mere possession of two limbs. Some of the quadrumans or apes may temporarily assume a bipedal attitude. The whales among mammals and the sirens among *Amphibians* or *Batrachia* (q. v.) may be termed *bipeds*, as these forms possess the front pair of limbs only. Some fishes also want two of the paired fins (representing the limbs of other animals), and may therefore be also termed bipedal in a sense.

Bipenn'is, a double-headed axe, said to have been wielded by the ancient Amazons.

Biquadratio (Lat. *bis*, twice, *quadrus*, square), in algebra is a term applied to equations of the fourth degree, the general form being $x^4 + ax^3 + bx^2 + cx + d = 0$. See EQUATION.

Bir, or **Bireh-jik**, a town of Asiatic Turkey, vilayet of Bagdad, Syria, situated on the Euphrates, in the great route from Aleppo to Diarbekr, and 150 miles W. of Adana. It is the ancient *Birtha*, Turkish *Bireh-jik*; the word *bir* meaning a 'well,' and occurring in the names of several other Arabian towns. B. is a place of some importance from its position, and has considerable trade in cotton, silks, wine, tobacco. It is 597 feet above the sea, and would form a station on the projected Tigris Valley Railway. Pop. 10,000.

Birch (*Betula*), the generic name of several species of trees and shrubs. The common or white B. (*B. alba*) is a well-known tree of a graceful and airy aspect, very common in the mountainous districts of Scotland, and being one of the hardiest of all trees, is found growing far N., even into Arctic regions. It has a wide geographical range, growing generally in the temperate and sub-Arctic regions of N. America, Europe, and Siberia. Great forests composed entirely of the B.-tree are found in Russia, where the bark and wood are applied to a great variety of useful purposes by the peasantry. The entire tree, wood, bark, and leaves is impregnated with essential oil, and to the oil of the bark is due the agreeable smell peculiar to Russia leather, in the tanning of which it is used. The outer cuticle of the bark becomes white, and scales off in thin papery sheets, and in India the sheets so obtained from a species of B. (*B. Bhojputra*) were at one time used as paper, while to the same property is owing the name of a species of B. growing throughout N. America (*B. papyracea*), from the bark of which very light useful canoes are fabricated. B.-bark is exceedingly tough and durable, and applied in Northern countries to many useful purposes. In Russia it is made into drum-shaped boxes for holding caviare, &c., and small boxes are frequently made from it, on which are impressed elegant stamped and incised ornaments. B. yields a close-grained durable wood, which is very extensively employed in the manufacture of chairs, tables, bedsteads, and the woodwork of furniture generally; but the great part of the B. wood for furniture is imported from America, and is the produce of the black B. (*B. lenta*). The wood of the white B. is used by the Tartar peasantry of the Russian empire for turning into sugar-basins, &c., which, painted a bright vermilion colour, and gilt, are exported from the Baltic ports. B.-wine is a beverage prepared from the fermented sap of growing trees, and prepared on a large scale in Russia. The dwarf B. (*B. nana*) is a low shrubby plant indigenous to Scotland, and found generally throughout the N. of Europe and the Arctic regions. Among the other species may be mentioned the white B. (*B. populifolia*) of N. America; the *B. acuminata* of Nepal; and the *B. Antartica* of the neighbourhood of Cape Horn.

Birch, Samuel, LL.D., keeper of Egyptian and Oriental antiquities in the British Museum, is the eldest son of the late Rev. Samuel B., D.D., and was born in London 3d November 1813. He completed his education at Merchant Taylors' School, which he left in 1831. B. began his career in the public service at

the age of twenty-one, when he was employed under the Commissioners of Public Records. Two years later he was appointed assistant in the department of antiquities in the British Museum, and rose in 1844 to be assistant-keeper. On the new organisation of the department in 1861, B. was appointed keeper of the Oriental, mediæval, and British antiquities and ethnographical collections; but, by a further subdivision of labour, his office is now keeper of the Egyptian and Oriental antiquities. B. is corresponding member of the Archæological Institute of Rome, of the Academy of Berlin, and of the Academy of Inscriptions and Belles-Lettres in the French Institute. The honorary degree of LL.D. is from St Andrews. He is also an honorary member of the Royal Society of Literature, of the Society of Antiquaries, of the Oriental Society of France, as well as of the Ethnological Society of America. B. has long been a profound student of Egyptian hieroglyphics. This latter fact attracted the admiring attention of the late Baron Bunsen, who availed himself largely of B.'s special knowledge in the philological portion of his work *Egypt's Place in Universal History*. Baron Bunsen requested that he should revise future editions of this work; and accordingly in 1867, some years after Bunsen's death, he issued the fifth volume, the greater part of which is written by himself. B.'s principal publications are *Gallery of Antiquities* (1842); the text of Owen Jones' *Vicinus on the Nile* (1843); along with Mr Newton, *Catalogue of Greek Vases* (1851); *Introduction to the Study of Hieroglyphics* (1857); *History of Ancient Pottery* (1858); *Description of the Papyrus of Nas-Khem* (1863), and the *Rhind Papyri* (1866). The papyrus of Nash-Khem, priest of Amen-ra, was discovered in an excavation made in a tomb near Gournah at Thebes by direction of the Prince of Wales, is the property of his Royal Highness, at whose expense it was printed for private circulation. B. presided over the Congress of Orientalists held in London in 1874. He is an able Chinese scholar, and has published (1841) *Analecta Sinensia*, short stories from the Chinese; *The Friends till Death* (1845), a translation from that language; and *Chinese Romance—The Elfin Foxen* (1863). He has written in the *Archæologia*, the *Transactions of the Royal Society of Literature*, the *English Encyclopædia*, *Chambers's Encyclopædia*, the *Encyclopædia Britannica* (new edition), the *Revue Archéologique*, the *Archæologische Zeitung*, and the *Zeitschrift für Ägyptische Sprache und Alterthumskunde*.

Birch, Thomas, D.D., author of many secondary works on history, was born at Clerkenwell, London, 23d November 1705. Although of a Quaker family, he entered the Church of England (1730), obtained numerous preferments, was made D.D., rector of Deepdene in Surrey, and one of the secretaries of the Royal Society (1752). He was killed by a fall from his horse, 9th January 1766. B. was an indefatigable, though not very elegant, writer in the departments of history and biography. Among his works may be mentioned *Memoirs of Queen Elizabeth*; *Lives of Henry Prince of Wales*; of Raleigh; of Boyle and Tillotson; *Thurlow's State Papers*; and a *History of the Royal Society*. B. left his library and a collection of MSS. to the British Museum, of which he was a trustee.

Birch-Pfeiffer, Charlotte, a celebrated actress and playwright, was born at Stuttgart, 1800, made her début at Munich in her thirteenth year, and played for many years at Berlin, Vienna, St Petersburg, &c. She married the Danish author Dr Christian Birch in 1823, was directress of the Zurich theatre, 1837-43, and also of the Hoftheater at Berlin from 1844. She died at Berlin, August 24, 1868. Of her numerous plays, which are marked by dramatic force, though marred by sensationalism, may be mentioned *Pfeifferrösel* (1833), *Der Glückhner von Notre-Dame* (1839), *Die Marquise von Vilette* (1845), *Dorf und Stadt* (1848), *Weise von Lowood* (1856). Her *Gesammelte Dramatische Werke* were published at Leipsic in 13 vols., 1863-69.

Bird-Bolt, an arrow with a blunt head, which in former times was shot from a crossbow to kill rooks with.

Bird-Catching Spiders, a name applied to spiders belonging to the genus *Mygale*, from their habit of entrapping small birds in their nets, and by other means. The name, so far as bird-devouring habits are concerned, might also be applied to another genera of spiders, such as *Epeira*, &c. *Mygale avicularia*, found in Surinam and elsewhere, a large black

spider, averaging about two inches in length, is thus said to capture birds by pouncing upon them. This American species has its allies in Africa and the E. Indies, which similarly hunt for birds, but prey also upon insects. The nests of these spiders consist each of a tubular cell, formed of a silky material, and situated among stones and in the clefts of trees. Madame Merian, in her account of travels and of the insects of Surinam, relates and figures the instance of a *Mygale* devouring a small bird which it had 'torn from its nest.'

The *Epeira* (of which genus the *Epeira diadema*, or common garden spider, is an example) of tropical countries are said to entrap small birds in their webs.

Bird-Cherry (*Padus*), a subdivision of the genus *Cerasus* (cherry), which is again perhaps only a sub-genus of *Prunus* (plum). The common bird-cherry (*Prunus Padus*), or haggberry, is a shrub of 6 or 8 feet, or sometimes a small tree, with small, nearly globular, black and bitter fruit, with a rugged stone. It is found in Northern and Central Europe and Asia, from the Arctic regions to the Caucasus and Himalayas, but disappears in S.W. Europe. It is rare or absent in Ireland and Southern England, but is scattered over the rest of Europe. A spirit is distilled from the fruit, and in Siberia the refuse after expressing the juice is made into cakes. *P. Virginiana* is found in America from Canada to Tennessee, and is cultivated in Britain as an ornamental tree. Its bark is febrifuge, and its wood is used by cabinetmakers. It grows to a height of from 80 to 100 feet.

Bird, Edward, an English artist, was born in Wolverhampton, 12th April 1772, and earned his first money by painting flowers, shepherdeses, &c., on tea-boards for a Birmingham manufacturer. Afterwards he established himself as an artist in Bristol, where he died, 2d November 1819. His 'Choristers Rehearsing' and 'The Will' were purchased by William IV. and the Marquis of Hastings, and after these successes he was elected Royal Academician. Princess Charlotte appointed B. her painter. His finest work is his 'Chevy Chase after the Battle.' Others well known and much admired are 'The Village Politicians,' 'The Blacksmith's Shop,' 'The Country Auction,' and 'The Young Recruit.'

Bird Land, one of the Sandwich Islands, 290 miles W.N.W. of Honolulu, and haunted solely by sea-fowl; hence its name.

Bird-Lice, the name applied to the insects of the order *Mallophaga*, a group of lower or apterous insects undergoing no metamorphosis, and which are destitute of wings. These lice are chiefly parasitic upon birds, and eat the feathers of their hosts by means of their strong masticatory mouths. They frequently destroy the entire plumage, and otherwise affect the health of the bird. They are classified in two families—the *Phthiraptera* and *Liothoridae*.

Bird-Lime, a viscid, tenacious substance used for spreading on branches, twigs, and other perches of small birds, for catching them. B.-L. is prepared from the bark of the holly, the mistletoe, and various other plants, by boiling, and allowing the strained boiled bark to ferment for some weeks. Boiled seed oil may also be used as B.-L.

Bird-Pepper is made from the powdered fruits of *Psidium baccatum* of the West Indies.

Bird of Paradise, a genus of Insectorial or catching birds, forming the type of the family *Paradisæideæ*, a group nearly allied to the crows (*Corvidæ*). The males of these birds are celebrated for the immense development of the feathers on the sides of the body and neck, these feathers in the common or emerald B. of P. (*Paradisæa apoda*) appearing as long detached plumes, of light texture, and of exceeding brilliancy. The emerald species averages a crow or jay in size, and is coloured cinnamon, the head and neck being yellow, whilst the front part of the body and throat are bright green, and the expanded feathers yellow. These shoulder-feathers attain a length of two feet. The tail in this species also possesses elongated filaments of horny texture with twisted extremities. The plumes are extensively used in the manufacture of head-dresses and other articles of female decoration. These birds appear to be polygamous. The females are coloured of a sombre tint, and want the splendid appendages of the males. *Paradisæa rubra* possesses the expanded shoulder-tufts of a red or carmine colour. Other

species are the *P. superba*, *P. sexoculata*, and *P. regia*. These birds inhabit New Guinea and neighbouring islands. They con-

gregate in troops in the dense forests, and appear to feed on fruits, rice, insects, &c. They pass from island to island according to the change of seasons, and appear to fly invariably against the wind. The wings are long and rounded. The tip of the upper mandible is notched. The hinder toe is long, and the claws are of large size and curved. These birds are shot by the Malays with arrows, and are generally captured during the night. The skins are dried by fire, and the legs are cut off—a circumstance which induced Linnaeus to give to the emerald species the specific name of *apoda*, or 'footless,' although the great naturalist was himself well aware that these birds possessed legs. Various fables and stories of a ridiculous kind have from time to time been promulgated respecting these birds, such as the ideas that they were footless, and wholly lived in the air; that they fed on dew and vapours, &c. The natives name them *Manuco-Dewata*, or 'God's birds;' and other names, such as 'sun-birds,' 'birds of the air,' &c., have been applied to them from their gorgeous appearance.

Birds or Byrd, William, an English musician, born about 1543, was the son of Thomas B., one of the members of the Chapel Royal in the reign of Edward VI. He composed ecclesiastical music, little of which is now known except the *Non nobis, Domine*. Elected organist at Lincoln Cathedral in 1563, he was appointed a gentleman of the Chapel Royal six years after. B. was reckoned the finest player on the virginal in his day. He died 21st July 1623.

Birds, a class of vertebrate animals, defined as possessing bodies covered with feathers; as being *oviparous*, or producing eggs, from which the young are afterwards hatched; as possessing warm blood, a four-chambered heart, a perfect circulation, and having fore-limbs modified for flight. The lungs in B. are further perforated, and the main bronchi or air-tubes open upon their surface, so that the air received into the lungs escapes into the body. This latter character is specially distinctive of the bird class. The body covering of B. consists of feathers, which are produced from *papillæ*, or small processes of the dermis or true skin. These papillæ are grooved, and in the grooves horny matter is deposited, and finally pushed outwards in the form of feathers. Each feather consists of the *quill*, continued upwards into the *shaft*, which bears on each side the *web* composed of *barbs*. The barbs are kept in close apposition by means of smaller barbs or *barbules*, which bind the various barbs of the web firmly together. The feathers of the hand are termed *primaries*; those attached to the fore-arm, *secondaries*; and those of the upper arm, *tertiaries*. The great tail-feathers are named *rectrices*. The *ulula*, or bastard wing, is the name given to the feathers borne by the small thumb.

The skeletons of B. exhibit many adaptations to their aerial life and habits. The bones are exceedingly light, owing to their containing a much greater proportion of phosphate of lime and analogous salts; and in most B., the long bones, instead of containing marrow, are filled with air: such bones are therefore named *pneumatic*. The neck region of B. is very flexible, and contains from nine to twenty-four vertebrae. This flexibility of the neck region admits of extensive movement of the beak. The back or dorsal region is fixed and consolidated, so as to afford a firm *point d'appui* for the movements of the wings. The dorsal vertebrae vary in number from six to ten. In Running B., however (e.g., ostrich, &c.), a greater or less amount of motion is permitted between the segments of the back region. The vertebrae which intervene between the dorsal segments and the caudal or tail vertebrae are ossified together, so as to form a single bone, named the *sacrum*, and which consists of from nine

Bird of Paradise.

to twenty united bones. The *caudal* or tail vertebrae number from eight to ten. The last vertebrae form the 'ploughshare-

The above cut, representing the skeleton of the falcon, shows the skull with the large orbit or eye-cavity; the flexible neck region (*h*); the dorsal or back region (*h*); the pelvis (*m, n, o*); the tail (*p*); and the ploughshare-bone or pygostyle (*q*). The breastbone with its prominent keel is shown at *s*; the united clavicles, forming the merry-thought, at *w*; the coracoid bones supporting the wing at *r*; and the ribs at *t*; and the scapula or shoulder-blade at *z*. The wing-bones consist of the humerus (*a*); the ulna (*4*); and radius (*3*); the thumb (*7*); the metacarpus or palm (*5* and *6*); and the fingers (*8, 9*, and *10*). In the lower limb, the thigh (*11*); leg (*12* and *13*); the tarso-metatarsal bone (*14*); and the toes (*15, 16, 17*, and *18*). The detached figure of the skull shows the frontal bone (*a*), parietal (*b*) and occipital bone (*c*), the articulating part of the occipital bone (*d*); the orbit (*e*); the mandible, or lower jaw (*g*); and at *h* the *os quadratum*, by means of which the lower jaw is articulated to the skull.

bone,' or *pygostyle*, on which the uropygium, or oil-gland, is situated, and into which the great feathers of the tail are inserted. The Cursorial or Running B. do not possess a ploughshare-bone, and in the extinct *Archaeopteryx* (q. v.) this bone was also wanting. The skull of B. is very compact, and is joined by a single occipital condyle, or process, to the spine. The Bill (q. v.) consists of the upper and lower mandible; the lower jaw in B. (as in reptiles) being a compound bone, and being joined to the skull by a special bone, the *os quadratum* or *os carré*. No teeth exist in B., although the horny sheaths of the jaws may be more or less strongly serrated. The orbit, or eye-cavity, is always of large size. The ribs forming the sides of the chest or *thorax* number from six to ten pairs. Each rib is generally joined to its hinder neighbour by a hooked bone or process, known as the *uncinate process*. The true ribs are joined in front to a series of bones which arise from the sternum or breastbone, and which are named *sternal ribs*. These latter correspond to the costal cartilages of mammalia, and constitute the movable centres in breathing. The *sternum* or breastbone bounds the chest in front. In all B. (save the Cursorial or Running B., which do not fly) the breastbone bears a prominent bony ridge or keel in front. This keel serves for the attachment of the great muscles of the wings (*pectoral muscles*); and hence it is easy to tell if a bird possesses great powers of flight by looking at the relative size of the keel, which, accordingly, is largest in the most powerful flyers. In the ostriches, &c., the breastbone, on the contrary, presents in front the appearance of a comparatively flat shield, without any ridge or keel. The collar-bones, or *clavicles*, are usually united to form the *furculum*, or 'merry-thought.' The *coracoid bones* are greatly developed, and articulate directly with the breastbone, so as to form the chief supports for the wings; whilst the *scapula*, or 'shoulder-blades,' exist as simple bones of small size. The wing consists of the *humerus*, or upper bone of the arm; of a large *ulna* and slender *radius* in the fore-arm; and of three wrist or *carpal* bones; of three united *metacarpals*, and of two *fingers* or *digits* (*index* and *ring* fingers), and a rudimentary thumb. The *pelvis* consists of two *innominate bones*,

which, however, are not united in front at the pubis in any bird, except in the ostrich. This open disposition of parts has probably reference to the laying of eggs. The lower limbs consist each of a *femur* or thigh-bone, of a large *tibia* or shin-bone, and small or rudimentary *fibula*. The upper extremity of the *tarsus* in B. is ossified to the lower end of the tibia, and the lower half of the tarsus is similarly ankylosed with the metatarsus. The tarsus and metatarsus thus together form the *tarso-metatarsal* bone, which, in Wading B., gives the great length to the legs.

Feet of Various Birds.

a, Foot of Raptorial Bird; *b*, of Percher; *c*, of Rasorial Bird; *d*, of Wader; and *e*, of Swimming Bird.

The ankle-joint of B., as in reptiles, is thus placed in the middle of the tarsus, instead of at the upper or proximal extremity, as in mammalia. The *toes* are four in number in most B., three being placed forwards, and the fourth (the *hallux*, or great toe) being directed backwards. Sometimes, as in parrots and other Scansores, two toes are directed forwards and two backwards. In Swifts, all four toes are turned forwards. The Ostriches possess two toes only, and the Emus three; while in many other B. the fourth or hinder toe may be rudimentary.

The digestive system of B. includes a *tongue* (which, however, is generally sheathed in horn, and not adapted to serve as an organ of taste); of *salivary glands* of simple structure; of a single or double *crop*, or *ingluvies*, serving as a receptacle for food; of the *proventriculus*, or true digestive cavity; and of the *gizzard*, a muscular cavity, usually provided internally with horny ridges, by means of which the food is triturated and broken down. The intestine is comparatively short; the beginning of the large, or terminal, part of the intestine being generally marked by two *caca*, or blind-pouches, often (as in grouse) of great length. The intestine terminates in the *cloaca*, a chamber which also receives the terminal ducts of the urinary and generative organs. The *liver* is always large, and the *pancreas*, or sweetbread, is contained within a loop of the intestine at its commencement of that tube as it leaves the gizzard. A *spleen* is always, and a *gall-bladder* generally present. The *gizzard* is best developed in grain-eating B. In flesh-eaters and insectivorous B. it is of rudimentary nature, and of thin membranous structure. Small pebbles or stones are generally swallowed by grain-eating birds, to assist the gizzard in its work of crushing the seeds and grains.

The heart and circulation of B. do not differ from those of mammalia. The heart consists of two auricles and two ventricles,

Internal View of Bird.

The gullet is represented in this cut at 1, the crop at 2, and the muscular gizzard at 3. The windpipe (4) is also seen; the heart (5), with the chief vessels (6), and pericardium, or heart sac (7). The liver is exhibited (8 and 9); the intestines covered by peritoneum (11); and the cloaca, or vent (12).

the right auricle and ventricle being exclusively devoted to sending the venous or impure blood for purification in the lungs, whilst the left side of the heart is as exclusively devoted to sending pure or arterial blood out through the body. The blood of B. is warmer than in any other group of animals. Its temperature varies from 100° to 110° or more; the average temperature being 103° or 104°. That of man and mammalia is about 98°. The red blood corpuscles of B. are oval in shape, and are nucleated. Only one *aortic arch*—the *right*—exists, instead of two, as in reptiles.

The *respiration* of B. is carried on by means of *lungs*, which are of a bright red colour, and of spongy or cellular texture. The lungs are attached to the back-wall of the chest, which, however, is not separated from the abdomen by a *diaphragm* or *midriff*, as in mammals. The bronchial tubes of each lung give off the air-cells in which the blood is purified; but the main bronchi pass through the lung and open on its surface by a definite number of apertures. Through these apertures the air escapes from the lungs into large sacs or cavities situated in various parts of the body of the bird, and known as *Air-sacs* or *Air-cells* (q. v.), whilst from the latter receptacles the interior of the bones are also filled with air. These bones are not pneumatic in young B., but become so as adult life is attained. In some

The air-cells and lungs of the ostrich are represented in the above cut. The windpipe is seen at 1; the lungs at 2; 2: the chief air-cells of the chest at 3, 3: with the orifices of the air-tubes which supply them. The heart is seen at 4; and the stomach and intestines at 5 and 6.

B. (e.g., penguin, apteryx, &c.), none of the bones are pneumatic; whilst in others (ostrich, &c.), only some of the bones are filled with air. Others (e.g., pelican) possess air in nearly every bone of the body. The uses of this distribution of air throughout the bodies of B. may be summed up by saying that, firstly, the specific gravity of the body is thereby diminished; secondly, the muscular work of the body is thus rendered less tiring; thirdly, the blood is more perfectly purified; and fourthly, a high temperature is thus maintained; whilst, fifthly, B. are also enabled thus to prolong their notes in singing to a great degree. The *kidneys* of B. are large, and two *ureters* discharge the urine into the *cloaca*. No urinary bladder exists.

The *brain* evinces a superiority to that of reptiles, its chief mass being made up of the *corpora striata* of the higher brain. The *cerebellum* or lesser brain is represented by its central lobe or vermiform process. The *corpus callosum* is absent, and no convolutions exist on the surface of the brain. The *eyes* are well-developed in all B., and possess *sclerotic plates* in their outer coat. Besides the ordinary eyelids, a third eyelid, or *nictitating membrane*, is present in B. No outer *ear* exists, but the feathers surrounding the aperture of the ear can in some cases be raised, so as to imitate the functions of an external ear. The internal ear is well developed. The nostrils open in the upper mandible, and are sometimes protected by scales or valvular processes. The sense of *taste* is not very perfectly developed, the tongue being horny in most B., but fleshy in the Parrots. Touch is a sense not present in great perfection in B. It may be subserved by the tongue, by the Bill, (q. v.), as in ducks, &c., or by the *cere*.

B. are strictly *oviparous*, producing eggs, which, as they pass through the *oviducts*, receive the 'white' or 'Albumen' (q. v.) and the 'shell.' The young are hatched by *incubation*—a process carried to its fullest extent in B. Some B. (*Autophagi*) run about as soon as they are hatched; others (*Heterophagi*) are dependent for a longer or shorter period on the parents.

B. possess both an *upper* and *lower larynx*, the latter, placed at the lower end of the *trachea* or windpipe, being the true organ of voice and song. For other particulars concerning the different kinds of B., and for other details regarding their structure,

reference must be made to the various respective articles treating of B.—such as ORNITHOLOGY, POULTRY, NESTS, EGGS, &c. &c.

B. are not plentifully represented as *fossils*—a fact presumably due to their aerial habits, precluding their deposition in favourable circumstances for petrification and fossilisation. The earliest bird-traces are found in the Triassic sandstones of America, in the form of footprints, which, some palaeontologists maintain, are rather those of reptiles. The oldest known bird-fossil is the *Archaeopteryx* (q. v.), from the Upper Oolites of Bavaria, this bird constituting of itself the order *Saurura*. In the cretaceous rocks of America, remains of extinct Wading B. (genera *Laornis*, *Hesperornis*, *Palaeotringa*, &c.) are found, together with the curious genus *Ichthyornis*. In the newer tertiary rocks—that is, in Eocene, Miocene, and Pliocene strata—bird-remains are comparatively plentiful. The Eocene *Gastornis*, *Lithornis*, and *Protornis* (this last the earliest example of the *Insectores* or *Perchers*), represent the bird-life of that period. The Post-Tertiary or Pleistocene formations, especially of New Zealand, are remarkable as containing the remains of gigantic wingless birds, referable to the genera *Dinornis* (q. v.), *Aptornis*, &c. And in Madagascar the *Aptornis* remains also belong to the later period of geology. The eggs of the *Aptornis*, also found in a fossil state, measure from 13 to 14 inches in diameter, and equal 3 ostrich eggs, or 148 hen's eggs in size.

Bird's-Foot (*Ornithopus*), a genus of plants of the sub-order *Papilionaceae*, of the natural order *Leguminosae*, so called from its curved pods, resembling the claws of a bird. There are few species, chiefly S. European, and one S. American. There are two in Britain, *O. cbracteatus* (sand-B.-F.), and *O. perpusillus*, the first growing in sandy situations near the sea, the other in dry pastures.

Bird's-Foot Trefoil (*Lotus*), a genus of *Papilionaceae*, a sub-order of the natural order *Leguminosae*, so named, like the preceding genus, from the resemblance of the pods to the claws of a bird. The genus is not numerous in species. They are abundant in Southern Europe and Northern Africa, and are widely scattered over the temperate regions of the Old World and Australia. In Britain there are *L. corniculatus* (B.-F. T. proper), and *L. angustissimus*. Of the first there are several varieties, which are by some authors described as species. It is by some considered to be the true Irish shamrock. *L. tetragonolobus* (the winged pea) of the S. of Europe is cultivated in our gardens as an annual, and in some parts of Europe for the sake of its seeds, which are used as one of the many substitutes for coffee.

Bird's-Head Processes, or *Avicularia*, the name given to certain peculiar structures which exist on the external surface of many *Polyzoa* (q. v.)—molluscan animals, of which the 'sea-mats' or *Flustra* are good examples. Each process consists essentially of a movable mandible or jaw-like piece, which works into a cup-like portion, the entire structure thus resembling in general form the beak of a bird. These processes appear to be endowed with independent vitality, and their motions are seemingly independent of those of the animal upon which they reside. The vibratile lash-like processes known as *vibracula* are often associated with the *avicularia*. By some naturalists these structures are viewed as peculiarly modified *Zooids* (q. v.) of the organism on which they reside; and by others their use is said to be that of detaining food-particles in the neighbourhood of the mouth of their hosts. See also PEDI-CELLARIAE.

Birds of Passage (*Aves migratoriae*), the name popularly applied to those birds which exhibit the migratory instinct, and pass from one country or region to another at different times and seasons of each year. The migratory instinct forms one of the most remarkable features of the bird class. The means by which birds are enabled exactly to time their flight to a certain day, and to return year by year to the same country, and even to the same spot, frequently flying over hundreds of miles of sea and land in their journeys, form problems of great interest and difficulty to the naturalist. Many differences may be observed, not only in the times and seasons at which different birds arrive in and depart from any given country, but also in their mode of flight, and in the apparent circumstances which inaugurate their migratory life. Many northern aquatic birds fly southwards to winter in Britain; whilst British birds (e.g., swallow, cuckoo, &c.) in turn pass to warmer and more southern climes on the approach of autumn.

Most sea-fowl appear and disappear with the utmost punctuality—the puffins invariably seeking their stations on a given day. If migratory birds are kept in confinement, they are generally observed to become restless and excited as the season for migration approaches. The mode of migration also varies greatly, some birds flying in great flocks or squadrons (e.g., swallows), whilst others leave singly or in detached groups. The scarcity of food, temperature, breeding-seasons, &c., have each and all been suggested as causes for the migration of birds, but neither singly nor collectively will these causes explain the phenomenon. More recently, the theory of natural selection has been suggested as explanatory of migration.

Birds of Prey, the popular name of the order *Raptores* or *Accipitres* (Linnaeus), distinguished by their curved, notched beaks, and the strong talons of the toes, which are placed three forwards and one behind. The order is divided into the *Nocturnal* B. of P. (owls), and the *Diurnal* forms (eagles, hawks, falcons, &c.).

Birkbeck, George, M.D., was born at Settle, in Yorkshire, 10th January 1776. After studying medicine at Edinburgh, he became in 1799 Professor of Natural and Experimental Philosophy in the Andersonian Institution, Glasgow, where he obtained great popularity through his gratuitous scientific lectures to the skilled artisan class. In 1807 he went to London, and secured a large medical practice, but found time to do much for popular education. He was associated with Brougham (whose friendship he had made at Edinburgh) in founding the London Mechanics' Institution, of which he became life-president. B. died 1st December 1841.

Birkenhead ('the head of the birken' or 'birchen trees'), a flourishing town and seaport of Cheshire, lies opposite Liverpool, on the left bank of the Mersey, which is here 1340 yards wide. It is of modern growth, and owes its increase and prosperity to its commodious and splendidly constructed docks. The town is regularly built, contains many fine public buildings, a large market, a free public library, and a beautiful public park of 180 acres. The chief industries for which it is universally famed are shipbuilding and the manufacture of machinery. There are here the shipbuilding-yard of Messrs Laird, the Canada Works for constructing great iron bridges, the Britannia Machinery Works, &c. The docks, however, are the principal feature of B., and the cause of its rapid rise. They include a floating harbour, with an area of 120 acres and a depth of 19 feet, and have a total accommodation (1875) of some 400 acres. The communication with Liverpool is maintained by means of an excellent system of steam ferry-boats, and is further facilitated by the railway bridge across the Mersey at Runcorn, 14 miles distant. A railway tunnel has been projected (1875) to pass below the river, and thus more completely to connect B. with its compeer. Pop. (1821) 236, (1861) 36,212, (1871) 42,981. Along with Claughton, Oxtou, Tranmere, and part of High Bebington, B. returns one member to Parliament. A Benedictine priory of the 12th c., the remains of which are still preserved, gave rise to the small village of B., the nucleus of the present town. Edward II. granted to the monks of this priory the monopoly of the ferries. The name B., like the 'Broomie Law' of Glasgow, points back to a time when nature was undisturbed by commerce.

Birmingham (Old Eng. *Bermingeham*), popularly called **Brummagem**, a city in Warwickshire, on the rivers Rea and Tame, 69 miles S.S.E. of Manchester, and 112 miles N.W. of London. It is the fifth city of Britain in point of size, and is the chief seat of the metallic manufactures. Situated in a fine district, it is one of the healthiest of English cities, having a splendid drainage and water supply. Its manufactures are valued at upwards of £5,000,000 yearly, and consist mainly of articles of gold, silver, iron, brass, steel, mixed metal, &c. Gun-making is carried on to a large extent; the jewellery trade and the manufacture of electroplated goods have largely increased; iron castings are made, from those of many tons weight, for steam-engines, machinery, and buildings, down to the smallest fittings for harness, guns, watch-keys, &c.; and more recently the manufacture of galvanised iron ware for roofing, buckets, &c., has become of prime importance. B. is unrivalled for its papier-mâché manufactures; button-making is a special trade; pins, the manufacture of which once employed so many different classes of labourers, are now

struck at once by machinery; and the best glass in the English market is manufactured in the district. To these industries may be added the manufacture of fancy goods in leather and wood, of surgical instruments, of soap, of varnish, &c. There are also numerous coachbuilding establishments, breweries, chemical works, cartridge factories, &c. B. is the great seat of the manufacture of steel pens, of which 98,000 gross are made weekly, the value of them amounting to £3000, and the weight of steel used in their production being about 10 tons. Steam-engines were first made in England at the Soho Works, founded by Watt and Boulton. The city has many handsome public buildings; among these are the Town Hall, built in 1833 to hold 6000 persons, with a magnificent organ; the B. and Midland Institute, finished in 1866, one wing of which contains the free library, opened in 1861; the Central Railway Station in New Street, an imposing structure in the Italian style; the Exchange, in course of erection; and the new Post Office, and Corporation buildings. Josiah Mason, a manufacturer of steel pens, built and endowed the Erdington Orphan Houses in 1869, and in 1873 endowed a college for the study of practical science. In 1853 the Queen's College was organised in connection with the London University; and there are a Roman Catholic college, a richly endowed grammar school, a diocesan training college for schoolmasters, a botanic garden, an art gallery, and four public parks. There are upwards of 170 churches, of which over 60 belong to the Establishment. Darwin, author of the once famous *Botanic Garden*, and grandfather of the celebrated propounder of the evolution theory, resided here. Pop. (1871) 343,787. B. returns three members to Parliament. Before the civil war B. has no place in history, and even after that it is long noticeable, except as a thriving seat of industry. It first, and not creditably, emerged into general notice by its outrage on Priestley, whose house was destroyed in 1792 by an ignorant mob, incensed at his liberality as a politician and a theologian—a crime for which it has recently atoned by erecting a statue to his memory; but since 1832 B. has taken a prominent part in national politics. It is now (1875) regarded as the representative city of what is known as the 'Advanced Liberal' or Radical party, and, unlike some other great cities, has never wavered in its love of extremes. After the passing of the Education Act of 1871, it displayed remarkable energy in carrying out its provisions, and in particular arrested universal attention at the last school board election by pronouncing in favour of the principle of 'united secular and separate religious instruction.' B. has shown great readiness to take advantage of the recently granted facilities for city improvements. For this purpose the municipality purchased some 30 acres in the centre of the city in 1875.

Birnam Hill, in Perthshire, near Dunkeld, 12 miles N.W. of Perth, is 1580 feet high. It was once covered with a royal forest, to which Shakespeare alludes in his *Macbeth* (Act v. Sc. 5)—

'Fear not till Birnam wood
Do come to Dunsinane.'

Bir'ni, the former capital of Bornu, Central Africa, on the river Yeu, 75 miles W. of Lake Tchad, not now in a prosperous state. It is, however, walled, and has still considerable markets. Pop. 10,000. The present capital is Kuka (q. v.), on W. shore of Lake Tchad.—New B., a walled town of about the same size as the former, lies 20 miles S. of Kuka, and has an extensive mud palace.

Biron, a title assumed by an ancient and distinguished French family, **De Gontaut**, of which the following are the most conspicuous members: 1. **Armand de Gontaut, Baron**, afterwards **Duc de B.**, born about 1524, secretly favoured the Huguenots, but took part against them in the religious wars of the times, and was one of the negotiators of the peace of St Germain in 1570. On the night of the massacre of St Bartholomew, B. was in the arsenal of Paris, and protected the Huguenots who were with him. Charles IX. appointed him to the command of La Rochelle, but the inhabitants successfully resisted the appointment. He was made a marshal of France in 1577; and at the death of Henri III., in 1589, was one of the first to welcome Henri of Navarre, under whom he distinguished himself at the first siege of Paris, and at the battle of Ivry. He was killed at the siege of Epernay, July 26, 1592.—2. **Charles de Gontaut, Duc de B.**, son of the former, was born in

1562; at the death of his father was made an admiral, and two years later a marshal of France. He stood high in the esteem of Henri IV., who heaped favours upon him. Daring and brave in battle, he was at the same time indifferent to both sides of the religious struggles of the time, vain, presumptuous, and always in want of money. This last circumstance induced him to intrigue against the king, who twice spared him, but at last was forced to send him to the Bastille. He was tried and condemned to death, a sentence which was put in execution, July 31, 1602.

—3. **Armand Louis**, first **Duc de Lauzun**, and subsequently **Duc de B.**, born April 15, 1747, brought himself into notice by a tract *Sur l'Etat de Défense de l'Angleterre et de toutes les Possessions dans les Quatre Parties du Monde*, owing to which he was put in command of an expedition against the British possessions on the W. coast of Africa. Arriving at Cape Blanco, he took the fort there, January 30, 1779, and sent a portion of his fleet towards the Gambia, which was successful in seizing some of the British possessions on the coast. After returning to France, B. crossed the Atlantic, and took part in the American War of Independence in 1780. Coming back to France, he was sent to the States-General as a deputy of the nobles; was appointed in 1791 to the command of the army of the north; in 1792, commander-in-chief of the army of the Rhine; in 1793, commander-in-chief of the army of the *Côtes de la Rochelle*, distinguishing himself greatly in all these positions. But he had the misfortune to excite the suspicions of the Committee of Public Safety, and after what was called a 'trial,' was guillotined, December 31, 1793. See *Mémoires de M. le Duc de Lauzun* (Par. 1822).

Biron, Ernst Johann, Duke of Courland, was the son of a Courland gentleman of German origin, named Bühren, and was born in 1687. He gained the favour of Anna Ivanovna (q. v.), niece of Peter the Great, and Duchess of Courland, and was made by her, when she ascended the throne of Russia in 1730, a principal administrator of the empire. At this time he assumed the name and arms of the French family of B. B. ruthlessly removed every obstacle in the way of his advancement, but introduced order and vigour into all the branches of the administration. He was made Duke of Courland in 1737, assumed the regency on the death of the empress in 1740, but in consequence of a successful conspiracy was arrested in less than a month, and sentenced to death. His sentence being commuted into banishment for life, he was exiled to Siberia. Recalled by Elizabeth in 1741, he was permitted to reside at Jaroslav. In 1763 Catherine II. reinstated him in his dukedom, which he governed with singular moderation and justice till his death, 28th December 1772. See *B.'s Leben*, Brem. 1772. He was succeeded by his son, **Pieter B.**, Duke of Courland and Sagan, and Count of the German empire, born at Mita, 15th February 1724. His reign was stormy and unfortunate. He could not manage his subjects at all, and finally (28th March 1795) he relinquished his duchy to the Empress Catherine, only reserving to himself and family ducal honours and rights. Pieter died, 12th January 1800, at Gellenau, in Silesia. By his third wife he had four daughters, the youngest of whom, Dorothea, born 21st August 1793, married, 23d April 1809, Edmond, Duc de Tallyrand-Perigord and Duc de Dino, in Calabria, and died 19th September 1862. Their eldest son, Napoleon Louis, Duc de Valençay, born 12th March 1811, inherited from his mother the Prussian principality of Sagan; while the second, Alexander Edmond, born 15th December 1813, obtained by his father's abdication the lordship of Deutsch-Wartenburg. See Tiedge's *Anna Charlotte Dorothea, letze Herzogin von Kurland* (Leips. 1823). A brother of Pieter's, the last Duke of Courland, carried on the male line of the Birones, some of whom have distinguished themselves in the Russian and Prussian services.

Birr. See PARSONSTOWN.

Birs, an inconsiderable Swiss stream which rises in the N.W. border of the Canton of Bern, flows in a N.E. direction, and joins the Rhine near Basel. Its banks are memorable for two conflicts: (1) that of 26th August 1444, fought at the Chapel of St Jakob, about a mile from Basel, in which 500 Swiss were slain by the army of the Armagnacs; and (2) that of July 22, 1499, in which 6000 Swiss defeated 15,000 Austrians at the village of Dornbach, 5 miles S. of Basel. This disaster forced the Emperor Maximilian to conclude the peace of Basel two months later.

Birth, in medicine. See PARTURITION.

Birth. See BASTARDY.

Birth, Concealment of, is a legal offence according to the law of England and the law of Scotland. By the latter, a woman who conceals her pregnancy, and does not call for help in the birth, and whose child is missing, is held guilty of murder. See PREGNANCY.

Birthright, or the right of Primogeniture (q. v.), is the rule of law by which the eldest son is preferred to younger ones and to daughters in succession to the father's real estate. The rule is one of feudal law. It has prevailed in Britain and in most countries of Europe. Its intention has been fortified by the device of entailing property, by which the succession is cut off from one or more of the heirs at law, and settled upon a particular heir or series of heirs. The object of these laws is of course to gratify that desire of human nature which leads a man to wish to preserve entire in his own descendants or heirs the wealth and social status which he has himself acquired or inherited. In considering the expediency of these laws, the fact of the existence of this instinct in our nature, as a strong motive power, is not to be ignored. It may be very contrary to reason that it should exist; but it does; and, were it annihilated, the motive which keeps many a man in the path of industry—which continues to give him an interest in the practical affairs of life, after he has ceased to be interested in these for his own immediate sake—would thereby be impaired or destroyed. The question is a very complicated and difficult one, probably not capable either of theoretical or practical solution. The evils that are alleged against the system lie, really or apparently, on the surface. By it immense estates are accumulated in the hands of one man, while his near relatives are comparatively poor and landless. Again, by it, as other laws affecting the right of property in land now are, enormous power is thrown into the hands of a few men; a power which, were they generally to exercise it, would be intolerable to the community. Thus it has been said that some half-a-dozen men might together exclude the public from half of Scotland. Not from the roads certainly, but from hill and dale, loch and stream; and from the two latter, in some districts, this not only might be, but has been done. On the other hand, to take the same country, the advocates of the system say—"True, 'Jock the laird's brother' may be aggrieved by the law, but this is not a public grievance. Where will you see a more flourishing agriculture—where will you see farmers so intelligent, so wealthy—where will you see a peasantry healthier and better contented than on the lands of the great proprietors of the Lowlands of Scotland?" While each man would no doubt like a slice of land to himself, sooner than see it generally cut up and equally divided among his neighbours and himself, he would probably prefer to have a large property in the hands of one. We give no opinion of our own; we merely endeavour fairly to state the arguments of the advocates and opponents of the system. Public opinion has in recent times certainly been running somewhat against the law of entail at least. Yet if this be bad, it may be difficult to see how B. is good. See ENTAIL, SUCCESSION.

Births, Registry of. Under recent statutes, the father or mother, or the occupier of any house in which a child is born, must give notice of the birth to the registrar of the district in which it happens within forty-two days from the date of birth. And, if required by the registrar, information must be given on the following points: the day of birth; the name, if any has been given; the name and surname of the father; the name and maiden surname of the mother; the rank, profession, trade, or calling of the father. The person giving the information must enter in the register his or her name, description, and residence; and unless this be done, no register can be given in evidence. No fee or payment can be lawfully required of any person giving information respecting any birth. No one shall knowingly cause any birth to be registered otherwise than as mentioned after forty-two days, under a penalty of fifty pounds; and no one shall knowingly cause any birth to be registered after six calendar months from the day of birth (except in case of children born at sea) under the same penalty. No register of births made after six calendar months, with exception as above, will be received in any court as legal evidence. Any one wilfully

making, or causing to be made, any false statement, for the purpose of having it registered, is liable to the penalties of perjury. The Scotch law of R. of B. is essentially the same as the English. But, in accordance with the law of legitimation in Scotland, it is provided that an entry of illegitimacy shall, on the subsequent marriage of the parents of the child to which it refers, be corrected on the margin by an entry of the marriage. See REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES.

Births, Deaths, and Marriages. See VITAL STATISTICS.

Birthwort. See ARISTOLOCHIA.

Biru' (*Walata*), a small native state of Sudan, Western Africa, on the S. border of the Sahara, and N. of Bambarra. Its capital, Walata, lies 275 miles N.W. of Timbuctu, and has a pop. estimated at above 10,000.

Bis (Lat. 'twice'), in music, denotes that the passage to which it refers is to be played twice.

Bisaccia (supposed to be the ancient *Romulca*), an Italian town in the province of, and 28 miles E.N.E. of the town of, Avellino. Pop. about 6000.

Bisacquino, a town in Sicily, 28 miles S. of Palermo, with an extensive trade in grain and oil. Pop. 8690.

Bisanagar, a town in the Gaikwar's territories, India, situated on the route from Mhow to Deesa, 44 miles S.E. of Deesa. It has considerable trade with Marwar in iron and other heavy goods, and also a considerable manufacture of cotton cloths. Pop. 18,000.

Biscay, or **Viscaya**, the most northerly of the three old Basque provinces in Spain, bounded on the N. by the Bay of B., E. by Guipuzcoa, S. by Alava, and W. by Santander. Area, 850 sq. miles. Pop. (1870), 187,926. The surface is generally mountainous, occupying part of the thickly-wooded and rugged northern slopes of the Cantabrian Mountains, the plains being confined to the lower courses of the streams, of which the Ibaizabal or Nerva is the largest. The climate though humid, from its proximity to the sea, is in general healthy; but the heat in the valleys during summer is almost insupportable. The chief crops are barley, maize, pulse, hemp, and fruits of various kinds; the principal live stock consists of sheep and goats. The inhabitants largely support themselves by fishing, wood-cutting, and mining; iron, lead, alum, and sulphur being found in abundance, and ropeworks, tanneries, and ironworks also giving employment to many. The Biscayans, who are a pure Basque race (see BASQUE PROVINCES), are bold and active, and distinguished for their love of freedom.

Biscay, Bay of (anc. *Mare Cantabricum*, Fr. *Golfe de Gascogne*), the name given to that part of the Atlantic Ocean which lies between the island of Ouessant in France and Cape Ortegal in Spain, washing the N. coast of Spain and the W. coast of France. Extreme length, 400 miles; extreme breadth somewhat less; depth varying from 20 to 200 fathoms. From Cape Ortegal to the western extremity of the Pyrenees the coast is precipitous, with numerous recesses which form convenient harbours; further N. the shore is low and sandy, the mouths of the Adour and Gironde forming the only harbours; but at the extreme N. (Bretagne) it again displays in some measure a broken and rocky character, and has numerous picturesque outlines and excellent havens. The rivers entering the B. from Spain are unimportant; but the Adour, Gironde, Charente, and Loire pour into it more than half the whole river drainage of France. The B. of B. contains the islands Belleisle, Ré, and Oléron. The navigation is proverbially dangerous, from the prevalence of western and north-western winds, which raise high, short, broken waves; and the agitation is increased by Rennel's Current, which runs along the entire coast of the bay. The commerce of the bay, which is considerable, is almost entirely in the hands of the French, the exports being mainly the products and manufactures of France.

Bisceglia, a strongly fortified seaport town on the Adriatic, in the province of Bari, S. Italy, 19 miles N.W. of the town of Bari. B. is the seat of a bishop, and has many churches, convents, &c. Some ruins still exist of the hospital for which it was famous during the Crusades. Pop. (1872) 21,371. The

produce of the neighbouring country consists chiefly of wine and currants, in which latter it rivals the Ionian Islands.

Bisch'of, Karl Gustav, a distinguished chemist and geologist, was born, January 18, 1792, at Nürnberg. He studied at Erlangen, where he first applied himself to mathematical and astronomical studies, but the influence of Hildebrandt soon induced him to devote himself exclusively to chemistry and physics. In 1822 he was appointed Professor of Chemistry at Bonn, and after a life of uninterrupted activity in scientific work died there November 30, 1870. B.'s chief works are, *Die Wärmelehre des Innern unsers Erdkörpers* (Leips. 1837), which appeared in an English form at London in 1841 under the title *Physical, Chemical, and Geological Researches on the Internal Heat of the Globe*; and *Lehrbuch der Chem. und Physik. Geologie* (2 vols. Bonn, 1847-54; new ed. 3 vols. Bonn, 1863-66; suppl. 1871).

Bischweiler (Fr. *Bischwiller*), a town on the Moder, province of Alsace-Lorraine, Germany, 15 miles N. of Strasburg, with which it is connected by railway. It has a trade in hemp, madder, socks, gloves, oil, soap, and an important hop-market. Pop. (1871) 9231.

Biscuits (Fr. *bis cuit*, 'twice baked'), the name applied to thin hard-baked cakes of unfermented, or in great part unfermented, flour. A biscuit essentially consists of a mixture of flour, salt, and water made into dough, and fired in an oven till all the water is expelled, and the flour is turned slightly yellow with heat, when the cake is found to have become hard and firm. This is the simplest form of cooking flour; and as well-baked B. will keep a long time perfectly unaltered, it is a very convenient manner for preparing flour for use at sea, for armies in campaign, and many other purposes. Besides water or ship B., an innumerable variety of fancy B. are manufactured and sold, which differ in size, shape, and the nature of their ingredients. In the composition of fancy B. milk often replaces water, and large quantities of butter, lard, sugar, eggs, and flavouring materials are used. B. are also often rendered porous by the addition of bicarbonate of ammonia to the dough, which, being volatile, is entirely dissipated in the firing process; and the same effect is produced by the addition of baking-soda with sour milk, or by inducing a slight fermentation of yeast in yeast-B. The biscuit manufacture has now become a great industry in the United Kingdom, and many hundreds of workpeople are employed in some of the greater establishments, which export enormous quantities of B. in tins, in addition to supplying a great demand for ship-B., as well as for general consumption. Very elaborate and perfect machinery has been adapted to the manufacture, and mechanical ovens have been introduced for biscuit-baking, through which the goods travel at various rates, entering as raw dough at one extremity, and being delivered as finished B. at the opposite end. The following description of a biscuit factory gives a general idea of the processes in making a water-biscuit.

The flour is, in the first instance, deposited in one of the upper storeys. It passes through spouts or tubes into a lower storey, where the sifting machinery is placed; and after that the flour passes through other tubes to the ground-floor, where it is delivered direct into the hoppers of the mixing-machine for biscuit-making. The machines are arranged in straight lines in front of each oven, and deliver their products into the latter immediately after it has received the proper consistency and form. The first machine in this series is the mixer, or cylindrical vessel of cast iron, in which a number of knives is kept revolving by a central spindle. The cutters are formed like screw-propeller blades, and their action in revolving is therefore a thorough mixing of the mass. The mass from which the dough is formed, say, for ordinary ship-B., is wheat-flour and water; it is delivered from the mixer to the "brake," a machine which is simply a small rolling-mill for rolling a plate of dough, say, 3 feet wide and about 10 feet long, and of the thickness required for the special class of biscuit. This sheet is then delivered to the third machine—the "cutting-machine." This is a somewhat complicated apparatus, operating upon the principle of a multifarious punching-machine, the punches having the regular and irregular shapes of the B. to be cut out of the dough. The cutting-machine faces the stove, and delivers its produce into it, either by the assistance of hand-labour or by a

self-acting apparatus, the latter being the more modern mode. The ovens are about 40 feet in length and 6 feet wide. One oven can produce about 3 tons of ship-B. per day of ten working hours. One cutting-machine is capable of supplying this quantity of cut biscuit-dough, both oven and machine working continuously. The time required for the B. to pass through the oven is about forty minutes; the process of baking evaporates not only all the water mixed with the flour for forming the dough, but also a certain percentage of hygroscopic water held by the flour in its apparently dry state. This loss amounts to 10 per cent. of the total weight of the flour, 10 lbs. of flour yielding only 9 lbs. of baked B.

Biscuits, Meat, are small cakes composed of fine flour and concentrated extract of meat thoroughly incorporated together. They are of American origin, and are designed to preserve for an indefinite time the nutritive properties of meat, 1 lb. of the preparation containing the extract of 5 lbs. of meat, with $\frac{1}{2}$ lb. of flour. They form a valuable addition to the traveller's stores, as they occupy little space, can be eaten dry, or boiled with water to form soup.

Biscuit Ware, a name given to pottery in its unglazed condition, when it is withdrawn from the first firing or biscuit oven. It presents a flat porous surface, and in this state it is frequently used for water-coolers, as red B. W. Parian statuettes and vases, &c., are a form of B. W.

Bish, a celebrated Indian drug and poison, obtained from the dried roots of various species of aconite (*Aconitum ferox*, *A. luridum*, *A. Napellus*, and *A. palmatum*).

Bish'op is the title now given to the highest order of the Christian ministry, who have the same oversight of all the clergy within their Diocese (q. v.) as these have of their flocks. Two rival accounts are given of the origin of this order, or rather a different colouring is given to the same facts, according to the theory held by the writers—Episcopalian or Presbyterian. An attempt is made in the following article to state the facts without any colouring at all.

1. In the New Testament the men appointed by the apostles to superintend the churches they founded, and to carry on the instruction of the people, are called *presbyters* (Gr.) or *elders* (Acts xiv. 23, xi. 30), since age, experience, and character would be essential qualifications for the office (2 Tim. ii. 2), *bishops* (Gr. *episcopoi*) or *overseers* (Acts xx. 28), *leading men* (Heb. xiii. 7), and *shepherds* or *pastors* (Eph. iv. 11). That the titles *B.* and *presbyter* are used synonymously in the New Testament is proved by the following facts: (1) Both titles are applied to the same persons (Acts xx. 17, cf. 28; Tit. i. 5, 7; 1 Pet. v. 1, 2). (2) They are never used together, as if applied to orders distinct from each other. (3) *Bishops* and *deacons* are mentioned as if they comprehended all the officers of the Church (Phil. i. 1; 1 Tim. iii. 1, 8). (4) *Presbyters* discharge duties which properly belong to the *bishops* (1 Tim. v. 17; 1 Pet. v. 1, 2).

2. It is the fact that in the 3d c. there were three distinct orders of clergy in the Church—deacons, presbyters, and bishops. Theodoret says (*Com.* 1 Tim. iii. 1), 'The same persons were anciently called promiscuously both bishops and presbyters, whilst those who are now called bishops were called apostles. But shortly after the name of apostles was appropriated to such only as were apostles indeed; and then the name B. was given to those who before were called apostles.' Here two things are to be distinguished: the fact that at a certain time there was an order of bishops above the presbyters, which is undeniable, and an explanation of this fact—namely, that there had been a regular and uninterrupted succession of apostles, who, very much out of respect for the apostles, came to get a name originally belonging to the second rank of the clergy, an explanation which itself requires to be established. So that the question comes to be, Were there from the first three orders of clergy in the Church—deacons, presbyters (at first also called *bishops*), and apostles (afterwards called bishops)? In other words, was the B. an apostolic and (therefore) divine institution, or was it an outcome of the ecclesiastical tendencies of the time, and a development of the presbyter?

3. *Proof that the B. was an apostolical institution.*—(a.) From the New Testament. The amount of proof claimed from the New Testament is that St Paul appointed Timothy B. of Ephesus

(1 Tim. i. 3, v. 22; 2 Tim. ii. 14), and Titus B. of Crete (Tit. i. 5-10). The worth of this proof to those who have no foregone conclusion on the subject will appear if we consider that the nature of their office is in no way defined by the passages cited than by the duties imposed, which might just as well have been discharged by evangelists. That Timothy was an evangelist is distinctly stated (2 Tim. iv. 5); while his having been ordained a B. seems to be disproved by 1 Tim. i. 3. That Titus was settled as a B. in Crete seems also disproved by Tit. iii. 9-13.

(b.) Coming to the Christian fathers, we find them unanimously testifying that the order of bishops is of apostolic institution. Indeed, so definite is their testimony, that they are able to give the name of the B. ordained by an apostle in each of the principal churches. Nay, Irenæus gives a list of the twelve bishops who had succeeded each other in the see of Rome to his own time: to St Peter, the first B. of Rome, succeeded Linus; to Linus, Clement; to Clement, Anacletus, &c. So the first B. of Jerusalem, ordained by the apostles, was James, the Lord's brother, who was succeeded by his cousin Simeon; of Antioch, Euodius, succeeded by Ignatius—both ordained by the apostles; of Smyrna, Polycarp, the disciple of John, by whom he was ordained (Jerome). According to similar testimony, Timothy was B. of Ephesus, Titus of Crete, and Epaphroditus (Phil. ii. 25) of Philippi. The worth of this as *history* (say the Presbyterians) may be estimated from one case taken as an example—Irenæus's list of the bishops of Rome. Not to mention the discrepancies in the testimony of different fathers regarding that list, every one knows the uncertainty regarding Peter's residence at Rome. That he was ever there, can at the best only be called a tradition. To this, again, the advocates of Episcopacy reply that the discrepancies only prove the inaccuracy of individual memories, and may even be regarded as less suspicious evidence of the common fact whose reality they attest, than any uniform consensus could possibly be. And further, they urge that the testimony (though traditional) in favour of Peter's visit to Rome is such that it is less reasonable to reject than to accept it.

4. An examination of the ecclesiastical tendencies of the time is supposed by Presbyterians to lead to the conclusion that the B. is not a divine—i.e., apostolic—but a human—i.e., ecclesiastical—institution, developed out of the presbyter. The first traces of this development, it is allowed, are apparent in the New Testament. Thus, in the pastoral epistles, while the singular of B. is always used, *presbyters* are always spoken of in the plural, as if it were implied that one of their number acted as president, *primus inter pares*. 'The angels of the churches mentioned in the Apocalypse (i. 20, &c.), if these be, as some suppose, functionaries borrowed from the Jewish synagogue whose name is a Hebrewism for 'ministers,' would point to the same thing. But whatever importance may be attached to these supposed traces of the germ of the B. in the New Testament, there is not (say Presbyterians) a more striking phenomenon in the development of the Church, nor a more undoubted fact in her history, than the gradual formation during the first centuries of a *sacerdotal caste*. Till late in the 2d c., *presbyter* and B. were still synonymous titles. Irenæus and Tertullian mark a transition period, for both sometimes use the names in this way, and sometimes distinguish the B. as president of the presbyters. As late as the 3d c., the presbyters remained as a college of counsellors to the B. Even Cyprian, to whom the episcopal system owes more than to any other individual, apologises both to his presbyters and the laity when he does anything without consulting them. But as early as the time of Tertullian, men had begun to compare the B. with the high priest, the presbyters with the priests, and the deacons with the Levites of the Jewish system. And besides Judaism, which always gets justice, another influence was at work, which is always overlooked, namely, Paganism. Thus the B. (not he of Rome merely) got the name of Pontifex Maximus and many other titles, all to express the honour to be heaped upon him: President, Provost, Inspector, Prince of the People, Prince of the Clergy, Pope, Vicar of Christ. A very significant indication, it is said, of how the B. grew to his full stature is to be found in what was further developed out of the order of bishops, namely, first, Metropolitans (q. v.), then Primates (q. v.), then Patriarchs (q. v.) or Archbishops (q. v.), and finally, a Prince of Patriarchs, the Pope. Even the origin of the inferior orders of clergy is a part of the same thing. For the presbyters, although at first (in the 3d c.) they protested

strongly against the usurpations of the B., soon began to follow in his steps, and the deacons in theirs; which created a necessity for inferior orders—sub-deacons, &c.—to take up the menial duties the higher orders cast off.

But Episcopals find it quite as easy to interpret the facts in accordance with a belief in the scriptural origin of their own system. They do not affirm that a New Testament B. was, or could possibly be, in power, position, circumstance, &c., what he subsequently became when Christianity spread and the Church grew. Even the theory of his office might become clearer under wider and more difficult conditions, until finally the organisation of an institution that reached to the ends of the Roman empire, and beyond it, might justly be thought to require an expansion of the original conception, which is not necessarily the same thing as the creation of a new order. This view they consider intrinsically more reasonable, and more in harmony with the facts of Church history.

At first bishops were elected by the clergy and the people. Then the Roman emperors reserved the right to themselves. Afterwards the B. of Rome brought it about that the canons in cathedral churches should have the right of election, which, however, had to be confirmed at Rome. Still princes had a certain power in the election of bishops in their own dominions. Especially was this the case in England, where all ecclesiastical dignities were conferred by the King in Parliament, till the right of investiture was given up by Henry I. The right of electing the bishops was confirmed to the chapters by John—the election, however, to be founded on the King's *congé d'élire*, and after to receive his assent.

The Church of Rome has retained, of course, her episcopal organisation. The Reformed Churches, modelled after the Genevan pattern, adopted the Presbyterian system. The Lutheran Church, in some countries, has kept her bishops. So has the Church of England, in which there are twenty-eight, including two archbishops, besides those in Ireland—twelve, including two archbishops—and those in the colonies. There are seven bishops of the Episcopal Church in Scotland. See Bingham's *Ecclesiastical Antiquities*; Neander's *Church History*; Kitto's *Cyclop. of Bib. Lit.*

Bishop, the name given to a pleasant beverage which is made by pouring Burgundy, claret, Medoc, or any of the red wines, cold or hot, on ripe bitter oranges, and regulating the taste of the mixture with sugar and spice. It is drunk hot or cold. Good B. requires excellent wine, and the white of the orange, between the peel and the pulp, must be removed. White wine similarly used instead of red, is called *cardinal*, and Tokay, *pope*.

Bishop, Sir Henry Rowley, an eminent English musical composer, born in London in 1780. He obtained an appointment at the Opera-House in 1806, and from 1808 to 1826 composed incessantly for the two great theatres, among his more popular operas being *Guy Mannering*, *The Miller and his Men*, *Maid Marian*, &c. Later on he conducted the Ancient Concerts for some years; in 1841 was elected Reid Professor of Music at Edinburgh (an appointment which he held only two years); and in 1848 he became Professor of Music at Oxford. Isolated glees and choruses which occur in his operas (e.g., *The Chough and Crow*, *Blow, gentle gales*, &c.) are still deservedly popular, as are also some of his songs. B. died in poor circumstances, 30th April 1855.

Bishop's Stortford, a town of Hertfordshire, on the Stort, 25 miles N. of London by rail, with some trade in grain, malt, and leather. It was the property of the Bishops of London till the 12th c., and formerly possessed a castle. Pop. (1871) 6250.

Bishop's Wal'tham, a town of Hampshire, 8 miles N.E. of Southampton by rail. It has been from the earliest times the property of the see of Winchester, and contains the ruins of a bishop's castle, founded by King Stephen's brother, Henry de Blois, in 1135, and destroyed in the civil war of the 17th c. The Black Act (q.v.) of 1723 was intended to put down the Waltham Blacks, or deer-stealers, who infested a forest in the neighbourhood. B. W. is the election town of N. Hants. Pop. (1871) 2618.

Bisignano, a town in the province of Cosenza, S. Italy, 15 miles N. of Cosenza, contains a cathedral and a castle, and

gives to the Sanseverino family the title of prince. It has some silk trade. Pop. (1871) 4096.

Bis'kupitz, a rising town in the circle of Oppeln, province of Silesia, Prussia, has manufactures of sugar and of iron and steel wares. In the vicinity there are extensive iron and coal mines and smelting furnaces. Pop. (1875) 5733.

Bisley, a town of Gloucestershire, situated on the Severn and Thames Canal, 3 miles E. of Stroud, with some manufacture of coarse cloth. It has a church built in the 14th c., which contains several interesting monuments. Pop. (1871) 4985;

Bismarck, or **Bis'marck** (as some branches spell the word), the name of an ancient and noble family of Brandenburg, believed to be of Wendish or Bohemian origin. At a very early period it appears to have founded the village of Burgstall and the petty town of B., in the circle of Stendal, district of Magdeburg, Prussia. In the 12th and 13th c. several members of the family figure as burghers at Stendal and Prenzlau. In 1494 the town of B. was acquired by the lords of Alvensleben, but in 1562 Burgstall was exchanged by Friedrich von B., *Landhauptmann* in the Altmark, for Schönhausen, Fischbeck, Crevese, Briest, &c., belonging to the Brandenburg Elector, Joachim II., and, on account of this barter, is called in the family history *Permutator* (the 'Exchanger'). Friedrich von B. became through his two sons the ancestor of the two still flourishing houses of B., that of Schönhausen in the Magdeburg region, and that of Crevese in the Altmark. Both lines have produced men notable in their day as statesmen and soldiers. **Christoph Friedrich von B.** (died 1704), lord of Schönhausen, was a Prussian general and commandant of Küstrin. **Levin Friedrich von B.** (died 1774) was a privy-councillor and minister of justice under Friedrich the Great from 1746 to 1764. His son, **August Wilhelm von B.** (died 1783), was also a Prussian privy-councillor, minister of war, president of the Board of Trade and Manufactures, and head of the Excise Department. To a Rhenish branch of the Schönhausen line belonged **Friedrich Wilhelm von B.**, who in 1816 was raised to the rank of count in the peerage of Würtemberg. His elder brother, **Freiherr Ludwig von B.**, died 31st March 1816, *Oberhofmarschall* and lieutenant in the service of the Duke of Nassau, and left four sons, all of whom received the rank of count in the Würtemberg peerage, 13th September 1831. To the Schönhausen line also belongs the world-famous statesman Karl Otto von B.-Schönhausen (q. v.).

Bismarck-Schönhausen, Karl Otto, Prince von, the greatest German statesman of the 19th c., was born at Brandenburg, 1st April 1814. He studied law at Göttingen, Berlin, and Greifswald, and after having passed his first trials, fell back on the life of a country gentleman. In 1846 he was elected member of the Diet of Prussian Saxony, and of the General Diet in 1847, and soon became marked as an extreme defender of the privileges of the nobility. B.'s eloquence and vigour of character were readily recognised, but he did not then get credit for that sagacity and craft which have since excited the admiration and fear of Europe. He was even thought to be a rash and unwise champion of monarchy and aristocracy; and the *Fortschritt* party (the 'Advanced Liberals') half despised their inveterate foe. But in reality B.'s principles were already fixed; and amidst all the changes of a necessarily tortuous policy, he has never faltered in his strong conviction that a king should govern, an aristocracy control, and a people obey. His contempt for representative institutions is probably as strong to-day as it was twenty-five years ago, though he has for nearly a decade relied for the success of his political strategy on the patriotic sentiments of the German people. B.'s earlier career is now almost forgotten except in Germany, but he was particularly active in the 1848-50 period by his strenuous opposition to the semi-socialistic revolutionists who drew up a 'constitution' for a German empire; he was one of the keenest opponents in the Erfurt parliament of 1850 of the efforts towards union made by the Prussian government; and publicly declared his approval of the reactionary policy of Manteuffel. The new corporation laws, the system of passive servitude, of heritable jurisdiction, and all the pretensions of the feudal party received from B. the most unmitigated support. At this time no one saw in B. more than a daring and passionate Junker. Whether the great idea of consolidating Germany under the leadership of Prussia as early as 1850 was the

master-motive of his action is uncertain. The germ may have been there, but to the outside world he appeared simply a headstrong, overbearing, and narrow-minded Prussian aristocrat. Probably the conduct of the national policy has not only thrust a certain greatness upon him, but also enlarged and ennobled his own nature and aims. At any rate he was a man to be trusted and employed by his sovereign and his party. He became secretary to the Prussian Legation at Frankfurt in 1851, was opposed to Rechberg at Vienna in 1852, and from 1859-62, acted as ambassador at St Petersburg. In 1862, on returning from an embassy to Paris (where Napoleon gave him the Cross of the Legion of Honour), he became Prussian Minister of Foreign Affairs. When his Budget and Army Re-organisation Bill were criticised, he instantly showed the stuff of which he was made by dissolving the Lower Chambers, and concluding a secret treaty with Russia, in spite of the censures of the deputies. In 1864, he forced Austria into the Slesvig-Holstein expedition, and shortly afterwards, by the Austrian war, which ended at Sadowa (1866), he not only obtained for Prussia the rights of Austria in Slesvig-Holstein, but finally excluded Austria from the Germanic Confederation, which was now re-cast, Hanover and Frankfurt being incorporated with Prussia, and the South German States contracting an offensive and defensive alliance with Prussia, whom they also recognised as supreme in military operations. A Federal Council, consisting of delegates from the States, and a Diet elected by universal suffrage, were also provided, and B. became Chancellor of the Confederation, and President of the Council. This is the turning-point in the public estimate of B.'s character and aims. Henceforth he is the pride of his countrymen, who begin to recognise a great patriotic purpose in his policy, and to share his belief that, if a nation is to be powerful, the state (*i.e.*, the governing body) must be strong. The *Fortschritt* party lost its hold on the German people, and everywhere there appeared a *National* party ready to support a minister whose genius already commanded the homage of Europe. Soon after B. obtained the neutralisation of Luxembourg, in place of its cession by Holland to France. Meanwhile it was becoming clear that a great struggle between France and Germany for supremacy in Europe was impending. B., with his allies Von Moltke and Von Roon, secretly prepared for it, and there can be little doubt that, when the proper moment arrived, he deliberately forced it on by the Hohenzollern candidature. After the war (1870) he became Chancellor and Prince of the new German empire. Since then he has actively pursued his great idea of the unification of Germany. His efforts to free education from ecclesiastical control, and to raise its standard, his measures to enforce the authority of the State over that of the Church, in the education of clergy, and in the question of civil marriage, and his determined attack on the Jesuit and Ultramontane party are still in progress, and cannot be adequately judged of. In November 1873, he became Prime Minister of Prussia; on the 13th July 1874 his life was attempted by the fanatic Kullmann, a crime which B. publicly charged the Ultramontane party with instigating; and a great part of 1874-75 was taken up with the trial of Count von Arnim (*q. v.*). Whatever verdict may ultimately be passed on the character and policy of B., he cannot fail to hold a foremost place in European history, and will probably rank as the greatest statesman of the 19th c. See Heseckiel, *Das Buch Vom Grafen* (1869); *Graf B., Ein Charakterbild* (1867); *Reden des Grafen B.* (1867-71); Rosler, *Graf B. und die Deutsche Nation* (1870); and Life by Görlach (Engl. transl., Tauchnitz, 1875).

Bismuth is a crystalline, brittle metal, having a white colour, with a shade in the red. It is first mentioned by Agricola (1529), and was subsequently investigated by Pott (1739), Beccher, Geoffrey, John Davy, and others. It usually occurs in the pure or native condition, and is often found beautifully crystallised. It is found chiefly in Saxony, and requires little other metallurgical treatment than fusion to get rid of earthy impurities. B. is very heavy (sp. gr. 9.8), readily fusible (fusing point, 247° C.), and may be distilled at a high temperature in a current of hydrogen. It may be obtained in beautiful cubical crystals by fusion and partial cooling. Its chemical symbol is Bi, and its atomic weight 210. It dissolves in nitric acid (*aqua fortis*) and in *aqua regia*; but is not attacked by hydrochloric acid. Its alloys with other metals are important, on account of their ready fusibility (*see ALLOYS*), and the property they possess of ex-

panding at the moment of solidification. Some of its compounds are employed in the arts and in medicine. *Basic nitrate of B.*, *trisnitrate of B.* or *flake white* (BIONO₃) is prepared by dissolving B. in nitric acid, and precipitating with a large excess of water. *Oxychloride of B.*, or *pearl white* (BiOCl), is prepared in a similar manner, substituting a solution of common salt for the water used to dilute the nitric acid solution. B. forms three oxides—BiO, Bi₂O₃, and Bi₂O₅; two sulphides, BiS, and Bi₂S₃,—the latter occurring native as *B. glauc*; a chloride BiCl₃, and other compounds not having any practical importance.

Bison (*Bos, Bison*, or *B. Europæus*), a genus or species of the ox family (*Bovidae*), represented in Europe by the Aurochs or Lithuanian B., and in America by the American B., a distinct species from the European form—the *B. Americanus* of the naturalist. The European B. formerly abounded over the whole of Europe, including Britain, as proved by the presence of its fossil remains which are found in strata of recent age. At present, it occurs wild only in the Caucasian forests, and is preserved by the Czar of Russia in Bialowieza, a Lithuanian forest. This animal is of very large size, and stands about six feet high at the withers. The back is highly arched, and rises abruptly at the neck, which appears humped from the presence of strong muscular developments. The horns are large, rounded, and tapering. They spread outwards, and curve inwards at the point. Fourteen pairs of ribs exist. The hair on the front of the body and shoulders is long, coarse, and of brown colour, and forms a kind of deep mane beneath the throat. The hair on the other parts of the body is short, and of a dark-brown colour. The long hair of the front part appears to be shed in summer. The tail is tufted. The males are larger than the females, which latter do not possess such shaggy hair in front. These animals appear to be fierce and untamable in their disposition, and they certainly possess immense strength. The European B. may have been the *Urus* of the ancients; altho' some naturalists give the name *Urus* to another ox of large size, which has become extinct within the recent historic period. The *Bonassus* of the ancients in this latter view corresponds to the B.

The American B., or Buffalo (*B. Americanus*) is found in numbers at present only in the western prairies of America, although it formerly occurred over the entire area occupied by the prairies. The body of this animal is thickly set; the head being low and the withers high. The head is very large, and, together with the neck and shoulders, is covered by a thick woolly hair of dark-brown colour. This coating acquires a greater length in winter. A hump exists between the shoulders. The rest of the body is covered by short hair, and the tail is short and tufted. These animals appear to migrate southwards in autumn, their most southern limit being in New Mexico, whilst their most northern point of distribution is at lat. 63° or 64°. They are hunted by the Indians, and serve for food to these nomadic tribes, whilst from the skin a variety of useful articles is manufactured. The horns are short and obtuse. These bison fight the wolves with much skill and activity. The flesh and fat constitute the *pemmican* of the fur-traders, and the tallow is also of commercial value. Attempts to domesticate these animals have met with partial success only.

Bissa'o or Bissa'gos Islands, a group of about 20 small volcanic islands enclosed by a reef, off the W. coast of Africa, opposite the mouth of the Rio Grande. The Portuguese have a fortified settlement on the principal island, B., and carry on an extensive traffic in slaves. The wealth of the natives consists of cattle and goats, only a small quantity of maize being cultivated, though the soil is fertile.

Bissen, Hermann Wilhelm, a Danish sculptor, was born 13th October 1798, near Slesvig, and studied ten years at Rome under Thorwaldsen, his countryman. He received several important commissions from the Danish Government, was made director of the Art Academy at Copenhagen in 1850, and was appointed by Thorwaldsen in his will to complete his unfinished

Bison.

works. B. died 10th March 1868. His works are distinguished by vigour and earnestness. Among them are the 'Valkyries,' a 'Venus,' 'Cupid sharpening his Arrow,' a frieze in the great hall of the palace at Copenhagen; and some works commemorative of the national struggle with Prussia.

Bis'ampur, or **Bish'ampur**, a town of British India, in the district of Bankora, division of Burdwan, province of Bengal, on the left bank of the river Bankora, 45 miles W. of Burdwan, and 83 N.W. of Calcutta. It has considerable manufactures of silk and indigo, and an active trade in metal wares, cotton, jute, and fibres. Pop. (1872) 18,047.

Bis'tort, or **Snakeweed** (*Polygonum Bistorta*), a perennial plant of the natural order *Polygonaceæ*, growing in moist pastures and meadows, chiefly in the hilly districts of Europe, Central and Russian Asia, and Northern America, extending into the Arctic regions, but not common in Britain, where it is frequently a straggler from gardens. It is a valuable astringent.

Bis'tre, an artist's colour of a warm brown colour, prepared chiefly from the soot of beechwood fires. It is used only as a water-colour, and chiefly in monochrome sketches.

Bis'tritz, or **Nösen**, a town in the N.E. of Transylvania, on the river B., a tributary of the Great Szamos, one of the branches of the Theiss. It has a Gothic church (1519), with a tower 300 feet high, two monasteries, two hospitals, a large bazaar, and an encircling wall with two bastions and fourteen towers. It had once a great transit trade with Dantzic and the Levant, but its commerce is now limited to the Bukowina. Frequent contests occurred here in 1848-49 between the Austrian and Hungarian generals. Pop. 3451, mostly German Protestants. The district of B. has a pop. of more than 100,000, mostly Roumans and Germans. Its mining, once so important that, according to authentic records, the Tartars in their invasion of 1242 partly slew and partly carried into captivity 40,000 workmen, has in the last century or two greatly declined, and at present is of no importance.

Bisulpur, a town in the executive district of Bareilly, N.W. Province, British India, 24 miles S.E. of Bareilly. Pop. (1872) 9005.

Bites of Rabid Animals. These are very dangerous, not only on account of the local effects, but more especially on account of the constitutional effects which may arise afterwards, as Hydrophobia (q. v.). The treatment consists in fying, where that is possible, a ligature above the seat of injury, or applying compression. This to some extent prevents absorption of the poison. The parts around the wound should be excised as soon as possible; the wound should now be well washed, and afterwards some caustic freely applied. Attention must be paid to the general health until the wound heals. It is only when the animal is really *rabid* that such severe treatment is necessary. Bites from animals not rabid are best treated by soothing applications, as poultices.

Bites of Venomous Reptiles. The serpents provided with poisonous fangs are chiefly natives of foreign countries, only one, the common adder or viper, being a native of this country. The general arrangement of their poisonous fangs will be described in connection with the serpents possessing them. The bite of the common adder is seldom fatal in man. The bites of some foreign species are fatal in a few minutes. Treatment consists in *sucking* the wound freely. This is quite safe if there be no broken skin in the mouth. This may be done by the person bitten, or by a friend. At the same time a ligature is to be tied above the injured part where that is possible. The part may be cut out, and some strong caustic applied to the wound. Internally stimulants are to be given freely, such as ammonia or brandy.

Bithoor, a town of British India, in the district of Cawnpur, division of Allahabad, N.W. Province, on the right bank of the Ganges. It was the stronghold of Nena Sahib during the Indian Mutiny. The fort was burnt by General Havelock after his defeat of the Nena, 16th July 1857. Pop. (1871) 8322.

Bithyn'ia, anciently a country in the N.W. of Asia Minor, extending along the Propontis, the Thracian Bosphorus, and the

Euxine, as far E. as Paphlagonia, and bounded on the S. by Phrygia and Galatia. The Greek poets sometimes called it *Bebrucia*, from its earliest semi-mythical inhabitants the *Bebruces*. The chief stream was the Sangarios (mod. Sakaria). Its most notable towns were the Greek colonies, Chalcedon, Heraclea, Myrlea (later Apamea), and Astakos; after whose destruction by Lysimachus Nicomedes I., Nicomedia was founded close by, and became the favourite residence of the kings of B., and one of the greatest cities of Asia Minor. Nicæa and Prusa also flourished along with Nicomedia. The inhabitants, according to their legends, were of Thracian origin. About 560 B.C. they came under the power of Croesus, the king of Lydia, and on the overthrow of the Lydian monarchy, 548, submitted to the Persians. In the 3d c. B.C. B. recovered its independence under native princes, who, however, became quite Grecised in manners and speech. Finally Nicomedes III. (died 75 B.C.) left his kingdom to the Romans, who made it a province. It is particularly memorable as the scene of Pliny the Younger's proconsulship, from which he wrote his famous letter to Trajan regarding the practices of the Christians. Under Diocletian it was the customary residence of the Roman emperor. In the 11th c. it came into the possession of the Seljukide Turks, from whom it was temporarily captured by the Christians during the First Crusade; and in 1326 it was conquered by the Osmanli, who made Prusa (Brusa) the capital of their Asiatic dominions.

Bit'lis, a town of Asiatic Turkey, vilayet of Erzurum, 120 miles S.E. of Erzurum, and 12 miles S.W. of Lake Van, on a river of the same name. The fertile ravine in which it lies is over 5000 feet above the level of the sea. It has an extensive trade, being an emporium for the imports and exports of Armenia and Kurdistan. Its dyes are famous for their brilliancy, and its carpets, of a rich texture, are elegantly and tastefully designed. The bazaars are well stocked and busy. Besides several mosques and Armenian churches, B. has about a dozen monasteries of howling dervishes. Pop. from 10,000 to 12,000, of whom a large number are Armenians.

Biton'to (the ancient *Butuntum*), a town in the province of Bari, S. Italy, about 10 miles W.S.W. of the town of Bari. Along with Ruvo it is a bishop's see, has a splendid cathedral, two monasteries, and a large orphanage. Zagarello, a wine of some reputation, is produced in the district in considerable quantities. Pop. (1872) 24,978. Here, on the 24th March 1734, the Spaniards won a victory over the Austrians which decided the fate of Naples.

Bitsch (Fr. *Bitche*), a town and fort of German Lorraine, 35 miles N. of Strasbourg, at the N. base of the Vosges, and a station on the Hagenau and Saargemünd Railway. It is considered nearly impregnable, being defended by an outer wall, and by a strong citadel built on a high rock, and capable of accommodating a garrison of 1000 men. There are manufactures of porphyry wares, papier-maché, clocks, hour-glasses, and earthenware, and in the vicinity are iron and glass works. B. came to France with the rest of Lorraine in 1738. In the Franco-Prussian war it was unsuccessfully besieged by the Germans, September 11-14, 1870, but was transferred from France to Germany along with part of the department of Moselle, on the conclusion of peace, May 10, 1871. Pop. (1874) 3047, including 650 soldiers.

Bitter Ash, or **Bitter Wood**, the common name in Jamaica for *Quassia* (q. v.).

Bitter Cucumber, or **Bitter Apple** (*Citrullus [Cucumis] Colocynthis*), supposed to be the *wild vine* or *wild gourd* of the Old Testament (2 Kings iv. 39). The fruit furnishes the drastic hydragogue cathartic known as Colocynth. Two kinds are known—*Pealed Colocynth*, from Smyrna, Constantinople, Alexandria, Italy, France, and Spain; and *Mogadore* or *Unpealed Colocynth*, which is obtained from Mogadore. The first is the best, and the kind generally employed in medicine (Bentley).

Bitt'ern (*Botaurus*), a genus of *Grallatorial* or Wading birds, included in the Heron family, *Ardeide*. These birds differ from the herons in building on the ground, and among reeds and in swamps, in which they lie concealed during the day. The plumage of the neck is of a detached and loose character.

and can be erected along with the other feathers at will. The back of the neck is bare, or invested by a meagre covering only.

Common Bittern.

The toes are very long, the middle toe especially being much elongated. They are nocturnal in habits, and feed and fly abroad during the night. The cry is sharp, harsh, and of a dismal character. The common B. (*Botaurus stellaris*) is the familiar species. The head is coloured greenish-black; the body plumage being yellowish in colour, mottled with black. It was formerly more abundant than it now is, owing to the drainage of marshy districts. The eggs number 4 or 5, and the young remain in the nest until they are fledged. The B. is a voracious bird, feeding on fishes and on other birds. It is distributed over the Old World. In summer it may be found in N. Europe and Siberia, and in winter it occurs in India, China, and S. Africa. The little B. (*Botaurus minutus*) is less common in Britain, and averages about 13 inches in length. The American B. (*B. Centigossus*) is found in N. America, but has occasionally been found in Britain. Its head is reddish-brown, and its colours are darker than the common British species. The *B. exilis*, or least B., is another N. American species of small size. The Australian B. (*B. Australis*) resembles its British neighbours in habits. The upper parts and head are of a purplish-brown colour; the wings being yellowish-brown or buff; and the throat, breast, and belly being brown with buff markings.

Little Bittern.

Bittern is the name given to the liquor which remains after most of the common salt has been separated by evaporation and crystallisation from sea-water or the water of saline springs. It consists chiefly of a solution of chlorides and sulphates of the bases, magnesium, sodium, and calcium, and also contains minute quantities of bromine and iodine.

In the south of France and elsewhere the extraction of the salts and bromine from B. is carried out on a large scale.

Bitter Orange. See ORANGE.

Bitters, a popular medicine extensively used as a tonic and carminative. B. are prepared by infusing in water some vegetable substance containing a bitter principle, and afterwards straining the infusion. The strained infusion alone should be used. To this infusion some rectified spirit should be added, to prevent the B. becoming putrid. A good proportion is one of spirit to two of water. This will keep for any length of time, and can be diluted when required for use. B. may be prepared from any bitter vegetable substance, such as gentian, bogbean, quassia, chiretta, willow (*salix*), centaury, Columba root, &c. B. are greatly improved by containing some aromatic substances, such as ginger, cinnamon, cassia, or pepper. Some substances contain aromatic properties in addition to bitter principles, and in consequence are held in high esteem for making B. To this class belong angelica and angostura or Cusparia bark. Care must be taken to avoid all plants containing poisonous ingredients, as strychnine bark. B. are best taken before meals, and tend to improve the appetite, promote digestion, and give tone to the whole system. B. are more agreeable, and of more medicinal virtue, when combined with aromatics and carminatives.

Bitter-Sweet, or **Nightshade** (*Solanum Dulcamara*), a plant of hedges and thickets found in moist situations all over Europe, except in the extreme N. In Russian Asia there occurs a variety, or a closely allied species. It is found generally over England and Scotland, though rarer in Scotland. The ovate

red berries are the cause of frequent poisonings, especially of children, who are tempted by their appearance to eat them. The leafless twigs are used as a diaphoretic and diuretic, and as a remedy in skin diseases.

Bitts, in shipbuilding, strong cylindrical pieces of wood or iron about 18 inches high, firmly fixed to the deck for the purpose of securing ropes. In modern ships iron bitts are so constructed as to serve as ventilators for the hold.

Bitumen. Under this name are included a series of substances which differ widely in their physical characteristics, but all of which have a common origin and gradually merge into each other. The bituminous series ranges from the volatile, clear, limpid, hydrocarbon naphtha through petroleum and the thick viscid naphtha to the black, hard, lustrous and glassy asphalt, the series of changes being produced by oxidation and exposure. As the name asphalt is generally applied to a limestone rock strongly impregnated with B., the term B. might properly be reserved for the varieties comparatively free from earthy matter which are employed for making varnishes, such as black Japan varnish, &c. See ASPHALT.

Bituminous Coal, a name given to such kinds of coal as contain a large quantity of organic, volatile, or resinous matters, and which consequently burn brightly, and yield in distillation large quantities of pure gas. They are chiefly used for the latter purpose.

Bituminous Limestones. This term denotes limestones which contain bituminous and resinous matters derived from the decay of organic matter, chiefly of plant kind.

Bituminous Shales, clay rocks occurring in the true coal measures, and which, when mixed with ordinary coal, may burn, owing to the amount of bituminous matters they contain.

These shales, however, even after combustion retain their form, and do not fall to ashes after the fashion of pure coals.

Bitzias, Albert, a celebrated Swiss writer of folk-lore, better known by his pseudonym of Jeremias Gotthelf, born at Morat, Freiburg, 4th October 1797. He was educated for the Church, and was pastor of Lützelflüh, Emmenthal, Bern, from 1832 to his death, 22d October 1854. His first work, *Bauernspiegel* ('The Mirror of Peasants,' Burgdorf, 1836; 3d ed. Berl. 1850), established his reputation. His *Leiden und Freuden eines Schulmeisters* ('Sorrrows and Joys of a Schoolmaster,' 4 vols. Bern, 1838; Berl. 1848-49); *Dursli, der Brantwein-säufer* ('Dursli, the Brandy-Drinker,' Burgd. 1839); *Bilder und Sagen aus der Schweiz* ('Scenes and Legends from Switzerland,' 6 vols. Soloth. 1842-46); *Eraählungen und Bilder aus dem Volksleben der Schweiz* ('Stories and Pictures of Popular Life in Switzerland,' 5 vols. Berl. 1852-55), are all admirable for their fine realism and their healthy morality. A collected edition of B.'s works, in 24 vols., was published at Berlin in 1855-58 (2d ed. 1861). See Manuel, *B. sein Leben und seine Schriften* (Berl. 1857).

Bivalve, the name applied to such molluscous animals as possess shells, which consist of two pieces or 'valves.' Each half of the shell is thus termed a 'valve.' This name, whilst convenient for popular use, is apt to be very misleading in zoology, since there are two groups of *Mollusca* which each possess B. shells, but which in respect of their internal structure and relations are very widely different. These classes are the *Brachiopoda* (q. v.) and *Lamellibranchiata*; the former class being represented by the 'lamp-shells' (*Terebratula*, *Lingula*, &c.), whilst the latter class contains the more familiar oysters, mussels, cockles. The *Lamellibranchiata* are admittedly of higher organisation in most points than the *Brachiopoda*. The shells differ widely, however, in external characters. Thus in the *Brachiopoda*, the valves are placed dorsally and ventrally; in the *Lamellibranchiata* they lie side by side or laterally. In the former the valves are opened and shut by muscles; in the latter, they are shut by muscles but opened by the action of an elastic ligament. The *Brachiopod* shell is equilateral, but inequivalve; the *Lamellibranchiate* shell is inequilateral and equivalve. In microscopic structure the shell of the *Brachiopod* is seen to be made up of numerous flattened prisms, arranged parallel to one another, and at a very acute angle with the shell surfaces; whilst the shell structure itself is perforated by a system

of canals continuous with processes of the *Mantle* (q. v.) which secrete the shell. The Lamellibranchiate shells want this characteristic structure.

The prominent point near which the hinge (formed usually of tooth-like processes fitting into sockets) is situated is termed the *umbo* or *beak*. This beak is placed on the *dorsal* or upper surface of the shell, and points towards the *mouth* or *anterior* border of the shell; whilst the opposite borders are respectively termed *ventral* and *posterior*. Internally, the living shell is lined by the *mantle*, the line along which the mantle is attached being termed the *pallial* line. See also MANTLE, MOLLUSCA, SHELL, &c.

Bivouac (Fr. originally *bivac*, from Ger. *beiwache*, 'bywatch'), a term in the military art introduced during the Thirty Years' War, signifying—(1) the encampment of a whole army during the night in the open air in expectation of a surprise or attack when in the vicinity of the enemy; and (2) any encampment for the night without tents. To secure rapidity of movement, the French revolutionary armies encamped regularly *en B.*, a practice never generally adopted, and now resorted to only in cases of absolute necessity.

Bixa (*B. Orellana*), the name given by the Indians of Darien to a plant from the reddish pulp surrounding whose seeds is produced the Anatto or Anatto (q. v.), used to colour chocolate, cheese, and butter.

Bixa-cos, or **Flacourtiaceæ**, the Anatto order (see BIXA), contains about 96 species, almost entirely confined to the warm parts of the W. Indies and Africa. Some of the plants, on account of their feeble astringency and bitterness, have been used as stomachics.

Biziura. See MUSK DUCK.

Björnson, Björnsterne, a distinguished Norwegian novelist and dramatist, was born at Kvikne, Oesterdal, December 8, 1832, entered the University of Christiania in 1852, and produced his first drama, *Valburg*, while still a student. Dissatisfied with the state of the theatre at Christiania, he withdrew his play from the managers before they put it on the stage, and devoted himself for a time to vigorous dramatic criticism, by which he did a great deal to improve the national stage of Norway. In 1856 B. went to Copenhagen, where he wrote the greatest part of *Synnöve Solbakken*, a novel which placed him in the foremost rank of Scandinavian writers, and may be said to have begun a new era in the literary life of Norway. From Copenhagen he returned to his native country, where he was for some years manager of the theatre at Bergen, and later of that at Christiania. He edited for a short time, at Christiania, the *Aften-bladet*, one of the leading Norwegian journals. Other novels, each of striking merit, published by B., are *Arne* (1858, translated into English 1866), *A Blithe Boy* (1860), *The Fisher Girl* (1868). They are all vivid pictures of peasant life in Norway. Among B.'s dramas are *Between the Battles*, *Hulda*, *King Sigurd*, and *Mary Stuart in England*.

Björnstjerne, Magnus Fredrik Ferdinand, Count, born 10th October 1779, at Dresden, where his father was then secretary to the Swedish legation, was educated in Germany, and entered the Swedish army in 1793, serving as captain in the Finland war. In 1813 he followed the Crown Prince (Bernadotte) to Stralsund; afterwards fought in the battles of Grossbeeren (23d August, against Oudinot), Dennewitz (6th September, against Ney), and Leipzig; and arranged the capitulation of Lübeck with Lallemand, and the cession of Maestricht. After the Holstein war with Christian Ferdinand of Denmark, B. terminated the Norwegian campaign by the treaty of Moss. He was created a count, and acted as ambassador at London for nearly twenty years. He died at Stockholm, 6th October 1847. B. wrote on political subjects, such as public credit, universal suffrage, and also on Hindoo religion and philosophy. *Engelska Statskrunden* (Stockh. 1833), and *Grunder för Representationens Möjliga Ombyggnad och Förenklighet* (Stockh. 1835), and *Det Brittiska Riket i Ostindien* (Stockh. 1839), are among his chief works. His *Anteckningar* ('Commentaries,' 2 vols. Stockh. 1851) are particularly interesting as contributions to the history of the Napoleonic struggle.

Black, though popularly spoken of as a colour, is really an effect produced by the extinction of all colour; that is, a purely B. surface absorbs all the rays of light which fall on it. B. is

produced when all the three primary colours are mixed in unequal proportions, although in theory equally mixed they should produce a white effect. B., in the symbolism of mediæval art, indicated evil, falsehood, and error, and among modern nations it is regarded as appropriate for the garb of grief and mourning. The principal B. pigments used by painters are ivory-B., bone-B., lamp-B., and beech-B. Brunswick-B. is used for covering cast-iron work, such as grate-fronts, fenders, &c. Blacks in dyeing are produced from logwood, sapan wood, and madder, with strong iron mordants, and there are several aniline blacks.

Black, John, an eminent journalist in the early part of the 19th c., was born in Berwickshire in 1783, his father being a shepherd in the Lammermoors, near Dunse. For some time he was employed in a writer's office, first in Dunse, and then in Edinburgh. After having devoted much time in that city to self-improvement, and especially to the acquisition of ancient and modern languages, he went to London about 1810, and became parliamentary reporter on the *Morning Chronicle*, and subsequently its editor. Under him the *Chronicle* became a most successful journal, and was celebrated for the fearlessness of the opinions it expressed. Retiring in 1844, he lived quietly at Birling in Kent, and died there, June 15, 1855. B. published a *Life of Tasso* (Edinb. 2 vols. 1810), and translated several works from French, Italian, and German; among others, the lectures of the Schlegels on dramatic art, and on the history of ancient and modern literature. He was a shrewd, cultured, and kindly man, and was considered in his time as a model newspaper editor.

Black, Joseph, author of the theory of 'latent heat,' was the son of a Scotch-Irish merchant, and was born at Bordeaux in 1728. He was sent to Belfast for his education at twelve years of age, entered the University of Glasgow when eighteen, and studied chemistry under Dr Cullen. In 1751, he proceeded to Edinburgh to complete his medical curriculum, and took his degree in 1754. In the following year he enlarged the Latin thesis which he read on that occasion, and published it as *Experiments on Magnesia, Quicklime, and other Alkaline Substances*. This paper excited great attention, as it explained the manner in which lime-water acted in alleviating the excruciating pains of stone and gravel. In 1756 B. succeeded Cullen in the chair of Anatomy and Chemistry in Glasgow; and between 1759 and 1763 he evolved his famous theory of 'latent heat.' In 1766 B. again succeeded Cullen as Professor of Chemistry in Edinburgh University. Here his class was always crowded; he paid great attention to the perspicuity of his lectures; but he did nothing to widen further the boundaries of chemical science. B. died November 26, 1799, at the age of seventy-one. His lectures were published (Edinb. 2 vols. 4to) in 1803, with a biographical preface by Professor Robison.

Black, William, a modern English novelist, was born at Glasgow in 1841, and was educated at various private schools. For several years he was exclusively a journalist, and though well known in his profession, could hardly be said to be even the shadow of a name to any considerable portion of the outside public. In 1868, however, appeared his novel *In Silk Attire*, which betokened the possession of exquisite talent, but did not forcibly arrest the attention of the public. There was no mistake, however, about the reception of *A Daughter of Helth* (1871, 11th ed. 1875), which at once placed its author in the front rank of living artists; and since then almost every book he has written, of which the best are *The Strange Adventures of a Phaeton* (1872), *The Princess of Thule* (1873), *The Maid of Killena* (1874), *Madcap Violet* (1876), and *MacLeod of Dare* (1878), has confirmed and deepened the impression he made in 1871. Subtle, delicate, and pure in his conception of character, B. is also incomparably graceful and chaste in style, everywhere showing some of the finest qualities of the poet and artist.

Black Alder Bark, or **Winter Berry**, obtained from *Prinos verticillatus* (natural order, *Aquifoliaceæ*). A decoction is used in the United States as a tonic and astringent.

Black Art. See MAGIC.

Black Assize, the name applied to the assize held in the old town-hall of Oxford from 4th to 6th July 1577, because at its close a terrible pestilence broke out, which by August 12th had carried off 510 persons, among whom were the chief digni-

laries who sat on the assize, and most of the jury. The malady, regarded at the time as a judgment from God on the cruelty of the sentence passed on a bookbinder named Rowland Jencks, accused of sedition, may with more propriety be attributed to the filth of the adjoining gaol.

Blackband Ironstone, an iron ore existing in large quantities in the S.W. of Scotland, and discovered about the year 1800 by the late Mr Musket. It is a carbonate of iron, mixed with clay and sand, and coloured by carbonaceous matter, which forms part of the fuel used in reducing it. It generally contains from 20 to 30 per cent. of metallic iron. Similar ore has since been discovered in Westphalia.

Black Beetle. SEE BLAPS and COCKROACH.

Blackberry. See BRAMBLE.

Blackbird, or **Merle** (*Turdus merula* or *Merula vulgaris*), a well-known species of Insectorial or Perching birds, included in the sub-family of *Turdina* or True Thrushes. The male bird is coloured a uniform deep black, the legs and claws being dusky brown. The bill, eyelids, and mouth are deep orange. The upper plumage of the female is of a dull brown hue, the chin, throat, and upper part of the breast being coloured of a lighter brown; whilst the belly, sides, and under tail-coverts are darker brown. Varieties of the common B. are occasionally met with of a pied or whitish colour. These birds pair early in spring, and are frequently said to pair for life, the male and female being seen together during winter. The nest is built amid thick shrubs, and the eggs, four or five in number, are of a bluish-green colour, spotted with reddish-brown, or they may be destitute of spots entirely. This bird feeds on insects, larvæ, worms, snails, fruits, and seeds. It occurs over Britain and Europe, N. Africa, and the Azores. The cry is cheerful, and these birds appear also to possess considerable imitative powers.

The *Turdus philopterus* of Asia is nearly related to the common B. The ring-ouzel (*T. torquatus*), so named from the possession of a white stripe across the breast, is sometimes known as the ring-B.

Black-Boy Gum, or the red resin of New Holland, is obtained from a Grass Tree (q. v.).—*Xanthorrhoea Hastile*. The yellow or Botany Bay resin is probably the product of *X. arborea*. Both resins exude spontaneously from the trunks of the trees, and have a fragrant balsamic odour.

Black Bully, or **Bally-Tree Wood** (*Achras sapota*), a S. American tree, belonging to the natural order *Sapotaceæ*, the wood of which is greenish and very hard, and is used for ship-building, &c. Its bark is febrifugal, and its seeds diuretic and aperient.

Blackburn, a flourishing town of Lancashire, on the Darwen, a branch of the Ribble, 9 miles S.E. of Preston, and 24 N.N.W. of Manchester by railway. It is one of the chief seats of the cotton manufacture, and produces calico, muslin, &c., to the annual value of £8,000,000, having some 110 mills, with 1,500,000 spindles, and employing about 36,000 persons of both sexes. As early as the 17th c. it was noted for the manufacture of what were called *B. checks* and *B. greys*, kinds of linsey-woolsey, and in later times it has been associated with many improvements in the cotton manufacture, chief of which was the invention (1767) of the spinning-jenny by Hargraves, who was born in the vicinity. Of late years the town has greatly improved, and has now many fine buildings, the most notable being the parish church of St Mary's, the Congregational Church, the Town-hall, the Exchange, and the Public Free Library (which contains 20,000 volumes). There are numerous charitable and educational establishments, including a free grammar school, founded by Queen Elizabeth in 1567. On the skirts of the town is the *Corporation Park*, with an area of some 50 acres. Besides having excellent railway communication, B. is connected with Leeds and Liverpool by means of a canal. The town is represented by two members of Parliament. Pop. (1871) of municipal borough, 76,339; of parliamentary borough, 82,928. The district in which B. lies, anciently covered with a vast forest, is now exceedingly populous, and abounds in coal and lime. See Abram's *Hist. of B.* (Blackb. 1878).

Blackcap (*Curruca atricapilla*), an Insectorial or Perching bird belonging to the sub-family of the *Sylvina* or True Warblers, and so named from the jet-black head of the male, which

is covered by feathers, giving the head a slightly tufted or hooded appearance. The females exceed the males in size, and their heads are rust coloured. The back, wings, and tail in both sexes are of an ashy-brown colour; the throat and breast being grey, and the under parts white. These birds are migratory, and arrive in Britain about the middle of April. They fly northwards in summer, even to Lapland, but appear to be permanent residents in Southern Europe. The B. is celebrated for its song, which is hardly inferior to that of the nightingale. It readily survives and sings in confinement. The male assists in incubation, and may sing when sitting on the eggs. The nest is fixed in a low bush, the eggs being five in number, coloured pale greenish-white and spotted with brown. The garden warbler (*Curruca hortensis*), the whitethroat (*C. cinerea*), and lesser whitethroat (*C. sylvicola*) are included in the same genus with this bird.

Blackcap.

Blackcap Titmouse, a name sometimes given to the Marsh T. of Britain, and also to the 'Chickadee' of N. America. (See TITMOUSE.)

Black Chalk, a variety of Clay-Slate (q. v.) containing carbon, and used for drawing and painting purposes. It is found in various places; for instance, the island of Islay, Caernarvon, Spain.

Blackcock, or **Black Grouse** (*Tetrao tetrix*), a species of Rasorial birds, included in the *Tetraonida* or Grouse family. The male birds possess a plumage of fine glossy black, with white on the lower wing-coverts, the under tail-coverts, and the bases of the secondary quills of the wing. The tail has a peculiar form, the four outer feathers of each side being long, and curved outwards at their tips, so as to give a double-hooked appearance to the tail. In the females the tail is simple and straight, the colour of the females being pale or rusty brown marked with brown hues. The shanks are feathered. These birds occur in moors, chiefly in Scotland, and particularly in mountainous districts. They are also found on the European continent, on the Alps and Apennines, and in Russia and Siberia. They feed on the twigs of heath, on the leaves and shoots of plants, and on berries. They are gregarious; the sexes in winter, however, keeping in separate flocks. They are polygamous in habits, and pair in spring, but the males take no part in the incubation of the young. The young males resemble the females in the colour of their plumage. The eggs number six or eight, and are of yellowish white colour, spotted with brown, and are each about two inches in length. The flesh is highly esteemed, these birds being considered as typical British gamebirds. Hybrids between these birds and other grouse, or even pheasants, are said to be occasionally produced, although the exact nature of these breeds has not been determined. The average weight of the male B. is 4 lbs., and that of the female about 2 or 2½ lbs.

Blackcock.

Black Grouse (female). The young males resemble the females in the colour of their plumage. The eggs number six or eight, and are of yellowish white colour, spotted with brown, and are each about two inches in length. The flesh is highly esteemed, these birds being considered as typical British gamebirds. Hybrids between these birds and other grouse, or even pheasants, are said to be occasionally produced, although the exact nature of these breeds has not been determined. The average weight of the male B. is 4 lbs., and that of the female about 2 or 2½ lbs.

Black Grouse (female).

Black Cummin of the Scriptures (Isa. xxvii. 25-27), believed to be the seeds of *Nigella arvensis*, natural order *Dilleniaceæ*, or of a closely allied species, the seeds of which are used by the Afghans for flavouring curries.

Black Dammar. See CANARIUM.

Black Death is the name given to the unusually severe epidemics of Oriental plague which visited Europe in the 14th c. Before the B. D. appeared on the coasts of the Mediterranean in 1347, it is said to have ravaged China, India, and Egypt. From Constantinople it spread through Southern and Central Europe and into England in 1348. It may be observed that the battles of Cressy and Neville's Cross in 1346 had relieved England from exhausting wars. Through Sweden and Poland it reached Russia in 1351. In some places—e.g., Avignon in 1360 (where it was observed by the heroic physician De Chauliac), and England in 1361 and 1369—it reappeared. Even Iceland was attacked, and the disappearance of the Norwegian settlements in Greenland has been attributed to this cause. Scotland suffered in 1349, and according to Wyntoun was—

‘Off sa gret wyolens,
That, it was seyd, off lyfand men,
The thyrd part it dystroyd then.’

(See also Macpherson's *Notes* on the passage in the *Cronykil*, B. 8. ch. xlii.) In Europe the B. D. originally appeared in the form of a carbuncular affection of the lungs, accompanied by ardent fever, which carried off the patient in periods varying from twelve hours to three days, the shortest period being that perhaps in Dorsetshire. Latterly, the symptoms described by the Byzantine writers also appeared in W. Europe; the glandular typhus and putrid inflammation of the lungs showing itself in buboes on the arms and thighs (the *gavoccio* of La Mortalega Grande in Italy), black spots or *petechie* all over the person, coma, and sometimes intense thirst. It has been conjectured that the resulting mortality in Europe, as a whole, amounted to 25 per cent., while in particular countries it is said to have varied greatly. Thus in Italy it rose to 50, while in France it only reached 10 per cent. In England, Wood states (*History of Oxford University*, 1674) that 90 per cent. perished. This is of course incredible—(see also Stowe's *Survey*, p. 478)—but we know that the price of labour rose so high that Parliament attempted to compel labour at certain prices (37 Edw. III. c. 3).

The B. D. has generally been connected with the great atmospheric disturbances, variously shown in droughts, famines, &c., which took their origin in the Chinese earthquakes of 1333 and following years. The College of Physicians in Paris believed it to have arisen in the form of a mist from the Red Sea, which, again, was caused by a disorder in the heavenly bodies. A more general opinion of the time referred it to the conjunction in the sign of Aquarius of the planets Jupiter, Mars, and Saturn; and the physician Santa Sofia of Padua endeavours to distinguish between the epidemic which is due to general atmospheric conditions connected with astral disturbances, and the enemy which is due to local telluric conditions. The hypothesis of a cosmic alteration of the air is not very intelligible. On the other hand, simple contagion (although it acted extensively without contact) cannot account for the progress of the B. D. We must suppose that, from a variety of causes—e.g., the previous plagues (of which at least six had appeared in the first half of the century), the famines, &c.—a predisposition had been created in many places; and we know that the domestic habits of the age, and the absence of public sanitary regulations, indefinitely multiplied all the risks with which later times are familiar. Purgation, bleeding, and the burning of odorous wood were among the chief remedies employed by the doctors, some of whom, as Gentilis of Foligno, died of the plague. Generally, however, both priests and doctors fled before the B. D., only some of the charitable orders doing their duty. Popularly, smelling flowers was thought to be a protection. The town of Reggio distinguished itself by its efforts to establish a system of separating the diseased from the healthy; but it was not till long after this that lazarettos were established in Italy. The Catholic Church is said to have gained much money and land, intrusted by desperate owners to its custody. The B. D. also revived in Hungary the Brotherhood of the Flagellants, or Brethren of the Cross, who had first appeared in Italy about 1260, under the name of *Devoti*. Men, women, and children, in great crowds, went roaming through the chief towns of Europe without any more definite object than that of flogging themselves for thirty-four days, or until they should obtain divine grace. These brethren had masters, rules, and a fund. Their pilgrimages, prohibited by the Pope (as also in Germany and France), only resulted in spreading the con-

tagion, which by self-mortification they hoped to escape. The disgraceful *Judenschlacht* (or slaughter of the Jews), in Switzerland, Germany, and elsewhere, was also an indirect effect of the B. D. The Jews were accused of poisoning public wells, but the only evidence in support of the charge was obtained by torture, and was therefore worthless. 12,000 Jews were, however, put to death in Mainz alone. (See Boccaccio, *Decamerone*; Hecker's *Epidemics of the Middle Ages*.)

There appeared in Ireland in 1866-67 an extensive epidemic, distinguished from the more common form of cerebral meningitis by the presence of purple blotches, or patches of effused and dissolved hæmatin, and resembling in other symptoms what has been described above. It was also called the B. D. (See Malpother's 'Malignant Purple Fever in Ireland,' read to the Epidemiological Society of Ireland, July 1867.)

Black-faced Sheep. The range over which these sheep extend, and upon which no other sheep could thrive so well, is a very wide one, extending from Derbyshire on the S. through the counties of Cumberland, Lancashire, Westmoreland, and Yorkshire, to all the Scottish mountains, and they have even penetrated into Orkney and Shetland. The B. S. are very hardy, and are now beginning to supplant the Cheviots on their own hills. They feed on scanty fare, their wool, naturally coarse, has by careful selection been much fined down of late years, and the mutton of a three or four year old B. wether is unsurpassable. The shearing rams bring high prices, as much as £65 having been given for one. Their horns are beautifully curled round their handsome faces, and their general aspect is gay. See *SHEEP*.

Black-Fish (*Centrolophus pompius* or *moris*), a genus of Teleostean fishes belonging to the family *Scomberidae* or mackerel family, and occurring rarely on the S. coasts of Britain, but more commonly in the Mediterranean Sea, and on the W. coasts of Europe. This fish may attain a length of from 20, to 30 inches, and may weigh as much as 14 lbs. The body is covered with small or minute scales, and one long, low dorsal fin exists. The body is of a black colour, the fins being darkest in hue. No Air-Bladder (q. v.) exists, and the skin is tough. The flesh is said to be very palatable.

Black Flux consists of an intimate mixture of charcoal and carbonate of potash, obtained by calcining *cream of tartar* or bitartrate of potash in a closed crucible. When compounds of easily reduced metals are heated with the flux, the metal becomes separated. B. F. is, therefore, a useful chemical re-agent.

Black Forest (the Ger. *Schwarzwald*, and the *Silva Marcidula* of the Romans), so called from the sombre foliage of its pine-trees, a mountain-chain chiefly in Baden, but also partly in Württemberg, which runs close to, and almost parallel with, the Rhine, from S.S.W. to N.N.E., and is considered by many a prolongation of the Jura range. The rivers rising in it are the Danube, Neckar, Kinzig, Murg, Enz, &c., most of which flow westward into the Rhine. The Feldberg, under 5000 feet, is the highest summit of the chain, of which the greatest length is about 80 miles, and the greatest breadth about 37 miles. The core consists of granite and gneiss, flanked by porphyry, sandstone occurring at the base and along the loftiest ridges. The most beautiful valley is the Murgthal. Among its mineral treasures are silver, copper, lead, and cobalt, and the mineral waters of Baden-Baden have long been celebrated. On the slopes facing the Rhine vineyards and orchards are profitably cultivated; but the rearing of cattle and the manufacture of fancy articles of wood, as clocks, music-boxes, &c., are the principal industries. The Hölle Strasse ('Hell Pass') and the Kniebis Strasse are associated with stirring incidents in the wars of the French Revolution. The inhabitants are simple and quaint in their ways of life, but pure in morals, and very intelligent. A halo of legendary romance and picturesque superstition still invests the region with an indescribable charm.

Blackheath, an extensive common in the county of Kent, 5 miles E.S.E. of London, formerly a noted resort of highway-men, now a favourite place for holiday parties in summer. B. was the rendezvous of the Kentish men in Wat Tyler's rebellion in 1381, and in Jack Cade's in 1450, and has been the scene of many other interesting historical events. Morden College, founded in 1695 for the support of decayed merchants, the free grammar school, erected by Abraham Colfe in 1652, and the

village of B., a station on the N. Kent Railway, and chiefly composed of handsome villas, all stand on the Common.

Black Hell'ebore. See HELLEBORE.

Black Hole, the place in which soldiers guilty of minor breaches of discipline are confined, and hence applied to a police cell, or any place where offenders are temporarily detained. The name has been distinctively applied to a small chamber, not 20 feet square, in the old fort of Calcutta, into which, after the surrender of the place to Surajah Dowlah, Nabob of Bengal, 21st June 1756, there were thrust 146 persons at the point of the sword, 'in one of the hottest nights of the most sultry season of the year.' Only twenty-three were found alive in the morning, and of these, says Macaulay, the ghastly forms could not have been recognised by their own mothers.

Blackie, John Stuart, Professor of Greek in the University of Edinburgh, was born at Glasgow in 1809. His university education, which included a three years' theological course, was received partly at Aberdeen and partly at Edinburgh. He went to Germany in 1829, and afterwards to Rome, and during this visit he devoted himself to the study of German and Italian literature. He passed advocate at the Scottish bar in 1834, but soon retired from the practice of his profession, and became engrossed in literary work, especially in contributing to magazines and reviews. In 1841, B. was appointed Professor of Humanity in Marischal College, Aberdeen, where he remained for eleven years, when he was elected to the chair of Greek in Edinburgh University. During his professorial career, B. has been instant in advocating, by pen and by tongue, the radical reform of the Scottish universities and higher-class public schools; and by his vigorous and effective eloquence he has acquired wide popularity as a public lecturer. In 1874, B. was made convener of the University Council Committee for promoting the foundation of a Celtic chair in Edinburgh University, and advocated the scheme throughout the country, with such enthusiasm and success, that at the close of 1879 the subscriptions amounted to £12,000. His works, of which the following are the chief, are very numerous, and evince the versatility and activity of his mind, as well as the range and power of his scholarship. *Goethe's Faust*, in English verse (1834); *The Lyrical Dramas of Eschylus*, 2 vols. in English verse (1850); *The Pronunciation of Greek* (1852); *Lays and Legends of Ancient Greece* (1857); *Three Discourses on Beauty* (1858); *Lyrical Poems* (1860); *Homer and the Iliad*, 4 vols. (the second and third containing the *Iliad* in English verse) (1866); *Musa Burschicosa* (1869); *War Songs of the Germans* (1870); *Lays of the Highlands and Islands* (1872); *Self-Culture* (1873); *Horæ Hellenicæ* (1874); and *The Language and Literature of the Scottish Highlands* (1877).

Black'ing, as the name implies, is a paste used for polishing black leather, especially the upper leather and the edges of the soles of boots and shoes. Different manufacturers put different substances into the paste with which they supply the market, but the main ingredients of the best B. are animal charcoal, otherwise called Bone-black (q. v.), sperm oil, raw sugar, and a slight infusion of sulphuric acid, which, by converting a large portion of the lime in the animal charcoal into sulphate of lime, thickens the mixture into the requisite pasty consistence. This compound, while it is still warm, is then diluted slightly with vinegar, and the B. is ready to be bottled for the market.

Black'lead, Plumba'go, or Graph'ite, one of the forms in which Carbon (q. v.) occurs native. B. has a metallic, lead-like lustre, and a greasy feel, and is found in Cumberland and other parts of Britain, in Ceylon, Siberia, Bohemia, Bavaria, &c., as well as in many localities of the New World. It occurs in beds or veins in granite, gneiss, and other rocks of early formation. The B. of Borrowdale in Cumberland is a fine-grained variety, and in its purest form contains 88 per cent. of carbon, the remaining impurities being hydrated oxides of iron and manganese, silica, and alumina; it is much valued for the manufacture of lead-pencils. B. is also employed for making crucibles, muffles for counteracting friction, and for giving a polished surface to cast-iron. It is a good conductor of electricity.

Black Letter, the name familiarly applied in this country to the various forms of what is generally known on the Continent as the Gothic letter, which about the close of the 12th c. began to supersede the Roman letter in the writings of Western

Europe. About the middle of the 14th c., B. was in common use in England in the production of MS. works; and when printing was invented a century later, both the block books and those printed with movable types were naturally in this character, and imitated manuscript so perfectly, that it was difficult to discriminate between the printed and the written. The Mainz Bible, known also as the Mazarine Bible, from a copy having been found about the middle of the last century in the library of Cardinal Mazarin in Paris, is an exquisite imitation of manuscript. Books printed before the beginning of the 16th c. are mostly in B. L., though Italy furnishes some exceptions,—e.g., the editions of Pliny's *Historia Naturalis*, printed at Venice by Spira (1469) and by Jenson (1472); but after that date the Roman character came into favour, and in a short period supplanted the Gothic for general purposes. B.-L. books are highly prized by the book-hunter, from their age and consequent rarity. In Germany the Gothic character is still in use, but the Roman character is occasionally employed, especially in printing works in some departments of science, and its use seems likely to become more general. See Hallam's *Literature of Europe*, and Dibdin's *Typographical Antiquities* (4 vols. 1810-19); his *Bibliomania* (1811), and his *Biographical, Antiquarian, and Pictorial Tour in France and Germany* (1821).

Black List, the name familiarly given to printed lists of bankruptcies, bills of sale, records of protests of bills, and other matters affecting the credit of individuals and firms. These are now extensively circulated among commercial men, bankers, and shopkeepers. The legality of publishing such information was at one time disputed, but it has been decided to be lawful to do so, the lists being merely extracts from public registers.

Blacklock, Thomas, D.D., born at Annan in 1721, a preacher and poet, and in both respects somewhat of a phenomenon, being blind from the age of six months. His parents were poor, but conspicuous talent found him a patron, and he studied divinity at Edinburgh University, where he remained till 1745. In the following year he published a volume of pieces in verse at Glasgow (2d ed. Edinb. 1754). In 1764 he finally settled in Edinburgh, where, on a small annuity received in lieu of a church appointment, he cultivated literature till his death, 7th July 1791. The degree of D.D. was received from Marischal College, Aberdeen. B.'s poetry is only mediocre, but he was the friend of Hume and Burns; and it was his appreciative letter in 1786 that prevented the latter from leaving the country. A collected edition of his works, with a biographical sketch, was published by Mackenzie (Edinb. 1793). See also Dr Robert Anderson's memoir in his edition of the British Poets.

Black-Mail, an unauthorised tax formerly levied in the Highlands and on the Borders by certain men who undertook to protect those paying it against the pillage of their cattle, and submitted to in consequence of the impotence of the law. The leviers of this tribute were sometimes themselves caterans or robbers. However, cattle-lifting, so far from being considered dishonourable, was regarded rather as a mark of spirit and enterprise, and the leviers of B.-M. could in many cases boast of ancient blood, and of distinguished and powerful kindred. The most famous specimen of the class was Rob Roy (q. v.). In the *Border Minstrelsy*, Jamie Telfer, who had been plundered of his cattle by the Captain of Bewcastle, is answered by a chief of the Elliots, to whom he had applied for assistance to recover them, 'Gae seek your succour where ye paid B.-M.,' referring to the head of the Scotts, the laird of Buccleuch. The levier of B.-M., when informed of a lifting, either recovered the cattle or paid an equivalent. In *Waverley*, Sir Walter Scott, with his usual graphic power, narrates a case of *harrying* or *hershing*, and the recovery of the cattle. The levying of B.-M. in the Highlands ceased after the suppression of the rebellion of 1745, the law thenceforth asserting its supremacy.

Blackmore, Sir Richard, a poet and physician at the courts of William III. and Anne, was born in Wiltshire about 1650. He was educated at Westminster School and Oxford, and took the degree of M.D. at the university of Padua. On his return to England he settled as a physician in London, and was knighted by William III. He died 8th October 1729. B. is notorious for the manufacture of voluminous epics. His persistent dullness provoked general ridicule. Dryden accused him of writing to the 'rumbling of his coach's wheels;' Pope made him outbray all

rivals at the games in the Dunciad; and Cowper said that B. had written more absurdities than any other English author. His chief works are *Prince Arthur*, *Creation*, *The Redeemer*, *Elisa*, *King Alfred*, *The Nature of Man*, *A Satire upon Wit*, *A Paraphrase on the Book of Job*, besides a number of prose works partly professional.

Black Nightshade (*Solanum nigrum*), a plant belonging to the natural order *Atropacea*. It possesses alterative and narcotic properties. Its fruit, as well as that of *S. oleraceum*, are common potherbs in the Mauritius.

Black'pool, a town in the county of Lancaster, on the coast, to the N. of the estuary of the Ribble, 16 miles W. of Preston and 30 N. of Liverpool. It takes its name from a dark boggy pool near the old seat of the Tildesleys, at the S. end of the town. It has no trade or manufactures, but is a celebrated bathing-place, with a pier (extended 1877), splendid sands, and pure bracing air, and is easily accessible by railway. There are fine churches, hotels, libraries, newsrooms, and a theatre. Pop. (1871) 6001, with over 100,000 visitors in the course of the year.

Black Prince, the name by which Edward, Prince of Wales, eldest son of Edward III. (q. v.), is best known.

Black Rod, Usher of the, an officer of the House of Lords appointed by letters-patent. He is a Knight of the Garter, and chief gentleman-usher to the sovereign. His duties are to summon the House of Commons to attend in the House of Peers, and to take into custody any peer guilty of breach of privilege.

Black Rood of Scotland, was a casket-shaped cross of gold, of peculiar sanctity, as containing what was deemed a portion of the true cross set in an ebony figure of the Saviour. It was brought into Scotland about the year 1068, by Margaret, sister of Edgar the Atheling, who was soon after married to Malcolm Canmore. Margaret left it to her children as a sacred heirloom. It was reverently preserved in Edinburgh Castle along with the regalia and the national records, till it was carried off by Edward I. in 1291. That monarch made use of it when he exacted oaths of fealty from the territorial and ecclesiastical magnates of Scotland, who, however, despite the veneration in which the B. R. was held, hastened to break their oaths as soon as they found it convenient. The B. R., restored to Scotland at the peace of Northampton in 1328, became the prize of Sir Ralph de Neville, when he defeated and took captive David II. at the battle of Neville's Cross, in 1346. From that time till the Reformation it was suspended in the shrine of St Cuthbert in Durham Cathedral; but its after history is unknown. See Burton's *History of Scotland*, vol. ii.

Black or Euxine Sea. The earliest Greek epithet for this sea, *Axinos*, the 'inhospitable,' suggested probably by the storms to which it was subject, and the cannibalism of the Thians who dwelt on its shores, was changed into *Euxinos*, 'hospitable,' when its waters were opened to the commerce of Greece: the epithet *Kara* ('black'), given to it by the Turks, expressed their fears of the perils of navigating it, from the incidence of sudden and heavy storms, and the scarcity of convenient ports. The modern Greeks have translated the Turkish name into their own language, *Mauri* (anc. *mauros*, 'dark') *Thalassa*. The B. S. is a large inland sea, separating the southern provinces of European Russia from Asia Minor, and extending from 40° 45' to 46° 45' N. lat., and from 27° 30' to 41° 50' E. long. Its extreme length from E. to W. is fully 700 miles, and its greatest breadth 380 miles; its coast-line exceeds 2000 miles, and its area is 172,000 sq. miles. The Strait of Yenikale connects it with the Sea of Azof, and the Bosphorus, the Sea of Marmora, and the Dardanelles, with the Mediterranean. The depth of water varies from 40 to 1070 fathoms. Like other inland seas, the Euxine has no tides; but it has strong and well-defined currents, caused by the large influx from the rivers, each square mile of its surface receiving the drainage of 54 sq. miles of land. Hence the comparative freshness of its waters, the average specific gravity being 1014, as compared with that of fresh water at 1000, while that of the water of the Mediterranean is 1028. The shores of the B. S. are very varied; in some places low and sandy, in others bold and rocky. The navigation is comparatively safe, there being few islands or rocks. The principal danger is from drift-ice for a part of the year; but this

affects only a narrow fringe in the N., between Odessa and the Crimea. There are few fisheries, owing to the depth of the sea and the absence of shoals and sandbanks. Of the numerous rivers which pour their waters into this sea, the principal are the Danube, Dniester, Dnieper, Bug, Don (Sea of Azof), on the W. and N., the Kuban on the E., and the Kizil-Irmak and Sakaria on the S. Its principal ports are Varna (European Turkey), Braila, in the delta of the Danube (Rumania), Odessa, Khereson, Eupatoria, Sebastopol, Kertch, Azof (Russia), Batum, Trebizond, and Sinope (Asiatic Turkey). In ancient times its shores were the seats of several Greek colonies that carried on a great trade with the mother-country, especially in the products of the East; and it continued to be the scene of commercial enterprise and industry till the overthrow of the Byzantine empire. The Turks excluded all foreign ships from 1453 till 1774, when Russia acquired the right to trade in it; a privilege extended to Austria in 1784, and to France and Britain in 1802. At the close of the Crimean war in 1856, Russian preponderance in the B. S. was carefully guarded against by treaty; but Russia succeeded, at a conference of the contracting powers held at London in 1871, in procuring the abrogation of the restricting clauses.

Black Snake (*Coluber or Bascanian constrictor*), a species of Colubrine snake included in the *Innocuous* or harmless section of that sub-order, and found in N. America, chiefly in the United States, from Louisiana to Connecticut. It attains a length of six feet, and is coloured a glossy black. It is highly active and swift in all its movements, and climbs trees with facility. It feeds on small birds, frogs, rats, &c., and will drink milk and cream. It possesses no poison apparatus, and is said to be readily tamed.

Blackstone, Sir William, an eminent commentator on English law, was born in London, 10th July 1723, educated at the Charterhouse and at Pembroke College, Oxford, and was called to the bar in 1746. In 1749 he was made recorder of Wallingford in Berkshire. In 1753 he gave a course of law lectures at Oxford, which led to his being appointed in 1758 to the Vinerian professorship in that university. The spirit of his lectures was in accordance with the Toryism then dominant in England, and led to B. being made a Q.C., or rather K.C. Other professional honours followed. Having entered the House of Commons (1761) as member for Hindon, he was made Solicitor-General to the Queen. In 1770 he was offered, but refused, the Solicitor-Generalship of England. He was then knighted, and made a Justice of the Common Pleas. B. died 14th February 1780. Though a respectable pleader and judge, he was not sufficiently distinguished to have been long remembered in either capacity. His fame rests wholly upon his *Commentaries on the Laws of England* (1st ed. 1764). It is generally conceded that in these he has succeeded in being eminently lucid—in extracting legal principles from the load of technical language under which they lay hidden and choked; but his want of historical scholarship and his incapacity for scientific thought unfitted him for being in any high sense a philosophic critic of the national legislation.

Black Varnish. That of the Burmese is obtained from *Melanorrhæa usitatissima*, natural order *Anacardiaceæ*. It is anthelmintic. The nuts of *Semecarpus anacardium*, belonging to the same order, is also extensively employed in the manufacture of a B. V., and is the source of the marking-nut.

Black Wad, the native black oxide of Manganese (q. v.), so called by miners.

Black'wall, a suburb in the E. of London, on the N. side of the Thames, 4 miles E.S.E. of the City, with which it is connected by a railway raised on a viaduct above the streets. It contains the E. and W. India Docks, numerous shipbuilding yards and foundries, and is a favourite point of embarkation for passengers who wish to avoid the 'Pool' and Greenwich Reach.

Black Warrior, also known by its Indian name, *Tuscaloosa*, a river formed by the confluence of the Mulberry and Locust, in Alabama, U.S., flows S., and enters the Tombigbee above Demopolis. It is navigable for steamboats for 150 miles. Its basin yields several valuable minerals.

Black Watch, the name of six companies of militia, three of 100 men each under captains, and three of 70 men each under captain-lieutenants, raised chiefly among the Whig clans, the

Campbells, Frasers, Grants, and Munros, about 1730, to watch and preserve order in the Scottish Highlands. The epithet *black* was in allusion to the colour of the tartans in which the men were dressed, and the *sidier dhu* ('black soldier') was an object of fear and aversion to those clans whose chiefs favoured the claims of the Stuarts. The companies, not being connected like those of a regiment, were known as the Independent Companies of the B. W. In 1739, the Highlands being then supposed to have been pacified, the companies were incorporated as the 42d Regiment, with the Earl of Crawford and Lindesay as colonel. A dark arbitrary or fancy tartan, the now familiar 42d, was adopted for the regimental kilt and trews. The B. W. is one of the crack regiments of the British army, its most recent distinctions having been won in the Ashantee war. For an account of its earlier exploits, see Colonel David Stewart's *Sketches of the Character, Manners, &c., of the Highlanders of Scotland, with Details of the Military Service of the Highland Regiments* (Edinb. 1822).

Blackwater, the seventh largest river in Ireland, rises in the W. of Kerry, near Killarney, traverses in an easterly direction the counties of Cork and Waterford, and, after a course of 100 miles, enters the sea at Youghal harbour. It passes the towns Millstreet, Mallow, Fermoy, Lismore, and Cappoquin, flows through a well-wooded and beautiful region, abounds in salmon, and is navigable to barges for about 15 miles. B. is the name of other four rivers in Ireland, the chief of which, rising in the W. of Fermanagh, flows E. through Monaghan, and then N.E. to Lough Neagh, forming the boundary between Armagh and Tyrone. The prevalence of the name in Ireland, both in its English and Gaelic forms, is explained by Joyce (*Irish Names of Places*, 2d ser. 1875, p. 261) by the great extent of bog-land.

Blackwell, Alexander, M.D., was born in Aberdeen about the beginning of the 18th c., studied physic under Boerhaave at Leyden, where he graduated, and afterwards became a printer in London, but was thrown into prison for bankruptcy in 1734. His release was effected by his admirable wife, who, having a talent for drawing, published a *Herbal*, which was patronised by the College of Physicians. The first vol. appeared in 1737, and contained 252 plates; the second in 1739 with 248 plates. It was then published in a complete form, under the title, *A Curious Herbal, containing 500 cuts of the most useful Plants which are now used in the Practice of Physic, engraved in folio copper-plates, after drawings taken from the life by Elisabeth Blackwell*. In 1740 B. removed to Sweden, where he enjoyed court favour till 1748, when he was accused of plotting against the king and government, condemned and executed, August 9, 1749. His works, both English and Swedish, treat specially of agriculture.

Blackwell, Elizabeth, M.D., the first female that ever obtained a doctor's diploma, and at present a practitioner in New York, U.S., was born February 3, 1821, at Bristol, where her father was a sugar-refiner. The family removed to the United States in 1832; and on the death of the father at Cincinnati in 1838 she opened a boarding-school, which soon gained a wide-spread reputation. After some time, however, she resolved to become a physician, and, with this end in view, passed through her preliminary studies at Asheville and Charleston, supporting herself in the meantime by teaching music. She then studied anatomy and midwifery privately under Professor Allen and Dr Warrington of Philadelphia, having vainly sought admission as a student into more than a dozen medical schools. After strenuous efforts, she obtained admission into Geneva University, New York, in 1847, and graduated in 1849. After visiting the London and Paris hospitals for a year and a half, she returned to America, and established herself in New York in 1851. In 1857 she opened an hospital for women, over which she presided, assisted by her sister, Dr Emily B., who graduated in 1854. In 1859 she paid a second visit to England, and delivered a course of medical lectures. She has published several professional works of considerable merit.

Blackwell, Thomas, LL.D., brother of Alexander B. (q. v.), was born at Aberdeen, August 4, 1701, graduated as M.A. in the university of that city, became Professor of Greek in Marischal College in 1723, and Principal of the University in 1748. B. died at Edinburgh in February 1757. His works are *An Inquiry Into the Life and Writings of Homer*

(1735), *A Key to the Inquiry* (1736), *Letters on Mythology* (1748), and *Memoirs of the Court of Augustus* (3 vols. 1753, 1755, 1764, the last being incomplete).

Blackwood, one of the commercial names for E. Indian rose-wood (*Dalbergia latifolia*, natural order *Leguminosae*).

Blackwood, William, a distinguished Scottish publisher, was born at Edinburgh, November 20, 1776. Passing through an apprenticeship to the bookselling trade, he became (1804) a bookseller on his own account in Edinburgh, and finally, in 1817, a publisher. In the same year he issued the first number of the celebrated magazine which bears his name. Gathering round him some of the ablest literary men of the day, including Wilson, Hogg, and Lockhart, B. instantly achieved success. Till his death, September 16, 1834, B. was the leading spirit of the magazine, of which there was never a sole and irresponsible editor. As a political organ of the Tory party it was long a power, and at first a terror. But its *forte* was literature; and if the 'sound of revelry by night' was in the old days too loudly echoed in its pages, it has now completely died away. Yet it has not lost, but only changed its spirit. Under the successors of 'Ebony,' *Blackwood* maintains its position in the face of numerous and formidable rivals, and is still admirable for the various talent it commands.

Bladder, Diseases of. The B. is liable to a number of diseases, the most important of which are—1. *Inflammation of the B.*—This may be either acute or chronic, technically called *Cystitis*. The acute form may be limited to a portion of the B., or involve the whole organ. It may be caused by cold, by inflammation extending from neighbouring parts, by a calculus in the B., by external violence, or by irritating injections. *Symptoms*—Shivering, pain in the region of B., pain in passing water, which is passed frequently, and in small quantities. There is generally high fever, with much constitutional disturbance. The treatment consists in applying soothing poultices over the region of the B., especially poppy-heads and linseed meal, hot hip-baths, gentle aperients, such as castor oil, in small doses. If there be retention of urine, it must be drawn off by the surgeon. The diet should be light, as milk, or root, barley-water, and mucilaginous drinks. All stimulants are to be avoided. Opium and belladonna are to be freely used, especially as Suppositories (q. v.). During the whole time, perfect rest must be maintained. In *chronic* inflammation of B. the symptoms are not so severe. It often occurs in old people, and here the cause must be ascertained; and if depending on a stone or calculus, it must be removed; if due to the state of the urine, that must be remedied. This disease is sometimes called *catarrh of the B.* Infusion of Uva-ursi (q. v.) and Bucku (q. v.), combined with belladonna or henbane, will often prove beneficial. Barley-water and linseed tea are also both good. When the pain is severe, opium or belladonna must be given.

2. *Paralysis of B.*—This is a common disease in the aged. It is often due to over-distension of the B., brought on by cold, or by being prevented from some cause from passing urine for a long time. In this case the urine generally dribbles constantly, and it is often mistaken for incontinence of urine. This mistake has often led to most serious results. The treatment consists in passing the Catheter (q. v.), and withdrawing the urine. This must be repeated two or three times a day. This state often continues for weeks before the B. regains its strength. When due to disease of the nervous system, it is often permanent. P. of B. frequently follows injuries, especially of head and pelvis. In some cases iron, strychnine, and other tonics may be given.

Irritability of B. may be due to disease of kidneys, B., or some other organ in that region; to piles, to pressure of the uterus, or a tumour; to worms in the rectum (a common cause in children), or it may depend on some morbid state of the urine. *Symptoms*—Constant desire to micturate, and a general uneasiness in the region of the B. *Treatment* consists in removing the cause, rest, attention to diet, avoidance of all stimulants, mucilaginous drinks, and iron tonics where there is debility. Belladonna is a most valuable medicine in such cases, and very specially in the irritability of B. in children.

Bladder, Urinary, is a membranous and muscular sac, which receives the urine poured into it through the Ureters (q. v.)

from the kidneys, and retains it until it is expelled from the body through the Urethra (q. v.). Its position varies according to its state of distention. When quite empty it lies deep in the pelvis, and when distended with urine it reaches above the pubes into the abdomen. In infancy it is more elongated, and extends much higher into the abdominal cavity.

Structure of B.—It is composed of three coats—a serous, a muscular, and a mucous coat. The serous coat is a portion of the Peritoneum (q. v.), and covers only the posterior and upper half of the B. The muscular coat lies beneath the serous coat, and is composed of three distinct layers, and it is owing to these muscular fibres that the B. owes its contractility, which enables it to expel its contents. The internal covering is called the *mucous coat*. This is sometimes described as composed of two coats—the cellular and mucous membrane. The so-called *cellular coat* is composed of a layer of areolar tissue lying between the muscular coat and the mucous membrane. The mucous membrane is 'soft, smooth, and of a pale rose colour.' It is continuous with the mucous membrane of the urethra and ureters. It is covered with an epithelium intermediate between the columnar and squamous varieties. The mucous membrane over the greater portion of the B. is loosely attached to the cellular tissue beneath it, and in consequence, when the B. is empty, is thrown into folds. At one portion of the B. the lining membrane is closely adherent to the subjacent tissue, and is never thrown into folds. This is at the base of the B., is triangular in shape, and has been called the *trigone* of the B. The apex of this triangle is in front, immediately behind the urethra, and its base is behind, the two angles of which correspond to the openings of the ureters. This portion of the B. is uncovered by peritoneum, is in contact with rectum in the male, and is the portion through which the surgeon punctures the B. when this operation is performed from the bowel. There are three openings into the B.—the mouths of the two ureters through which the urine flows into the B., and the entrance into the urethra, through which the urine passes out of the B.

Bladd'er Oampion. See SILENE.

Bladd'er Green. See BLACKTHORN.

Bladd'erlocks, Henware or Honeyware, a local name applied to *Alaria esculenta*, a species of seaweed found abundantly on the shores of Great Britain. It is sometimes eaten.

Bladd'er-Nut (*Staphylea*), a genus of plants which, in combination with *Euscaphis*, is by some botanists considered the type of the small natural order *Staphyleaceæ*, containing 14 species. They are mostly shrubs. The bark of some of them is bitter and astringent, while others, like *Staphylea*, have somewhat purgative seeds.

Bladd'erwort (*Utricularia*), a genus of *Lentibulariaceæ* (q. v.), found in ditches, lakes, and marshes in all parts of the world, including Britain, of which three species are natives. Some of the leaves are transformed into *utricles* or bladders, which float the plant to the surface during the flowery season. Insects are sometimes imprisoned in these utricles, and it has lately been debated whether these insects do not contribute to the food of the plant. (See DIONÆA, DROSER, and NEPENTHES.)

Blad'ensburg, a post-town of Maryland, U.S., on the E. arm of the Potomac, 6 miles N.E. of Washington, and the scene of a victory won by the English under General Ross over an inferior force of Americans, August 24, 1814.

Blae'berry. See WHORTLEBERRY.

Blaeu, or Blaeuw, the patronymic of a family of Dutch printers and publishers, distinguished by their learning, and by the elegance and general correctness of their publications.—**Willem B.**, born at Alkmaar in 1571, a friend and disciple of Tycho Brahe, acquired a high reputation as an astronomer and geographer, and as the constructor and publisher of a terrestrial and celestial globe of remarkable beauty and correctness. His own works are *Zeespiegel* (1627 and 1643); *Onderwijs van de Hemelsche en Aardsche Groten* (1634); a *Novus Atlas* (6 vols. 1634–62), partly published by his sons; and a *Theatrum Orbium et Imperiorum* (1619). After his death, October 21, 1638, the business was conducted by his sons Jan and Kornelis,

the latter of whom died in 1650.—**Jan B.**, born at Amsterdam in the beginning of the 17th c., published his *Atlas Magnus* in 11 vols. (1650–1662; French, 12 vols. 1663; Spanish, 10 vols. 1669–72), a magnificent work, the details of which were furnished for the several countries by learned natives. He was an enterprising man, and entered into important speculations in conjunction with foreign publishers, having an establishment even at Vienna. He died 28th December 1673, after which the business was carried on by two of his sons, Jan and Pieter, with distinction and success till about 1700.

Blain'ville, Henri Marie Ducrotay de, a celebrated French anatomist and zoologist, was born at Argues, near Dieppe, September 12, 1778, and graduated at Paris in 1808, where he soon attracted the notice of Cuvier, who chose him for his assistant in the Collège de France and the Athénée, and in 1812 secured for him the chair of Anatomy and Zoology. Soon after a quarrel broke out between the master and disciple, which found melancholy expression in their scientific papers. Cuvier ignored B., and B. declared that Cuvier's labours were of no value. Nevertheless, in 1832, he succeeded Cuvier as Professor of Comparative Anatomy in the Museum of Natural History, and died May 1, 1850. B. was a devoted and enthusiastic savant. If he did not create a science, like Cuvier, he immensely extended one by his observations and experiments. His principal works are *Faune Française* (1821–30); *Manuel de Malacologie et de Conchologie* (1825–27); *Ostéographie* (Par. 1839–49); and *Histoire des Sciences Naturelles au Moyen Age* (Par. 1845).

Blair, Hugh, a Scotch theologian and rhetorician, more esteemed in his own than in our time, was born at Edinburgh, April 7, 1718. Educated at Edinburgh University, he was licensed to preach in 1741. His career was very successful, and he filled in succession the charges of Colleslie in Fifeshire, Canongate Church in Edinburgh, Lady Yester's, and finally (in 1759) the High Church in the same city. The literary style of his sermons was much admired, and when the chair of Rhetoric and Belles-Lettres was created in the University of Edinburgh, he was appointed, in 1762, professor. In 1780 he received from George III. a pension of £200 a year, retired from his professorship in 1783, and died December 27, 1799. Both his sermons and his lectures as Professor of Rhetoric were published, and obtained a high reputation. They were translated into almost every language of Europe, and everywhere held in the highest honour. It is almost ludicrous to see a great original genius like Jean Paul quote B. as an authority. Yet they are still pleasant reading,—the former as moral essays, the latter for their clear, if thin, style.

Blair, Robert, a Scotch poet and divine, the son of the Rev. David B., was born at Edinburgh in 1699. He was educated for the Church, and from 1731 till his death, February 4, 1746, was minister of the parish of Athelstaneford. B. is best known by his gloomy but powerful poem of the *Grave*, which was illustrated by the gifted and eccentric artist William Blake. Although he looked upon life from the serious point of view, he was a man of many accomplishments and a keen botanist. His fourth son, Robert B. of Avontoun, became Lord President of the Court of Session.

Blair, Robert, a noted Presbyterian divine, was the son of John B. of Windyedge in Ayrshire, and was born at Irvine in 1593. He studied at Glasgow, was licensed to preach in 1616, and, after several vicissitudes, was settled at St Andrews. In 1640 he accompanied the Scottish army to England, was conspicuous in the prosecution of the adherents of Montrose after Philiphaugh, was appointed one of the divines who were sent (1645) to Newcastle to reason King Charles out of Episcopacy, and in 1648 was employed by the Church to treat with Cromwell for uniformity of religion throughout the island. At the Restoration he was deprived of his parish, and forbidden to preach. B. died at Meikle Couston, near Aberdour, 27th August 1666. He was a man of considerable force, but altogether too narrow to be remembered with much pleasure. Robert B. (q. v.), the author of the *Grave*, was his grandson, and Hugh B. (q. v.) was a great-grandson.

Blair-A'thol (the 'battle-field' of Athol), a small village in Perthshire, Scotland, at the confluence of the Till and Garry, 30 miles N.N.W. of Perth, near which is Blair Castle, the seat

of the Duke of Athol. The largest and oldest larch-trees in Scotland are to be found here.

Blair-Gowrie (the 'battle-field' of Gowrie), a small town in Perthshire, on the Erich, 16 miles N.N.E. of Perth, with some industry in flax-spinning and weaving. It lies picturesquely at the E. base of a range of hills, and is connected with Cupar-Angus by a branch railway. Near it fine white marble is quarried. Pop. (1871) 4832.

Blake, Robert, a great English admiral, was born at Bridgewater, Somersetshire, in August 1598, and was educated at Wadham College, Oxford. In the struggle with Charles I., he heartily threw in his lot with the Puritan and Republican party, and earned such distinction by his heroic defence of Taunton in 1644 that he was appointed to the command of the fleet which the energy of Parliament and the policy of Sir Harry Vane, who wished to create in the navy a force that might neutralise the army, then beginning to be troublesome to the Parliament, had called into existence. B. found the sea to be the proper element for his genius as well as patriotism. He destroyed the fleet of Prince Rupert in the harbour of Malaga, after having pursued it from Kinsale in Ireland. In 1652 and 1653, by a series of brilliant and desperate engagements, in only one of which he was beaten (from being outnumbered), he established the naval supremacy of England—destroying that of Holland, and defeating her chief admirals, De Ruyter and Van Tromp. In 1654 he was sent to the Mediterranean. He destroyed the capital of Tunis, beat a Turkish fleet, and set free the English detained as slaves at Algiers. In 1657 he gained a great victory over the Spaniards, forcing his way into the harbour of Santa Cruz, in Teneriffe, burning the galleons there, and working his fleet out with only the loss of one ship and 200 men, in the face of a heavy gale. His health had, however, given way, and he died, August 27 of the same year, while the fleet were entering Plymouth Sound. Cromwell honoured his remains with a public funeral in Henry the Seventh's Chapel; but after the restoration of Charles II., they were thrown into a pit in St Margaret's Churchyard. B. was a man of the highest character, honesty, and piety, as well as patriotism, and he raised British seamanship to a reputation which has never left it. See Hepworth Dixon (assisted by Lord Dundonald), *Robert B., Admiral and General at Sea, based on Family and State Papers* (Lond. 1852).

Blake, William, a great erratic genius and mystic, the author of a number of exquisite lyrics, and of many designs, chiefly allegorical or symbolical, betraying a lofty but peculiar imagination, was born in London, November 28, 1757, and was apprenticed in 1777 to an engraver. In 1783 he published his *Portraiture Sketches*, but which were written previously to and during the year 1777. In 1789 appeared his *Songs of Innocence and of Experience*, accompanied by sixty-five plates, both designs engraved and poems hand-printed upon copper by a secret process (revealed to B., according to his own account, by the spirit of his brother), and the specialty of which was, that when the uncovered parts were eaten away by acid, the design remained as in stereotype. Others of his works are the *Gates of Paradise* (16 plates); *Urien* (27 plates, 1794); *Jerusalem* (100 plates). He also illustrated the *Night Thoughts* and Blair's *Grave*; and his *Illustrations to the Book of Job* are among his best efforts. B. died August 12, 1828. He was the admired friend of Flaxman the sculptor; Mrs Jamieson writes of his conception of angels as in the highest degree pure; Charles Lamb speaks of his work as executed 'with wonderful power and spirit,' and of B. himself as 'one of the most extraordinary persons of the age;' and A. C. Swinburne says of him, that he was 'the single Englishman of supreme and simple poetic genius born before the closing years of the 18th c.;' the one man of that date fit on all accounts to rank with the old great names. See *Life of William B.* by Alexander Gilchrist (Lond. 1863); and *William B., a Critical Essay*, by Algernon Charles Swinburne (Lond. 1868).

Blanc, Jean Joseph Louis, a notable French politician and socialistic philosopher, of Corsican extraction, was born at Madrid, October 28, 1813. After being an attorney's clerk and a tutor, he established himself in Paris as a writer on politics and literature, and unfolded a system of socialism in the *Revue des Progrès Politiques, Social, et Littéraires*, which he established in 1838. In 1840 appeared his most important

socialistic work, *Organisation du Travail*, in which he advocated the absorption of the individual in a great 'solidarity.' This book gained B. a high reputation in Paris, especially among the working-classes, by the brilliancy of the style, and the thoroughness and simplicity of the schemes proposed. By his political writings, and particularly his *Histoire de Dix Ans*, 1830-40, he did much to hasten the fall of Louis Philippe in 1848, and after the February revolution became a member of the Provisional Government. Subsequently, getting mixed up with attempts to forcibly carry socialism into practice, B. fell under the suspicions of his colleagues, and, had he not escaped to London after the June insurrection, would probably have been thrown into prison. He lived in London, writing on politics and history, and with equal ease, apparently, in French and English, till the fall of the Second Empire. He returned to France in 1870, and has since been gradually regaining a political position; but is apparently as eager as ever to reconstruct society. His chief work is his *Histoire de la Revolution Française* (1st vol. Par. 1847), which is still unfinished. His historical knowledge is great, and he is a dignified and eloquent writer; but though his enthusiasm and earnestness are beyond suspicion, and his intellect is singularly clear and logical, he has not impressed his contemporaries with a belief in his wisdom or insight. B.'s latest work is *Dix Ans de l'Histoire d'Angleterre* (Par. 1879).

Blanc, Le, a town in the department of Indre, France, on the Creuse, 55 miles S.S.W. of Tours, formerly fortified; with some trade in wine, lace, iron, timber, and hardware. It has several old castles, and a Roman church of St Genitour. Pop. (1872) 4332.

Blanc, Mont. See MONT BLANC.

Blanc-Mange (*blanc*, 'white,' and *manger*, 'to eat'), a white jelly, made principally of milk and isinglass. The following is a very simple recipe for making B., but it is only one of many:—Dissolve half an ounce of isinglass in three gills of milk; add four well-beaten eggs, and the peel of two lemons rubbed in a few lumps of sugar; sweeten it to taste, and stir it over a slow fire until it is on the point of boiling; add a little brandy, if liked, and pour the whole into a mould.

Blanching, or *Etiolation*, a process, natural or artificial, by which leaves and succulent stems of plants are in growing kept pale and watery by exclusion of light from their growing surfaces. The natural process is seen in cabbages, and other 'heart'-forming vegetables, where the inner leaves are tender and white. B. is produced artificially by earthing up around growing shoots, by tying leaves together, or by covering over with an inverted flower-pot, or a special B.-pot. The plants chiefly blanched for table use are celery, seakale, and asparagus; but rhubarb, chardoon, endive, and various salad plants are also artificially blanched. B. prevents the elaboration of chlorophyll, and the secretion of acrid juices, besides preventing the formation of hard, indigestible, woody fibre within the parts operated upon.

Blanche-Lyon, a *pursuivant-at-arms* in England. See PURSUIVANT.

Blanc's Cape (*i.e.*, 'white cape'), the name of various promontories, the chief of which are in Africa, America, Spain, Greece, and the Philippines. There are two in Africa, one in Tunis, which is the most northerly point of the continent, and the other on the W. coast, forming the Great Bay, a large natural harbour, about 390 miles N. of Cape Verde. Cape B. in Peru is the most westerly headland in S. America.

Blandford-Forum, or **Market-Blandford**, a town of Dorsetshire, on the Stour, 16 miles N.E. of Dorchester, and 103 S.W. of London by rail, with horse, cattle, and cheese markets. It is a very old place, and was a market-town in the 13th c. It was partly destroyed by fire six times (1579-1731), and on the last occasion was rebuilt with the aid of public subscription. At one time B. produced the finest point-lace in England, and also large quantities of shirt-buttons, before pearl was used in the manufacture. Pop. (1871) 4011. Creech, the translator of *Lucretius*, and Archbishop Wake, are among its more distinguished natives.

Blandrata, Giorgio, an Italian physician, was from 1544-51 in the service of Isabella, mother of Johann Sigismund II. (Zapolya), King of Transylvania. Persecution on account of his Arian

opinions drove him from Pavia, Geneva, and Poland, back to Transylvania, where he became court-physician, and, in 1564, President of the Synod of Enyed. With the help of Francis David, a Unitarian preacher, and of the King, B. secured toleration, and soon after a wide diffusion, for Unitarian principles in Transylvania. On the accession of Christoph Bathori (1571), a Catholic, B., having quarrelled with David (then superintendent of the church at Klausenburg) about the duty of prayer to Christ, after a public discussion at which Faustus Socinus assisted, procured the disgrace of David, and the punishment of all who denied this duty. B. died at Gyula Fejervar, in 1588. In Poland (which B. revisited under Stepan Bathori) he had from 1558-63 been attacked by the letters of Calvin, and exposed to the suspicions of the orthodox party (See Wallace's *Antitrinitarian Biography*, ii. p. 140; Bayle's *Dictionary*; Langre's *History of Reformed Church in Hungary and Transylvania*, 1728, p. 116).

Blane, Sir Gilbert, an eminent physician, born in Ayrshire, August 29, 1749, and educated at Edinburgh. In 1780 he accompanied Lord Rodney as his private physician when he took the command of the W. Indian fleet; was appointed physician to St Thomas's Hospital, London, in 1785, and ten years later head of the Navy Medical Board. In 1812 he received a baronetcy, and was physician successively to the Prince Regent and to William IV. B. died June 27, 1834. His principal service to the navy was the introduction of the use of lime-juice, which has nearly extirpated scurvy from the fleet. Among many valuable professional works, his *Warning and Admonition to the British Public on the Introduction of the Cholera of India* (Lond. 1832) may be mentioned as having been opportune and salutary.

Blan'es, a Spanish town in the Mediterranean province of Gerona, 21 miles S. of the town of Gerona, and 32 miles N.E. of Barcelona, with which it is connected by railway. Pop. 5000.

Blank Bonds were, in the practice of Scotch law, bonds in which the name of the creditor was left blank. They passed like bills by mere delivery; the bearer being at any time at liberty to fill up his name and to take action for payment. Being found to facilitate fraud, B. B. were in 1696 made null by Act of Parliament.

Blank Cartridges. See CARTRIDGES.

Blankenburg, a walled town in the Duchy of Brunswick, on the northern slope of the Hartz mountains, 38 miles S.S.E. of the capital, is the chief town of a circle of the same name. It has a pop. (1871) of 3853, chiefly engaged in mining. Overlooking the town, on the Teufelsmauer, is a palace belonging to the Duke of Brunswick, and at a short distance are the remains of a large castle hewn out of the rock by Henry the Fowler in 919. The district is noted for its fine fruits.

Blank'ense, a beautiful village on the right bank of the Elbe, about 4 miles from Altona by rail, is a favourite residence of the Hamburg merchants. It nestles picturesquely among the knolls and gardens on the steep bank of the river, which is here fully a mile wide, while from Sandhill (*Blanke nase*, 'bare nose') a splendid view can be got stretching away to the sea. B. is the headquarters of the North Sea fishermen and the Elbe pilots, and has, although without a harbour, some 300 craft. Pop. (1871) 3321.

Blank Verse, strictly defined, is verse *without rhyme*, and irrespective of the *length* of the line. In this sense it is applicable to the Greek and Roman epics, which are in hexameter; to Italian dramatic verse, which consists of eleven syllables; to German and English non-rhyming epic and narrative verse, in which the line may be of any length, from that of *Hiawatha*, which contains six, to that of *Evangeline*, which contains sixteen syllables. The term, however, is usually applied in England to the non-rhyming heroic, or decasyllabic line, first made use of by the Earl of Surrey in his translation of the *Aeneid*, published in 1557, and immediately afterwards adopted by our early dramatists as the most suitable from its elasticity and its freedom from caesural fetters for dramatic purposes. Several of the early poets and dramatists—notably Shakespeare, Massinger, and Fletcher—frequently add an additional syllable, making the number eleven; but this, according to modern canons at least, must be reckoned a liberty. Milton, by his *Paradise Lost*, has

constituted B. V. the measure for English epic, and though in the Queen Anne era the rhyming decasyllabic verse came into vogue, and was demonstrated by Pope to be admirably adapted for didactic verse and for the poetical essay, yet the adaptability of B. V. for narrative and dramatic purposes has never been impugned. For a fine analysis of the B. V. of our greatest dramatists, see Scott's 'Letter' to Lockhart on the authorship of the *Two Noble Kinsmen*.

Blan'qui, Jerome Adolphe, an eminent French economist, was born at Nice, 21st November 1798. Coming to Paris, he made the friendship of J. B. Say, who procured for him some public teaching on subjects connected with political economy, notably at the Athénée in 1825, where he delivered a course of lectures on *L'Histoire de la Civilisation industrielle des Nations Européennes*. In 1830 he became director of the *École spéciale du Commerce*, and in 1833 succeeded Say at the *Conservatoire des Arts et Métiers* as Professor of Industrial Economy. From 1846 to 1848 he was a useful deputy, doing much commission work. His special reports on Corsica (1838), Algiers (1840), and the London Exhibition of 1851, furnished to the Academy of Moral and Political Science, are valuable. Besides a journal of travel in England and Scotland in 1824, B. wrote two important works in political economy, in which he supported free trade, and adopted a position between the 'Utopias of Socialism' and the rigour of Malthus. These are his *Précis Élémentaire d'Economie Politique* (Par. 1827), with a biography of economists; and his *Histoire de l'Economie Politique en Europe* (4th ed. Par. 1860), with a biography of the science. B. says in the latter work, 'It is not sufficient for political economy that wealth has been produced, she must see it equitably distributed.' Hence he carefully analyses the historical phenomena of slavery and pauperism. B. died at Paris, 28th January 1854.—**Louis Auguste B.**, brother of the preceding, was born at Nice in 1805, and at an early period involved himself in secret associations for the overthrow of the existing forms of society. Captured in the armed outbreak of 12th May 1839, he was condemned to perpetual imprisonment, but was released at the revolution of February 1848, and instantly set to work to reorganise—that is to say, to disorganise—society. He founded the Central Union Republican Club, had a chief hand in the inflammatory 'manifestoes' of the 17th March, 16th April, and 15th May, and was in consequence again imprisoned for ten years at Belleisle (q. v.). In 1861, on account of fresh plots, he was once more sentenced to an additional four years' imprisonment. After the overthrow of the Napoleonic dynasty in September 1870, the grey-haired 'Irreconcilable,' most of whose life had been spent in chains, reappeared in Paris, as eager as ever for a social republic. In 1872 he was again sentenced to perpetual imprisonment.

Blaps, a genus of *Coleoptera* or beetles, represented by such species as the *B. mortisaga* or churchyard beetle, by the *B. sulcata*, &c. These forms belong to the *Heteromereus* group of the order, the members of which possess four joints in the tarsi of the hinder pair of feet, and five joints in the tarsi of the other legs. No distinct neck exists in this genus. The colour is black, the elytra or wing-cases, representing the first pair of wings, being joined together. These beetles are nocturnal in habits, and of slow movements. They feed on decaying vegetable matter, and some species possess the power of secreting a brownish liquid of irritating odour and properties. *B. sulcata* is said to be eaten in Egypt, under the idea that it gives to the female figure a fatness and redundancy.

Blas'ius, St. the martyr, was Bishop of Sebaste in Cappadocia, when Licinius, the rival of Constantine the Great, began a persecution of the Christians. He thereupon left the town, and hid himself among the rocks; but was discovered, and brought back to Sebaste, where he suffered a cruel martyrdom in A.D. 316. Because a wool-comb was one of the instruments by which St B. was tortured, the woolcombers claim him as their patron; and at Bradford, in Yorkshire, a procession is held on St B.'s day, the 3d of February, every seven years. In the Greek calendar, however, St B.'s festival is celebrated on the 11th of that month. He is invoked for sore throats, because he is said to have saved the only son of a widow from being choked by a fish-bone.

Blas'phemy. It has been held in England that this crime is not committed by an attack, however violent, on any religion

except the Christian religion, nor on any form of the Christian religion except that established by law. If, however, there be an attack on a dogma or principle of any form of Christianity, which that form holds in common with the established religion, then the crime of B. is committed. The reason being simply that the form established is established by law, and so entitled to its protection. It may, however, be questioned whether any expression of theological opinion, if in temperate language, however heterodox, would now be considered criminal. The decision above referred to—that of Baron Alderson, in the case of *Gathercole*, tried at York in 1838—so far rests on a sound legal principle, that that which the law establishes, the law must protect from contempt; but it is not contempt to discuss with perfect freedom, if in temperate language, the merit or truth of any principle or institution which the law has established. To lay down that there are certain subjects which no one shall publicly discuss, except with a foregone conclusion, may be held as a violation of the principle of personal liberty. On the other hand, it is perfectly right that that which the great majority of a people of a country hold sacred should be protected from ridicule or from being made the subject of virulent or contemptuous attack; just as any one is entitled freely to discuss the wisdom of a law, while no one is allowed by word or act to treat that law with contempt. In Scotland, in 1843, in trial for B., in which the prisoner was found guilty, it was laid down by Lord Justice-Clerk Hope, that those who publish opinions 'contrary to the known principles of Christianity' may be lawfully proceeded against for so doing before the civil magistrate. In the case in question, however, the publication by which the offence was constituted seems to have been violent and virulent in its tone; and probably no temperate discussion, whether written or spoken, however untrammelled, would now be regarded by a civil court as injurious to 'the known principles of Christianity.'

Blast, Hot. In 1828, Mr James Beaumont Neilson, then manager of the Glasgow Gasworks, discovered that great benefit would arise from heating the air used to support the combustion in Blast Furnaces (q. v.), and he took out a patent for his discovery. The ironmasters ridiculed it at first, then adopted it everywhere, and then in some cases made a discreditable attempt to evade payment of any royalty to the inventor. The action against Messrs Baird of Gartsherrie, in 1843, has become almost historical. That firm admitted to have made a profit of £260,000 in ten years on H.-B. iron, but refused to pay his royalties to the man through whose invention they had been able to make this money. After a ten days' trial, in which the defendants' conduct was severely censured by the judge, the validity of Mr Neilson's patent was fully established. As an instance of the value of the H. B., it may be noted that by its use the Clyde Ironworks, which in 1829 were using 8 tons 1 cwt. of coal made in coke for the manufacture of 1 ton of iron, were enabled in 1831 to double their turn-out, and use only 2 tons 5 cwt. of coal in its raw state per ton of iron. The temperature of the blast is from 500° to 800° Fahr., or even more, and its pressure about 3 or 4 lbs. per sq. in.

Blast Furnace, a furnace to which the air for supporting combustion is introduced under pressure—generally used for the reduction of metallic ores. The most important blast furnaces in this country are those used for the reduction of iron from its ores and the manufacture of 'pig-iron.' These are generally in external appearance immense cylinders of brickwork, 50 to 100 ft. high, bound with iron. Internally the smallest and lowest part is a cylindrical chamber called the *hearth*, and above this the furnace expands rapidly in the *boshes*, where its shape is that of an inverted cone. The part of the furnace above the boshes is called the shaft, and is commonly cylindrical, or tapering slightly inwards towards the top. In some modern furnaces the alteration of shape which distinguishes the parts just named is almost obliterated, the one running fairly into the other. The top or mouth of the furnace should be closed with a cast-iron *bell*, so as to prevent the free escape of the gases of combustion. The furnace is fed with fuel and ore at the top (the bell being lowered at intervals for that purpose), and the Blast (q. v.), which is supplied by a blowing-engine, is injected through a number of nozzles, called *tweyers* (*hygiers*), in the sides of the hearth. The reduction of the ore takes place as it makes its way down the shaft and boshes, and the liquid iron accumulates in the hearth. A tap-hole in the latter is opened as often as may be

necessary (say once in twelve hours), and the metal allowed to run out and fill a number of channels prepared for it in the sand of the *pig-bed*. When anything like economical working is desired, the gaseous products of combustion are carried off into flues through openings near the top of the B. F. below the bell, and are used to heat the blast on its way from the blowing-engines to the furnace. The iron produced by the B. F. is crude pig-iron, often containing sulphur, phosphorus, and other detrimental impurities.

Blasting, the operation of breaking up stone or rock *in situ* by the use of an explosive agent. It may be divided into three stages—boring the holes, loading, and firing. The holes in small-shot B. are commonly from 1½ to 3 inches in diameter, and from 3 to 12 feet deep, according to circumstances. Hand-boring is done with a steel-pointed tool called a 'jumper,' either by striking it with hammers, or by weighting it, and allowing it to fall from a little height. When the hole has been bored to a sufficient depth, the fragments of rock not previously taken out are removed, and the powder is introduced. A fuse (commonly Bickford's) is then placed in the hole, one end in contact with the charge, the other projecting at the mouth of the opening, wadding of turf or hay is pushed down upon the charge, and the hole *tamped*—that is, filled up with fragments of stone or brick or clay, rammed down so as to present as great resistance to the charge as possible. The charge is fired by igniting the free end of the fuse.

For carrying on large B.-work, 'mines,' or shafts of considerable diameter, take the place of the holes above described. The shafts are large enough for men to work in, and have in some cases been made as much as 80 feet long. The charge has sometimes been as much as 3000 to 4000 lbs. of B.-powder. The mines are exploded by electricity instead of fuses. As much as 10,000 or 12,000 tons of stone were several times thrown down by the explosion of a single mine during the quarrying operations for the stone of the Holyhead Breakwater. For many years gunpowder was the only explosive agent used in B. operations, but lately various other explosives—as Dynamite (q. v.), Gun-cotton (q. v.), lithofracteur, &c., have been also employed to some extent. See also BORING and TUNNEL.

Blastoids, an order of extinct *Echinodermata*, the fossil remains of which are exclusively confined to rocks of the oldest or palæozoic period of geology. They are most commonly found in the Carboniferous rocks, and the typical genus is *Pentremites*. *P. pyriformis* and *P. conoideus* are familiar species. The body was fixed to the sea-bed by a short, slender, and jointed stalk or column, and was of oval or globular shape. It was composed of limy plates, united together, and arranged in five *ambulacral* and five *inter-ambulacral areas*. No distinct arms, as seen in the *Crinoids*, appear to have been developed in the *Blastoidea*.

Blatt'a. See COCKROACH.

Blaye, a fortified town of France, in the department of Gironde, on the right bank of the estuary of the Gironde, with an export trade in corn, wine, brandy, fruits, soap, and oil, and some manufactories of linens, woollens, glass, and earthenware. In addition to its fortifications, it is overlooked by a castle on a rocky eminence, and its approaches are defended by three forts. Pop. (1872) 4478, including the garrison. B. is the *Blavia* of the Romans. In the 4th c. it was won over to Christianity by the preaching of St Romanus, in whose church are said to repose the ashes of the first Merovingian Duke, Charibert, brother of Dagobert, and of Roland, the nephew of Charlemagne. Its mediæval history was much chequered, but not significant.

Bla'zon, Bla'zoning, Bla'zonry, is the art of describing armorial charges in correct heraldic language, and of representing them accurately in form, position, arrangement, and colouring. The German word *blasen*, 'to blow a blast on a horn,' is the origin of these terms; and its meaning refers to the fact, that when a knight entered the lists at a tournament, his presence was announced by sound of horn, after which the official heralds declared his armorial insignia.

Bleaching, the art of rendering animal and vegetable products white in colour by atmospheric agencies or the employment of chemical substances; an important operation in the process of manufacturing textile fabrics used in clothing, which

branch of the subject will only be treated of in this article, leaving the B. of paper, straw, wax, &c., to be dealt with under their respective heads. Cotton, flax, wool, and silk all possess a certain amount of colouring matter, and in the operations of spinning and weaving these fibres gather certain impurities. B. is resorted to to cleanse and whiten the woven fabrics, as well as to prepare them for the reception of dyes and ornamental designs. One hundred years ago cotton and linen were bleached by exposing the fabrics to the combined action of light, air, and moisture; this method, however, was a very tedious one, and the fortunate discovery of the effective and rapid B. properties of chlorine speedily effected a revolution in the art of B. In the middle of last century the Dutch were esteemed the best bleachers in Europe, and it was the usual practice to send linen of Scotch manufacture to be bleached in Holland. Soon thereafter, through the instrumentality of the Board of Manufactures, bleachfields were established in Scotland. The operations were based on the Dutch method, and consisted of steeping the cloth in alkaline leys and washing with soap, called 'bucking'; then immersing the cloth in butter-milk, called 'souring'; and afterwards exposing it to the action of sunlight and frequent waterings, called 'crofting.' These several operations were repeated till the desired purity was obtained, many months being thus occupied. Dr Home of Edinburgh effected the first improvement by employing, in the 'souring' process, water acidulated with sulphuric acid, with considerable saving of time. In 1785 Berthollet, a French chemist, demonstrated that *Chlorine* (q. v.) was eminently suited for B., and this led to its adoption in the form of an aqueous solution, a change which shortened the process of B. cottons to almost as many days as months were formerly occupied. One objection to the employment of the chlorine solution lay in the difficulty of regulating its proper strength, for when too strong the fibres of the cloth were permanently injured. In 1799, however, this objection was removed by the discovery, by Mr Tennant of Glasgow, that dry slaked lime was an excellent absorbent of chlorine gas; and since that time the compound so produced, properly called *Chloride of lime* or *B.-powder* (q. v.), has been in universal use for B. vegetable fibres. Animal fibres, as wool and silk, are bleached with sulphurous acid. Subsequent improvements consisted in the introduction of machinery where practicable for facilitating operations. B. is now carried on as a rapid and continuous process, a great number of pieces of calico being sewed end to end, and carried by machinery from one stage to the next. A preliminary process is *singeing*, by passing the grey cloth over red-hot plates or through a gas flame, to remove the downy nap from the surface. The general sequence of operations then are—1st, *liming*, passing the cloth through a super-saturated solution of lime; 2d, boiling, or *bowking*, in large close kiers for several hours. The boiling with lime forms a calcareous soap with the grease in the cloth, which is, 3d, *washed* out to remove the weaver's dressing, &c. The cloth is, 4th, *soured* with hydrochloric acid solution, which removes the remaining lime and calcareous soap, after which it is, 5th, again *washed*. It is next, 6th, again *boiled* in kiers with rosin and soda-lye; and, 7th, again *washed*. The calico is now ready for the, 8th, *chemic* or B. liquor, a weak solution of chloride of lime, 9th, *soured* with very dilute sulphuric acid, and, 10th, thoroughly *washed*, after which it is ready for *drying*. If intended for printing, this finishes the processes through which the cloth passes; if for white bleach only, the cloth passes through several important finishing operations (see *CALENDERING*). The B. action of chlorine depends upon its power of decomposing water, combining with the hydrogen and liberating oxygen.

When the oxygen is liberated it is *nascent*, or in the state of single atoms, and immediately attacks the vegetable colouring matter to form compounds destitute of colour. Free oxygen does not possess this property to any great extent, because it consists of a molecule or a group of atoms with less active properties than the element in the nascent state. On the other hand, the element in a condensed form, called *Ozone* (q. v.) (three volumes of oxygen forming two volumes of ozone), is more active than free oxygen, and as ozone is always present in the atmosphere, it is probable that the B. action which follows the exposure of cloth to the air is due to its activity.

Linen contains more colouring matter than cotton, and whereas cotton only loses about $\frac{1}{10}$ of its weight in B., linen loses about $\frac{1}{2}$. Linen is occasionally subjected to the operation just

described, but with more dilute solutions and repetitions of the processes, as the colouring impurities have a firmer hold of the fibres. For some varieties of linen, the operation of 'crofting' is combined with the chlorinating process. Animal fibres are more liable to injury from chlorine than vegetable fibres, therefore in B. wool and silk the *sulphuring* process is pursued. Wool contains a large amount of natural grease, and it is increased by the weaver's dressing, and to remove this the wool is scoured with water and stale urine; carbonate of ammonia is evolved, which combines with the grease, and the soapy compound formed is removed by washing with water. Washing-soda and soap are sometimes substituted for the urine, but the result is not so satisfactory. The damp woollen cloth is then submitted in a close chamber to the action of burning sulphur; the dioxide produced in the combustion readily combines with the moisture to form sulphurous acid, which discharges from the wool the colouring matter by forming with it a colourless compound. Fabrics composed of cotton and wool are bleached by passing them through a warm solution of soap and soda, and then sulphuring for several hours. Silk, except in special circumstances, is not bleached with sulphur. The prevalent pale tint is acquired by boiling the silk in a strong solution of soap, thereafter immersing it in a solution of washing-soda, and then for a short time in a very dilute acid, washing and rinsing in water between each operation. If perfect whiteness is desired, the silk stuff is bleached by sulphurous acid like wool.

Bleaching-Powder, or *Chloride of Lime*, is an important substance manufactured in large quantities in this country and abroad as a disinfecting and bleaching agent. It is prepared by slowly passing chlorine over slaked lime spread in layers 2 to 3 inches in thickness on perforated leaden shelves or flag-stones, till the gas ceases to be absorbed. B.-P. consists essentially of a compound of lime and chlorine, generally represented by the formula CaOCl_2 . It was formerly regarded by chemists as a mixture of hypochlorite and chloride of calcium, CaCl_2O_2 , CaCl_2 . Its use as a bleaching and disinfecting agent depends upon the ease with which it is decomposed by acid into free chlorine and a salt of lime. The carbonic acid of the air is sufficient to produce this change.

Bleak, a *Teleostean* fish, belonging to the *Cyprinidae* or Carp family, and scientifically known as the *Leuciscus alburnus*. The B. inhabits fresh water, and averages about 6 inches in length. It somewhat resembles the nearly-allied dace (*L. vulgaris*). A single dorsal fin placed far back on the body exists. The beak is pointed, and the lower jaw protrudes. The scales exhibit a striated or striped appearance, and are used for making artificial pearls and other ornaments. The back is coloured greenish, the fins and rest of the body being silvery white. The tail is deeply cleft or forked. The B. inhabits most of our English streams and rivers. It is active in its movements, its food consisting of flies and insects, which it pursues at the surface of the water. Its flesh is very palatable, its small size rendering its use as a common article of diet rather less frequent. These fishes are caught by means of gentle bait and also with flies. They are fond of bran, and may be allured to the surface by strewing this substance on the water.

Bleeding. See *HÆMORRHAGE* and *BLOOD-LETTING*.

Bleek, Friedrich, one of the most learned of modern German theologians, was born at Arensbök, in Holstein, 4th July 1793, studied first at Kiel and afterwards at Berlin under De Wette, Schleiermacher, and Neander. After holding several minor appointments, he was appointed Professor of Theology at Bonn in 1829, where he laboured till his death, 27th February 1859. B., whose writings embrace the whole field of biblical exegesis, is notable alike for his clear and acute criticism, his exegetical skill, and his warm enthusiasm for Christianity. His masterpiece is *Der Brief an die Hebräer* (Berl. 1828-40). In his *Beiträge zur Evangelienkritik* (Berl. 1846) he sought, among other things, to vindicate the genuineness of the Gospel of St John against the destructive criticism of the Tübingen school. After B.'s death appeared his *Einleitung in das Alte Testament* (Berl. 1860), and *Einleitung in das Neue Testament* (Berl. 1862), both of which display in a high degree his fine intellectual scholarship, reverence, and love of truth. The same qualities are visible in his *Synoptische Erklärung der drei ersten Evangelien* (Leips. 1862), and *Vorlesungen über die Apokalypse* (Berl. 1862).

Black, Wilhelm Heinrich Immanuel, son of the foregoing, an able linguist, was born 8th March 1827, studied at Bonn and Berlin, and at an early period chose for his specialty the S. African languages. His thesis, when he took his degree, was *De Hominum Generibus Linguarum Africa Australis* (Bonn, 1851), in which he sought to prove the N. African origin of the Hottentot tongue. In 1855 he went out to Natal along with the newly-appointed Bishop Colenso, and in the course of extensive journeys into the interior and the neighbouring Caffre lands, made himself acquainted with the languages, manners, and customs of the natives. In 1856 he obtained an appointment at Cape Town, which gave him an opportunity of prosecuting further his linguistic studies, especially in reference to the languages of S. Africa, Australia, and Polynesia. B. is the chief author of the *Handbook of African, Australian, and Polynesian Philology* (Cape Town and Lond. 1858-63), a work which not only embraces all the literature extant in these tongues, but attempts also a classification and characterisation. Of his other productions, besides a *Vocabulary of the Mozambique Languages* (Lond. 1856), may be mentioned his *Comparative Grammar of South African Languages* (Cape Town, 1862); *Reynard the Fox in S. Africa, or Hottentot Fables and Tales* (Lond. 1864, Ger. ed. 1870); *Über den Ursprung der Sprache* (1868), &c. He died 17th August 1875.

Bleiberg ('lead hill'), a town of Austria, province of Carinthia, situated at an elevation of 3000 feet, on a range of hills 8 miles W. of Villach. The hills are rich in metallic wealth, and are literally honeycombed by lead and zinc mines, the number of which amounts to nearly 500, though only 50 are in full operation. There are also 22 smelting furnaces. Pop. (1869) 4061.

Blende (ZnS), the sulphide of zinc, a valuable ore of that metal. When pure, it has a yellow or pale-brown colour, and contains in every 100 parts 67 of zinc and 33 of sulphur, but as found native it is usually of a brown or black shade from the admixture of sulphides of iron and cadmium and other impurities: iron imparts the latter hue, whence the name 'black-jack,' given to B. by English miners. B. occurs, usually associated with Galena (q. v.), in Derbyshire, Cumberland, and Cornwall, in England, and in numerous localities throughout the globe. The term B. is also sometimes applied to the sulphides of other metals, as antimony B., manganese B., &c.

Blén'ean, a village of France, department of the Yonne, 30 miles W.S.W. of Auxerre, is the scene of Turenne's victory over the Prince de Condé in 1652. Pop. (1872) 1433.

Blén'heim (Ger. *Blindheim*), a village of Bavaria, 23 miles N.N.W. of Augsburg, near the scene of Marlborough's 'famous victory' of 13th August 1704. Assisted by Prince Eugene and the Imperialists, Marlborough, with 52,000 men, attacked the French and Bavarian army of 56,000 men under Tallard, Marsin, and the Elector of Bavaria, and gained a decisive victory. The loss of the French and Bavarians killed, wounded, and prisoners (among these last was Tallard himself) was estimated at fully 30,000. The allies lost about 5000 in killed and had 8000 wounded. Bavaria came into the possession of the victors. The battle is known to the Germans as that of Hochstädt, the name of the village where the conflict actually occurred. The Austrians were defeated by the French near B. in 1800.

Blén'heim Dog, a spaniel allied to the Cocker (q. v.), and so named from its having been originally bred by one of the Dukes of Marlborough. The colour is usually black, with light-brown or yellowish spots on the feet and breast and above the eyes. The muzzle is broader than in the cockers. The ears are also, if anything, longer, and more drooping, than in the latter dogs.

Blennorrhoe'a, or **Blennorrhæ'gia**, from two Greek words signifying a flow of Mucus (q. v.), and if applied literally would signify an unusual flow of mucus from any Mucous Membrane (q. v.). When used in medicine, however, it is almost always restricted to a specific disease of the urethra, termed *Gonorrhoea* (q. v.), or gleet. B. is almost always the result of inflammation of the mucous membrane with which it is connected, and the treatment consists in subduing that inflammation by soothing measures, by local astringents, and attending to the general health.

Blenn'y (*Blennius*), a genus of Teleostean fishes belonging to the section *Acanthopterygii*, and family *Gobiidae* or *Blenniidae*.

The fishes of this family have large, blunt heads, with an abrupt profile, and usually possess fringed appendages also. A single but divided dorsal fin exists. The ventral fins are placed on the front of the throat, and consist of two

Blenn'y.

rays ununited by any membrane. No air-bladder exists. The skin is furnished with small, concealed scales, and gives off a mucous secretion like that of the eels, whence the name B. (Gr. *blennos*, mucus) is derived. The pectoral fins are of large size, and the anal fin is long. The Shanny (*Blennius pholis*) is the common British species, and, like others of these fishes, hides in the nooks and crannies of rocks as the tide recedes. Another species is the ocellated B. (*B. ocellaris*), which possesses curiously branched filaments borne in the head. One species, termed the 'eel pout,' and included in a different genus (*Zoarces viviparus*), is noted as bringing forth its young alive—a function said to be exhibited by other blennies. Other species are the *Blennius Yarellii*, *B. gattorugine*, &c. They are active fishes, and can live for a considerable period out of water.

Bléré, a town of France, department Indre-et-Loire, on the Cher, 15 miles E.S.E. of Tours. Pop. (1872) 1992. Close by is the castle of Chenonceaux, purchased by Henri II. of France for Diana of Poitiers, and afterwards the residence of Catherine de Medici. It also possesses an abbey of the 12th c., and the ruins of an aqueduct.

Blessed Thistle. See THISTLE.

Blessington, Margaret, Countess of, a celebrated leader of society, was the daughter of an Irish gentleman named Edmund Power, and born at Knockwill, near Clonmel, Tipperary, September 1, 1789. She was first married to Captain Farmer, who died in 1817, and in the year following to Charles John G. Her, Earl of B. She had literary tastes, travelled much, and, both in London and on the Continent, during her husband's life and after his death (1829), gave soirées which were much frequented by authors. A most prolific writer of novels, travels, sketches, memoirs, &c., her only important book is her *Conversations with Lord Byron* (1834), with whom she formed a friendship. Along with Count D'Orsay, she followed the late Louis Napoleon to Paris, where she died, June 4, 1849. See Madden's *Literary Life and Correspondence of the Countess of B.* (Lond. 1855).

Bletch'ingly, an agricultural town in Surrey, 20 miles S. of London. It has a large and handsome parish church, St Mary's, with a low square tower and a chime of eight bells. Pop. (1871) 1916. Old Roman coins are found in its vicinity, and the fossil remains of the iguanodon, an extinct reptile, were discovered in cutting the B. railway tunnel.

Blett'ing, from the Fr. *blesse*, a term applied by Lindley to that intermediate stage between the maturity and decay of a fruit. It is the first change after the sugar in the ripe fruit has commenced to oxidise. Accordingly, if fruits like pears and apples be kept in close vessels free of oxygen, they will preserve for a much longer period than they would otherwise do.

Blich'er, Sten Stensen, a Danish novelist and poet, born at Viwm, in Jutland, 11th October 1782; studied theology at Copenhagen; in 1819 obtained a living at Thorning, which he exchanged in 1825 for one more valuable at Spentrup, Jutland, where he died, 26th March 1848. Belonging to no poetical or philosophical school, he was long known only as the translator of *Ossian* (2 vols. 1807-9); although two volumes of poems which appeared in 1814 and 1817 proved him to possess unquestionable genius. The first thing that attracted much notice was his *Sneeklokken* (1826), and still more his contributions to the monthly journal the *Nordlyset* (12 vols. 1827-29). Here appeared his *Lydske Romanzer*, a happy attempt to turn the Jutish dialect of Danish to poetical uses. A collected edition of

his novels, in 5 vols., was published at Copenhagen in 1833-36, and of his poems in 2 vols. 1835-36. B. has humorously sketched his own life in his *Gamle og nye Noveller* (7 vols. Copenh. 1846-47; 3d ed. 8 vols. 1861-62). His novels contain exquisitely truthful pictures of country life in Jutland, with which his pursuit of the chase over its barren solitudes had familiarised him, and his poetry is equally national and spirited.

Blidjah, a town of Algeria, 30 miles S.W. of Algiers, and 220 E.N.E. of Oran, with both of which it is connected by rail. It lies to the S. of the fertile plain of Metidjah, and has a growing trade in esparto-grass, wine, cotton, wheat, and barley. Pop. (1872) 8113.

Bligh, William, was born at Plymouth in 1753, and after serving as a lieutenant under Captain Cook, was in 1787 sent out in the *Bounty* to Tahiti to ship a cargo of bread-fruit trees for the W. Indies. He left Tahiti in 1789, and was proceeding to Jamaica, when Fletcher Christian and twenty-four other members of the crew mutinied, turned B. and the remaining eighteen seamen adrift in the launch with a few days' provisions, and returned to Tahiti. This was near Topea, 19° S. lat. 184° E. long. B. managed to reach the island of Timor, 3600 miles distant, in about six weeks, but only twelve of the faithful crew reached England with him in 1790. He was appointed a commander, and soon afterwards succeeded in taking the bread-fruit from the South Seas to the W. Indies. In 1792 he published an account of his voyage. In 1806 he became Governor of New S. Wales, but in 1808 resigned this post, on account of his extreme unpopularity. B. died in London, 7th September 1817. See Lady Belcher's *Mutineers of the Bounty* (Lond. 1870).

Blighia. See **AKEE**.

Bligh Islands, Polynesia, in long. 180°, and S. lat. 15° 30'-19° 30', a group discovered by Tasman in 1643, and named after Captain Bligh, who sighted them from the open boat in which he made his perilous voyage after his expulsion from the *Bounty* by his mutinous crew.

Blight, a term vaguely applied to a diseased condition of various grains and other grasses, no matter how caused, but is, properly speaking, limited to those diseases caused by minute parasitic fungi, known as Smut-Balls, Bunt, Pepper Brand, or Stinking Rust (q. v.). B. is often owing to errors in manuring, the fungi attacking unhealthy plants so caused. A false B., which does little harm to the plant, is caused by an abnormal development of the epidermal cells (the *Derma*, q. v.), which bursts the cuticle and forms mealy patches on the surface of the plant, simulating by their colour and appearance an attack of true B.

Blimbing, the acid fruits of *Averrhoa Bilimbi* and *A. Caranbola*, two plants belonging to the natural order *Balsaminaceæ* (q. v.). They are eaten by the natives of India, and are used as pickles by the Europeans.

Blind, The, is the name applied to those who lack the sense of sight. This class, which is greatly on the increase in England and various other countries, has received inestimable benefits at the hand of modern philanthropy. Charitable institutions for the maintenance of the B. existed, indeed, as early as the 12th c., but provision for their education and self-improvement has only been made within comparatively late years. To the present century belongs not only the foundation of almost all the asylums now existing, but also the vast extension of the field of B. industry, and above all, the invention of relief-printing, and the consequent creation of a B. literature.

In 1871 the number of the B. in the British Isles was 30,956, or 1 in every 1022; and this proportion almost exactly corresponds to that of the various flat areas of Europe, as France, Prussia, Belgium, and the plains of Hungary, Denmark, and Lombardy. Mountainous countries have a much lower average, with the singular exception of Norway, which has 1 blind person in every 482 inhabitants. It has been estimated that the B. in the world are not fewer than 3,000,000; and of this vast number, some 30,000 belong to France, 35,000 to Germany, upwards of 70,000 to Russia, some 1600 to Holland, 3300 to Sweden, and upwards of 2000 to Norway. The large number of the B. in all highly civilised countries would seem to indicate that intellectual pursuits and industrial modes of life are among the more

important causes of blindness. (See **BLINDNESS**.) The B. in Britain, arranged in the order of age, are as follows, according to the census of April 3, 1871:—

	England.	Scotland.	Ireland.	Total.
Under 5 years of age	567	48	31	646
From 5 to 10 . . .	700	103	67	870
" 10 " 15 . . .	871	135	116	1122
" 15 " 20 . . .	881	143	140	1164
" 20 " 30 . . .	1728	248	637	2613
" 30 " 40 . . .	2048	281	701	3030
" 40 " 50 . . .	2314	325	717	3356
" 50 " 60 . . .	2878	380	947	4205
" 60 " 70 . . .	3491	471	1243	5205
" 70 " 80 . . .	3883	533	1020	5436
" 80 " 90 . . .	2985	300	588	3873
" 90 " 100 . . .	248	51	126	425
" 100 and upward .	2	7	5	14
	21,590	3019	6347	30,956

The small proportion of juveniles in this table, and more especially in the column relating to Ireland, is worthy of note, while the fact that 13,962, or 45 per cent. of the whole, are above sixty years of age shows clearly that old age and infirmity contribute largely to blindness. It is also seen from the census that the B. are more numerous in agricultural than in manufacturing and mining counties, a circumstance partly to be ascribed to the great average age attained in the former, and partly to the constant exposure of an agricultural life. In Scotland and Ireland the females steadily predominate, while in England the males are as fixedly in excess, as will be seen from the following table, giving the census of the three decades 1851-71:—

		Males.	Females.	Total.
England . . .	1851	9,807	8,670	18,477
	1861	10,340	9,199	19,539
	1871	11,378	10,212	21,590
Scotland . . .	1851	1,466	1,544	3,010
	1861	1,399	1,421	2,820
	1871	1,490	1,529	3,019
Ireland . . .	1851	3,588	3,999	7,587
	1861	3,149	3,730	6,879
	1871	3,022	3,325	6,347

The gradual decrease in the total number of the B. in Ireland, observable in the above table, is in a great measure due to a falling off in the population at large. In England, again, the number has steadily increased, and in Scotland it is almost exactly the same as it was twenty years ago.

As early as 1178 an asylum for the B. was established by Weef VI. at Memmingen. In 1260 the *Hospice des Quinze Vingt* was opened in Paris by St Louis, for the reception of 300 persons (as its name implies), and was originally intended for those Crusaders who had lost their sight on the burning plains of Egypt and Syria. Here pensions were granted of a franc and a half a day to those who chose to reside in the house, while smaller pensions were granted to any who preferred to reside with friends. In 1784 the cause of the B. seems to have attracted special notice, and in Paris the first institution for their education was opened by the famous M. Valentine Haüy, under the patronage of the Philanthropic Society. This establishment was closed during the Revolution, but was re-opened in 1817, and since 1843 has occupied a building capable of receiving 160 pupils, who receive, in addition to a primary education, careful instruction in music, for which many discover a special aptitude. Institutions of a similar kind were soon afterwards founded in Amsterdam, Berlin, Breslau, Brussels, Copenhagen, Dresden, Edinburgh, Liverpool, London, Vienna, Zürich, and in many towns of the United States. In 1791 the Liverpool school for the B. (Hardman Street) was opened; but it was left to the Rev. Dr Johnston, of North Leith, assisted by Dr Blacklock, the poet, and William Witherforce, to open, in 1793, at Edinburgh, the first institution for the employment and industrial training of B. adults. In the same year the school at Bristol was begun; then followed, in 1799, St George's-in-the-Fields, London; in 1805, Norwich school; in 1810 (Sackville Street), Dublin; in 1812, Aberdeen (Industrial); in 1815 (Moly-

neur), Dublin; in 1827 (Henshaw's), Manchester; in 1828, Glasgow (Industrial); in 1831, Belfast; in 1833, York; in 1835 (Gayfield Square School), Edinburgh; and 'The Society for Teaching the B. to Read,' in London, in 1838. In 1873 there were 148 institutions for the B. in the world. A splendid new building for the B. in Edinburgh was completed in 1876.

The industrial employment of the B. is necessarily restricted to departments of work which do not require very delicate manipulation; but instances are on record of B. people who have maintained themselves as clock and watch cleaners, sculptors, surveyors, &c. Large numbers of the male B. are employed as basket-makers, rope and twine spinners, brush and mattress makers; others are employed as mat and matting makers, choppers of firewood, and sack-weavers; while a few are engaged as shoemakers and wood-turners. Piano-tuning has recently been added to the employments of the B., and from their quickness of ear it is very likely to prove a valuable addition to their limited resources. The female B. are usually taught to knit, net, and make fancy-work of various sorts, which seldom pays. In Scotland, and especially in the Royal B. Asylum, Edinburgh, sewing has been long a remunerative source of employment. Sewing sacks and bags for grain, &c., also pays well. Brush-making by the females is now carried on to a great extent, while the seating of cane chairs, making of carpet brooms, &c., gives employment to a number more. The use of the sewing-machine was a few years ago introduced into some of the London institutions, but the amount of supervision required is so great that it is very questionable if it ever can be employed extensively.

M. Haüy, as the inventor of printing in relief, is to be regarded as the founder of the literature for the B., although there had been several previous attempts to give to this class a knowledge of letters. The invention of M. Haüy, which has never been superseded, was taken up subsequently by Mr James Gall, of Edinburgh, among whose modifications may be mentioned the reduction of the number of letters of the alphabet, the employment of a larger type, and the substitution for curves and circles of angles and straight lines. In 1827 Mr Gall issued his *First Book*, printed in the new manner, and such was its success, that it was quickly followed by his *Scripture Statements* and an *Epitome of Old Testament History*. Two years later, having procured a sufficient number of subscribers, at the rate of one guinea a copy, he began to print the first book of the Bible ever brought thus within the reach of the B., namely, the Gospel by St John—a work which did not, however, appear till 1834, owing to many serious causes of delay. These works showed an advance upon the French printing, and could be read by the B. with greater ease, but they were so costly as to be practically beyond the reach of the class for which they had been mainly produced. Still the success of Mr Gall had roused the interest of the public, and for the time being Edinburgh was the enthusiastic centre of this new branch of philanthropy. In 1832 the Edinburgh Society of Arts offered their gold medal (value twenty sovereigns) for the best B. alphabet and method of printing. Mr Gall's establishment was visited by the Abbé Carton, in the name of the Belgian Government, and later by Dr Howe of America, and these visits led to the foundation of similar institutions in Boston and Brussels. In America, a private press had been set up in Philadelphia by Mr Jacob Snider, who issued the Gospel by St Mark, in 'the capital alphabet,' in 1834. When the general attention had thus been once fairly stirred, there began to appear the utmost variety of schemes and theories for the perfection of this method of printing, and many were the attempts made ostensibly to improve and simplify the alphabet. The only inventions of any great value in the way of printing were—(1) the serrated type, which produces a series of dots instead of straight lines; and (2) the 'return line,' or the alternate printing of lines running from left to right and from right to left. As regards the alphabet, it seems long to have remained a pet subject for the apprentice hand of the inventor. Till about 1830 there had been nothing used but the ordinary Roman alphabet, more or less modified for the sake of distinctness; but subsequently there were issued numerous experimental works in characters taken from existing systems of stenography. Among the twenty-one alphabets submitted to the Committee of the Edinburgh Society of Arts, there was one of this latter kind, which has since come to be employed extensively. It was that, namely, of Mr M. T. Lucas, to the merits of which we shall again refer. The medal of the Society, on the same occasion, was awarded to Dr Fry of London, whose

alphabet was a Roman one; but this decision was only come to after nearly five years of deliberation, and when a report had been obtained from the Rev. W. Taylor, a gentleman of great practical experience in teaching. Mr Alston, of Glasgow, subsequently so improved Dr Fry's system as to render the letters sharper and more tangible; and in this higher form it soon found its way into most of the schools throughout the country, and acquired everywhere a lasting popularity.

The question of stenographic *versus* Roman alphabets was long warmly discussed by the adherents of the two systems, but this dispute seems likely to obtain a quiet settlement from the test of experience in favour of the latter. As long ago as 1833, Mr Taylor saw 'no sufficient reason for departing from the common Roman letter,' and spoke decidedly against the adoption of any merely arbitrary characters.

The testimony of the Edinburgh Society was given in favour of the Roman letter in an elaborate report of over 30 printed pages. In this report it was stated—(1) 'That although an arbitrary character might possess in itself superior advantages in simplicity and tangibility, yet there would be great, and in many cases insuperable, obstacles to the B. generally acquiring a knowledge of any character not familiar to those possessed of sight. . . . (2) that the same objection applies, though perhaps in a less degree, to Mr Gall's angular modification of the Roman alphabet. . . . (3) that from being almost universally known in Europe and America, . . . the common Roman capital alphabet, as represented by the late Dr Fry, seems not only the best adapted for teaching the B. to read, but also as a medium of correspondence; . . . it would sooner be brought into general use than any of the other characters, . . . and expense would be greatly diminished.' Of the alphabetical systems still in use, the principal are those employing (1) Alston's Roman capitals, (2) the American smaller capitals, and (3) the French alphabet. The chief arbitrary systems are those of Lucas, Frere, Moon, Carton, and Braille. The alphabet of Mr Lucas of Bristol consists of thirty-six characters, ten of which represent double letters, and in printing, not only are all letters omitted that are not necessary to the sound, but whole words are often represented by single letters, as *the* by *t*, *yet* by *y*, *me* by *m*, &c. This system was held to have the manifold advantages incident to great condensation, but was found ultimately to be even longer than Alston's. The New Testament of the former occupied 841 pages, whereas in the full-length Roman capitals of the latter it only took 623. The system of Mr J. H. Frere of London, again, was founded on Gurney's shorthand, as that of Lucas was on Byron's, and its special feature is its being purely phonetic, the characters being intended to represent the simple sounds in the language. Its alphabet is composed of thirty-two characters, the vowels being represented by simple dots, which in a variety of positions indicate the different vowels. The many rules and directions for learning this system do not to any considerable extent obviate its difficulty. The alphabet of Mr W. Moon of Brighton (himself blind) contains six of the Roman letters unaltered, twelve others with parts left out, so as to be more open to the touch, while the rest are new and comparatively simple. All the words are printed in full, but this makes the system cumbrous and expensive. The works issued in it, including a monthly magazine, have, however, been widely circulated throughout the country by agents, and the inventor states in the preface to *Light for the B.* (1875), that '5000 persons have learned to read, including several at the advanced age of eighty or ninety, as well as children of tender years.'

In 1834 M. Louis Braille introduced his *point* system (a modification of an invention by a M. C. Barbier) into the Institute at Paris. It is very easily felt, and can be printed in much less space than Moon's or Alston's. In France no other method is used, and over the whole Continent it is fast displacing all other systems.

Its root form is simply six dots (thus ::), and from these sixty-two variations are made. Besides having become the medium of many publications, it has been made the basis of a thorough musical notation. With the aid of printing frames, the B. themselves can use it as a means of correspondence. In 1871

the Braille system was ingeniously adapted in New York by Mr William Wait, who, by laying the root on its side (thus : . . .), and by representing the letters of most frequent occurrence by the fewest possible points, achieved a great reduction in expense. The Boston system, however, is firmly established in America by Dr Howe's long and energetic labours, which are being ably seconded by Mr N. B. Knease of Philadelphia, who issues a monthly journal, among many other works.

The present price of a copy of the New Testament by Alston is £2, by Gall £1, 12s., by Frere £2, 10s., by Moon £4, 10s., by Lucas £2, while the Gospel of St John is issued by Mr Wait at 2s.

See T. Anderson, *Observations on the Employment, Education, and Habits of the B.*; Dr J. Kitto, *The Lost Senses*; Dr G. Wilson, *The Five Gateways of Knowledge*; V. Haiiy, *L'Educat-ion des Aveugles*; P. A. Dufau, *Des Aveugles, leur Etat Physique, Moral et Intellectuel*, crowned by the Academy.

Blind'age, screens made of timber and earth, or of trees slanting towards each other, which are sometimes placed in an inclined position against the walls of besieged towns to add to their strength.

Blind Coal, a popular name of Anthracite (q. v.).

Blind, Karl, was born at Mannheim, September 4, 1820, studied at Heidelberg and Bonn, and early became known as an impetuous advocate of German freedom and unity. He played a leading part in Hecker's rising in Baden in 1848, for which he was subsequently exiled. Later he headed the second republican insurrection in the Black Forest, when he was captured, tried, and sentenced to eight years' imprisonment. Liberated by the people, he was sent by the Provisional Government on a diplomatic mission to Paris, where he was arrested on a charge of implication in Ledru Rollin's movement in favour of the Roman Republic. After much public discussion, B. was finally banished from France. He has since resided in Belgium and England, actively engaged in a democratic propaganda. B. is an honest enthusiast, who is ready to turn the world upside down in the interests of humanity. Politically he belongs to the order of 'Irreconcilables.'

Blind'ness may exist in any degree, from the smallest impairment of vision to total loss of sight. This state may be congenital, or it may occur at any period of life, but most frequently in old age. It may arise from many causes, as disease of the brain, rendering the person unable to recognise the impressions produced in the eye by the rays of light. B. may be the result of disease of the optic nerve or of the retina. It may arise from inflammation of any of the structures composing the eye, or from affections of the crystalline lens and humours of the eye. It may also be due to adhesions of the eyelids or to absence of the eyeball. Whatever tends to obstruct the rays of light as they pass through the eye may be said to cause B. The different kinds of B. will be treated under the various affections that constitute B., as amaurosis, cataract, glaucoma, &c. Day-B. (*Nyctalopia*) is a peculiar condition in which vision is most powerful during twilight, due to a kind of amaurosis, and exists among those who are confined in dark cells. Night-B. (*Hemeralopia*) is the converse of day-B. The patient sees only in broad daylight, but not at all at other times. It is common in India and other tropical countries, caused by the exposure of the eyes to a burning sun. The treatment consists in protecting the eyes by a shade. A similar affection is common among the Esquimaux and those engaged in Arctic travelling, called Snow-B. This affection is caused by the reflection of light from the snow. See COLOUR BLINDNESS.

Blind'story, in ecclesiastical architecture, is the second or middle arcade in that wall which separates the body of a church from the aisles. In cathedrals it serves to give access to different parts of the building. Its apertures admit no light, and thus B. is opposed to *Clerestory* (q. v.), the third arcade, which admits light. B. is also called the *trifonium*.

Blind'worm, a name given to the *Ceciliada*, a group of *Amphibian Vertebrata* (see BATRACHIA), but more commonly applied to indicate the slow-worm (*Anguis*), included in the *Lacertina*, or Lizard order of reptiles, which is represented by the common blind or slow worm (*Anguis fragilis*) of Britain, Europe, Asia, and N. Africa. The slow-worms are included in the family *Scincida*. In length the common species measures from

10 to 15 inches. The tail is blunted, the body being of almost equal thickness throughout, and covered by very small scales. The tongue is free, fleshy, and slightly notched at its tip. The teeth are very small; and although it has been credited with venomous properties, it is perfectly destitute of such, and is altogether harmless. No limbs are outwardly developed, and although a true lizard, its appearance is decidedly serpentine. It feeds upon snails, insects, and worms. The specific name *fragilis* is derived from its habit of stiffening the muscles of the body when touched, so as to cause the tail readily to be broken off, as if exceedingly brittle. The young are produced from eggs, but in a living state (*ovo-viviparously*); and although termed 'blind,' the eyes are well developed, but of small size. The amphibian *Ceciliada* above alluded to are snakelike forms found in Java, Ceylon, and S. America. The eyes are rudimentary, and are concealed beneath the skin. They burrow in marshy ground; and the young, as in all *Amphibia*, possess external gills in early life.

Blistering Flies. See CANTHARIDES.

Blis'ters are substances used medicinally to produce counter-irritation. When applied to the surface of the body they raise the cuticle by causing serum to be exuded between it and the true skin, and thus form a vesicle. This vesicle should be punctured to allow the serum to escape, but the raised cuticle is not to be removed except in those cases in which a running sore is to be maintained. When this is desirable, it can be promoted by applying a second blister or some irritating substance, as savin ointment. B. should be dressed with lard and cotton wadding, great care being taken not to irritate the blistered part.

The substances used to produce B. are *boiling water*, strong ammonia, vinegar, cayenne pepper, mustard, turpentine, and cantharides. Of these, cantharides, either as a plaster or as *blistering fluid*, is by far the most common substance for producing B. It is generally allowed to remain for ten or twelve hours applied to the part.

Uses of B.—They are generally applied to relieve deep-seated pain in inflammation and congestion of internal organs. B. are also extensively applied to remove glandular swellings and other tumours. B. are very useful in removing fluid from internal cavities, especially in pleurisy and pericarditis. B. form the best application to indolent and callous ulcers.

B. should be used very cautiously in infants and old people, as they are very apt to produce great depression, and not unfrequently in such cases produce troublesome sloughing wounds. In all such cases it is best to remove the blister after a few hours, and afterwards apply a poultice. B. are to be avoided in all cases of inflammation of the kidneys, on account of the tendency of cantharides to produce bloody urine. Other remedial agents act in much the same way as counter-irritants, but produce a pustular eruption instead of vesicles, the chief of such substances being croton oil and tartar emetic.

Blis'ter Steel, a variety of steel, showing, when broken across, a fine granulated texture, and marked on the exterior with blister-like prominences of varying diameters. It is formed in a furnace in the process of converting bar-iron into steel by carburisation, which is effected by building up alternate layers of bar-iron and powdered charcoal, the upper layer of charcoal being covered over with a damp siliceous powder, the product of the wear of grindstones in the manufacture of steel articles, and keeping the whole at a red heat for from seven to ten days. The blisters are supposed to arise from a part of the charcoal cement combining with the oxygen of the included air to form carbonic oxide, which permeates the whole mass of iron carburising it, and rendering the surface vesicular. B. S. is employed in making files and tools of all descriptions. The first use of the process is unknown, but it was described at length by Reaumur in 1722.

Bloch, Marcus Elieser, a Jewish physician and ichthyologist, was born at Anspach, Bavaria, 1723, graduated as M.D. at Frankfurt, and settled at Berlin, where he died, 6th August 1799. His great work is *Allgemeine Naturgeschichte der Fische* (with 432 coloured plates, 12 vols. Berl. 1782-95). His *Systema Ichthyologia Iconibus CX illustratum* was left unfinished, and was published by Schneider (Berl. 1801).

Block, a nautical term, meaning the case or shell which contains the wheel or sheave of a pulley. A *tackle* is two or more blocks with the rope. The B. is called single, double, treble,

fourfold, according as it contains one, two, three, or four sheaves. The manufacture of this important part of a ship's rigging, so necessary for raising sails, tightening ropes, and other purposes, was carried on by hand till the year 1781, when a Mr Taylor invented and patented a process for making sheaves and sheaves. The late Sir Mark Isambard Brunel set up his ingeniously invented machinery in the dockyard at Portsmouth between the years 1802 and 1808. A duplicate of it was erected at Chatham about 1807. By this machinery every operation connected with the making of a B. is performed. It cuts up the rough timber, and polishes the iron for the pin on which the sheave turns. There is a machine for boring, for mortising, for shaping, for scoring, and for many other minute purposes. The whole of the machinery is put in motion by straps passing over drums, and is driven by a steam-engine of 32-horse power. By means of it, ten men can with ease finish from 130,000 to 140,000 blocks of different sizes in a year. The B. is made of elm, the sheaves of *lignum vitae*, and the pins are made of iron prepared so as to reduce friction as much as possible. The importance of this invention will be seen when it is mentioned that a single line-of-battle ship requires about 1430 of these articles for her equipment. Brunel received £20,000 for the invention, and for superintending the erection of his machine.

Blockade, in military or naval tactics, signifies the effectual stoppage, by a circle of fortifications or men-of-war ships, of all means of external communication with the garrison of a besieged fortress or port. If resistance is determined on by the garrison, the governor places the civilians (if any) under strict military rules; superintends the consumption of food, which is regulated as economically as possible; and makes frequent sorties, so as to at least retard, if not prevent, the complete investment by the enemy.

Blockade, in international law, means the rendering of intercourse with the ports of an enemy unlawful on the part of neutrals. In England, it has always been held that a B., to be valid, must be effective—that is, that there must be a force of ships sufficiently near the port to make it dangerous for a vessel to attempt to enter. On the Continent less strict conditions have generally been held to constitute a valid B. The French have held that a ship attempting to run the B. was entitled to warning, and that seizure was not legal until an act was done in defiance. To be binding on neutrals, a B., besides being effective, must be presumably known to them. Official notification ought, therefore, to be made of the fact.

A breach of B. may be made either by coming out of or going into the blockaded port. It subjects vessel and cargo to confiscation by the blockading power. A B. can only be maintained during war. It ceases on the proclamation of peace.

Block-house bears the same relation to a temporary fortification that a tower does to a permanent one. It is especially useful in a wooded country, where it is quickly raised, and where it is not easily attacked by large guns. The form is either rectangular or like a Greek cross, preferably the latter. The roof is composed of 3 or 4 feet of earth, strong and fire-proof; the walls are provided with port-holes, through which the besieged may fire; and a ditch is not unfrequently dug round it, thus preventing the near approach of the enemy. If opposed to artillery, the walls must be composed of two rows of trunks, with earth rammed firmly in between them.

Block Printing. See PRINTING.

Blocksberg, the name of several mountains in Germany, and, in particular, the popular name of the Brocken (q. v.), a famous eminence of the Hartz Mountains, on which the witches were popularly believed to hold their orgies on *Walpurgisnacht*, the night between the 30th of April and the 1st of May.

Block System. See RAILWAY.

Block Tin. In order to purify crude tin, it is subjected to the process of *liquation*. This consists in gradually heating ingots of the metal on the bed of a furnace, when the purer or *grain tin* fuses first and runs off, leaving an impure and less fusible alloy, containing, in addition to tin, iron, copper, lead, arsenic, and antimony. This alloy when remelted forms B. T.

Blois (Lat. *Blesia*), the capital of the department of Loire-et-Cher, France, 35 miles S.W. of Orleans by rail, beautifully situated on the right bank of the Loire, here crossed by a fine bridge

of eleven arches. It is the see of an archbishop, and has a communal college, a botanic garden, and a public library of 20,000 volumes. Its manufactures are chiefly porcelain, lace, and holser, and there is some trade in brandy, wine, and timber. Pop. (1872) 14,496, including the suburb of Vienne. B. contains a cathedral, a Roman aqueduct, which supplies the public fountains, and an ancient citadel, partly built in the 15th c., famed for its historical associations. In this castle Louis-XII. was born, and the Duc d'Alençon and Marguerite of Anjou, and also Henry IV. and Marguerite of Valois, were married; in it François I., Henri II., Charles IX., and Henri III. held their courts; and within its walls the Duc de Guise and his brother were murdered in 1588. At B. have been concluded numerous treaties. In the Franco-Prussian war, the troops of Hesse-Darmstadt here gained a striking victory over the French, June 28, 1871.

Blomfield, Charles James, an eminent English Churchman, was born at Bury St Edmund's, May 29, 1786. He studied at Trinity College, Cambridge, where he distinguished himself highly, and was elected fellow in 1809. In 1813 he became domestic chaplain to the Bishop of London, in 1821 Archdeacon of Colchester, in 1824 Bishop of Chester, in 1828 was translated to the see of London, and after a laborious and energetic career, died at Fulham, August 5, 1857. B. edited four of the tragedies of *Æschylus*; the *Fragments* of Callimachus, Sophron, of Sappho, and Alcaeus; contributed to the *Edinburgh* and *Quarterly Reviews*; and published sermons, lectures, pamphlets, &c. But his principal distinction was gained by his activity in the management of his diocese, and by his exertions for church-extension. His efforts for the suppression of certain offices in cathedrals, that their revenues might be applied to the augmentation of the smaller livings, subjected him to the unenviable satire of the Rev. Sydney Smith. See *Life of Bishop B.*, by his son Alfred (2 vols. Lond. 1863).

Blommært', Philip, Flemish *littérateur*, born about 1809, earned some reputation as a poet in 1834, but is now best known by his careful editions of Flemish poems of the middle ages, as the *Theophilus* (Ghent, 1836) of the 14th c., and the *Oud-vlaemsche Gedichten* ('Old Flemish Poems') of the 12th, 13th, and 14th centuries (3 vols. Ghent, 1838-51). He also translated the *Nibelungen* into Flemish iambs; but probably his greatest work is his History of the Belgians (*Alonde Geschiedenis der Belgen of Neder Duitschers*, Ghent, 1849), in which he shows strong Teutonic sympathies. B. died at Ghent, 14th August 1871.

Blon'del, properly **Blondiaus**, also **Blondel de Neale** or **Néele**, so named from his birthplace in the old French province of Picardy, a minstrel and poet of the 12th c., was the favourite comrade and brother-poet of Richard Cœur de Lion of England. His name has, however, been immortalised, after a fashion, by a beautiful but baseless tradition, which tells how Richard, kidnapped and hidden away in prison by Duke Leopold of Austria, was sought for and at last found by the faithful B., who wandered through Austria in disguise, until he finally came to a fortress in which a distinguished prisoner was said to be confined. Approaching close to the place, B. chanted a stanza of troubadour song well known to himself and to Richard, and was overjoyed to hear it answered from within in the voice of the King. Having thus discovered his master's prison, B. hurried back to England, where the required ransom was soon obtained, and the royal prisoner freed. The only ancient source for this tale is the Chronicle of Rheims belonging to the 13th c. (Par. 1836); all earlier records, English, French, and Austrian, are silent in regard to B. Even the songs of the *trouvères* Blondiaus and of King Richard, published by Tarbé (*Les Œuvres de B. de Néle*, Rheims, 1862), furnish no trace of the legend. But after the 15th c. the story began to spread, and its beauty has since won for it an abiding place in the human memory, if not in history. In the work of Tarbé's referred to, he has gathered together everything relating to the legendary and the historical B.

Blood, the most important fluid of the body, is a somewhat clammy liquid, a little heavier than water, its specific gravity being 1052 to 1057, water being 1000. It has a saltish taste, a peculiar odour, and is alkaline. In man and the higher mammalia it is florid red in the arteries, and dark purple in the veins. To the naked eye it appears a homogeneous liquid, but when

examined with a powerful microscope it is found to consist of a colourless fluid called the *liquor sanguinis*, in which float numerous corpuscles. These corpuscles are of two kinds, red and colourless corpuscles. The *red* are by far the most numerous, and are smaller than the *white* corpuscles. In man the red corpuscles are circular biconcave disks, and in B. drawn from the body have a tendency to run together, adhering to one another by their flat surfaces like pieces of coin piled one above another, forming cylindrical columns. This is easily seen under a powerful microscope. The size of these red corpuscles in man has been estimated at $\frac{1}{2500}$ to $\frac{1}{3000}$ of an inch in diameter. In quadrupeds they are generally smaller than in man, in the elephant, however, they are larger. In reptiles and amphibia they are much larger. The largest corpuscles yet observed are in the *protus*, in which they are about $\frac{1}{100}$ of an inch in length. The shape of these corpuscles varies in different animals. In most mammals they are shaped as in man; in the camel, however, they are elliptical. In reptiles, fishes, and birds, they are generally more or less oval. In most of the invertebrate animals the corpuscles are colourless, and hence their B. is also colourless.

White or Colourless Corpuscles are much fewer, somewhat larger, and lighter than the red corpuscles. 'In man (during health) the proportion of white corpuscles to the red is 2 or 3 to 1000. This proportion is diminished by fasting and increased after a meal, especially of albuminous food. Their number compared with the red corpuscles is said to be greater in venous than arterial B., and it is much greater in the B. of the splenic and hepatic veins than in venous B. generally.'—*Quain's Anatomy*. In certain diseased states of the spleen, the white corpuscles are much increased. See LEUCOCYTHÆMIA, or WHITE-CELLED BLOOD.

Liquor sanguinis is a pale clear fluid in which the corpuscles float. It consists of fibrine and serum, and has a great tendency to coagulate. The fibrine is best obtained by stirring newly-drawn B. with a bundle of twigs, which entangle the fibrine. Fibrine exists in B. about $\frac{1}{2}$ parts in 1000.

Serum of B. is a thin yellowish fluid, holding in solution about 10 per cent. of solids. It coagulates when heated owing to the albumen it contains. Serum also contains fatty matters and a peculiar nitrogenous principle called globulin, and certain salts, potash, and soda. Many chemists have carefully analysed B., but as that fluid is always changing, and differs very much in different parts of the body, it is impossible to give an exact chemical composition of B. The following, however, may give a general idea of its chemical constitution:—1. 1000 parts nearly 800 parts consist of water and the rest solid matters. This solid residue has nearly the same chemical constitution as flesh. The red corpuscles contain a principle termed *Globulin*, closely allied to albumen, and a colouring matter called *Hæmatin*. The hæmatin contains iron. The globulin, along with some colouring matter, forms the so-called B.-crystals. These crystals are very beautiful and are differently shaped according to the B. of the animal from which they are drawn.

Coagulation of B.—When B. is drawn from the vessels it very soon coagulates. This is due to the fibrine separating into a solid mass, entangling within its meshes the corpuscles, and allowing the serum to escape. In inflammation and certain other diseases the red corpuscles separate from the *liquor sanguinis*, and fall to the bottom before coagulation takes place, and the white corpuscles, on account of their lightness, float on the surface; and hence, when coagulation takes place, the clot is of a light colour, forming what has long been called the '*buffy coat*.' Cold retards coagulation whilst moderate heat accelerates it. It is also much affected by chemical substances. It is retarded by acids and prevented by alkalies. Faintness promotes coagulation, whilst excitement, as a rule, retards it. The colour of the B. is due to the red corpuscles. These undergo a remarkable change in passing through the capillaries. The corpuscles then give off oxygen, which unites with the carbon of the tissues to form carbonic acid and render the B. dark in the veins. On the other hand, as the B. passes through the lungs it takes in oxygen, and again assumes the florid red colour of arterial B. The B. receives the products of digestion and carries them to the tissues, and receives the waste of the tissues to be excreted by special organs of which the kidneys are the chief. The quantity of B. in the human body is said to be above 30 lbs. in the male and less in the female. The B. varies much in

disease, but the special B. diseases will be treated under their respective heads. See CIRCULATION OF THE BLOOD, RESPIRATION.

Blood, Thomas, a singular and successful desperado, was born in Ireland about 1628, his father being according to one account a blacksmith, according to another an ironmaster. He served in the Parliamentary army in his own country, and the desperate character of the man was shown in a plot which he made after the Restoration to seize Dublin Castle and the person of the Duke of Ormond, the Lord-Lieutenant. The plot was discovered, and B. fled the country. After a wandering life in Holland, Scotland, and England, he placed himself at the head of another conspiracy against the Duke of Ormond, seized him in his coach on 6th December 1670, and all but succeeded in having him hanged at Tyburn. Singularly enough, he was never suspected of having had anything to do with this desperate villain, although there is some reason to think that he was screened by the Duke of Buckingham, if not hired by him for the purpose. His next exploit was the most daring of all. Disguised as a clergyman, he attempted with two accomplices, May 9, 1671, to carry off the regalia from the Tower. He was, however, seized with the crown in his possession, and thrown into prison. There he was visited by Charles II., whom he so alarmed by a statement that he was at the head of a large band of conspirators who would certainly avenge his death, that the king not only pardoned him, but gave him a pension of £500 a year. 'Colonel' B., as he was called, became indeed an influential person at court. Subsequently, however, he fell out with Buckingham, made a scandalous imputation against him, and was imprisoned. He was, however, admitted to bail, and he died in his own house, 24th August 1680.

Blood, Avenge of, the man whose duty it was, according to a custom yet in vogue among nations of patriarchal habits, to avenge the death of a murdered relative, unless a certain compensation or B.-money were paid by the murderer. The Mosaic law was peculiar in preventing the escape of the wilful murderer by the payment of B.-money, in restricting the vengeance to the offender himself, and in providing means for the escape of an unintentional manslayer. See NUMB. xxxv., and CITIES OF REFUGE.

Blood, Corruption of. See TREASON.

Blood, Eating of, prohibited Genesis ix. 4, and frequently in the Mosaic law, generally in connection with sacrifices. The prohibition was renewed by the council of apostles and elders at Jerusalem (Acts xv. 29), but coupled with things offered to idols, an evident compromise between Christian liberty and Jewish prejudices. The Koran, too, enjoins abstinence from B. and from things offered to idols.

Blood-Bird (*Myzomela sanguinolenta*), a species of Honey-eater (q. v.), a native of New South Wales, and named from the scarlet colour of its body, except the wings and legs.

Blood-Flower (*Hemantus*), a genus of bulbous-rooted plants (natural order, *Amaryllidaceæ*), which gets its name from the colour of the flowers of most of the species. There are about fifteen or sixteen species, nearly all natives of the Cape of Good Hope, and many of them cultivated in our conservatories. Most of them are poisonous. The inspissated juice of *H. toxicarius* is used by the Bushmen to poison their arrow points.

Bloodhound, a breed of hounds known also by the name 'Sleuth-hounds,' possessing a broad-chested, muscular body. The ears are large and pendant, as also are the overlapping upper lips. The usual colour is a tan of various shades, interspersed with black. These dogs have gained an unenviable reputation, from their having been used to track fugitives, and especially runaway slaves. The breed has lately declined in Europe, although in America, but more particularly in Cuba, these dogs are still bred for the purposes above noted. They are not naturally fierce, but possess a powerful and acute scent; and are trained to show a great

Bloodhound.

amount of dogged perseverance in following up the trail, as well as to exhibit ferocious traits. The Cuban B. is a variety more nearly allied in general conformation and in ferocity to the bulldog. It is still used in Cuba in tracking slaves.

Blood-letting may be either general or local. General B. consists in abstracting blood from the general circulation. This may be effected from an artery (arteriotomy), or from a vein (venesection or phlebotomy). When from an artery, it is usually the anterior branch of the Temporal Artery (q. v.). The vessel is cut obliquely but only punctured, care being taken to have the wound in the integument much larger to allow the blood freely to escape. When sufficient blood has been drawn, the artery is to be completely cut across and a pad and bandage are to be applied. In venesection, blood is generally drawn from the arm. A bandage is tied above the part to be opened, sufficiently tight to obstruct the blood in the veins, but not tight enough to interfere with the flow of the blood in the arteries. It is generally the median Cephalic Vein (q. v.) which is selected. The vein is opened obliquely, and when sufficient blood is abstracted, the bandage is untied and a pad and bandage applied to the wound. In certain cases B. is performed on the external Jugular Vein (q. v.) in the neck. B. is now seldom resorted to in surgical practice. At one time it was universal in all inflammatory diseases, and even a common occurrence for the most trifling complaints, and in many instances for no disease whatever. Now it is rare in any instance. This change has been brought about partly by an alteration in the type of disease, but chiefly by a more correct knowledge of the nature of disease, and of the proper medicines to be applied. Local B. is more advantageous, especially to relieve local congestions, and may be performed by simple incisions, by cupping, or by leeches. See CUPPING and LEECHES.

Blood of our Sa'viour, an order of knighthood limited to twenty knights, instituted by the Duke of Mantua in 1608. The Dukes of Mantua were sovereigns of the order, the name of which was suggested by the preservation in the Church of St Andrew, Mantua, of what were believed to be some drops of the B. of Christ.

Blood of St Janua'rius. See JANUARIUS, St.

Blood-root. See GEUM, HÆMODOREÆ, and SANGUINARIA.

Blood-stone. See HELIOTROPE.

Bloom (Old Eng. *bloma*), originally a mass of malleable iron obtained by direct reduction of the ore in a hearth or bloomery. The word is now used in ironworks for the spongy mass of iron taken from the puddling-furnace. See IRON.

Bloom, in art, an appearance on the surface of paintings resembling in some points the B. of certain fruits, which destroys the transparency of the picture, and is caused by moisture in the varnish or on the picture before varnish is laid on. It is removed by sponging the picture with hot camphine, smoothing with a soft brush, and drying in the open air. Most pictures painted nowadays are not varnished at all.

Bloom'erism, a momentary fashion in ladies' dress, originating in America in connection with the female rights movement. It took its name from Mrs Anne Bloomer, who, in 1849, adopted and advocated the so-called reform. The dress originally consisted of a jacket with close sleeves, a skirt reaching a little below the knee, and trousers. The dress subjected its wearers to a good deal of ridicule and even social persecution, and although some more or less graceful modifications of it have been suggested, it has never become popular here or even in America.

Bloom'field, Robert, one of the best English pastoral poets, was born in 1766, at Honington, Suffolk, where his father was a poor tailor. He worked first as a farm-servant, then as a shoemaker in London, and after unsuccessful efforts in various occupations, died at Shefford, in Bedfordshire, August 19, 1823, deprived of memory and almost of reason. His chief works are *The Farmer's Boy* (composed in a London garret), *Rural Tales*, and *Wild Flowers*. They are admirable for their charming artlessness, fidelity to nature, and fresh, honest flavour of rusticity. They have been often reprinted.

Blouse, a light, loose, blue over-garment, worn especially by the working-men of France, who are hence called *blousers*. A white B. is Sunday dress. The smock-frock of the English waggoner and farm-labourer is now frequently called a B. It is made of coarse, under-bleached linen, and is plaited and embroidered on the breast and shoulders. It is sometimes worn by butchers in the Lowlands of Scotland, the colour being blue, as in France. It is worn blue also in Germany, where the B. is frequently tightened by a belt.

Blow-Fly, or **Flesh-Fly** (*Sarcophaga carnaria*), a genus of *Dipterous* insects or flies, belonging to the *Muscidae*, or family including the domestic fly, &c. The adult B.-F. possesses a yellowish head, a greyish thorax, whilst the abdomen is coloured of a blackish-brown with a bluish or metallic lustre. The eyes are set apart in both males and females. The body is hairy. The wings may measure an inch in extent. The eggs are deposited in decaying flesh and organic matter, or upon the bodies of living animals (e.g., sheep), in the skin of which the larvæ cause much irritation or even serious disease. Sometimes the eggs appear to be hatched within the parent body, the flies being thus ovo-viviparous. Another species (*S. mortuorum*) is said to inhabit cemeteries and graveyards, this form being distinguished by a red line or mark on the front of the head. The larval flies, deposited in decaying matter, do good sanitary service by removing putrescent material from the earth's surface.

Blowing Machines are instruments for producing blasts or currents of air, and are used for exciting combustion or generating a great heat. The common bellows is one of the simplest in use, and very primitive forms are met with among uncivilised nations. All, however, work on the same principle—viz., by contracting the dimensions of the space within which a quantity of air is confined, and thus forcing the air out with a velocity proportional to the pressure and to the smallness of the aperture. The space is refilled by taking advantage of the elastic properties of air as a gas. A serious objection to such machines as the common bellows is the want of a continuous blast, and to remedy this defect, various improvements have been suggested, such as the use of two bellows. This, however, was soon superseded by the double bellows, which consists of two contiguous chambers, connected by a valve opening into the upper one, with which the exit-pipe is connected. The upper chamber is filled by compression of the lower one, which is itself refilled by merely permitting it to open by the gravitating weight of the lowest board, which is also provided with an inlet valve.

In blast furnaces, the blowing arrangement is somewhat more complicated, and is worked by a steam-engine. There is an ordinary steam-cylinder at one end of the beam, and at the other is a blast-cylinder. This latter is provided with an air-tight piston, connected with the beam by a piston-rod, and with several inlet valves and an outlet valve at each end. The outlet valves both open into the exit-pipe. Suppose, now, the piston to be at the top of the cylinder, the lower part of which is filled with air. As the piston descends, the inlet valves below are closed, and the compressed air escapes through the outlet valve into the exit-pipe; but at the same time the pressure of the external atmosphere opens the inlet valves above, and fills the upper portion of the cylinder with air, which is, in its turn, forced into the exit-pipe by the ascending piston. Meanwhile, the lower portion of the cylinder is being refilled with air through the inlet valves, and thus the operation is repeated and a tolerably continuous-blast produced.

Another important blowing machine is that known as the *fanning* machine or *Fanners* (q.v.), originally used as a winnowing machine, but now applied to purposes of ventilation, heating, drying, water-raising, &c. It consists usually of a wheel with fans instead of spokes, rotating in a box, open at the centre, and shaped spirally with respect to the wheel. The air sucked in at the centre is driven to the extremities of the fans, and forced round till it finds its exit along a pipe fixed tangentially into the box. There are various modifications of this, such as Chaplin's double fans, and Platt & Shiele's silent fans, which latter are provided with curious-shaped vanes.

Blow-pipe. The B. is an instrument of great value to the chemist and mineralogist for detecting the presence of many elements and their compounds in substances to be analysed; it is also employed in the arts for soldering and glass-blowing. The

discovery of the B. is ancient, but its application to analysis comparatively modern, having been introduced by the Swedish chemists of the last century. Many forms of the instrument are made, but the simplest is that invented by Black, and known as Black's B. It consists of a conical tube made of sheet-iron (A), at the wide end of which is attached a thin brass tube (B), provided with a nozzle of brass or platinum (C). In using the instrument, the narrow extremity (D) is placed in the mouth, and the nozzle applied to the flame of an oil or gas lamp; a steady blast of air is then forced from the mouth through the nozzle against the flame. The B. flame consists essentially of three parts: A is a non-luminous cone in which is a mixture of unburnt combustible gases and atmospheric air, both at a low temperature. B is luminous, and consists of burning gases containing an excess of carbon and carbonic oxide; whilst at C the flame again becomes less luminous, owing to the abundant supply of oxygen, which deprives it of its combustible materials; the temperature of C is exceedingly high, particularly in the neighbourhood of the point of B. If any easily reducible compound—such, for instance, as the oxide of lead—

Black's Blowpipe.

Blowpipe Flame.

be applied on a suitable support to B, the unburnt carbon combines with the oxygen of the oxide at the high temperature to form carbonic oxide, and lead becomes separated or reduced. B is therefore called the *reducing* or *inner* flame; whilst C, on account of its oxidising properties, is called the *oxidising* or *outer* flame. The following are the more important B. tests: (1) The substance placed in a cavity scraped in charcoal, and mixed with carbonate of soda, is heated in the reducing flame; if it contain antimony, arsenic, bismuth, copper, lead, silver, or tin, these metals become separated in *beads*, and may be recognised by their physical properties, and often by the incrustation of metallic oxide left on the charcoal. (2) The substance is heated on platinum wire in the hottest part of the flame; if barium, calcium, potassium, sodium, or lithium are present, the flame assumes a characteristic colour. (3) The substance is heated on platinum foil after it has been moistened with nitrate of cobalt; if aluminum, magnesium, or zinc is contained in it, the resulting mass is blue, pink, or green, as the case may be. (4) A small particle of the substance, together with some borax, is heated on a loop of platinum wire before the flame; the resulting borax *bead* becomes coloured if chromium, cobalt, copper, iron, manganese, or nickel be present, the colour varying in some cases according as the bead is heated in the inner or outer flame.

Blowpipe and Arrow, a native weapon found among several tribes of S. American Indians, who use it with great skill and precision. The pipe is a straight tube formed of the small palm stem, and is usually from 8 to 12 feet long. The arrows, which vary much in length, are made to fit exactly the hollow of the pipe by means of the down of the silk-cotton tree, and are expelled with great force by blowing through the tube.

Blubber. See CETACEA, WHALE, and WHALE-FISHERY.

Blücher, Gebhard Leberecht von, Prince of Wahlstadt, a distinguished Prussian commander, belonged to one of the oldest Mecklenburg families, and was born at Rostock, Mecklenburg-Schwerin, December 16, 1742. He entered the Swedish service at the age of fourteen, but being captured by the Prussians, joined the standard of Friedrich the Great. He served during the Seven Years' War, and rose to the rank of captain. Being, however, offended at what he imagined to be a slight passed upon him, he requested his discharge, and Friedrich granted it, in a *brusque* manner telling him he 'might go to the devil if he pleased.' After a few years spent in retirement on his Pomeranian estate, B. returned to the army, and served with considerable distinction, particularly as a leader of cavalry, in 1792, 1793, and 1794. In 1806 he commanded the advanced guard at the battle of Auerstadt, and defended Lübeck with

great obstinacy. Taken prisoner, he was soon exchanged for Marshal Weber, and kept persistently rousing his country against Napoleon, until it did rise. In 1813 he fought bravely at Lützen, defeated Macdonald on the Katzbach, and aided greatly in achieving the victory of Leipsic, obtaining from the Russians, on account of the rapidity of his movements, the nickname of 'Marshal Forward.' Crossing the Rhine on the 1st of January 1814, he fought desperately against Napoleon, sometimes winning and sometimes losing, but always cheerful, confident, and stubborn. Finally his victories at Laon and Montmartre in March crushed his once terrible foe, and on the 31st of that month the 'old captain of hussars' rode proudly into Paris. On following the allied sovereigns into England, B. was received with great enthusiasm. In 1815, after Napoleon's escape from Elba, he was again appointed to the command of the Prussian troops; and although beaten and all but killed at Ligny, he brought up his troops in time to make the battle of Waterloo decisive. He once again entered Paris, and, remembering what shame and disgrace Germany had suffered at the hands of France, would have allowed his men to plunder it had he not been restrained by Wellington. B. was honoured by his king and country as a hero. Statues were erected to him; he was made Prince of Wahlstadt, and the estate of Kriebowitz, in Silesia, was bestowed upon him. There he died, September 12, 1819. As a man, B. was open-hearted but uncultivated; as a soldier he was intrepid, rapid in movement, and indifferent to defeat. Nothing could daunt the spirit of the man, but his strategy was not remarkable for its skill, and was utterly unlike the profoundly scientific style in which Prussia went to work against Austria (1866) and against France (1870). B.'s intense patriotism helped the great cause of the unification of Germany, which has been accomplished in the present day. See Varnhagen Von Ense's *Lebensbeschreibung B.'s* (Berl. 1827); Schöning's *Geschichte des Preuss. 5 Husarenregiments mit besonderer Rücksicht auf B.* (Berl. 1843); Bieske, G. L. *Blücher von Wahlstadt* (Berl. 1862); Scherr, B., *Seine Zeit und Sein Leben* (Leips. 1862). For an interesting account of the ancient and honourable family to which B. belonged, see Wigger's *Geschichte der Familie B.* (1871).

Blue, one of the so-called primary colours, seen in nature in the clear expanse of the heavens. From the azure vault, the colour B. has acquired a peculiar significance, and in mediæval times it was taken as the emblem of eternity and immortality. The Virgin Mary, represented in a B. mantle, symbolised virginal modesty, and angels in B. garments were typical of faith and fidelity. In heraldry, B. is regarded as an emblem of chastity, loyalty, and fidelity. Its significance extended to its combinations with other colours; thus purple in which red predominated indicated love of truth, while B. purples were emblematic of the truth of love. The connection of B. with fidelity still lingers in popular apprehension in such an expression as 'true B.'

B. dyes are not numerous, and before the discovery of the aniline or coal-tar colours, dyers principally depended for their blues on WOAD, ARCHIL INDIGO, and PRUSSIAN B. Now, a series of very brilliant blues and bluish-purples are obtained from coal-tar, and they are possessed of great tinctorial power and durability. Among these may be mentioned *bleu de Lyon*, or *bleu de Paris*, Nicholson's soluble B., and azurine (see DYEING and CALICO PRINTING). The principal B. colour used by painters is ultramarine, a brilliant azure colour, which was originally prepared from lapis-lazuli, a mineral found in China and other oriental countries. Ultramarine, as now prepared, however, is an artificial compound, prepared by roasting together certain proportions of China clay, carbonate of soda, sulphur, and charcoal (see ULTRAMARINE). Among other painters' blues may be enumerated Prussian B., and various modifications of the same base, by the addition of materials which alters its body, indigo, cobalt B., smalts, or powdered cobalt glass, and mountain B. or bice, prepared from carbonate of copper. The oxide of cobalt is an important basis of many blues in use besides the two above indicated, which are very extensively used in the colouring of pottery, porcelain, and glass. The various colours alluded to will be found more particularly detailed under their own names.

Bluebeard, the title of a French tale, the hero of which, a certain Chevalier Raoul, is distinguished by having a *blue beard*. The tale, which is too familiar to require analysis, has become ex-

tremely popular, especially in its nursery form, in all countries of Western Europe, and has formed the basis of several well-known dramatic compositions. It is thought that a certain Gilles de Laval, Seigneur de Riaz, marshal of France in 1429, a man whose acknowledged patriotism and valour were cast into the shade by his atrocious cruelty, was the original of the fictitious Raoul. Riaz was burnt alive in 1440, at the instance of Jean VI., Duke of Brittany. As his crimes are detailed in connection with charges of *diablerie*, it is probable that truth and fiction are inextricably intermingled.

Blue-Bell. See HYACINTH.

Blue-Bird, or Blue-Robin (*Sialia* or *Sylvia sialis*), a genus of Insectorial birds, included in the sub-family of the *Erythacinæ* or robins. It inhabits the United States of America in summer, and usually migrates southwards in winter to the W. Indies and tropical America. The B.-B. represents in America, from its familiar habits, the redbreast of Britain. It is coloured

Blue-Bird.

sky-blue in its upper parts, red or chestnut on the breast, and white on the belly, the colours of the female being less brilliant than those of the male. The song is very agreeable. The nest is built generally in the holes of trees, and the eggs, of a pale blue colour, number five or six. Two or even three broods are produced annually. The B.-B. rather exceeds our redbreast in size, but resembles the latter in the general shape of its body. These birds are remarkably pugnacious and courageous. Nearly allied species, or varieties, represent this bird farther north on the American continent, whilst it also occurs in Brazil, Guiana, Mexico, and the W. Indies.

Blue-Books, the printed publications of the British Parliament, so called from their being uniformly bound in blue paper, as those of the French Government, are named *livres jaunes* ('yellow-books'), from a similar circumstance. They have been published regularly since the beginning of the 18th c., and consist chiefly of the votes and proceedings, acts of Parliament, the estimates, correspondence connected with matters of discussion, and reports of commissions. Those of a single session now form a collection of some sixty large folio volumes, which, though containing papers on the utmost diversity of subjects, treated on no regular principle, are rendered handy and coherent by means of annual indexes. In the United States the name is applied to a book containing the names of all persons in the Government service, together with their salaries.

Blue-Bottle Fly. See FLESH-FLY.

Blue Cardinal. See LOBELIA.

Blue-Coat School, the common name of Christ's Hospital (q. v.), arising from the circumstance of the boys wearing blue coats or gowns.

Blue-Eye (*Entomysa cyanotis*), belongs to the family of Honey-eaters (q. v.), and is a native of Australia. It is gregarious, and one of the most pleasing sights in the Australian bush is afforded by the flocks of blue-eyes flitting from tree to tree sipping the honey from the flowers with their long tongues. They also eat small insects, and berries in the winter-time.

Bluefields, a river rising in Nicaragua, Central America, and flowing through the Mosquito territory to the Caribbean Sea, which it enters about 210 miles S. of Cape Gracias à Dios. At its mouth is situated a small town of the same name (pop. 600), the residence of the ruler of the Mosquito territory.

Blue-Gowns, a class of privileged beggars popularly so called in Scotland. They had a small royal bounty. The last of them drew his last allowance from the Exchequer in Edinburgh in 1863. See *Baldmen*, under BEAD.

Blue-John, the name given by miners to a rich violet-blue variety of Fluor-spar (q. v.), found abundantly in Derbyshire, and manufactured into vases, &c.

Blue-Mantle, the title of a pursuivant-at-arms in England. See PURSUIVANT.

Blue Mountains.—(1) A range of mountains which traverses the island of Jamaica (q. v.) from E. to W. It is densely wooded, abounds in splendid scenery, and varies in height from 5000 to 7000 feet.—(2) A mountain-chain in New S. Wales, extending, strictly speaking, from 34° to 33° S. lat., but often popularly regarded as reaching to 32° S. lat. The B. M. in their proper signification consist of two parallel ranges, of which the western one is the higher. They are full of gloomy ravines and fearful precipices, and the two ranges are divided by an immense chasm 1500 feet deep. The character of these huge fissures has been graphically depicted in the following sentence: 'Narrow, gloomy, and profound, these stupendous rents in the bosom of the earth are enclosed between gigantic walls of sandstone rock, sometimes receding from, sometimes overhanging, the dark bed of the ravine and its black silent eddies, or its foaming torrent of water.' The highest peak is Beemarang, 4100 feet; and the average height of the range is 3300 feet. The B. M. are now traversed by a railway, which attains at Blackheath station a maximum height above the sea of 3494 feet. The ascent from the plains on either side of the range is made by 'zigzags.' The western one is a remarkable specimen of engineering skill.

Blue Pill, the *Pilula hydrargyri* of the Pharmacopœia, consists of 2 parts of mercury, 3 of confection of roses, and 1 of liquorice powder. The dose is 3 to 8 grains (one or two pills). This is a useful pill when a mild mercurial is indicated. It is less liable than certain other preparations of mercury to cause irritation. It is useful in certain sluggish states of the liver and bowels, but, like all preparations containing mercury, should be administered with great caution. This pill may be used to produce the constitutional effects of mercury when that is considered desirable. The medicinal effects of B. P. as a mercurial will be treated under MERCURY (q. v.).

Blue Ridge, the eastern range of the Appalachians (q. v.), United States, extending almost continuously from New York to Georgia. The highest peak is Mount Mitchell in North Carolina, which has an altitude of 6470 feet.

Blue Shark (*Carcharias glaucus*), a genus of true sharks common in the Mediterranean, but sometimes occurring on the southern coasts of Britain. The head is pointed and flattened, the teeth being sharp and notched at the edges. No spiracles or breathing-holes, placed on the top of the head, exist in this form. These sharks attain a length of eight feet or more, and are of voracious disposition, feeding chiefly upon fish. The B. S. is said to manifest a close attachment to their young. The common or white shark (*C. vulgaris*) is a nearly allied form. See SHARK.

Blue Skate (*Raja batis*), a genus of skates, sometimes also, from its bluish-grey colour, named the grey skate. This form possesses a rhomboidal body. The tail is spineless, and two small dorsal fins exist far back on the tail. The females of this genus in Plymouth market are named 'maids,' and 'good wives.'

Blue-Stocking, a name applied to female pedants, and suggested by the blue stockings of a Mr Stillingfleet, a conspicuous member of a society of both sexes formed in London about 1780 for literary conversation. The name is generally used somewhat opprobriously, as indicating that the B.-S. indulges her literary tastes to the neglect of home duties.

Blue-throat, or Blue-breast (*Sylvia* or *Phenicura suecica*), a genus of Insectorial birds, rare in Britain, but found very generally distributed over the continent of Europe, averaging a robin in size, and possessing the throat and breast of a bright blue colour. In the centre of the blue patch a spot, white in some forms, and red in the adult males, exists. Beneath the blue, the front parts are barred with black, white, and chestnut colour. These birds are eaten in Alsace and Lorraine, and pass in Italy by the name of Becfin (q. v.), and Beccaficci (q. v.). Their song is very sweet, and they possess considerable imitative powers.

Blue-wing (*Cyanoptera discors*), an American genus of Anatida or ducks, resembling the teal, but of larger size; the males in full plumage being coloured black in the upper parts of the head, the rest of the head being blue, and a crescentic patch before each eye being white. The wings are coloured with various shades of blue; the upper parts being brown, glossed with green, and the under parts orange or reddish.

mottled with black. The tail contains fourteen feathers, and is of shortened conformation. This bird is named the blue or blue-winged teal in the United States of America. In summer these birds fly to the 57th parallel, but in winter they migrate southwards. In Jamaica, Texas, and elsewhere these birds are said to be permanent residents. The flesh is much esteemed for table.

Blum, Robert, a German political writer and agitator, was born of humble parentage at Cologne, November 10, 1807, and rose from the position of scene-shifter to that of manager in the Cologne theatre; afterwards holding a similar situation in Leipzig, where he cultivated letters and latterly became a publisher in 1847. Besides his contributions to various political and literary journals, he published along with Herloszsohn & Marggraf a *Theaterlexikon* (7 vols., 1839-42), with Steger, the political almanac, *Vorwärts* (5 vols., 1843-47), and independently, a *Staatslexikon für das deutsche Volk* (1847). In 1845 he distinguished himself in the German Catholic movement at Leipzig as a bold and eloquent speaker, and in 1848 was made vice-president of the provisional parliament at Frankfurt, performing his duties with characteristic vigour and intelligence. In the same year he was elected a member of the National Assembly, and became the leader of the Left, or democratic party. During the October rising in Vienna, along with Fröbel he conveyed a memorial of congratulation from the Left to the insurgents, but on the recovery of the city he was captured and shot, November 9, 1858. His son, **Hans B.**, born at Leipzig, June 8, 1841, was chosen a member of the Reichstag in 1866, and has been editor of the *Grenzbote* since 1871.

Blumenbach, Johann Friedrich, a celebrated naturalist, was born at Gotha, 11th May 1752. After studying at Jena and Göttingen, he became (1778) ordinary Professor of Comparative Anatomy and Physiology at the latter university. These subjects he made the stepping-stone to the natural history of man, comparing men and animals with respect to cranial and facial developments, and originating in 1785 the classification of the human race into white, black, red, yellow or tawny, and Malayan. On these subjects and on the history of medicine he lectured for 50 years. B. died 22d Jan. 1840 at Göttingen, where a colossal monument to him was unveiled May 19, 1878. His *Handbuch der Vergleichenden Anatomie und Physiologie* (Gött. 1804; 3d ed. 1824), and *Handbuch der Naturgeschichte*, have been very popular all over Europe. His observations on skulls are contained in the *Decades VIII. Cran. div. Gent.* (1790-1828). His speculations on the generative principle (*visus formativus*) were valueless. See Marx, *Zum Andenken an J. F. B.* (Gött. 1840).

Blumenthal, Leonhardt Von, a distinguished Prussian general, was born at Schwedt on the Oder, July 30, 1810, educated in the military academies of Culm and Berlin 1820-26, and received the appointment of lieutenant in 1827. After holding various minor posts, he was raised (1849) to the general staff, and appointed to the command of the Slesvig-Holstein army. He was twice subsequently employed to convey to England special military propositions. In the Danish war of 1864, however, came his first great military success, when his strategical ability was so decidedly shown in the taking of Missunde, the storming of the trenches at Duppel, and in the passage to the island of Alsens. In acknowledgment of these services, he was raised to the rank of major-general. B. afterwards greatly distinguished himself in the Austro-Prussian war of 1866, and on the outbreak of the Franco-Prussian war was appointed chief of the general staff of the army of the Crown Prince. To the skilful operations of B. in the latter campaign were in great part due the catastrophe of Sedan and the capture of Paris.

Blunderbuss is a short and wide-bored musket, capable of taking in several bullets at once. It is destructive only at close quarters, and is now almost entirely superseded by the carbine. (The name is a corruption of the Dutch *donderbus*, 'thunder-gun.' Comp. Ger. *donnerbüchse*.)

Blunt'schli, Johann Kaspar, a distinguished Professor of Political Science in Germany, was born at Zürich 7th March 1808. He studied at Berlin (1827) under Savigny, and afterwards at Bonn under Hasse and Niebuhr. In 1833 he was appointed a professor in the newly-founded university of his native town, went to Munich in 1847, and accepted a call to Heidelberg in 1861, where he has since remained. B.'s career has been active and patriotic. Averse to the narrow and schis-

matical Radicalism of the German democrats, he has laboured unweariedly to create a national party which should be at once liberal in politics and conservative in spirit. Of his numerous writings we may mention *Staats- und Rechtsgeschichte der Stadt und Landschaft Zürich* (Zür. 1838, 1839; new ed. 1856); *Geschichte des Schweizer Bundesrechts* (Zür. 1846-52); *Allgemeines Staatsrecht* (Mün. 1852; 4th ed. 1869); *Deutsches Privatrecht* (Mün. 1853; 3d ed. 1864); *Die neuen Rechtsschulen der Juristen* (2d ed. Zür. 1862); *Geschichte des Allgemeinen Staatsrechts und der Politik* (Mün. 1864); *Das Moderne Völkerrecht* (1866); *Das Moderne Völkerrecht als Rechtsbuch* (1868).

Bo'a, a name applied generally to the serpents included in the family *Boide*, which includes the true Boas and Pythons (q. v.). These serpents are the giants of the serpent tribe, and are included in the sub-order *Colubrina*, and in the *Innocuous* section of that group. These forms possess ordinary teeth in the upper jaw, and are destitute of fangs and a poison-apparatus; but, although innocuous as far as venomous qualities are concerned, they are yet greatly to be dreaded on account of their immense strength, by means of which they are enabled literally to crush their victims to shapeless masses, by entwining themselves round their bodies, and inclosing the victim within the folds. Rudimentary hind-limbs exist, these being indicated externally, by the presence of two horny claws or spurs, placed in close proximity to the vent. The tail is eminently prehensile, and is covered below by a double row of plates. By its aid these forms suspend themselves from trees, whilst they lie in wait for their prey. The head is covered by scuta, or shields, is roughly triangular in shape, and is separated from the body by a neck-like constriction. The mouth is very wide, the gape extending far behind the eyes. The throat is scaly, and the belly is covered by transverse plates. No intermaxillary teeth exist in the boas, and the teeth are conical and somewhat recurved in form. These serpents occur chiefly in S. America. The *B. constrictor* is the best known, but by no means the largest species. It generally attains a length of 12 or 15 feet. The *B.*, or *Eunectes marinus*, or 'Anaconda' of some writers, is larger than the *B. constrictor*—this latter term, like the name *B.* itself, being applied indiscriminately, and in a popular sense to all the members of the group.

These forms are credited with being able to swallow prey of very large bulk; and there can be no doubt that a large *B.* can swallow animals of the size of a sheep or goat. Various circumstances contribute to the easy deglutition of prey of such bulk. Thus, firstly, the body of the victim is crushed to a shapeless pliant mass by the folds of the serpent. Its body is probably smeared over by the viscid or glutinous saliva of the *B.*, and is thus more readily swallowed. The mouth of these serpents can be greatly distended from side to side; the halves of the lower jaw being connected by ligament only, and the mouth-cavity can also be greatly widened in a vertical direction, owing to the mode in which the lower jaw is articulated to the skull. Then, lastly, the teeth, from their recurved position, assist in retaining the prey in the mouth as it is being slowly swallowed. After a full meal, these forms generally lie torpid for a longer or shorter period. As in many other serpents, only one lung is functionally useful in the boas, the other lung being abortive or rudimentary. These serpents generally inhabit the neighbourhood of rivers and lakes, and lie concealed amid the branches of trees, so as to pounce with certainty upon the animals which come to drink. The nearly related Pythons (q. v.) of the Old World very closely resemble the boas in their essential characters, but possess intermaxillary teeth, and their labial or lip-plates are deeply pitted.

Boadice'a, 'the British warrior queen,' ruled over the Icenii, in the district now known as Norfolk and Suffolk, in the latter half of the 1st c. A.D. Her husband, Prasutagus, to win the favour of the Romans, had left (60 or 61 A.D.) his wife and two daughters and the Emperor Nero his joint-heirs. The bribe proved of no avail, for the Roman soldiers plundered the country, scourged B., and violated her daughters. The Britons rose, and in revenge took several colonies and destroyed about 70,000 Romans. Suetonius, the Roman governor, now advanced, and

Boa Constrictor.

was met by B. at the head of a great horde of her infuriated countrymen. A terrific battle ensued, in which the Britons were completely overwhelmed, and the Roman power in Britain firmly established. Tacitus tells us that some writers state the number slain amounted to 80,000. B., in despair, took poison and died (62 A.D.).

Board, the name usually applied to the directors and others having the management of any public institution, or of any legal, commercial, or charitable trust. In various departments of the government, the term is also used to denote those in management, when met for business purposes.

Board, a plank or deal of timber, as used in most operations of joinery. From the use of such timber in vessels B. has come to have a special application in nautical affairs. Aboard or on board ship are phrases used in connection with the loading of ships' cargoes or the reception of crews or passengers. Boarding an enemy is a phrase in the tactics of naval warfare which was formerly much practised, but in the transition state of vessels and armaments it is difficult to say what may be the future course of sea-fights. 'On the boards' is an expression having originally a theatrical application, meaning the bringing forward of anything on the stage; but it has now passed into current language to indicate the production of any project or display.

Board of Admiralty is a department of government which has the control of all matters relating to the British navy. In former times the functions of the B. of A. were discharged by the Lord High Admiral of England. See ADMIRAL.

The board is composed of five Lords Commissioners. Two of these are civilians, and three are naval officers. Besides his share of corporate action, each lord has his special function. The First Lord is always a cabinet minister. At board meetings he has, like the rest, but one vote; but his parliamentary responsibility as a member of the Government practically invests him with absolute authority.

Board of Ordnance was a department of the government having control of all that related to the artillery and munitions of the British army. It was found that in matters relating to coast defences there was some conflict between the jurisdiction of the B. of O. and that of the Admiralty; and the earlier events of the Crimean war showed in other respects a want of working harmony between it and some other government departments. These facts led to the dissolution of the B. of O.

The surveyor-general of the Ordnance is now an officer in the department of the Secretary of State for War. The surveyor-general is responsible for the munitions of the army.

Board of Trade is a department of the government having very wide and important functions respecting the trade and navigation of the United Kingdom. It has a general superintendence over the mercantile marine. It exercises considerable control over marine boards. It appoints officers to inquire into and report on the condition of trading vessels. The board is chiefly composed of a president and secretary, with three assistant secretaries and four inspectors. Perhaps the most important function of the B. of T. is now the supervision of railways and railway companies. Notices of application for railway acts with plans, must be deposited with the board before the relative bill can be brought before Parliament. Before a railway is opened for traffic, the permission of the board on the report of an inspector, must be got. On the occurrence of an accident, notice must be given to the board, which is then empowered to take any measures which it may consider advisable for public safety.

The B. of T. prepares and publishes at monthly and other periodical intervals, accounts showing the exports and imports of the United Kingdom for the period, with relative matter, so as to show the commercial position and progress of the country. It also prepares selections from the commercial statistics of foreign countries.

All applications made to the sovereign for charters of incorporation are referred to the B. of T.

Boar-Fish (*Capros aper*), a fish belonging to the *Scombridae* or Mackerel family, possessing a short, deep, oval body, greatly compressed and covered with scales. Two dorsal fins exist closely situated together; but no elongated filaments or

spines along the base of the dorsal and anal fins exist in the B. F., as in the nearly allied *Dory* (*Zeus faber*). The eyes are of large size, and the jaws project to form a snout. The body is coloured red, and banded with orange bands across the back. This fish inhabits the Mediterranean Sea, and is rare on the southern English coast.

Boar-Fish.

Boast (Fr. *baucher*, to rough-hew), is, in sculpture, a term applied to the blocking out of a piece of stone or wood into rude outlines of the figure to be afterwards finished.

Boat, a small vessel adapted for navigating water, and propelled by means of oars, sails, or steam. The earliest kind of B. was formed of wicker-work: coated inside and outside with bitumen, or covered with skins. The Egyptians and other ancient nations used boats of this description, and a similar B. was known among the ancient Britons, and is still in use on the Welsh and Irish coasts. (See CORACLE.) There are very many varieties of boats in form and construction, designed to serve different purposes; for instance, boats for swiftness are slim, and have fine lines; those for carrying burdens are of a strong construction; for shallow water they are flat-bottomed; and so forth. Boats form a very necessary adjunct to a ship, and accordingly ships-of-war are equipped with a number of boats, including *longboats*, *barges*, *pinnaces*, *cutters*, *gigs*, *yawls* and *jolly boats*, each kind having its special uses. Heavy built steam launches, adapted for carrying a gun, are also attached to men-of-war. A *wherry* is a light, sharp B., used for transporting passengers or goods on a river, and sometimes employed in B.-racing (see BOATING). A *punt* is a small flat-bottomed vessel; a *skiff*, a small light B. for river-sailing. The principal parts of a B. of ordinary form are—the *bow*, the *stern*, and the *midships*. The bow is the head of the vessel placed behind the *stem*, or *cutwater*, the opposite end is the stern, and the intervening space is the *midships*. At the stern is the *stern-post*, to which the *rudder* is fixed for steering. The side boards of a B. are called *strakes*, the lower of which are termed *garboards*, and beneath these is the *keel*, the principal timber on which the whole frame rests. The *bow sheels* are the timbers at the bottom of the B. at the bow, and the corresponding parts at the stern are the *stern sheels*. The seats placed athwart the B. are called *thwarts*, and on the upper edge or *wale* of the B. are placed the *rowlocks*, projecting pieces of wood or iron, between which the oars or sculls rest. See LIFEBOAT.

Boat-bill (*Cancroma cochlearia*), a genus of gallatorial or wading birds, belonging to the family *Ardeida* or herons, and found in S. America. The bill resembles in shape a boat with the keel uppermost, whilst it has also been compared to the bowls of two spoons placed with their concavities together. The upper mandible terminates in a strong hooked process. The legs are shorter than in the generality of wading birds, and this bird is believed to perch on trees situated by the sides of rivers, and to dart down upon fishes. The French colonists of Guiana term the B. *Crabier* from their belief that it subsists on crabs, and from this supposition the generic name *Cancroma* is also derived.

Boat-Fly (*Notonecta*), a genus of insects belonging to the *Hemiptera* or bugs, and included among the *Hydrocoris* or aquatic members of the group. The group *Notonectida* includes those distinguished by the broad rounded form of the head. The legs are adapted for swimming, and these forms both swim and rest in the water on their backs. They inhabit fresh-water pools, and, like other *Hemiptera*, possess a powerful *rostrum* or 'beak,' by means of which they can inflict severe wounds. The air required for breathing is contained within a cavity placed between the wings and the back. *N. glauca*, or the 'water-boatman,' is the familiar species. These insects are carnivorous in tastes, and feed on other insects. The common species is about $\frac{1}{2}$ an inch in length.

Boat'ing, the art of propelling a boat by means of sails (see YACHTING) or by oars, called *rowing*, which method is treated of in this article. Rowing is a useful art and forms a healthy physical exercise. Of late years its cultivation has immensely

increased in British waters. There are now innumerable rowing clubs, of which the principal are those of the Thames, Tyne, Mersey, and Clyde. *Gigs*, *outriggers*, and *outriggered gigs* are the chief varieties of boats used in rowing on rivers; wherries and skiffs are also sometimes employed by watermen and amateur rowers. (See BOAT.) Gigs are found of all sizes suitable for from 6 to 8 oars; when there are three seats the boat is called a *réndan* gig, in which the centre rower plies a pair of sculls, and the other two rowers a single oar each. A *scull* is a light and short form of oar, a pair of which can be worked easily by one person in the operation of *sculling*. Outriggers are used for racing purposes, and are propelled by a single sculler. They are much lighter and narrower than a gig, being usually 30 feet in length with a breadth amidships of a little over one foot, tapering off to mere points at the ends. Amidships is placed the 'box' in which the sculler sits, and the leverage necessary to propel the boat is gained by mounting the rowlocks at the end of an iron support rigged outside of the box—this arrangement giving the boat its name. Outriggered gigs, or *wager-boats*, are constructed like a gig, with outriggered iron rowlocks, and carry from 2 to 8 oars according to size. Most of the universities of Great Britain have B. clubs, and upon the Cam and Isis, specially, rowing is zealously practised. The 8-oared match between the representatives of Oxford and Cambridge, which takes place annually at Easter on the Thames between Putney and Mortlake, is an event that always awakens public interest. From 1829 (the year of the first contest between the rival university crews) to 1875, 32 matches have been rowed, of which Oxford has won 17 and Cambridge 15. The length of the racing-course is about $\frac{1}{4}$ miles, and the shortest time occupied by either of the representative crews was in the match of 1873, when Cambridge performed the distance in 19 minutes 35 seconds. On 27th August 1869, a 4-oared match between the representatives of Harvard College, Massachusetts, and those of Oxford, took place on the Thames course, Oxford winning, after a gallant contest, in 22 minutes 20 seconds. A decisive victory was also gained on 10th June 1872 by the London Rowing Club over the Atalanta Boat Club of New York in an international 4-oared match over the Thames course; the English crew on this occasion conformed to the American practice of rowing without a coxswain, one of the oarsmen steering the boat by means of an apparatus managed with his feet. By far the greatest innovation, however, of late years, was the introduction of sliding seats in 1871, an invention now everywhere admitted to be the means of a great increase of speed. Among other interesting boat-races may be mentioned the annual one on the Thames between young watermen for Dogget's coat and badge, a prize given in 1715 by an eminent actor of that name, who left a sum of money at his death for the yearly continuance of the match on the 1st of August, the anniversary of the accession of George I. See W. B. Woodgate's *Oars and Sculls* (Lond. 1875).

Boat-lowering Apparatus, an arrangement usually consisting of pulley-blocks and ropes, or other gearing, whereby boats may be lowered from a ship in perfect safety when the vessel is in motion. It is a matter of the utmost importance, in the event of any emergency at sea, that the boats of a ship should be available for lowering without fear of mishap, whether the sea be smooth or rolling. Until of late years it was a common misfortune, from the clumsy construction of the ships' davits, and the unworkableness of the accompanying gearing, in lowering the boat, that one 'fall' was released while the other could not be disengaged, and the boat was swamped in consequence of being lowered perpendicularly. It often happened, too, that the boat was bilged against the ship's side in process of lowering. The risk attending the lowering of boats at sea is now, however, greatly diminished by the adoption of one or other of many recent inventions of E. A. Clifford's method has probably been adopted more than any other system, and is in use in many vessels of the British navy. His apparatus was patented in 1856, and consists of a rope passing from each davit-head through peculiar blocks in the ends of the boat; thence they are coiled upon a barrel or roller placed under one of the seats in the centre of the boat, the ends of each rope being firmly secured to the roller by a special contrivance, till the boat is launched, when they are set free. To the roller is attached a third rope, which controls the unwinding of the other two in the descent of the

boat, and this regulating rope is held by a man in the boat. Dr Nicholson, of the royal navy, has recently made the following invention the subject of a patent: A 'cradle' is attached to and suspended from the upper end of a frame, consisting of two long vertical arms, strengthened by transverse bars and hinged at their lower ends to the ship's side at a suitable distance from the water's edge, the whole apparatus being made of iron. The cradle carries the boat, and, to lower it, with the crew already seated, it is only necessary, by means of lowering tackle and blocks, managed either from the boat or the ship's deck, to ease off the upper ends of the frame, which describe an arc of a circle in passing to the water, on reaching which the boat is disengaged by the cradle passing under the water in consequence of the momentum acquired in its descent. Mr Hill has also invented an apparatus which has been tried with success in the British navy. It consists mainly of two disengaging hooks of peculiar form, which are fixed to ordinary chain slings at each end of the boat; and with these hooks the rings attached to the lower tackle-blocks are locked by means of a small piece working on a pivot. So long as there is any strain upon the rings, they cannot be detached from the hooks; but, on the strain ceasing by the floating of the boat, the rings slide off the hooks. To prevent one fall disengaging without the other by the boat being water-borne at one end by a wave, the two rings are connected by a 'life-line' stretching between them, thus distributing the strain, and only allowing the rings to be unlocked when the boat is completely water-borne and the falls at both ends slackened.

Boat'swain, the second of the three warrant officers on board Her Majesty's ships. He has charge of the boats, rigging, anchors, and cables. It is his duty to turn the hands up to relieve at the watches, and, if necessary, to summon the whole crew. The *B.'s mate* assists him, summons the watches or other portions of the crew, and inflicts the flogging—a punishment to which British seamen are still liable.

Boat-Tails, a name applied to the Insectorial birds forming the family *Quiscalinae*, represented by American birds allied to the starlings. Of these birds the *Quiscalus ferrugineus*, and the *Q. versicolor*, or 'Crow Blackbird,' are good examples. The tail is long and tapering, and the edges are curved upwards like the sides of a boat, this conformation suggesting the above familiar name. *Q. versicolor* is about 12 inches in length, and is coloured entirely black, with metallic tints and lustres. These birds feed on insects, but they also damage the crops of Indian corn.

Bobb'in, a wooden implement upon which thread of any kind is wound for use. The best bobbins are made from birch, but the scarcity of that kind of wood causes other hard woods to be frequently employed. Bobbins are of three kinds—1st. Those employed in the spinning of yarns; 2d. Weavers' bobbins; and 3d. The bobbins or reels used for sewing thread. The bobbins used in spinning have large flanges, and are usually of three sizes; a large size being employed for holding 'slubbings'; a medium size containing the somewhat more compressed and drawn out 'rovings'; and a small size, on which is wound the spun yarn. Weavers' bobbins, which have only a flange at their upper extremity, also vary according to the size of the shuttle used, which is regulated by the fineness of the material to be woven. In the manufacture of thread bobbins or reels, ingenious automatic turning machinery is employed, which produces the reels with great accuracy and rapidity.

Bobb'in Net, a kind of network made in the lace manufacture, in which the threads are twisted round each other, so as to form an open reticulated texture. It was originally made by hand-work on a pillow with pins and bobbins, but in 1808 Mr John Heathcot invented the first effective B. N. machine, and net-work is now made by very intricate and ingenious machinery. See LACE.

Bobb'io, an ancient ecclesiastical town of N. Italy, province of Pavia, on the Trebbia, 30 miles S.E. of the city of Pavia. It is the see of a bishop, and has a trade in wheat, Indian corn, wine, and fruit. B. was almost destroyed by an inundation of the Pellice in the time of Oliver Cromwell, who gave a grant of money for the building of a protecting wall. Pop. 4575.

Bo'bia, called also Pirate Isle, an island in the Bay of Amboise, on the coast of Guinea, Africa. It is said to be densely

peopled, but its shores are steep and difficult of access, and it is slowly diminishing in size, owing partly to its gradual subsidence, and to the action of the sea.

Bob o' Link Reed Bird, or Rice Bird (*Dolichonyx oryzivorus*), a bird included in the Conirostral section of the Insectorial order, and allied to the *Fringillina* or finches. It occurs in the winter in the W. Indies, but migrates northwards in summer to lat. 54°, and is chiefly found at the latter season in the eastern parts of N. America. The tail feathers are pointed and of stiff conformation. It averages a yellowhammer in size; the males exhibiting a brilliant plumage in spring and summer; the plumage being black, the hinder part of the head yellowish white; and the rump and tail-coverts white, tinged with ash. The food of these birds consists of insects, worms, and seeds, and in autumn of the seeds of oats and barley. The song consists of a medley of notes. They grow fat in August particularly on the wild rice which grows along the shores of the rivers in Carolina, New York, and Pennsylvania. Their flesh is then much esteemed, and they are shot in large numbers. The males in winter assume the more sombre plumage of the females. These birds are kept in cages chiefly for their gay appearance, and on account of their song.

Bobrinez, a town of Russia, government of Cherson, 132 miles E.N.E. of Odessa. Pop. above 10,000.

Bobrujsk, a town of W. Russia, government of Minsk, on the right bank of the Beresina, 88 miles S.E. of Minsk. It carries on an important trade in wood and corn. Pop. (1867) 24,681, among whom are upwards of 11,000 Jews. B. was besieged by the French without success in 1812. By the Emperor Nicholas it was made a fortress of the first rank.

Bobstays, the stays or strong ropes which keep down the bowsprit during the plunging of the ship, and also sustain the other stays which keep the foremast, fore-topmast, &c., and therefore the main-topmast, from falling aft. B. are frequently made of chains.

Boca, the Spanish word for 'mouth,' is used geographically in Spanish America to denote the outlets of straits and rivers, as *B. Chica* ('little-mouth'), the entrance into the harbour of Cartagena, in S. America; *B. del Drago* ('dragon's-mouth'), the strait leading from the N. into the Gulf of Paria, between the Island of Trinidad and the mainland. There are also *B. del Navio* ('entrance for ships'), the estuary of the Orinoco river; *B. Grande* ('the great entrance'), at the mouth of the Zucar river in Costa Rica; *B. del Toro* ('bull-mouth'); and *B. del Tigre* ('tiger-mouth'), in the S.W. angle of Costa Rica.

Booa's Tigris, or **Bogue**, is the Portuguese name given by Europeans to the entrance of the Canton River in China. Among the Chinese themselves it is known as *Hu-mén*, or in the Canton dialect *Fu-mén* (i.e., 'Tiger-port').

Boccaccio, Giovanni, who may be regarded as the creator of Italian prose, was the son of a Florentine merchant, and born at Paris or Florence, it is uncertain which, in 1313. When ten years old he was apprenticed by his father to a merchant at Paris; but mercantile pursuits and the study of the canon law, to which he afterwards applied himself, were equally distasteful, and as soon as he was his own master, he devoted himself entirely to literature and study. He commenced his career as an author by publishing at Naples in 1341 *Il Filicopo*, a prose romance of no great merit, inspired by his passion for an illegitimate daughter of King Robert. This was followed by *La Teseide*, a romantic epic in *ottava rima*, a measure of which B. is believed to have been the inventor. The *Knights Tale* of Chaucer was probably suggested by this poem. His fame was established on an imperishable basis by the composition of the *Decamerone*, begun, it is said, at the request of Queen Joanna, and finished about 1358. It consists of 100 tales, represented to have been related in equal portions in *ten days* (hence the name) by a party of seven ladies and three gentlemen, who had retired from Florence to a villa in the neighbouring hamlet of Fiesole, during the destructive plague of 1348, to dispel their fears for a season by an episode of uninterrupted and unreflecting gaiety. The incidents are partly the invention of the author, but partly derived from earlier *Contes* and *Fabliaux*, and even from fables found in Greek

authors. Many of the tales are licentious in the extreme, and were the cause of deep regret to B. in after years; others, however, are informed with the finest morality, and breathe the deepest pathos, while they have furnished themes for the muse of Chaucer, of Shakspeare, of Dryden, and of Keats. The style is beyond all praise—exquisitely symmetrical and polished—and the narrative is full of grace and liveliness. Soon after he had finished the *Decamerone*, B. applied himself to the study of Greek, was a collector of manuscripts of the classical authors, and became one of the most learned men of his age. These pursuits brought him into contact with Petrarch (1350), and thenceforth, till severed by death, these distinguished geniuses were the firmest friends. B. is the author of several works in Latin prose, now little read, among which are his *Genealogia Deorum*, *De Mulieribus Claris*, &c. His death, which occurred at Certaldo, 21st December 1375, is said to have been hastened by his zeal in preparing his *Commento Sopra la Commedia di Dante*, having been appointed by the magistrates of Florence to give public lectures on the *Divina Commedia* of the great poet. A complete edition (*Opere Complete*) of his works was published by Moutier at Florence in 1827, in 17 vols. Of the *Decamerone*, which has been translated into almost every European tongue, the *editio princeps* was published at Venice in 1471; of the modern editions, Biagoli (1833), Foscolo (1825), and Fanfani (1857), the last is the best. See the biographies of Manetti, Manni, Mazzuchelli, Tiraboschi, and Baldelli (Flor. 1806); also Ciampi's *Monumenti d'un Manoscritto autografo di Giov. B.* (Flor. 1827); but the most recent and the best work is Dr. M. Landau's *Giovanni Boccaccio: sein Leben und seine Werke* (Stuttg. 1877). See also *Le Lettère edite e inedite di Messer Giovanni Boccaccio, tradotti e commentate da Francesco Corazzini* (Firenze 1877).

Boccage, Marie Anne Du, a French writer, much admired by Voltaire, Fontenelle, and others, was born at Rouen, October 22, 1710, and became the wife of a wealthy financier. Her writings comprise a translation of Pope's *Temple of Fame* (1746); an imitation of Milton in her *Paradis Perdu*, and *La Mort d'Abel* (1748); an epic poem, called *La Columbiade* (1749); and a tragedy, *Les Amazons*, produced at the Comédie Française. Her poems were translated into English, Spanish, German, and Italian. She has long ceased to be read. The *Lettres* (1751) descriptive of her travels in England, Holland, and Italy, were translated into English. She died 8th August 1802.

Bochart, Samuel, a French protestant theologian, born at Rouen, May 30, 1599. After having given proof of extraordinary philological aptitude during his studies at Paris, Sedan, Saumur, and Leyden, he became, in 1625, Protestant pastor at Caen, where, in 1628, he disputed for nine days with the Jesuit Vérin, a protégé of Richelieu, and published an account of the discussion in 1630. His *Geographia Sacra* (Caen 1646), a favourite with Humboldt, embodied the results of twenty years' special study; his *Hierozoicon*, or *Sacred Zoology* (Lond. 1663), greatly commended by Cuvier, owed much of its value to information found in some Arabic manuscripts lent to B. by Queen Christina of Sweden, whom he had visited in 1652. This work, impugned by Simon, was defended by J. Leclerc; and an edition, in 3 vols. 4to, with notes by E. J. C. Rosenmüller, was published at Leipzig (1793–1799). B. died at Caen, 16th May 1667.

Bochart, a town of Austrian Galicia, situated 23 miles E. by S. of Cracow. There are extensive mines in the neighbourhood, yielding gypsum, zinc, and rock-salt—the last forming by far the most important product, as much as 15,000 tons being raised annually. Pop. of town (1869) 7480.

Bocholt, or Bochold, a town of Prussia, province of Westphalia, on the Aa, 12 miles N. of Wesel, on the Rhine. It has a fine Catholic church, a synagogue, an hospital and orphanage, some twenty cotton-mills, ten dye-works, and also manufactures of woollens, silks, hosiery, and ironwares. It is the chief town of the barony of B. and Anholt, which belongs to the Princes of Salm-Salm, who have here a castle. Pop. (1872) 6127.

Bochum, a town of Prussia, province of Westphalia, 5 miles E.N.E. of Essen by railway. It has large manufactures of cloths, iron and steel wares (notably coffee-mills), tobacco, and tapestry. There is a chamber of commerce, a royal technical school, a municipal high school, and various other public institutions. Pop. (1872) 21,192.

Bookau, a town in the circle of Zwickau, Saxony, 25 miles S.S.W. of Chemnitz, in the Erzgebirge, famous as a centre for the gathering of many valuable medicinal herbs. It has some manufacture of drugs and tinctures. Pop. (1871) 1860.

Bookenheim, a town of Prussia, province of Hesse-Nassau, and a station on the Main and Weser Railway, about a mile N.W. of Frankfurt-on-the-Main, of which it is virtually a suburb. It has manufactures of culinary articles, pianos, cigars, spirits, fancy wares, and bijouterie. Pop. (1872) 8483.

Böckh, August, one of the most learned philologists and ingenious antiquaries of this century, was born at Karlsruhe, November 27, 1785. He entered the university of Halle in 1803, and studied under Wolf. After being engaged for a short time as professor at Heidelberg, B. was appointed in 1811, Professor of Rhetoric and Ancient Literature at Berlin, a post which he held with distinguished honour for over half a century. He died August 3, 1867. B. began his career as an author by his first publication, *Commentatio in Platonis qui vulgo fertur Minoem* (Halle, 1806). Two years later appeared his *Græcæ Tragædiæ Principum, Æschyli, Sophoclis, Euripidis num ea quæ supersunt et genuina omnia sint*. His *Pindar* (3 vols. Leips. 1811-22) is a great work of classical criticism. Other writings of B.'s which hold the first rank among works of the kind are *Die Staatshaushaltung der Athenen* (1817, 2 vols. 8vo), *Die Entwicklung der Lehren des Pythagoræ Philolaos* (Berl. 1819), *Metrolologische Untersuchungen über Gewichte, Münzfusse, und Masse des Alterthums* (Berl. 1838), *Urkunden über das Seewesen des Attischen Staats* (Berl. 1840). Along with these labours must be noticed his collection and elucidation of Greek inscriptions in the *Corpus Inscriptionum Græcarum* (Berl. 1824-62), which he began with the intention of giving in it every Greek inscription known in print or manuscript. After his withdrawal from the undertaking, it was carried on first by Franz, and afterwards by Kirchhoff. His minor writings have been collected and published (*Gesammelte kleinere Schriften*, 5 vols. Berl. 1858-71).

Bocland, or **Bookland**, one of the original modes of the tenure of manor-land. It was constituted by a short deed stipulating for rents and free services. It was sometimes granted for one or more lives, with remainder in perpetuity to the Church. See *Kerr's Blackstone* and *Wharton's Law Dictionary*.

Bode, Barons de, a family well known in England through a claim made on account of an estate in Lower Alsace confiscated in 1793, for a share of the sum granted by France as indemnity to the English sufferers by the Revolution. The claim was repeatedly discussed in Parliament, and was finally dismissed on the ground that at the time the estate was lost the then baron was not an English subject. See J. Hodgkin, *Case of the Baron de B. in its Present Aspect* (1860).

Bo'den-See. See **CONSTANCE, LAKE**.

Bode's Law is an empirical law in astronomy, connecting the distances of the planets from the sun, and may be thus stated. Reckoning from the orbit of Mercury, and supposing the distance of Venus to be 3, that of the earth is 6, that of Mars 12, that of the Asteroids 24, &c. Hence, taking the distance of Mercury from the sun as 4, we have the following numbers representing the distances of the planets, the true distances being placed below for comparison:

Mercury	Venus	Earth	Mars	Asteroids	Jupiter	Saturn	Uranus	Neptune
4	7	10	16	28	52	100	196	388
3.9	7.2	10	15	27.5	52	95	192	300

Neptune is the only one which falls short to any considerable extent. Similar laws are found to hold for the several systems of satellites.

Bod'kin (etymology uncertain), originally a poniard or dagger, in which sense it is used by Shakespeare in Hamlet's famous soliloquy (Act 3, sc. 1), 'When he himself might his quietus make with a bare bodkin.' The word also denotes an instrument for piercing holes in cloth, a large species of needle for drawing tape or ribbon through a loop, and a straight hair-pin which was used in ancient times, and still turns up in the changes of fashion.

Bodley, Sir Thomas, born of an ancient family at Exeter, 2d March 1544. His father going to Geneva during the perse-

cutions of Mary, B. had an opportunity of attending the lectures of Calvin and Beza. After becoming a graduate and proctor at Oxford, he travelled on the Continent to learn the languages, and was subsequently employed by Queen Elizabeth in several important diplomatic missions connected with the Protestant cause, especially in France and Holland. B. says his further political career was stopped by the disputes of Essex and the Cecils. He then (1597) devoted himself to the library at Oxford which bears his name, giving books worth £10,000, endowing the officers of the library, and helping the construction of the new house. B. died at Oxford, 28th January 1612. See his *Autobiography in Reliquiæ Bodleianæ* (published by Hearne in 1703).

Bodleyan, or **Bodleian Library**, the public library of the University of Oxford, was originally founded by Humphrey of Gloucester, almost entirely destroyed by the visitors of Edward VI., but re-established and endowed by Sir Thomas Bodley about 1602. Bodley drew up statutes which prohibit lending of books. The visitors and curators now consist of the vice-chancellor, proctors, regius professors of divinity, civil law, medicine, Greek and Hebrew, and five residents elected for ten years by Congregation. The present librarian is Mr B. O. Cox, with a salary of £1000, and two assistants. The library is free to literary men on proper recommendation; members of the university are admitted on payment of a small sum annually. The library is supported by voluntary contributions, the endowment (increased this c. by the Mason bequest of £40,000), the charge on matriculation (introduced by Lord Stowell in 1780), and the statutory right to a copy of every book published in the United Kingdom. This right originated in an agreement between Sir T. Bodley and the Company of Stationers in 1609, which was enforced by a decree of the Star Chamber, and ultimately recognised in the form of a condition of the printing licence in the Sedition Act, 14 Charles II. c. 33. Among the valuable collections may be mentioned Lord Pembroke's Greek MSS., collected by Barozzi; Sir T. Roe's Oriental and Greek MSS.; Dodsworth's collections on English History; the MSS. of Archbishop Sharpe; Selden's Library (containing many Talmudical and Rabbinical treasures); the Hebrew Library of Oppenheim; Malone's poetical collections, presented by Lord Sanderlin; Gough's collection on British Topography, and Douce's Library. The library has a number of Biblical codices. The books number about 300,000, the MSS. between 20,000 and 30,000.

Bod'mann (anc. *Bodami Castrum*), a village in Baden, on Lake Constance, 12 miles N.W. of Constance. Pop. (1872) 891. Close by stand the ruins of a castle, formerly the residence of the lieutenant of the Karoling kings, the *Botemann* or *Bodmanno*, from whom the lake takes its German name of *Boden-See*.

Bod'mer, Johann Jakob, a German *literateur*, and for fifty years Professor of History at Zurich, was born 19th July 1698 at Greifensee, near Zurich. An intimate acquaintance with foreign literature showed him how tasteless that of Germany had become, and he set himself to reform it with more zeal than ability. The boldness of his attempt provoked the ire of Gottsched, and their fierce disputes did something to pave the way for the splendid epoch that commenced about 1770. B. died 2d January 1783. His poems, dramas, and translations never rise above mediocrity; but his republication of a part of the *Nibelungen* (Zur. 1757), and his *Sammlung der Minnesänger* (2 vols. Zur. 1758), acted on the current poetic literature of Germany somewhat as the publication of *Percy's Reliques* acted on that of Britain. His *Noachide* (Zur. 1750-52; new ed. Basel, 1781) is the most widely known of his works. See Danzel's *Gottsched und seine Zeit* (Leips. 1848), and Mörikofer's *Die Schweiz-Literatur des 18 Jahrh.* (Leips. 1861).

Bod'min, the county town of Cornwall, lies in a picturesque valley near the centre of the county, 26 miles N.N.W. of Plymouth, with some manufacture of woollen and yarn, and a trade in cattle and sheep. It is connected by a branch railway with Wadebridge, its port, 7 miles to the N.W., and it is 7 miles distant from the B.-road station on the Cornwall line. The chief buildings are a church of the 15th c., the market-house, county jail, built in 1859 at a cost of £40,000, and the Cornwall Lunatic Asylum, built in 1866. B. returns one member to Parliament. Pop. (1871) 6758. B. is an old town, which grew up around a priory said to have been founded by King Ethelstan in 936, and at one time had a cathedral, and was a place of im-

portance. Thomas Sternhold, joint author with Hopkins of the first English metrical version of the Psalms, was once the proprietor of B. Priory. The town declined in the 16th c., but has regained much of its importance.

Bodo'ni, Giambattista, a distinguished Italian printer and type-cutter, was born at Saluzzo, Sardinia, February 16, 1740. In 1758 he went to Rome, where he remained six or eight years as compositor in the printing-office of the *Propaganda*. In 1768 he removed to Parma, and became in 1789 the superintendent of the Duke of Parma's private printing establishment. From this press he sent out his editions of the *Iliad*, *Virgil*, and several other classical works, and also the Lord's Prayer done in 155 languages, all of which are admirable for their beauty of type. B. died at Parma, November 20, 1813.

Body, Human, will be described in detail under the various organs, tissues, and functions of the body, as Arm, Bone, Brain, Cerebellum, Leg, Liver, Lung, Muscle, Nerve, Spleen, the organs of Sense, Connecting Tissue, Circulation, Digestion, Perspiration, Respiration, &c. For a general description of the progress and present state of human anatomy, see ANATOMY, HISTORY OF; also article MAN.

Body-snatch'ing. See RESURRECTIONIST and ANATOMY (in Law).

Boece (Boyce), Hector, was born at Dundee about 1465, educated at Aberdeen, and afterwards at Paris, where he gained the friendship of Erasmus, and was made Professor of Philosophy in 1497. In 1500 he was appointed Principal of the newly-founded College of Aberdeen, where he did much to promote learning in Scotland. In 1522 he published at Paris his *Lives of the Bishops of Mortlach and Aberdeen*, and in 1526 his *Scotorum Historia* in seventeen books. Like Geoffrey of Monmouth, he pretended to have derived his history from imaginary authorities, declaring it to be based on the writings of two putative authors, Veremundus and Cambell. The work is less sober than the Chronicles of Fordun and Wyntoun, and abounds in romantic fable; but his narrative seems, says Mr Burton, 'to have been skilfully adjusted to the conditions of belief in his own time.' Shortly after publishing the history, B. received from James V. a pension of £50 Scots yearly, and was likewise presented with the rectory of Fyvie, in Aberdeenshire, before his death in 1536, in which year John Bellenden produced a translation of his history. See Irving's *Literary Scotchmen of the Last Four Centuries*.

Boehme'ria, a genus of plants of natural order *Urticaceæ*, much esteemed for their fibres. *B. nivea* yields the fibres out of which the Chinese Grass Cloth (q. v.) and other articles are made. It is extensively cultivated by the Chinese under the name of Tschou Ma, and having been introduced into Siam, Burmah, Assam, and other semi-tropical countries, it is likely to prove a valuable article of commerce, its fibre being now highly appreciated in Europe. It is also known by the Sumatran name of *Caloe*, the Malayan one of *Ramee*, under which name it is cultivated in the United States (*Rep. Dep. of Agriculture*, 1873, p. 261), but more frequently by that applied to it in Assam, viz., *Rheem*. *B. candicans*, *B. utilis*, *B. Fuya*, *B. caudata*, and other species of the genus, yield similar fibres of greater or less value and fineness. Forbes, *Journal of the Society of Arts*, 1875, p. 521.

Boeo'tia, a political division of ancient Greece, bounded S. by Attica and Megaris, W. by the Gulf of Corinth, N. and N.W. by Locris and Phocis, and E. by the Eubœan Sea, with an area of 1119 sq. miles. A mountain chain, extending E. and W., divides it into N. and S. B., the former containing Lake Copais, which would be a fertile plain had the waters of the Cephissus and its tributaries an outlet to the sea. There are several natural subterranean channels in the limestone mountains, which, it is said, the old Minyæ of Orchomenus supplemented by artificial tunnels, the greatest engineering enterprise of the pre-historic age. One of these was four miles long, and had twenty vertical shafts, with apertures 4 feet square, and a depth calculated at from 100 to 150 feet. Orchomenus consequently became great and powerful at an early period; but when the power of the Minyæ was broken, the tunnels being neglected, the plain was flooded and the city gradually dwindled. S. B. was divided by Mount Teumessus into the plain of Thebes and the valley of the Asopus. The climate of B. was supposed to be unfavourable to

mental activity; but the proverbial dullness of the inhabitants, ascribed to the denseness of the atmosphere, was due rather to greater attention being paid to physical than to intellectual development; and the poets Hesiod, Corinna, and Pindar, the historian Plutarch, and Epaminondas, one of the greatest military geniuses of Greece, were all Boeotians. B. produced heavy corn crops, and had excellent pasture grounds; the vine was cultivated with success, and the mountains yielded iron and marble. The larger cities of B., under the presidency of Thebes, formed a confederacy known as the Boeotian league, at the head of which was the archon. The affairs of the separate states were managed by military chiefs called Boeotarchs, who also discharged several executive functions. B. differed from the other Greek states in this, that it could scarcely be regarded as a truly federal state, on account of the hardly disguised sovereignty of Thebes. Attica and B. united now constitute a nomarchy of the kingdom of Greece, with an area of 2481 sq. miles, and a pop. (1870) of 136,804.

Boerhaave, Hermann, a celebrated physician, was born at Voorhout, near Leyden, 31st December 1668, and commenced the study of theology at Leyden, where he took the degree of Doctor of Philosophy in 1689. In 1690 he commenced to study medicine, reading carefully ancient and contemporary treatises on the several branches, and took the degree of Doctor of Medicine at Harderwyck in 1693. In 1701 he succeeded Drelincourt as lecturer on the theory of medicine, and at first recommended the method of Hippocrates, that, namely, of simple observation, for which, however, in 1703, he began to substitute mechanical applications and calculations bearing on the healthy equilibrium of the animal fluids. In 1709 he succeeded Hottot as Professor of Medicine and Botany, and revived the method of clinical teaching, while his services to botany were many and important. His *Institutiones Medicæ* (Leyd. 1708), and his *Aphorismi de Cognoscendis et Curandis Morbis, &c.* (Leyd. 1709), still classics are models of learning and methodical arrangement, and even Arabic translations have been made of them. In 1715 B. was made Rector of the University of Leyden; in 1718 he became Professor of Chemistry, and his *Elementa Chimiæ* (1724) is still of value as a landmark in the history of chemistry. He died September 23, 1738, leaving a fortune of two millions of florins. B. perhaps the greatest physician of modern times; his fame filled Europe, and is said to have reached even China. He was an Associate of the Academy of Sciences at Paris, and a Fellow of the Royal Society of London. See Burton's *Account of the Life and Writings of B.* (2 vols. Lond. 1743), and also the *Biographies* of Kesteloot (1825) and of Johnson (1834).

Boerhaavia, a genus of plants of the natural order *Nyctaginaceæ* (the Marvel of Peru order), (q. v.). *B. diffusa* possesses expectorant qualities. Other species of the genus are laxative, anthelmintic, or emetic.

Boers (Ger. *Bauern*, peasants, boors), the name by which the Dutch agriculturists of the Cape of Good Hope generally are known, but which is also applied more strictly to a small band of desperadoes, mostly of Dutch extraction, who have sought refuge in the Cashan mountains, and are notorious for their rapacity and violence. See Dr Livingstone's *Travels and Researches in S. Africa* (1857).

Boë'thius, properly Boetius, Anicius Manlius (Torquatus) Severinus, one of the most illustrious men of his time by his talents, his virtues, his services, and his misfortunes, was born about 470 A.D., of a noble Roman family. When Theodoric, King of the Ostrogoths, entered Rome (500), B. was appointed by the senate to address him. Theodoric was so charmed with him then and afterwards, that he made him Master of the Palace and of Offices (*magister officiorum*), in which position B. was long the oracle of Theodoric and the idol of the Ostrogoths, while he always exerted his influence for the benefit of his countrymen. Three times he was made consul, and in 510 enjoyed the unique distinction of having no colleague in that office. His two sons, while yet youths (522), were designated consuls, an honour reserved for the sons of emperors, and he himself received the greatest possible honour from people, senate, and king. But Theodoric, who became melancholy and jealous in his old age, was worked upon by creatures whose hatred B. had incurred by his opposition to their injustice and oppression. He was accused of high treason, arrested, kept in

confinement for a time, and then put to death. B. was the last Roman of any note who studied the literature of Greece. His most celebrated work, *De Consolatione Philosophiæ*, written while in prison, was translated into old English by Alfred the Great (reprinted and edited by Fox, Lond. 1864), into modern English by Chaucer and by Queen Elizabeth. It was extraordinarily popular during the middle ages, and was to be found in almost every monastic library. The oldest printed edition is that of Nürnberg (1473); the latest and best is that of Obbarius (Jena, 1843). Whether B. was a Christian or a Pagan has been keenly discussed. The Catholic Church has canonised him, and yet there is no evidence in his *De Consolatione* that he sustained himself in his last hours by the hopes of the gospel.

Bog (Gael. *bogach*, a soft, tender, moist place), another name for a moor or marsh. A B. is formed in hollows and levels by the accumulation of vegetable matter, which at one time having covered the surface as living plants, has decayed, and served to form the soil for a subsequent growth. As each generation has thus decayed, and has been replaced by a new one, the lower layers, on account of the superincumbent pressure yearly increasing, have in time consolidated to form a thick viscid mass, in some cases resembling *brown lignite*. This ultimate cohesion is doubtless aided by the chemical action of water. The British Islands afford many good examples of bogs. Ireland is specially noted in this way, B. covering as much as one-tenth part of its surface. In France, the United States, and Canada, there are also many bogs, often of vast extent. Chatmoss, in Lancaster, is a famous B., rendered so by George Stephenson's engineering triumph in carrying a line of rails across the yielding swamp. Solway Moss and B. of Allen are also well known, and continue to defy all efforts at reclamation. Perhaps one of the best instances that can be given of the transformation of a peat-B., an unhealthy and unprofitable waste, into fruitful fields, is furnished by the example of a portion of the estate of Dargavel, belonging to the late Mr Hall Maxwell, for many years the Secretary of the Highland and Agricultural Society of Scotland. This peat-B. lay between Glasgow and Greenock, about 3 miles N. from Paisley. The moss, in its original state, was a quagmire of from 20 feet to 25 feet deep. It was saturated with water, and covered with coarse heather. Not only was it unproductive in itself, but it had an injurious influence on the crops in its vicinity. Mr Maxwell brought his agricultural knowledge to bear upon this repulsive-looking subject. He began by trenching up the sub-lying clay on the spots from whence the moss had been removed by cottars to make fuel. It was thought the money spent in reclamation would be thrown away, the land then being deemed absolutely worthless. But an expenditure of £30 an acre brought in an annual value of £2 per acre, which is not a bad percentage on outlay. And as land differs from house property, that early 6½ per cent. will inevitably increase under careful and scientific management every year, instead of deteriorating. As there are many hundreds of thousands of acres in this country at the present time equally susceptible of being changed from pestilential swamps into productive potato and corn plots, it is well to give Mr Maxwell's method. In regard to the drains—the basis of operations in improvement of this kind—it was found, after trial at shallower depths, that it was best to go down 4 or 5 feet, the distance between the drains being 20 feet. At first horse-shoe shaped tiles, floated on wooden lobs, or boards of larch, were formed, but they did not answer, and double tiles, flatter than the ordinary horse-shoe, with a broad flange instead of the usual narrow edge, which enables the one to rest securely on the other, while by 'breaking band' in the laying the pressure is divided, and the conduit is kept together. A thick sod cut from the surface to fit the bottom is placed over the tiles, with the heather downwards, and this method is found to act well in the softest of peat. The next step is to dig and level the surface to about the depth of 12 inches at first, the depth being increased as cultivation goes on. Mr Maxwell's experience taught that it was well to allow the surface to lie a considerable period after having been dug, in order that it might be acted upon by the ameliorating character of the weather. Two winters he deemed necessary. He considered that the digging should be conducted in autumn, winter being too wet for the operation, and the solar heat in summer baking the peat so as to render its disintegration difficult. After fields lie fallow for the period stated, two years' clods are broken, lime applied

at the rate of five tons per imperial acre, and the ground is ready for potatoes, which ought always on such ground to be the first crop. The drills should be formed by the spade, 30 inches apart, to admit of a flat surface, which is carefully compressed by treading after the field is covered. Twenty-five tons of best dung, and 2 cwt. of guano is a profitable manurial allowance upon such a soil. After potatoes, oats sown down with grass should be taken; clay to the extent of 100 or 120 carts per acre being mixed with the peat. The grass following upon this treatment is very good, and the satisfactory feature of this system of reclamation is that the pasture improves with age. It proves thick in the sole, and sheep prefer it to that grown upon better land. Under such management of B.-land as described, the health and material welfare of the community at large would, as a matter of course, greatly and rapidly improve.

Bogan, a river in the interior of New South Wales. It rises in Goonambra Hill in 33° S. lat. 148° 20' E. long., and flows N.W. into the Darling (q. v.) in 30° 4' S. lat. 145° 55' E. long. Its length is 450 miles, and it drains an area of 8300 square miles. During a great part of the year it is reduced to a chain of lagoons.

Bog-Butter a peculiar fatty substance found in the peat-bogs of Ireland. It is void of taste or smell, has a white colour and the consistence of butter, and is composed of 75 per cent. of carbon and 12½ per cent. each of hydrogen and oxygen. It melts at 51° C. (124° F.), and separates from an alcohol solution in needle-like crystals.

Bogdanovitch, Ippolyt Fedorovitch, a Russian poet, born 28th December 1743 at Perevolotchna. He was appointed inspector of the University of Moscow in 1761, and afterwards secretary of legation at Dresden. He published in 1775 his poem *Dushenka*, founded on the myth of Psyche; and on this, and not on his other works, which are chiefly translations, his fame must rest. Being the first of its kind in Russian literature, it may have been unduly praised, but it is sufficiently graceful and melodious to sanction the wish that he had attempted works of greater originality. He died at Kursk, 18th January 1803. A collected edition of B.'s works in 6 vols. appeared at Moscow (1809-10; 2d ed. 4 vols. 1818).

Bogen, a market-town of Lower Bavaria, near the left bank of the Danube, with some breweries, and a pop. of 1383. It is much visited by pilgrims on account of a celebrated image of the Virgin contained in its chapel on the adjoining Bogensberg.

Bögermann, Jan, a Protestant theologian, born at Oplewert, E. Friesland, in 1576, and took a prominent part in the controversies between the Calvinists and Arminians, which in his time distracted Holland. He was Professor of Divinity in the University of Franeker, and in 1618 was elected President of the Synod of Dort, where his zeal so far outran his discretion that he displeased the Frieslanders, whose delegate he was. The Dutch version of the Bible, still used in churches, and the greater portion of which is the work of B., entitles him to the gratitude of his countrymen, while his polemical works are happily forgotten. He died at Franeker, 11th September 1637.

Boghaz' Kie'ui or Koi (Turk. the 'pass village'), a village of Asia Minor, vilayet of Sivas, 90 miles S.W. of Amasia. It consists of some 150 scattered dwellings. In its vicinity are several ruins, especially of a magnificent temple, which may be that of Jupiter mentioned by Strabo (lib. xii.). Hamilton supposes B. to be the ancient *Tavium*, but Barth, after Texier, disputes this, and endeavours to show that it is probably the ancient *Pleria*.

Bog Iron Ore, a porous ore of iron of a brown colour, found abundantly in the peat-bogs of Ireland, and in marshy alluvial districts of different countries. It is the result of the decomposition of other iron ores by atmospheric or chemical agencies, and is composed of hydrated ferric oxide and phosphate of iron in variable proportions; sometimes hydrated oxide of manganese is also present. It is not wrought in the United Kingdom, but is used in North Germany, where it is considered valuable for castings. The iron obtained from it is very brittle, owing to the presence of phosphorus.

Bog-Moss. See SPHAGNUM.

Bog'nor Beds. See LONDON CLAY.

Bogodukhov, a fortified town of Russia, government of Kharkov, situated on the Merle, 31 miles W.N.W. of the city of Kharkov. Pop. (1867) 10,069, trading chiefly in cattle, hides, and leather manufactures.

Bogomil'i, a Slavonic religious sect of the 12th c., resembling the Paulicians and Kathari, and whose headquarters were in Bulgaria. The name, which is Slavonic, means, 'Lord pity us,' and has a reference to the fervency and frequency of their prayers for deliverance from the influence of the evil principle, Satan, which created matter and man, and from whose thralldom men are delivered by the Logos, or Christ. The B. banished the sign of the cross and images from their worship, and rejected the sacraments, substituting for baptism certain repetitions of the Lord's Prayer, and regarding the Eucharist as a sacrifice to devils. Their canon consisted of the Psalms and Prophets, and the entire New Testament. Their leader, Basilus, was burned in 1118, by Alexius Comnenus. Remnants of the sect still existed at Philippopolis in the following century.

Bogong', a mountain range in the N.E. of Victoria. Several of its peaks exceed 6000 feet in height. The loftiest are Mount B. (6588 feet), and Mount Feather-top (6303 feet). The range derives its name from a large moth found in elevated regions, and highly relished as food by the blacks.

Bogon'ion, a popular name in Westmoreland and some parts of Lancashire for the royal fern, *Osmunda regalis* (q. v.). The rhizome or underground stem, when beaten and macerated in water all night, is esteemed as an application to bruises, sprains, &c. (Bentley).

Bogotá, Santa Fé de, the capital of the United States of Colombia, S. America, in the state of Cundinamarca, situated on an extensive plateau 8700 feet above the sea, near the head waters of the Meta, a branch of the Orinoco, and 290 miles S.E. of the Gulf of Darien. It was founded in 1538, is the seat of an archbishop, and contains a remarkable number of churches and convents, and, besides the Government buildings, a university, a theatre, and a national academy. A statue of Bolivar was erected here in 1847. In 1827 B. was partly destroyed by an earthquake. Pop. (*Almanach de Gotha*, 1875) 50,000. The tableland in which B. is situated is rich in pasture, and yields abundance of wheat and barley, being visited annually by two rainy seasons. Near the town there are emerald, gold, and silver mines. The *Rio de B.* drains the tableland, forms the remarkable fall of Tequendama, 900 feet high, and joins the Magdalena (q. v.).

Bog'ra, the chief town in the District of the same name, Bengal, British India, on a tributary of the river Attri, 85 miles N.W. of Moorshedabad. Pop. (1872) 5872. The district has an area of 1491 sq. miles, and a pop. (1872) of 689,467. In 1876-77 the exports included £121,000 of rice and £80,000 of jute.

Bog'-Spavin, a disease in horses, affecting the hock-joint, and exhibiting as its chief feature a swelling and distended state of the joint-capsule (capsular ligament). It is generally caused by a sprain or sudden start, and in all probability is most frequently found in horses in which inflammatory or other lesions of the joints already exist. Soft swelling of the joint, complete lameness, and inflammatory symptoms, are the chief aids to the diagnosis of this affection; the swelling having a 'boggy' feel, and remaining persistent after the acute symptoms have disappeared. The treatment of B.-S. consists in the ordinary antiphlogistic remedies—fomentations, with liniments and blistering afterwards to favour resolution. The condition is one very difficult, and in some cases impossible to cure.

Bog'-Trotter, a derisive appellation occasionally given to the Irish peasantry from their living in a boggy country, their ability to traverse which with safety and expedition has often saved them when pursued by the officers of justice.

Bogus, Rev. D., was born in the parish of Coldingham, Berwickshire, 18th February 1750. He was licensed as a preacher of the Church of Scotland, but went to London in 1771, and afterwards became pastor of an Independent congregation at Gosport, where he also established a college for Independent ministers. From this time he became a zealous worker in the cause of missions, and took an active part in the establishment

of the British and Foreign Bible Society, of the Religious Tract Society, and especially of the London Missionary Society, of which last he has been called the father. B. died 25th October 1825. Besides some minor works, he wrote, in conjunction with James Bennett, a *History of Dissenters from 1688 to 1808* (4 vols. Lond. 1808-12). His *Theological Lectures*, edited by Frey, were published at New York in 1849.

Bogus is an Americanism, and is often used in the sense of *sham* or *fraudulent*, as B. money. B. election-tickets, having some names of the opposite party on the list, are sometimes put into the hands of the voters at the polls.

Boguslav, a town of Russia, government of Kiev, situated on the Rossa, 60 miles S.S.E. of the city of Kiev. Pop. 6000, chiefly Jews.

Bohea'. See TEA.

Bohemia (Ger. *Böhmen*), so called after the Boli, who settled in it in the 2d c. B.C., formerly an independent kingdom, now a crown-land of Austria, in lat. 48° 33'-51° 5' N., and in long. 12°-16° 46' E. It is bounded N. by Saxony and Prussian Silesia, E. by Prussian Silesia and Moravia, S. by Upper and Lower Austria, and W. by Bavaria. Area, 20,000 sq. miles; pop. (1869) 5,140,544, of whom 4,940,898 are Roman Catholics, 89,933 Jews, and the remainder belong to different Christian sects.

Physical Aspect, &c.—B. is encircled by mountains: W. by the Böhmerwald, N. by the Erzgebirge, E. by the Iser-Rieser- and Adlergebirge, and S. by the Bohemian-Moravian plateau. The elevations range from 2000 to above 5000 feet, while offsets traverse the interior from N. to S., enclosing many fertile valleys. The slope of the country is towards the centre. The principal river is the Elbe, with its great affluents the Moldau, Iser, and Eger. Instead of lakes there are numerous ponds and morasses. The climate is considered healthy, but is cold in the highland borders, and snow lingers on the summits of the hills through a great part of the year.

Products.—B. has very little waste land. Over 90 per cent. of the soil is available for culture, and of this more than a half is arable. Grain is raised in abundance, the principal crops being wheat, oats, barley, and rye, much of which is exported; hops and flax are important products; the cultivation of root crops is becoming general; the forests are extensive and valuable; and the vine is partially cultivated. Cattle-breeding is not skilfully carried on, but the breed of horses is superior. In some districts swine are reared in large numbers, while in the S. flocks of geese form a considerable portion of the cultivator's stock. B. has great mineral wealth in silver, tin, iron, lead, graphite, granite, coal, and marble; but there are no salt-mines. Its mineral springs are among the most noted in Europe—e.g., Karlsbad, Marienbad, Franzensbad, and Teplitz.

Manufactures, &c.—The industries of B. are the most important in the Austrian empire. Their chief seat is in the N. Altogether it is computed there are about 1400 manufactories, whose yearly production is valued at £20,000,000. Reichenberg is the headquarters of the woollen, Rumburg of the linen, Schönlinde of the thread, and the Erzgebirge of the lace manufacture. There are upwards of eighty cotton-mills, with 500,000 spindles, of which the largest are at Reichenberg. There are calico-printworks on a large scale in Prague, Hirschberg, &c. Bohemian glass, which is not only the best in Austria, but perhaps the best in the world, is manufactured at Haida, Steinschönau, Gablenz, Turnau, Burgstein, and Neuhurkenthal. In addition to these, B. has manufactures of sugar (from beetroot), leather, porcelain, paper, metallic wares, chemicals, and beer. For its import and export trade there are not very good water highways, but there is an admirable network of railways converging in Prague. There are Chambers of Commerce at Prague, Reichenberg, Eger, Pilsen, and Budweis.

Government, Administration, Education, &c.—B. is divided into thirteen circles—Präuge, Leitmeritz, Gitschin, Jung-Bunzlau, Königgrätz, Chrudim, Czaslau, Tabor, Budweis, Pisek, Pilsen, Eger, Saaz. It has its own provincial Diet, or Parliament, consisting of one house of 241 members, representing in different degrees the various classes and orders of the community; and it sends fifty-four representatives to the Austrian Reichsrath. B. has one university, that of Prague, twenty-two gymnasia, numerous real and technical schools, and nearly 4000 elementary schools;

yet it is to be said that, though education is widely diffused, Bohemian educational institutions still stand in need of reform.

History, &c.—B., originally in the possession of the Boii, was seized by the Marcomanni in the 1st c. A.D. The latter in turn were destroyed or driven out by the Czechs—the ancestors of the present Bohemians—in the first half of the 6th c. A.D. About the year 627, Samo, uniting the neighbouring Slavic lands with those of the Czechs, formed a kingdom, which, however, fell to pieces on his death, in 662. Partly dependent under the Karolings, it next became tributary to the Moravian prince, Swatopluk (871–894), who introduced Christianity. The Czech chieftains, on the death of Swatopluk, did homage to the German king, Arnulf. About the year 900, Spithinew I. obtained the supreme power in the land; but his nephew, St Wenzel, was forced by the march of Heinrich I. on Prague, 929, to acknowledge the suzerainty of the German emperors. Nor did this feudal dependency of B. ever again cease, though at one time it was weaker than at another. Duke Wratislaw II. (1061–92) received from the Emperor Heinrich IV. the title of king, which was ever after borne by the rulers of B. After a long period of strife, the succession was secured by Ottokar I. (1197–1230). His grandson, Ottokar II. (1253–78), acquired the duchy of Austria, Styria, Carinthia, Carniola, and ruled from the Baltic to the Adriatic; but lost crown and life in the battle on the Marchfeld in 1278. In 1310 a new dynasty came in with Johann of Luxembourg, son of the Emperor Heinrich VII., who acquired Silesia. Under his son, Karl, who also became Emperor of Germany, B. reached its acme of mediæval prosperity, which the Hussite wars (1378–1419) completely destroyed. After the extinction of the Luxembourg dynasty, in the person of the Emperor Sigismund (1437), the crown became elective, and was first by a Protestant noble, Georg of Podiebrad (1458–71), and afterwards (1471–1516) by Vladislav II., who being chosen king of Hungary (1490), removed his residence to Ofen or Buda. On the death of his son, Ludwig, who fell in the battle at Mohacz (1526), B., together with Hungary, passed to the Archduke Ferdinand of Austria, and its later history, though deeply interesting, and at times tragic, is blended with the fortunes of the House of Hapsburg (see AUSTRIA). Since the revolution of 1849, B. has shown a marked disposition to reassert its Czechic character, and to insist upon an amount of autonomy little short of independence. The Austro-Prussian war of 1866 has raised its hopes of securing the triumph of its nationality in education, politics, literature, &c. See Pelzel, *Geschichte der Böhmen* (Prag, 1772; 4d ed. 1817); Palacky, *Geschichte von B.* (Prag, 1836–60); Jordan, *Geschichte des Böhmen. Volks und Landes* (Leips. 1845–47), and *Fontes Rer. Bohem.* (3d. vol. 1878). For a notice of the important language and literature of B., see CZECHS.

Bohemian Brethren, a strictly religious body, which survived after the politico-religious confederation of the Hussites (q. v.) had been finally broken up in 1453. The members assumed the name of 'Brethren of the Law of Christ,' and were distinguished as *B.* or *Moravian B.*, according as they lived in Bohemia or Moravia. In 1467 they formally constituted themselves a sect by electing elders, whom they afterwards, 'for expediency,' got ordained as bishops by Stephen, an exiled bishop of the Waldenses. In 1481 they were persecuted and driven from Moravia, but most of them returned six years after. As regards doctrine, at this time they rejected the doctrines of purgatory, worship of saints, and transubstantiation, though retaining that of the real presence in the Eucharist. Afterwards their views coincided generally with those of Calvin. In the beginning of the 16th c. the B. B. numbered about 200 congregations in Bohemia and Moravia, and their numbers were at that time augmented by many of the Calixtines (q. v.); but in 1627 they were again driven from both countries, and since then most of them have been found in Poland. See Camerarius, *Hist. Narr. de Fratr. Orthod. Eccl. in Boh. Mor. et Pol.*; Comenius, *De Eccl. Fratr. in Boh. et Mor.*; Eisner, *Brevis Conspectus Doctr. Fratr. Boh.*

Bohemond I., eldest son of Robert Guiscard, the Norman Duke of Apulia and Calabria, was born about 1065, and distinguished himself by his victories over Alexius Comnenus, the Greek emperor, at Janina and Arta, though these were neutralised by the successful intrigues of his opponent. His father dying in 1085, left the dukedom to his youngest son, Roger, from whom B. wrested the principality of Tarentum, but only after

a bloody struggle. Joining the first Crusaders in 1096, with 10,000 horse and 20,000 infantry, he first tried to persuade Godfrey to turn his arms against Alexius, who sought to disarm his hostility by the splendour of his reception and the magnificence of his presents. On the march through Asia Minor, B. was conspicuous by his valour and endurance. When Antioch fell he was invested with the sovereignty, receiving investiture at a later period from the Patriarch of Jerusalem. His title was afterwards recognised by the emperor, who was constrained by the successes of B. to grant him an advantageous peace. He died in Apulia in 1111. The Christian principality of Antioch lasted for 170 years under nine princes, the last of whom was B. VI., who was forced to surrender the city to Bibars, the Mameluke Sultan of Egypt, in 1268. See Gibbon, *Decline and Fall of the Roman Empire*, ch. 58–59.

Böhme, or Beh'men, Jakob, the mystic cobbler, was born in 1575 at Alt-Seidenberg, near Görlitz, in Lusatia. With the exception of his *Wanderjahre* and a visit to a public discussion of his books at Dresden shortly before his death, he spent his life at Görlitz, cobbling and dreaming. He read the mystics Weigel and Schwenkfeld, and adopted from Paracelsus the doctrines of the Mikrokosm (viz., that the analogy between individual and cosmic life is perfect), and of the triad of sulphur, salt, and mercury. His chief friends were Frankenberg, who wrote the biography prefixed to Gichtel's edition of B.'s works (1682, translated by Fras. Okely, 1870), Dr Kober of Görlitz, and Dr Walther, a Dresden chemist. In 1612 he completed his *Aurora, or Morgen Röthe im Aufgang*, the result of two 'illuminations' or short periods of intense cerebral excitement which occurred in 1600; and ten years later Richter, chief pastor of Görlitz, tried unsuccessfully to banish B. from the town. In 1619 he completed his *Three Principles of the Divine Being*, and later a discourse on *Repentance*. B. died 21st November 1624. The last edition of his works is that of Schiebler (Leips. reprinted 1861). Under the Commonwealth there were in England societies of Behminists. John Pardage, royalist clergyman and medical man, and Jane Lead of Norfolk, endeavoured about 1697 to revive B.'s doctrines among the Philadelphists. William Law of Oxford translated B.'s works in 1764, and expounded part of them in his *Spirit of Prayer*. B.'s characteristic belief was in a revelation of truth from within. This was, of course, harmonised with the Bible, but it declined the authority of creeds. Salvation was not possible through assent to propositions; man must recognise his three natures (terrestrial, astral, and celestial), and his true relation to God—that of 'nothingness' to the 'All.' An *à priori* scheme of the Trinity is given; evil is explained by the logical doctrine of contraries; and nature, or the *mysterium magnum*, the *Urgrund*, the eternal will of the Eternal Spirit, is represented as governed by the seven forms or fountains of life—viz., the astringent, sweet, and bitter qualities, and the qualities of fire, love, sound, and essential substance. These forms are traced through organic and inorganic nature, and even in the human spirit. Thus the bitter is seen in sulphur, the planet Mars, war, dogs, red colours, and choleric temperaments. It is obvious that B.'s generalisations are those of a strong uncultivated fancy, and quite devoid of philosophical value. His worth consists in the sincerity of his religious experience, and his courage in trying to express to others what he felt to be the true paradise of the soul. His own account of the regenerate man was, 'Wem Zeit ist wie Ewigkeit, und Ewigkeit wie Zeit.' See Fechner, *Jakob B., sein Leben und seine Schriften* (Görlitz, 1857).

Bohn, Henry George, a scholarly and enterprising publisher, of German extraction, was born in London, January 4, 1796. He was one of the earliest and most active promoters of the movement in favour of cheap and genuine literature, in the interests of which he published his standard historical, classical, scientific, philological, ecclesiastical, reference and antiquarian libraries, amounting in all to about 700 volumes. He is also well known as the translator of Schiller, Goethe, and Humboldt, as the editor of the *Bibliotheca Parriana*, Lowndes' *Bibliographer's Manual*, and Addison's works, and as the compiler of a *Polyglot of Foreign Proverbs*, an *Illustrated Handbook of Geography*, a *Handbook of Pottery and Porcelain*, &c. B. is also a distinguished antiquary, and a member of many learned and scientific societies.

Boiardo, Matteo Maria, Count of Scandiano, a famous Italian poet, was born at Scandiano, in Lombardy, 1433-34, and studied at the University of Ferrara. He lived for some time at the court of the great patron of letters, Duke Borso d'Este, and was subsequently made governor of Reggio (1478), then of Modena (1481), and once more of Reggio shortly before his death, which took place December 21, 1494. His lesser works comprise *Sonetti e Canzoni* (Reggio, 1499); *Il Timone*, a drama in five acts (1500); *Cinque Capitoli in Terza Rima* (1523); and *L'Asino d'Oro*, a free translation of the *Golden Ass* of Apuleius (1523); but by far his greatest effort is the *Orlando Innamorato*, an unfinished poem based on the chivalrous fable of Charlemagne. While the earlier poets had contented themselves with representing the nephew of the great emperor purely as a Christian champion, B. who was familiar with the general character of mediæval romance, and particularly with that of the Arthurian cycle, sought to add a new grace to the tale by introducing the element of the love of woman. The loves of Orlando and 'the fairest of her sex, Angelica,' are told with a freshness and splendour of fancy that ought to have ensured the work a perpetual popularity; but, as Hallam justly remarks (*Intro. to the Lit. of Europe*, part i. ch. iii.), 'it has not received that share of renown which seems to be its due; overpowered by the splendour of Ariosto's poem (the *Orlando Furioso*, which was suggested by it), and almost set aside in its original form by the improved edition or remaking (*rifacimento*) which Berni afterwards gave, it has rarely been sought for or quoted, even in Italy.' This is substantially true. Up to 1545, indeed, it would seem to have been greatly relished, for between that year and the date of the *editio princeps* (1495), it had passed through no fewer than sixteen editions. But after 1545 it was never again reprinted till 1830, when Pantizzi published an excellent edition, with notes and introduction, in 9 vols. See also Wagner's text in the *Parnasso Italiano Continuato* (Leips. 1833). The poem was translated into French as early as the 16th c., and of late years versions of it have appeared in most of the languages of Western Europe.

Boieldieu, François Adrien, 'the French Mozart,' born at Rouen, 15th December 1775, received his first instructions in the cathedral of his native city, and was, with Auber, a pupil of Cherubini. After a busy and prolific career, he died, 8th October 1834. His opera of *La Dame Blanche* (the 'White Lady of Avenel' in Sir Walter Scott's *Monastery*) has been extremely popular in France, but none of his works have become well known in this country. His principal operas are *Le Calife de Bagdad* (1799), *Jean de Paris* (1812), *Le Nouveau Seigneur* (1813), and *Le Chaperon Rouge* (1817). His son, **Adrien B.** (born 1816), is also a composer, and produced the opera *La Hôte du Roi* at Rouen on his father's centenary in 1875.

Boi'i, a Celtic people, who emigrated from Transalpine Gaul into Italy, where they occupied the old seat of the Umbrians, between the Po and the Apennines. In B.C. 283, the B. were defeated by the Romans at the Vadimonian lake, and thereafter prolonged through numerous campaigns, especially in support of Hannibal, but sometimes single-handed, their resistance to the Roman arms, till their complete defeat by Scipio Nasica, B.C. 191. They were subsequently compelled to recross the Alps, and dwelt for more than a century in a part of modern Bohemia (which derives its name from them), but were ultimately exterminated by the Dacians.

Boil, sometimes called *Furunculus* (from *ferveo*, to burn), is a name given to an inflammation of the skin. This inflammation is limited, and the skin becomes enormously thickened. The swelling is conical, with a hard base, and contains pus at its apex. B. is exceedingly painful, is most common in the young and middle-aged, generally always in robust and florid people, and most frequently in the spring-time. B. is seldom single, and is most frequently on the parts where the skin is thickest, as back, shoulders, hips, back of neck, &c. B. is generally due to derangement of the general health. Treatment is both local and general. Local treatment consists in applying hot fomentations and poultices; in some cases of great pain a free incision does good by relieving tension. When suppuration has formed, a free incision permits the pus to escape, and also the 'core,' which must slough out before the flesh around can heal. Poultices and afterwards hot-water dressings are to be applied. Constitutional treatment consists in attend-

ing to the general health, administering a saline purgative, as Epsom salts, followed by quinine, iron, or other tonics. Great attention must be paid to diet, which should be non-stimulating and not too rich.

Boileau Despréaux, Nicolas, the greatest of the earlier French critics of *belles-lettres*, was born at Paris, 1st November 1636. Educated at Beauvais for the Church, he chose literature, or rather poetical criticism, as a profession. Between 1660-68 B. produced his nine *Satires*, in which he assails the pedantic worship of classical Spanish and Italian models in such men as Scudery and Quinault, and even in Corneille, the heroes of the Hôtel Rambouillet. From 1669-77 he produced *L'Art Poétique* (imitated by Pope in the *Essay on Criticism*), in which he enunciates positive rules of art, illustrating them by reference to distinguished contemporaries; the greater part of *Lutrin* (the model of Pope's *Rape of the Lock*, but not equal to the brilliant performance of the Englishman), a mock-heroic directed against the Parisian canons; a translation of Longinus *On the Sublime*; *Les Héros de Roman*, another blow in imitation of Lucian against the romantic school; and his first nine *Épîtres* on such subjects as self-knowledge, false shame, the usefulness of jealousy, pleasures of the country, &c. B. was now appointed, along with Racine, royal historiographer. His publications during the last years of his life (including three more *Épîtres*) are inferior; but his letters, extending from 1672 to 1710, are valuable as literary history. Many are addressed to Racine, of whom, and of Molière and La Fontaine, he was an intimate friend. B. died at Auteuil, 13th March 1711. He was an upright man, of warm and generous feeling. He aided struggling talent, and protected the unpopular Arnauld and the aged Corneille. As Madame de Sévigné says, 'he was cruel only in verse.' He had no profound knowledge of French literature or of the general laws of poetical expression, but he substituted common sense as a literary standard for the ridiculous 'conceits' which Molière has referred to in *Les Précieuses Ridicules*. B. has had an immense, and on the whole beneficial, influence on the national literature. Upwards of sixty editions appeared in the author's lifetime, and more than 350 in all have appeared. The best is that of Berriat Saint-Prix (Par. 1830; 1860). See Desmaizeaux, *Vie de Nic. B. Despréaux* (Amst. 1712); also Laverdet, *Correspondance de B.* (Par. 1858). B. had two elder brothers; the one, Gilles (born 1631, died 1669), translated Diogenes Laertius; the other, Jacques (born 1635, died 1716), wrote a *Historia Flagellantium*, and many other ecclesiastical and theological works.

Boiler, a vessel in which steam is generated. A B. may be either open or closed; in the former case, the temperature of the steam formed remains at or near 212° F., and its pressure is the same as that of the atmosphere, or about 14.7 lbs. per square inch; in the latter case, the temperature and pressure may be made to exceed these limits to any required extent. Two considerations mainly determine the form of a B.—viz., its strength to resist internal pressure and its efficiency in producing steam. The best B. is that which has sufficient strength safely to withstand the pressure to which it is subjected, combined with such a form and arrangement as shall enable the water to abstract a maximum of heat from the gases of combustion. The spherical form is the strongest, and seems to have been the earliest used; it presents to the fire, however, a minimum of surface in proportion to its contents, and therefore has a low efficiency as a steam-raiser. After spherical boilers cylindrical ones came into use, at first set on end, and afterwards placed horizontally. Later on these were furnished (as now used) with internal cylindrical tubes for furnaces. Watt's 'wagon' B. (so called from its shape) was used for many years, but being quite unfit for any but very low pressures, it has long been discarded. So long as the steam pressures employed were only a little above atmospheric pressure, it was common to make boilers with flat sides, to which stiffness was given by internal stays; but now that it is quite common to use pressures of 50 lbs. per square inch and upwards above atmospheric pressure, a form of B. has to be employed which shall be strong enough without such stays, which it would be most inconvenient to provide in such cases. It is for this reason that the cylindrical form is the one now chosen almost invariably for the B. shell.

Boilers may be classed as (a) horizontal, vertical, (b) internally and externally fired, or (c) plain, multitubular, and tubular. Large boilers are almost invariably horizontal, the vertical

form being only used in the small boilers of steam cranes or traction engines, or in connection with some furnaces, or in other places where length cannot be so easily provided as height. In this country, where the fuel commonly used is tolerably good coal, boilers are generally fitted with internal furnaces; but upon the Continent, where the fuel is inferior, external firing is often advisable and economical. All ordinary cylindrical boilers come into the class of 'plain' boilers. They are the simplest and cheapest that can be made, and when properly proportioned they possess a very considerable evaporative efficiency. The common Cornish B. is the leading type of plain

Longitudinal Section.

Cornish Boiler set in Brickwork.

boilers. Its shell is a cylinder (from 4 to 8 feet diameter), placed horizontally, and encloses a smaller cylinder called a flue, which is always surrounded by water, and in which, at its front end, the fire-grate is placed. The Lancashire B. is similar to this, but has two flues. The Galloway B., which resembles a Cornish B. with cross water tubes placed in the flues, is probably the most perfect type of plain horizontal B. Where it is necessary to economise space or fuel, or both, a multitubular B. is commonly used. In this the flame and gases of combustion are made to pass through a number of tubes surrounded by water, commonly from 2 to 4 inches diameter, on their way to the chimney, so that a multitubular B. offers a much larger surface to the flame than a plain one of the same bulk, and its steam-generating power is correspondingly increased. Marine boilers are invariably multitubular, as are locomotive boilers also. Tubulous boilers not only contain tubes, but consist of them entirely. They possess some advantages on the score of safety when very high pressures are used, but those hitherto designed have for the most part been defective in means for causing the water to circulate, and have not, consequently, realised all the advantages expected of them either in security or economy.

In a good marine B., 1 lb. of good coal evaporates 10 or 11 lbs. of water from and at 212° F. In a less perfect B., and with inferior fuel, the evaporation is proportionately less, being sometimes only one-third as much.

Boilers are always made of wrought-iron plates, of a thickness proportioned to the diameter of the B. and the pressure of steam. The plates have occasionally been welded together, but are in almost every case fastened by rivets. The tubes are generally of iron, but sometimes of brass. Copper is occasionally used for the fire-box plates of locomotives, but very rarely elsewhere. The larger class of land boilers are commonly set in brickwork, forming a system of flues through which the products of combustion pass on their way to the chimney.

The destruction of boilers is principally due to two causes—(1) the burning of the plates in places where a solid deposit ('scale') has formed upon their inner surfaces, and (2) the corrosion of the plates by the chemical action of various impurities in the water. See COMBUSTION and FUEL.

Boiling, in cookery, is one of the most frequent and important operations connected with the preparation of food. It is a process applicable to almost all varieties of food and every kind of culinary preparation, and the necessary appliances are simple and inexpensive. In the boiling of animal food, if it is desired to retain the nutritive juices within the substance, the meat to be boiled should be suddenly plunged entire in boiling water, and briskly boiled a few minutes. This coagulates the albuminous matter in the outer portion of the meat, and prevents the exudation of the fluid juices within. Thereafter the water should be maintained somewhat under the boiling-point till the meat is sufficiently dressed, a period which varies according to the amount being operated on. By this means the meat is kept at once juicy, tender, and nutritious. When meat is boiled for the preparation of broths or soups, it should be cut up into small pieces, placed in cold water, and gradually brought to the boiling-point, by which means the juices are transfused through the liquid, the

meat consequently becoming in proportion less nutritious. Fish ought to be boiled in water containing a quantity of salt, as it is thereby rendered firmer, and retains a fuller flavour. The boiling of food starchy such as arrowroot, corn-flour, &c., ruptures the starch granules, and renders them digestible, and the same thing occurs in boiling meal, flour, and vegetables generally, which all contain starch in large proportions. Boiled food is more digestible than the same either roasted or stewed, but it wants the empyreumatic odour and sapidity communicated by these processes. It is the most economical of these three processes, as shown by the following table of percentage of loss, extracted from Dr Letheby's *Food*:

	Boiled.	Baked.	Roasted.
Beef	20	29	34
Mutton	20	32	35
Leg of mutton	20	32	33
Shoulder of mutton	24	32	34

See COOKERY.

Boiling-Point of a liquid is that temperature at which the liquid boils—i.e., the temperature at which it gives off vapour freely. When this point is reached, the temperature of the liquid undergoes no further change, the energy of the heating being all spent in converting the liquid into a gas. When a liquid is becoming gaseous, it expands and does work. If the pressure be increased, more work will require to be done to expand it to the same amount, and therefore, according to the conservation of Energy (q. v.), more heat will require to be spent, and the B.-P. will consequently be raised. Similarly, if the pressure be diminished, the B.-P. will be proportionately lowered; and this is found to be the case in elevated regions where the atmospheric pressure is considerably diminished. The variation of the B.-P. of water may thus be used for determining heights. See also PAPIN'S DIGESTER, GEYSERS, and SPHEROIDAL STATE OF LIQUIDS.

Bois Blanc, an island, at the N. end of Lake Huron, U.S., America, 10 miles long and 3 broad, is provided with a lighthouse at its eastern extremity.

Bois-de-Boulogne. See BOULOGNE.

Bois-le-Duc (Dutch, *Den Bosch* or *Herfogenbosch*, 'the Duke's forest'), a strongly fortified town and capital of the province of N. Brabant, Netherlands, at the confluence of the Dommel and Aa, with large manufactures of linen thread, woollens, ribbons, cutlery, jewellery, and cigars. The cathedral, St Janskirke, is a splendid building. B. was founded in 1184 by Godfrey III., Duke of Brabant, the site being the heart of a forest, whence its name. The states from which it had rebelled besieged it in 1601, and again in 1603, but it was not till 1629 that it surrendered. The army of the French republic here defeated the English under the Duke of York in 1794. Pop. (1875) 24,190.

Boisserée, Sulpiz, a celebrated architect and archaeologist, was born at Cologne, 2d August 1783. Assisted by his younger brother, Melchior, and a friend, Johann Baptist Bertram, he gathered together with great labour, and classified with consummate skill, 200 specimens of early German art which had got widely scattered. These pictures were first arranged in historical periods at Stuttgart, in a spacious building presented to the brothers for that purpose by the King of Württemberg, and the study of the collection has shed great light on the sources of mediæval art in Germany. In 1827 the 'Boisserean Collection' was sold to the King of Bavaria for 120,000 thalers. In 1836 the pictures were hung up in the Pinakothek (picture-gallery) of Munich, where they still remain. S. B. died 2d May 1854, his brother Melchior 14th May 1851. The elder brother published *Ansichten, Risse und einzelne Theile des Doms zu Köln* (Stuttg. 1822-31); *Die Denkmale der Baukunst vom 7 bis 13 Jahrh.* (Stuttg. 1831-33); *Ueber den Tempel des heiligen Graal* (Mun. 1834); *Die Kaiser-Dalmatika in der Peterskirche zu Rom* (Mun. 1842). His widow published his biography and selections from his correspondence in 1862, under the title *Sulpiz B.*

Boissonade, Jean François, an eminent French scholar, was born at Paris, 12th August 1774. In his youth he held office under the ministry of Dumouriez, and subsequently under Lucien Bonaparte. In 1809 he succeeded Larcher as Professor of Greek Literature to the Faculty of Letters of the Academy of Paris; and in 1828, on the death of Gail, he became Professor of Greek Literature in the College of France. His lectures from three chairs gave

a great impulse to philological studies in France. He issued an immense number of works, especially of authors till then unedited, or editions of classics enriched by commentaries, which display sound and learned criticism. Among these publications were the *Life of Proclus* by Marinus (Leips. 1814); the *Letters of Lucas Holstenius* (Par. 1817); *Lives of the Sophists* by Eunapius (Amst. 1822); the *Dialogue of Psellus on The Work of Demons* (Nürnb. 1838); the *Letters of Aristænetus* (Par. 1822); the *Letters of Philostratus* (Par. 1842); the *Fables of Babrius* (Par. 1844), of Syntipas (Par. 1828); *Anecdota Græca* (5 vols. Par. 1829-44), and *Anecdota Nova* (Par. 1844). In addition to his own separate works, B. made innumerable contributions, philological and critical, to the works of others, to classical journals, and to the daily press of Paris. He died in September 1857.

Boiss'y d'Anglas, François Antoine Comte de, a celebrated French publicist, born in the department of Ardèche, 8th December 1756, and came, while still young, to Paris, where he soon acquired a high literary reputation. In 1789 he was chosen a deputy to the States-General, in 1791 became secretary to the National Assembly, and on the eve of 9th Thermidor united with Tallien and Barrère for the overthrow of Robespierre. Soon after, being charged with the task of provisioning Paris, he was subjected to imminent peril, from which his intrepidity saved him, and procured for him the thanks of the Convention. He was afterwards loaded with honours both by Napoleon and Louis XVIII., and died at Paris, 20th October 1826. In addition to numerous brochures of ephemeral interest, he published an essay on Malesherbes, with notes, letters, and unedited pieces (*Essai sur la Vie, les Écrits, et les Opinions de Malesherbes, &c.* (2 vols. l'ar. 1819 and 1821), and *Recueil de divers Écrits en Vers et en Prose* (Par. 1825). See *Notice sur la Vie et les Ouvrages de B. d'A.* in the *Mémoires de l'Académie des Inscriptions*, t. ix. p. 146.

Bois-tan, the name applied to the fruits of *Byrsonima spicata*, a tree of the natural order *Malpighiaceæ*, which are used in dysentery. In Brazil the bark is also used for tanning.

Bojador, Cape (Port. *bojao*, to bend outward), on the W. coast of Africa, forming one of the projecting points of the Great Desert, rises to a considerable height, and is the southern limit of the low, flat, gently sloping coast, one of the most dangerous in the whole globe, which extends as far N. as Cape Nun. Cape B. was doubled by Gilianez, a Portuguese navigator, about the year 1432.

Boja'no, a town in the province of Campobasso, Central Italy, 13 miles S.W. of Campobasso, and 92 miles S.E. of Rome. It stands on a rocky hill, has a cathedral, and contains several parts of an ancient wall. Pop. 3000. It is said to occupy the site of the ancient Samnite capital, *Bovianum* ('Ox-town'); but T. Mommsen, who has investigated the topography of the place, is of opinion that the famous Samnite city lay 20 miles N., where ruins are still visible.

Bojar (pronounced *Boiar*, 'a warrior'), a class of Russian nobles, now extinct. The B. was originally a popular 'hero' in all the Slavic lands; but afterwards the name was definitely given to an independent landholder. In the old Russian gradation of ranks, he came next to the *Knjase*, or prince. He was the follower of the *Knjase*, but not his feudatory. The B. had a train of his own dependants, and could select the prince whom it pleased him to aid, as well as shift his allegiance if he thought proper. The Bojars had a prescriptive right to the chief posts both in the army and the civil administration, and possessed a power which even the Czar respected. The peculiarly Slavonic custom of *miestnicestvo* entered largely into their order. According to this curious institution, which seems to be Asiatic in origin, property and titles were hereditary, but rank was wholly personal. Military dignity conferred by the Czar, or length of political service, constituted the patents of rank. A B. who had been appointed Councillor of the Empire would take precedence of a noble of the same class, though the latter might be of older family, or have ten times greater wealth. While the B. class existed, it prevented the Russian form of government from becoming an absolute despotism. The imperial ukase admitted its power, being thus framed:—'The Czar has willed, the Bojars have approved it.' Peter the Great finally succeeded in destroying

the order, by elevating its members to the level of the higher nobility, but denuding them of their ancient and peculiar rights. The last of the Bojars died in 1750.

Bokha'ra ('Eastland'), the most important khanate of Central Asia, situated between the river Amu Daria and the sandy desert of Kizil-Kum, with an area of 100,000 sq. miles, and a pop. of some 3,000,000. It is in great part a fertile plain, the eastern portion of which especially is a region of flourishing towns and villages, with their orchards and mulberry groves, and of well-cultivated tracts of wheat, barley, maize, rice, cotton, gourds, and water-melons. The extent of cultivated land is not known, but B. is second only to Khiva in the quantity and quality of its products, while it is unrivalled in Central Asia for the variety and excellence of its fruit. The chief rivers are the Amu (anc. Oxus), near the S. frontier, on its N.W. course to the Aral Sea; the Zarafshan (Pers. 'the scatterer of gold'), rising in the Fan-Tagh mountains in the S. of Kokan, flowing through the heart of the country, and entering the Karakul (Turk. 'black-lake') 50 miles S.W. of the city of B.; the Sogd, an offshoot of the former, which is absorbed by the western steppe; and the Balka, a vast tributary of the Amu, by which the E. portion of the khanate is watered. In metals B. is very rich, there being copper, silver, lead, iron-ore, sulphur, salt, and saltpetre. Gold-washing is carried on in some of the rivers. The industries are chiefly agriculture, the breeding of sheep, goats, horses, and camels, and the manufacture of silk. B. has a healthy climate, but is liable to severe summer heats and to occasional sandstorms. The inhabitants are partly Turkish Tartars, known as Usbeks and Turkomans, and partly Aryan Tajiks, or Persians. They are Mohammedans, partly Sunnites and partly Shiites, who reverence the Khan of B. next to the Turkish Sultan, who is the spiritual head of Islamism.

B. is the ancient Sogdiana, or Maracanda, of which the capital was the modern Samarcand. In the 8th c. it was conquered by the Arabs, under whom it flourished till 1220, when it fell under the power of Genghis Khan, whose descendants were dispossessed by Timur about 1370. It was finally seized (1505) by the Usbeks, who are still the dominant race. After the Russians had annexed part of Khokan in 1865, they found themselves harassed incessantly by the petty attacks of Bokharan troops, and entering the khanate, they gained a decisive victory at Jdjar (1866), and afterwards took possession of the city of Samarcand in 1868. The Khan, Musaffer-Eddin, paid a large indemnity, and ceded Samarcand and the fertile upper courses of the Zarafshan, but was allowed to retain his throne, subject, however, to an annual contribution to the Russian exchequer. B. is being rapidly transformed by Russian influence, which is promoting its trade and introducing the civilisation of Europe into its towns. It aided the Russian forces in the recent Khivan expedition, and in return for this service received (July 1873) a grant of territory on the right bank of the Oxus. See Vambéry's *B., its History and Conquest* (Lond. 1873), and E. Schuyler's *Turkestan* (Lond. 1875), and Fedtchenko's *Journey in Turkestan* (St Petersburg. 1875).

Bokha'ra, the capital of the khanate of the same name, and the most important trading centre in Turanian Central Asia, 140 miles W. of Samarcand, on the Khyrabad, a small branch of the Zarafshan. It is surrounded by mud walls, nearly 9 miles in circumference, and in its centre, on an elevation of between 200 and 300 feet, stands the Khan's palace, together with the harem, public offices, barracks, and royal stables. The city has long been celebrated in Central Asia as a seat of learning, being called the 'Treasury of Sciences,' and has 180 mosques, with high minarets, nearly 100 academies of Mohammedan theology, and numerous schools. But B. is still more important as a mart or entrepôt for the growing caravan commerce of Turkestan with China, India, Persia, Siberia, and Europe. It has also considerable manufactures, chiefly of silk stuffs, cotton, thread, firearms, shagreen, and jewellery. Pop. estimated at from 70,000 to 180,000.

Bokha'ra Olo'ver. See MELILOT.

Bolabo'la, or **Bo'rabora**, one of the Society Islands, in the S. Pacific Ocean, about 200 miles N.W. of Tahiti, in lat. 16° 32' S., and long. 151° 52' W. It is surrounded by coral reefs, contains a lofty hill, and has a coast-line of about 24 miles. The rest of the group is under the French protectorate, but B. forms an independent state. Pop. 1800, chiefly of Malay race.

Bolan, one of the two historical passes leading from India into Afghanistan, through the Suleiman range. The point of departure is Sukkur on the Indus in Scinde. From Dadur, at the foot of the Pass, to Quetta (q. v.), at the farther end, is about 54 miles, the greater part of the route being a narrow gorge, enclosed between precipitous cliffs. In one day's journey of 10 miles, the B. river has to be crossed no less than seventeen times. The summit of the Pass is 5900 feet above the sea. By this route a British army marched to the capture of Candahar, in 1839, and again in 1878. The annual value of the trade by the B. Pass is estimated at £50,000.

Bolbec, a town of France, department of Seine-Inférieure, on a small river of the same name, and on the Havre and Paris Railway, 18 miles E.N.E. of Havre. It has increasing manufactures of woollens, linens, printed cottons, and chemicals. Pop. (1872) 9048.

Bol'do, or **Bol'du**, a small tree, *Boldoa fragrans*, growing in Chili, the leaves of which yield an essential oil, and an alkaloid termed *boldine*. They have been recently imported into Europe, and proposed for medicinal use in liver complaints. The bark of B. is available for tanning.

Bole, an earthy unctuous clay, coloured red, yellow, or brown, according to the quantity of iron present, as ferric oxide with silica, alumina, and water make up its usual constituents. It is found in Saxony, Bohemia, Silesia, Styria, Italy, &c. The chief varieties are—*Armenian B.*, of a fine bright red colour, used as 'keel' for red marking, in the preparation of a tooth-powder, and in India as a tonic and astringent; *B. of Blois*, of a yellow hue, and containing carbonate of lime, which effervesces with acids; *Bohemian B.*, a yellowish-red variety; and *French B.*, a pale red, with streaks of yellow. The Lemnian earth, formerly in medicinal repute as an astringent, tonic, &c., is also a kind of B.

Bole'ro, a Spanish national dance. Its music is in triple time, and has a strongly marked rhythm.

Bole'tus, a genus of *Fungi* (q. v.), division *Hymenomycetes*, subdivision *Polyperi*, many species of which are edible. In general appearance most of them resemble the common mushroom (*Agaricus*), but instead of having gills on the under surface of the umbrella-like cap (*pileus*), their place is occupied by a porous substance, which looks as if it was composed of a number of tubes placed side by side. *B. edulis*, though not highly valued in Britain, is commonly eaten on the Continent. It is believed to be the 'suillus' of the ancient Romans, who obtained it from Bithynia. *B. asivialis* is still better, having when ripe a nutty flavour. *B. scaber*, *B. bovinus*, *B. castaneus*, *B. chrysenteron*, *B. luridus*, and *B. submentosus* are less valued, and the three last named are even said to be sometimes poisonous. *B. Grevillei*, *B. flavus*, *B. granulatus*, *B. collinitus*, *B. luteus*, *B. elegans*, *B. flavoidus*, *B. versipellis*, *B. leucomelas*, and *B. ovinus* are also edible. See Cooke, *Fungi, their Nature and Uses* (1875).

Boleyn, **Boulen**, or **Bolen**, **Anne**, one of the wives of Henry VIII., was born about 1507. Her father was Sir Thomas B., afterwards Lord Rochford and Earl of Wiltshire, and her mother a daughter of the Duke of Norfolk. When about seven years of age, she went to France with the Princess Mary, sister of Henry VIII. Returning to England, she became one of the maids of honour to Catherine of Aragon, and her great personal beauty excited a strong passion in the king, which, however, she refused to gratify unless she were made his wife. This refusal may be said to have hastened the Reformation in England. Henry, enraged at the refusal of Rome to declare his marriage with Catherine null, contracted a private marriage with Anne about the end of 1532 or the beginning of 1533, in which year he also declared himself, and not the Pope, the supreme head of the Church. In September 1533 Anne gave birth to a daughter, afterwards Queen Elizabeth. For a short time she retained her hold upon Henry's affections, but in 1535 he became alienated from her, and transferred his love to Jane Seymour. Anne was then arraigned on the charge of adultery with several of the courtiers, including a musician of the name of Smeton, and her own brother, Lord Rochford, also with conspiring against the life of the king; and being condemned by a council of peers, was beheaded May 19,

1536, praying for a blessing on Henry. Whether Anne was guilty or not is one of those historical mysteries which appear destined never to be solved. She had undoubtedly a strongly sensuous nature, which was transmitted to her daughter; and before Henry took proceedings against her, grave reports as to her character were current in the court. These, however, may be accounted for by the free manners which she had acquired in France, and it is certain that she never confessed to infidelity, although it is believed that she admitted to Crommer some engagement which rendered her marriage with Henry illegal. Anne seems to have been a friend to the Reformation, and favoured the translation of the Bible. See Froude's *History of England*, and Miss Benger's *Memoirs of Anne B.* (2 vols. Lond. 1821).

Bolingbroke, **Henry St John**, **Viscount**, one of the most celebrated Tory statesmen, orators, and pamphleteers of the 18th c., was born at Battersea, 1st October 1678, of an ancient and distinguished family. One of its members was the celebrated lawyer on the side of the Parliament, Oliver St John, who defended Hampden in the ship-money trial, and was made a chief justice by Cromwell. B., who was educated at Eton and Christ Church, Oxford, seemed likely to waste his energy at the beginning of his career in dissipation, in regard to which he avowed his intention to rival his kinsman Rochester. When, however, he entered Parliament in 1700, as member for Wootton Bassett, he found a worthier vent for his powers in political ambition. He attached himself to the moderate Tory party, of which Harley was then the head, and his brilliant talents and great eloquence, added to a singularly fine presence, and a manner in which dignity was mingled with sweetness, soon made him, next to Harley, the foremost man in his party. In 1704 B. was appointed Secretary at War in the Godolphin administration, but retired in 1708 when Marlborough and Godolphin allied themselves with the Whigs. On the fall of the latter he returned to power as Foreign Secretary, the colleague, but in reality the rival, of Harley. He negotiated the peace of Utrecht in 1713—the year before which he had been elevated to the House of Lords as Viscount B. The jealousy between him and Harley ended in a quarrel and the expulsion of the latter from the position of Premier and Lord Treasurer, to which B.—who had been in correspondence with the Pretender, chiefly because he thought Queen Anne favoured him—succeeded in July 1714. The death of his sovereign, however, blasted his prospects. On the accession of George I. he was deposed from office, fled to France in March 1715, and some months later was attainted. In France, he held for a short time the office of Secretary of State to the Pretender. He managed, however, to make his peace with the reigning family, and to have his property, though not his seat in the House of Lords, restored to him. Returning to England, he lived at Dawley, near Uxbridge, where he enjoyed the society of Pope, Swift, and other old literary and political friends, and in the *Craftsman* and in pamphlets bitterly attacked Sir Robert Walpole and his policy. B. never was able, however, to reappear on the scene of active political life. He died 12th December 1751. B. was twice married. His first wife was the daughter of Sir Henry Winchcombe. With her he did not live happily, and, on her death in 1718, he married the wealthy widow of the Marquis de Vilette. B.'s complete works were published by Mallet (1753–54, new ed. 8 vols. 1808–9). The best-known of these are his *Dissertation on Parties*, *Study of History*, in which he attacked Christianity, and *A Patriot King*. His style is singularly brilliant, witty, and emphatically rational. But for his religious opinions, and the general belief that he was unscrupulous and insincere, B.'s reputation would stand much higher than it does. It may, however, be safely affirmed that B.'s reputation stands higher to-day than it did at any period since his death. Few accurate readers of history would endorse the verdict of Lord Shelburne, first Marquis of Lansdowne, as given in his autobiography recently published, that he was 'all surface' and 'both a political and personal coward.' See B.'s *Correspondence* (Lond. 1793), and Macknight's *Biography of B.* (Lond. 1865).

Bolívar, **Y Ponte**, **Simon** (named *El Libertador*, 'the Liberator'), was born at Caracas, 24th July 1783. Having completed his education at Madrid, he applied himself diligently to the study of politics, and enlarged his experience by travel in Europe and the United States. Returning to his native country in 1810, he associated himself with the 'patriots' who sought to

establish the independence of the Spanish provinces in America. In 1811 he joined the standard of Miranda; and on August 4, 1813, at the head of an army of volunteers, he entered Caracas as a conqueror, having liberated the greater part of Venezuela from the domination of Spain. Being invested with supreme powers under the title of dictator, he prosecuted the war for some time with success; but having been defeated at La Puerta (June 14, 1814), and afterwards (17th August) at San Mateo, he retired to Jamaica, where he narrowly escaped assassination at the hands of an agent of the royalist party. In December 1816, he made himself master of the island of Margarita; the next two years were marked by brilliant successes; and in 1819 Venezuela and New Granada were united as a republic, under the title of Colombia, with B. as president. In 1822 B. aided in the liberation of Peru, and was made dictator, an office which he resigned, 1st January 1825, the country having been entirely freed from the enemy by the victory of Ayacucho of 9th December preceding. As a mark of gratitude, the Peruvians named the southern half of the new republic Bolivia (q. v.) in honour of the Liberator, and presented him with 1,000,000 dollars, with which he purchased the freedom of 1000 negro slaves. After having been confirmed twice in his presidency of Colombia, in 1826 and in 1828, he resigned it in January 1830, and died 10th December of the same year, at San Pedro, near Santa Marta, having failed in his object of uniting the whole of the S. American provinces into a gigantic republic. See Larrazabal's *Life of B.* (1867).

Bolivia, a republic on the W. side of S. America, between lat. 10° and 23° S. and long. 57° 30' and 70° 10' W. It is bounded W. by Peru and the Pacific, N. and E. by Brazil, and S. by the Plate provinces and Chili. Area, 536,180 sq. miles; pop. (1874) estimated at 2,000,000, of whom about one-seventh are Indians. B. is divided into nine departments, Chuquisaca or Sucre, Potosi, Oruro, Tarija, Cobija, La Paz, Santa Cruz, Trinidad, and Cochabamba. Nearly the whole country lies within the tropics, but not more than the half has a tropical climate, on account of its great elevation. The mountains belong to the range of the Andes (q. v.). Between two meridional parallel ridges of these lies the vast tableland known as the valley of the Desaguadero, which includes Lake Titicaca. The river system of B. is unique. On the W. of the Andes there is scarcely a river, while on the eastern side are found the sources of the Plata and the Amazon. Two circumstances explain this: on the western side the air is dry, while on the east, the Atlantic trade winds, that cross the S. American continent, are laden with vapour, and there is ample space for river development. The waters of the central plateau fall into Lake Titicaca, the overflow of which is carried off by the Desaguadero, which, after a course of 180 miles, loses itself in Lake Ullagas. The principal grain crops are maize, wheat, barley, and rye. The mineral wealth is great. Gold, copper, lead, and tin abound; and the silver-mines of Potosi were once the most productive in the world. Commerce is crippled for want of facilities of transport. Puerto-de-la-Mar, formerly Cobija, is now a free port, but the greater portion of the trade is done through the Peruvian ports of Tacua and Arica. A line of railway was nearly completed (1874) between Autofagasta and Salar del Carmen, but the Rio Amazonas line into the interior has meanwhile (1876) been abandoned. The principal exports are guano, Jesuits' bark, copper, tin, and the precious metals; imports, iron, hardware, and silks. There are no reliable commercial returns, but the total imports are valued at £1,000,000, and the exports at something less.

B. declared its independence of Spain 6th August 1825, and was named after its liberator; but its subsequent history has not been more fortunate than that of other Spanish republics. The present (1876) president is Dr Thomas Frias, who was elected 14th February 1874.

Bolkhov, an ancient town of Russia, government of Orel, situated on the Nugra, 35 miles N. of the city of Orel. There are manufactures of gloves, hats, leather, &c., and trading in tallow, hemp, hides, &c. Pop. 18,491.

Boll, or **Bole**, a dry measure still occasionally used in Scotland for measuring potatoes, cereals, &c., and has the value of six bushels.

Boll'andists, the name given to those learned Jesuits who during the years 1643-1794 published at Antwerp, Brussels, and Tongerlo, the famous *Acta Sanctorum* (q. v.), a collection of the

lives of the saints of the Catholic Church. They received this name from Johann von Bolland (born in Limburg 13th August 1596, died 12th September 1665), who was the editor of the first five volumes. Among the numerous distinguished men who have edited or contributed to this colossal work, the most notable are Gottfried Henschen (born 1600, died 1681), Dan. Papebroek of Antwerp (died 1714), Konrad Janning (died 1723), Peter Bosch (died 1736), Suyskens (died 1771), Hubens (died 1782), Dom Anselmo Berthod (died 1788), and Jos. Ghesquière (died 1802). On the abolition of the Jesuit order in 1773, the B. found an asylum in the Augustinian Abbey of Candenberg in Brussels, where they continued their vast and laborious work until the persecutions of the 'enlightened philosopher,' Joseph II., brought about the dissolution of the learned society. In 1789 the Præmonstratensian Abbey of Tongerlo in Brabant undertook to complete the publication, but had only reached the fifty-third volume (6th October in the Calendar of Saints), when the French occupation of the Low Countries (1794) put a sudden end to their industry. In 1837 a new association of B. was formed in the old order, and several volumes have been issued since 1845, but the work is still unfinished. Those who desire to consult this great treasure-house of mediæval legend or history should get Palmé's volume of tables to the *Acta Sanctorum* (Par. 1875).

Bolo'gna (Lat. *Bononia*), one of the oldest and richest cities of Italy, capital of a province of the same name, lies at the foot of the Apennines, between the rivers Reno and Savena, 190 miles N.N.W. of Rome. It was long one of the most powerful cities in the Papal States, and is still the see of an archbishop and the seat of a prefect, of a general in command, and of a court of appeal. Adorned with numerous palaces and rich in art treasures, it is inhabited mainly by an aristocratic class, and is little disturbed by the bustle of trade. The houses are mostly three-storied, while the streets are broad, and the pathway is usually covered by arcades, which afford both shelter and shade. The two finest squares are the Piazza Maggiore del Gigante, or 'the Forum of the Middle Ages,' 395 feet long and 320 broad, surrounded by many splendid public buildings, and adorned with beautiful fountains (1563); and the extensive *Mea*, used as a military parade-ground. Among the most notable buildings of B. are the Palazzo del Podestà (1201), remarkable as the depository of the city archives, and as the prison (1249-72) of Enzius, son of the Emperor Friedrich II.; the Palazzo Publico, which has many splendid halls, as the Sala Farnese, and is adorned with beautiful frescoes and statuary; the cathedral (*il Duomo*), completed in its present form in 1748; the large church of San Petronio, on the floor of which is traced a meridian by Cassini (1653); the beautiful church of San Domenico, rich in monuments, and containing the tomb of St Dominic. There are some 130 other churches. B. has two extraordinary leaning towers, that of Asinelli (built by Gerard Asinelli, 1109), 256 feet high, with a lean of 3 feet 2 inches; and the Garisenda tower (1110), referred to by Dante (*Inferno*, 1st canto), which has a lean of 8 feet in an elevation of 130. About 3 miles from B. is the nunnery Madonna di San-Luca, towards which there runs a splendid colonnade of 654 arches. The *University of B.*, which claims to have been first founded by Theodosius the younger in 425, was founded anew by the famous Irnerius or Wernerus (died 1140), and subsequently gained a European reputation. Notable among its many celebrated professors have been several learned ladies, of whom three prelected respectively in the chairs of law, mathematics, and anatomy. In 1262 it had some 10,000 students, but though one of the best of Italian schools, it only now numbers some 600. The university library, of which Mezzofanti was for some time keeper, has some 200,000 volumes and 1000 MSS. Prince Marsigli here founded the *Institute delle Scienze* (1690), also an astronomical observatory, botanical garden, &c. Pope Clement XIII. instituted the *Accademia delle Belle Arti*, also called *Accademia Clementina*, which contains the masterpieces of the famous Bolognese school, formed in the 15th c. by the Carracci, Guido Reni, Domenichino Albano, and others. B. is the birthplace of the Popes Honorius II., Lucius II., Gregory XIII., Innocent IX., Gregory XV., and Benedict XIV. The manufactures are chiefly silks, velvets, jewellery, glass, artificial fruits and flowers, scented soap, liqueurs, macaroni, and the far-famed *cervelat* and *mortadello* sausages. Pop. (1872) 115,957.

B. is said to have been founded by the Etruscans under the name *Felina*. It passed into the hands of the Boian Gauls, and became a Roman colony B.C. 189, when it was first called *Bononia*. It was taken by the Lombards A.D. 728, but was made a free city by Charlemagne. B. received additional privileges from Heinrich V. in 1112, and soon rose to be the most flourishing republic of Italy. But after suffering from the party strife of the Guelphs and Ghibellines, it was united to the Papal See in 1513. Taken by the French in 1796, it was restored to the pope in 1815, again taken by the Austrians in 1849, and finally constituted itself a part of the Italian kingdom in 1860. See Savioli, *Annali della Città di B.* (3 vols. Bassano, 1788-95); Gatti, *Guida delle più rare Cose di B.* (Bolog. 1813); and Bädcker, *North Italy* (1875).

Bologna Phi'al, a small flask of unannealed glass, which stands a severe shock or blow on the outside without breaking, and flies into pieces immediately an angular bit of glass or flint is dropped into the interior. At glassworks the quality and colour of the pot metal is tested by blowing these phials, and their strange behaviour is accounted for by more rapid cooling on the outside than inside, and consequent unequal contraction.

Bolognese' Stone, a variety of sulphate of barytes obtained from a bed of clay near Bologna, which is phosphorescent while heated with charcoal and exposed to sunlight. Sticks of 'Bolognese phosphorus' are made from it, by mixing the powdered mineral with gum.

Bolor-Tagh, a lofty tableland of Central Asia, also called the Pamir Steppe, stretches from the range of the Hindu Kush northwards to the Thian-Shan, and separates Turkestan into an eastern and western portion. It was long erroneously regarded as a mountain chain of the first magnitude.

Bols'na (anc. *Vulsinium*), a walled town in the province of Latium, Central Italy, on the N. shore of the lake of the same name, 20 miles N.N.W. of Viterbo. It was in ancient times one of the twelve famous Etruscan towns, and was taken and destroyed (280 B.C.) by the Romans, who here built a city of which there are still numerous remains. B. is celebrated for its wine. Pop. 2100. The malarious *Lago di B.* (anc. *Lacus Vulsiniensis*) is 9 miles long and 8 broad, and contains the islands Martana and Bisentina, where Pope Leo X. resided during the autumn months, and where the Farnesé family built a castle and a church, of which the tower still exists.

Bolsward' (Lat. *Bolverda*), a town of the Netherlands, in the province of Friesland, and 15 miles S.W. of Leeuwarden. It is surrounded by an earthen wall and a canal, and has a splendid Gothic church, a grammar school, and several benevolent institutions. The principal industries are shipbuilding, tanning, worsted-spinning, and wool-carding, brickmaking, and the manufacture of coarse pottery. There is a trade in butter, cheese, and cattle. Pop. (1870) 4630.

Bolt, a piece of metal (generally iron), with a screw cut on it, used in connection with a 'nut,' which has a corresponding internal screw, to fasten together the parts of structures or machines.

Bol'ton, or **Bolton-le-Moors**, a flourishing town of S. Lancashire, and one of the chief seats of the cotton manufacture, on the Croal, 11 miles N.W. of Manchester by rail. It contains about 80 mills, with some 2½ millions of spindles, and produces chiefly plain and fancy muslins, fine calicoes, dimities, quiltings, and counterpanes. Many of the modern improvements in manufacture originated here. Arkwright resided at B., and Samuel Crompton was born in the parish. There are also in B. more than 40 foundries and ironworks, and extensive dye-works and bleachfields. In the time of Henry VIII. B. was noted for its woollen industry, introduced by Flemish clothiers in the 14th c. The town was garrisoned during the civil war, and in 1644 was stormed by the Earl of Derby, who was beheaded here after the battle of Worcester. Near it are many coal-mines. It returns two members to Parliament. Pop. (1871) 92,655.

Bolt-Rope, the rope sewn along the borders of sails to strengthen the canvas. It is a *leach-rope* up the sides of a sail; along the top, a *head-rope*; and a *foot-rope* at the bottom.

Bo'lus, a round semi-solid mass of some medicine intended to be swallowed at once. It differs from a pill in being much larger and generally also less solid.

Bo'ly, or **Bo'li**, a town of Asia Minor, in the vilayet of Kash-amuni, on the caravan route between Constantinople and Erzeroum. Standing on the left bank of a river of the same name, it occupies an eminence, supposed to be the site of the Roman Hadrianopolis. B. has several mosques; and near the town there are mineral springs and much-frequented baths. Pop. 5000.

Bo'marsund. See **ALAND ISLANDS**.

Bomb, a hollow spherical projectile fired from a Mortar (q. v.), and fitted with a fuze to explode the charge of gunpowder which bursts within the shell. Bombs are chiefly employed in vertical fire (that is, they are fired from the mortar at an angle of 45°, and fall vertically), to destroy earthworks, &c., or in bombarding towns; in horizontal fire they are most destructive against troops or shipping. The maximum diameter of spherical shell of this kind in use in the British army is 13 inches, and such are calculated to penetrate earth to 6 feet, and brick-work or concrete to 1½ feet, before exploding.

Bom'ba (It. *bomba*, a bombshell), the name applied to Ferdinand II., king of the Two Sicilies, to mark the scorn with which he was universally regarded for his merciless bombardments of Messina during the war of 1848.

Bomba'ceæ. See **STERCULIACEÆ**.

Bom'bard, an obsolete kind of cannon, very short and thick, with a wide bore, from which were projected large stones. Some bombards in the 15th c. hurled through the air stones of from 200 to 500 lbs. weight.

Bombardier', an artilleryman whose duties are to load shells and grenades, to make and fix the fuzes, and who is particularly appointed, on the field or at sieges, to the service of mortars and howitzers. A certain number of these non-commissioned officers are attached to every company of artillery.

Bombardier' Bee'tle, the popular name applied to beetles belonging to the genera *Brachinus* and *Aptinus*, from their habit of ejecting a fluid, of a pungent irritating odour, from their abdomens when irritated. These beetles belong to the *Pentamerous* section of the Coleoptera, and are included in the family Carabidæ. The liquid thus discharged changes vegetable blue to red, and ultimately produces a yellow stain. When brought in contact with mucous membrane of the tongue it produces a smarting sensation. Several very small species of these beetles occur in Britain; the larger species are tropical in their distribution. The *Aptini* want membranous wings, whilst the *Brachini* possess both *elytra* and membranous wings. *B. crepitans* and *B. displosor* are familiar species.

Bombard'ment, throwing shells, red-hot shot, rockets, carcasses, and other destructive missiles into a tower or fort, to destroy property, and terrify or kill the people, with the view of compelling the military defenders to yield up the place. It is a cruel operation, and is resorted to in modern times mainly as an adjunct to a regular siege, or to punish the inhabitants of some seaport town, when the B. is inflicted by ships of war. Odessa was bombarded by the allied fleets of Great Britain and France in 1854. The most celebrated bombardments on record are those of Gibraltar, Copenhagen, Algiers, Sebastopol, and Paris. It was estimated that for a time, in January 1871, 20,000 shells were hurled daily at the forts and city of Paris. The distance from which these shells, weighing on an average 80 kilogrammes, or over 1½ cwt., were sent, and the precision with which they were aimed, surpassed anything of the kind the world had ever seen.

Bombard'on, a bass brass instrument of the Bugle class (q. v.), used in military bands.

Bom'baz. See **SILK COTTON TREE**.

Bom'bay, Province of, formerly the most important division of British India, occupying the N.W. coast region, extends from Mysore in the S. to Beloochistan and the Punjab in the N., and is bounded W. by the Indian Ocean, and E. by Raj

putana, the Central Province, Berar, and the territories of the Nizam and Indore. Area, 188,195 sq. miles, of which 63,253 are in native states; pop. (1872) 25,624,696, including the native pop. of 9,272,073. It presents great diversity of physical aspect—high tablelands, fertile valleys, rugged mountains, and sterile plains—and is naturally divided into four parts: (1) the N. and S. Concan, which lie between the Western Ghâts and the sea, and are fertilised by the vapours of the S.W. monsoons; (2) the dry tract beyond the Western Ghâts, comprising the divisions Kaira, Khandesh, Nasik, Ahmednuggar, Belgaum, and Kaladgi; (3) to the N. of these, the rich alluvial region about the mouths of the Tapti and Nerbudda; and (4) still further N., the detached territory of Sindh (q. v.). For administrative purposes, B. is separated into a Northern and a Southern Division, with nineteen executive districts, while Sindh forms a subordinate province by itself. The only foreign possessions within the limits of B. are the Portuguese Goa, Damaun, and Diu. The principal rivers are the Nerbudda, Tapti, Mahi, and Sabarmati, entering the Gulf of Cambay; the Indus in Sindh; and the Godavari and Krishna, which flow into the Bay of Bengal. There are few lakes, the chief being the Munchur, and the amphibious Runn of Kutch. B. and Poona cities are supplied with water by the vast artificial basins of Velhar and Karak-wasla. The climate varies greatly over so wide an area, but is generally more healthy than in the other provinces. Along the coast the rainfall ranges from 70 to 300 inches, and in some parts of the Concan a temperature of 117° F. is experienced. A great part of B. is covered with forest, and among the existing wild animals are tigers, lions, elephants, leopards, hyenas, wild boars, and a vast variety of serpents. In 1873, some 2334 deaths were caused by the bites of snakes and other wild animals. Agriculture is making rapid progress, the number of agriculturists returned in 1872 being 3,835,163, and the chief products are cotton, rice, tobacco, opium, wheat, barley, and various other grains. The system of land revenue administration brings each ryot into direct relation with Government, and is fruitful in precise statistics. Cotton, which was introduced from America, is also indigenous, and in 1872-73 was cultivated over an area of 1,502,523 acres, while 46,735 acres were under tobacco, of which the export exceeds 3,000,000 lbs., and 1,377,464 were under rice. In all 21,852,974 acres were under crops. There are extensive manufactures of cotton cloths and yarns, and a considerable amount of dyeing and cotton printing. Other manufactures are silks, cloth of gold and silver, woollens, leather, paper, pottery, native cutlery, gold, silver, and ivory ornaments, and lacquered furniture. The salt manufacture, yielding (1872-73) a duty of £628,722, is partly in the hands of the Government, to which belong the Gujerat Salt Works, opened in 1873. The famous opium of Malwa, in passing through B., yielded (1872-73) a duty of £2,612,520. The industries of B. generally received a vast impulse from the opening of the three great lines of railway to Madras, Baroda, and Calcutta. Many extensive public works have been recently completed, the most important being the Krishna Canal, while great improvements are being effected in the means of irrigation.

In 1661, the island of B., the nucleus of the present territory, became a British possession, and in 1668 it was granted to the East India Company, being made, in place of Surat, their chief presidency. For nearly a century its dominion remained unextended, but within comparatively late years it has been rapidly increased, chiefly by the annexation of Mahratta country. Its administration is under the control of the Governor-general of India in council, and consists of a governor and three councillors. The annual revenue is some £10,000,000; expenditure, £9,000,000, the surplus going to the Indian imperial charges. In 1871-72 the army was 39,270 strong, with 1332 European officers, embracing 26,764 native troops. B. has now only a small local marine. The pop. of B. comprises 12,440,650 Hindus, 2,847,756 Mohammedans, 192,245 Buddhists, 106,133 Christians, 67,115 Parsees, and 603,836 aborigines. The Church of England is here represented by a bishop, an archdeacon, and a small body of chaplains, while there are also numerous denominational missions. Education is now receiving great attention, there being (1872-73) as many as 3595 vernacular schools, attended by 182,147 pupils; 176 middle-class schools, with 16,612 pupils; 41 high-class schools, where 7167 pupils were being trained for the six colleges affiliated with the university. The University of B., based on a system of examina-

tion similar to that of London University, was opened by Lord Elphinstone in 1857. In 1872, there were 909 candidates, of whom 378 passed. In B. there are four languages widely spoken, Marathi, Gujarathi, Canarese, and Sindi; and of 52 native newspapers, 28 belong to the first, and 23 to the second of these, while there is one in Hindustani. Considerable intellectual activity is shown by the appearance (1872) of 124 poetical works, and of 61 religious and 16 legal publications. See official *Statement of the Moral and Material Progress and Condition of India*, by Clements R. Markham (Lond. 1874); *Annals of Indian Administration for 1872-73*, edited by Dr George Smith (Seram. 1874).

Bom'bay (named after an Indian goddess, *Bombê*, and translated by the Portuguese into *Bom Bahia*, good bay), formerly an island of India off the coast of the Concan, but now connected by causeway with the mainland, and included in the province of the same name, in about lat. 18° 57' N. and long. 72° 52' E. It is traversed by a deep valley, and has a good climate, but its productions are insignificant. Area, 18.62 sq. miles; pop. (1872) 644,405, including the old fort or city portion of B., which occupies the S. of the island. As early as 1530 the Portuguese possessed the whole of B., which they ceded to the English (1661) on the marriage of Charles II. with the Infanta Catherine. Between the island and the mainland there is a splendid bay, accessible to shipping even during the S.W. monsoons. There are several islets in close proximity to that of B., of which the chief are Salsette, containing the reservoir of Velhar, constructed in 1856-60, Caranja, Elephanta, famous for its rock-cut temples, and Old Woman's Isle.

Bom'bay, the capital of the province of the same name, is practically co-extensive with what was the island of B., and, next to Calcutta, has the greatest trade of any port in India. It is divided into a European and a native town, which lie apart about three-quarters of a mile, and the space between them is occupied by the railway termini, several factories, and the barracks and esplanade. The principal public buildings are the Town-hall, the Secretariat, the Custom-house, the Mint, the Public Works Office, the Post-office, the University, the Elphinstone College, the Grant Medical College, the School of Arts, the cathedral, the mission colleges, the two Jamsetjee hospitals, and the governor's official residences at Parell and Malabar Point. About a century ago B. was one of the unhealthiest, but is now one of the healthiest, of Indian cities. It has an efficient sanitary system, and the death-rate for the five years ending 1872 was 25.45 per thousand. There is here a Chamber of Commerce and a Geographical Society, founded in 1830, and united in 1873 to the B. branch of the Royal Asiatic Society, which publishes a *Journal of Transactions*, and to which belongs a valuable library. The Victoria and Albert Museum, of which Sir Bartle Frere laid the foundation in 1862, together with an extensive botanical garden, was opened in 1871. There are also numerous commercial and insurance offices, and many banks, of which the chief are the new Bank of Bombay, and the Bank of Bengal's branch. In 1872-73 the Elphinstone College was attended by 184 students, of whom 45 were Brahmins. To the S.E. of the European town is the harbour, placed under the B. Port Trust by Act 1873, with docks extending over some 200 acres. The large new Sassoon dock (so called after the eminent Jew) was opened in 1875. The principal industries of B. are shipbuilding, extensively carried on by the Parsees, and the manufacture and printing of cotton. In the city and throughout the island there are 13 steam cotton-mills, employing 848 looms and 60,000 spindles, and producing 100,000 lbs. of yarn daily. Besides unrivalled harbour accommodation, B. has a splendid commercial position, especially since the opening of the Suez Canal, and does nearly one-third of the trade of India. In 1873 the exports, including treasure, were £21,573,829; the imports, £13,676,002. Among the articles of export are cotton, opium, shawls, coffee, ivory, gums, pepper, and tobacco. The Indian mails are sent to B., from whence letters are despatched by railway to Madras, the N.W. Province, Punjab, and Calcutta. Pop. (1872) 644,405, of whom 408,680 are Hindus, divided into 56 castes; 21.3 per cent. are Mohammedans; 43,945 are Parsees; 23,534 Indo-Portuguese; and 4796 British born. There are an immense variety of languages spoken in B., of which the chief are those of the province, or Marathi and Gujarathi; all those of the Punjab, the N.W. Province, and Rajpootana; most of the

Aryan family connected with Bengal and Orissa; all the leading Dravidian languages of Madras; Arabic, Turkish, Persian, Hebrew, Burmese, Malay, Chinese; several European languages, as English and Portuguese; and most of the languages of the E. coast of Africa, as Sowahili, Somali, Galla, &c. The Parsees, descendants of the Persian fire-worshippers, used to be the richest and most influential of the native citizens, till the collapse of the speculation caused by the American civil war in 1866. The Hindus, including Jains, have since gained on the Parsees. The principal Hindu is Sir Munguldass Nathooobhoy, K.C.S.I., and the leading Parsee is Sir Jamsetjee Jejeebhoy, Bart. From 1829 till his death in December 1875, the Rev. Dr John Wilson, F.R.S., was, as missionary, scholar, and citizen, identified with all progress in B. The late Dr Buist also was long a distinguished savan, writer, and philanthropist in this city. See GUERRES and PARSEES.

Bom'bay Army. See INDIA (EAST) ARMY.

Bom'bay Duok', the name given to a Teleostean fish (*Saurus ophiodon*), generally regarded as belonging to the family *Scopelidae*, which resemble the salmon, and possess a small soft second dorsal fin. The edge of the upper jaw, however, is formed in the *Scopelidae* by the intermaxillary bones. The pylorus possesses caeca, and an Air-bladder (q. v.) is generally wanting. The B. D. inhabits the seas round the Indian coasts, particularly near Bombay and Malabar. Its flesh is highly esteemed, and is variously prepared and preserved, and even imported into this country as a relish. It is also known in commerce by the name *Bummaloiti*. Its body is elongated. The mouth is very large, and provided with numerous small teeth.

Bombazine' (*Bombax*, the silkworm), a textile fabric having a silk warp and a woollen weft, mostly made of a black colour, and used for mourning dress.

Bomb'Proof Buildings, in fortification, are erections of masonry sufficiently strong to resist the penetrative power of bombs or shells falling from a great height. Permanent buildings of this kind are called *Casemates* (q. v.); temporary erections, *blindages*.

Bom'byx. See SILKWORM.

Bom Jardim ('good garden'), a town in the centre of a very rich district in the province of Bahia, Brazil, situated on the river San Francisco, 155 miles due N. of Rio Janeiro. Pop. 6000.

Bom'mel, or **Zalt-Bommel**, a prettily-built town, at one time a fortress, in the province of Gelderland, Holland, on the Waal, here crossed by a railway bridge, 20 miles S. by W. from Utrecht. Pop. (1870) 4162, engaged in the manufacture of iron utensils, leather, and soap, and trading chiefly in the produce of the field.

The Bommelerwaard ('Bommel-meadow') is a district in the same province, 16 miles long by 6 broad, bounded by the rivers Waal and Maas, and forming all but an island. It is defended on the E. by Fort St Andrie, and on the W. by Fort Loevenstein, and has a population of about 15,000, chiefly engaged in agriculture. The St Andrie's Canal, at the E. end, has been done away with by the erection of a dam, and so one cause of the great inundations has been removed.

Bona (Fr. *Bône*; Arab. *Beled-el-Arb*), a seaport in the province of Constantine, Algeria, beautifully situated near the mouth of the Sebus, on a bay of the Mediterranean, at the base of a hill. It occupies the site of the ancient *Aphrodisium*, and near it are some remains of the famous Hippo Regius, a residence of the Numidian kings and the see of St Augustine. B. is walled round, and further defended by Fort Cigogne. There is a growing trade in hides, wool, corn, tobacco, cork, bark, ironstone, and coral. Near B. are iron and copper mines, the former employing 1200 workers. The town communicates with Marseille by telegraphic cable, laid in 1870, and a railway to the mines of Ain-Mokra is (1875) in course of construction. Pop. (1872) 16,196.

Bona (Lat. 'goods') is a term sometimes used in English law to denote personal estate. Thus, *B. confiscata* means forfeited goods; *B. notabilia*, goods of a certain value; *B. buxantier*, stray goods, such as wrecks, treasure trove, &c.

Bona De'a ('the good goddess'), a Roman divinity, described as the sister, wife, or daughter of Faunus. Her worship was confined to women. Her festival was celebrated yearly on the 1st of May, and at night, in the house of the consul or prætor, and was conducted by the Vestals, and while it lasted no male was allowed to be in the house. The wine used in the solemnities was called milk, and the vessel holding it *mellarium*. The goddess was supposed to possess healing powers, in token of which the serpent was her symbol.

Bona Fides. In law, a possessor in *bona fide* is one who believes that he has a good legal title to that which he possesses. B. F. ends when the possessor becomes aware, by private knowledge or otherwise, that his title is insufficient. When the question of right is one of difficulty, the interruption of the B. F. may not be held to have taken place until after litigation; perhaps even not until final decree in the action. The legal effect of being held as acting in *bona fide* is most important.

Bonald, Louis Gabriel Ambroise Vicomte de, a politico-religious philosopher and statesman, born at Monna, near Milhaud, in Rouergue, 2d October 1753, emigrated at the revolution of 1789, and wrote at Heidelberg in 1796 his *Théorie du Pouvoir Civil et Religieux*, which was suppressed by the French Directory because it advocated the restoration of the Bourbons. B., however, returned to France, was associated with Chateaubriand on the *Mercur*, and placed in the department of Public Instruction by Napoleon. In the Chamber of Deputies, under the restoration, he pled for a censorship of the press, the abolition of divorce, and the restoration of Church lands. He was made a peer in 1823, but disappeared from public life at the revolution of 1830, and died 23d November 1840. B.'s principal work is *La Législation Primitive*, which appeared in 1802 (2d ed. 1821). In this he bases the right to govern on the will of God, supernaturally revealed in the gift of language, and preserved by the Bible and the Church. He reduces everything to the categories of cause, mean, and effect (e.g., God, Mediator, man; Church, clergy, laity; king, nobility, people; father, mother, child), and argues that the same relation exists between the cause and the mean as between the mean and the effect. Although based on verbal analogies, B.'s system was regarded by the Catholic Conservatives of the restoration as their main stay in philosophy. He has been classed with De Maistre and De la Mennais in the theocratic school of sociology. See B.'s *Œuvres Complètes* (Par. 10 vols. 1817-19).

Bon'aparte, Family of, appears as early as the 13th c. (according to some historians as early as the 10th c.), in Italian history. One branch settled in Ajaccio, Corsica; and in the 18th c. its representatives were Lucien B., an archdeacon, Napoleon B., and their nephew Charles. Charles B., father of the Emperor Napoleon, was born March 29, 1746, and in 1767 married a beautiful patrician, Letizia Ramolino. At first he espoused the cause of Paoli in the struggle for Corsican independence, but ultimately, thinking it hopeless, took the French side; became assessor of the town and province of Ajaccio, and in 1777 was one of a deputation of Corsican nobles sent to the French court. He took advantage of this visit to get his son Napoleon admitted into the military school of Brienne. Charles B., who seems to have been a very amiable man, died at Montpellier of cancer in the stomach, February 24, 1785. His family consisted of eight children—Joseph B., king of Spain; Napoleon (q. v.), Emperor of the French; Lucien B., Prince of Canino; Maria Anna (afterwards Elise); Louis B., king of Holland; Carlotta (afterwards Marie Pauline), Princess Borghese; Annunciata (afterwards Caroline), wife of Murat, king of Naples; Jerome B., king of Naples. These, with the children of Beauharnais, became the *Napoleonidae*—the Emperor, by advice of the senate, November 6, 1804, confirming the right of succession to his own heirs and those of Joseph and Louis—Lucien and Jerome being excluded on account of their marriages. A brief sketch of the more important of the *Napoleonidae*, not separately treated, may be here given.

MARIA LETIZIA RAMOLINO B., mother of Napoleon I., was born August 24, 1750. On her son's accession to the dignity of First Consul, she went to Paris; and when he became Emperor in 1804, she was known as Madame Mère. After his downfall, Letizia, who seems to have been prepared for that event, lived with her stepbrother, Cardinal Fesch, and died February 2, 1836, leaving considerable property.

JOSEPH B., eldest brother of Napoleon, born at Corte, Corsica, January 7, 1768, first obtained prominence when, in 1800, he was sent by his brother, then First Consul, as plenipotentiary to the United States. Joseph, who was an intelligent and amiable man, stuck by his brother from first to last, and the latter seems to have loved him alone of his family. In 1805 he was made ruler of the Two Sicilies, in 1806 king of Naples, and in 1808 king of Spain. In the last position he was unfortunate, and after the defeat of Vittoria returned to France. After some hesitation, in 1813 he allowed his brother to recognise Ferdinand VII. as king of Spain. After Waterloo, he tried to aid his brother to escape to the United States, and when the latter resolved to trust himself to the English Government, crossed the Atlantic himself, remaining in America till 1832, when he came to England. In 1841 he was permitted to go to Italy to reside with his wife. He died at Florence, July 28, 1844. His wife, Julie Marie Clary, born December 26, 1777, died April 7, 1845, was the daughter of a citizen of Marseille, and sister-in-law of Bernadotte, who became king of Sweden. She had two daughters, Zenaïde Charlotte Julie B. (born July 8, 1801), who became the wife of Lucien B.'s son, the Prince of Canino, and Charlotte Napoléone (born October 31, 1802, died October 31, 1839), who married Louis Napoleon, second son of Louis B., king of Holland (died 1831).

LUCIEN B., second brother of Napoleon, was born at Ajaccio, 21st May 1775. He was a man of very considerable ability and decision of character, and, before his brother's ambition developed itself, was a keen republican. He aided his brother in his aspiration after the office of First Consul, and was the hero of the 18th Brumaire, but differing from Napoleon, who wished him to divorce his second wife, and offered him the crowns of Spain and Italy, he retired to his estate of Canino in Tuscany, devoting himself to literature and art. Sailing for America in 1810, he was captured by the English. After his brother's downfall, he returned to Rome. He made a brief appearance in French politics in 1815, but finally retired to Italy, and died at Viterbo, June 30, 1840. Lucien made various unsuccessful attempts to obtain a literary reputation, having composed, among other poems, a forgotten epic entitled *Charlemagne, ou l'Eglise Déliée* (1814). He was twice married, first, in 1795, to Christine Boyer, daughter of a citizen of St Maximin, and secondly, in 1803, to the widow of a stockbroker, Madame Joubertson, who survived him. By his first marriage he had a daughter; by his second, nine children, of whom his eldest son, **LUCIEN JULES CHARLES B.** (born May 24, 1803, died July 29, 1857), displayed in a high degree the parental love of literature and science, and reached distinction as an ornithologist.

LOUIS B., third brother of Napoleon I., was born September 2, 1778. He was made king of Holland in 1806, but was never popular, although he was sufficiently noble not to attempt to enrich himself at the expense of his subjects, and to refuse the throne of Spain. His later years were spent in Italy, and he died at Livorno, July 15, 1846. Louis had the family taste for literature, and wrote some political and historical treatises. His wife, Hortense Eugénie Beauharnais, the adopted daughter of Napoleon, was born at Paris, April 10, 1783. Naturally an amiable woman, she lived unhappily with, and was finally separated from, her husband, for whom, to please Napoleon, she rejected her lover, Général Desaix. She died at Arenenberg in Switzerland, October 3, 1837, and her remains were placed near those of her mother Josephine at Rueil, near Paris. She wrote several songs, including the patriotic *Partant pour la Syrie*, and also the book, *La Reine Hortense en Italie, en France, et en Angleterre pendant l'année 1831*. She had three sons, the two eldest of whom, Napoleon Louis Charles and Louis Napoleon, died in 1807 and 1831 respectively. The third, Charles Louis Napoleon, became Emperor of the French under the title Napoleon III. (q. v.).

JÉRÔME B., youngest brother of Napoleon, was born at Ajaccio, November 15, 1784, and educated for the navy. During the war between France and England in 1803, Jerome lived in the United States, where he married Elizabeth Patterson, daughter of a Baltimore merchant. By his brother he was made king of Westphalia (1807), in which position he did nothing but live in pomp and spend money. He fell with Napoleon after the battle of Leipzig, but reappeared in public during the Hundred Days, and fought for his brother at Ligny and Waterloo, in 1815. He then went to Florence, but in time

was allowed to return to France, and was even made a marshal in 1850. On his accession to the throne of Westphalia, Jerome was compelled to divorce his American wife, and to marry Sophia Dorothea, the daughter of the King of Württemberg. He died at Villegienis, near Paris, June 24, 1860. His *Mémoires et Correspondance du Roi Jérôme et de la Reine Catherine* was published at Paris in 5 vols. (1861-64). By his first wife he had one son in America, and by his second three children, one daughter and two sons. The elder of the sons, Jerome, was born August 24, 1814, and died 1847. For an account of the latter, Napoleon Charles Paul B., born September 9, 1822, see **NAPOLÉON, PRINCE**. The daughter, Mathilde Letitia Wilhelmine B., born at Trieste, May 27, 1820, married Anatol Demidoff, Prince of San-Donato, in 1841, separated from him in 1845, and lived subsequently in Paris. At the court of Napoleon III. she did the honours up till the date of the Emperor's marriage. For an account of Jerome's American wife, see *Didier's Life and Letters of Mde. Bonaparte* (Lond. 1879). The chief works on the history of the Bonaparte family are *Famiglia Buonaparte del 1183 al 1834* (Naples, 1840); *Storia Genealogica della Famiglia Buonaparte* (Flor. 1847); *Le Antichità dei Bonaparte*, by F. Stefani and L. Baretta (Ven. 1857), and *Origine des Bonapartes* (Tur. 1859).

BONA'IA, a genus of Rasorial birds belonging to the family *Tetraonidae* or grouse, represented by the European hazel-grouse or Gelinotte (*B. Europæus*), and by the ruffed grouse (*B. umbellus*) of America—the 'pheasant' of the United States. These birds are nearly related to the true grouse (genus *Tetrao*), but possess the shank and toes destitute of feathers, and the feathers of the upper part of the head are elongated. The hazel-grouse occurs throughout Europe from the N. in Siberia to the extreme S., but is absent from Britain. It is also found throughout Africa. It averages the common partridge in size, and is coloured grey and reddish brown, with a black stripe near the end of the side feathers of the tail. The flesh is highly esteemed in Germany and elsewhere. It inhabits wooded districts. The eggs vary from ten to eighteen in number. The ruffed grouse of America averages 18 inches in length, and is plentiful throughout the United States of America, but especially abounds in hilly districts. A tuft of brown or black feathers situated on each side of the neck, and which can be erected at will, has procured for this ~~genus~~ the name of ruffed grouse. At the breeding season the polygamous males call the females with a *drumming* noise made by clapping the wings forcibly. The flesh of these birds is much esteemed in America. The eggs vary from four or five to twelve in number, the nest being generally formed on the ground, and under the shelter of a bush or shrub.

BONA'SUS, or **BONASS'US**. See **BISON**.

BONAVENTURA, St., originally **Giovanni di Fidanza**, a famous theologian and schoolman, was born at Bagnorea, in Tuscany, in 1221. In 1248 he entered the order of St Francis; in 1253 he obtained a chair of Theology in Paris; in 1256 he became General of his order, which he governed with equal zeal and prudence. After the death of Clement IV. in 1268, the see of Rome remained vacant for nearly three years, the cardinals being unable to agree on a successor. B. reconciled their differences, and prevailed on them to give a unanimous vote in favour of Tedaldus Visconti, Gregory X., who, in token of his gratitude, conferred on him the bishopric of Albano, and whom he accompanied to the Council of Lyon, at which town he died, July 15, 1274, while engaged in the work of the council. B., who enjoyed even while living a high character for sanctity, was shortly after his death assigned by Dante a place among the saints of paradise, and was canonised in 1482. Sixtus V. classed him as the sixth of the great doctors of the Church. B. ranks as the greatest philosopher of his order, and the Franciscans proudly maintain his merits against those of the scholastic chief of the Dominicans, Thomas Aquinas (q. v.). Many of his thoughts are at once sublime and mystical, the product of a strong imagination and an ardent faith; and one of his most characteristic works, the *Reductio Artium in Theologiam*, displays in its very title the drift of all his thought. B. was a pure mediævalist, in whom no trace of modern thought is visible, as it is, for example, in Abelard. The worship of the Virgin, the celibacy of the priesthood, transubstantiation, communion in one kind, the rules of monastic life, these are the favourite themes on which his genius spent its force. His collected works were published at Rome in 7 vols. fol. (1588-96). Many of these, however, are apocryphal.

such as the *Psalter of Mary*. He was known among his contemporaries as the *Seraphic Doctor*.

Bon'na Vis'ta, a bay and cape on the E. coast of Newfoundland, also the chief town of a district of the same name on the bay, and one of the oldest settlements in the colony. Pop. (1871) 2600.

Bon'champ, Charles Melchior Artus, Marquis de, a Vendean general, born at Jouverdeil, in Anjou, 10th May 1760. He was a captain in the French service when the Revolution broke out, but being a fervid royalist, he withdrew to a chateau near Saint Florent. The Vendean insurgents chose him for their leader; and after defeating the republicans in several engagements, he was mortally wounded before Chollet, October 17, 1793. He died the following day, not, however, before having prevailed on his troops to spare 5000 republican prisoners who had fallen into their hands. See Chauveau and P. Dussieux, *Vie de B.* (Par. 1817).

Bond, in brickwork, is the method of laying bricks so that the vertical joints in adjacent courses may not occur immediately over each other, and so that by placing some bricks with their length across the wall (*headers*), and others with their length parallel to its face (*stretchers*), the wall may have the greatest attainable stability in both directions. Special arrangements of headers and stretchers have received the names English B., Flemish B., &c., for which see BRICKLAYING.

Bond is, in law, a legal instrument, by which one person becomes bound to another for the payment of money, or for the performance of some act. The general conditions which attach to the validity of all contracts attach to that of a B. Thus an infant or a lunatic cannot bind himself by a B., and a B. by a married woman is null. But a B. in favour of an infant, a lunatic, or a married woman is valid. There are also special points of law regarding the validity of a B. It need not generally be technically worded, but it must not be ambiguous. Due legal execution is necessary. It is of non-effect until delivered. In Scotch law, the deed constituting the security, analogous to Mortgage (q. v.) in England, is called a heritable B., or B. and disposition in security—the latter being the more modern form of deed. It is a B. for a sum of money, with a conveyance of real estate in security to the lender. It stipulates for rate and dates of payment of interest. Being placed on the records, it constitutes a security valid against creditors. In a competition between two or more holders of a B. over the same subject, preference is given, not according to priority of date of B., but according to priority in date of placing on record. See RECORDS.

Bond of Caution.—See CAUTION.

Bond for a Cash-Credit in a Bank.—The cash-credit is an arrangement peculiar to Scotch banking. Under it, on satisfactory security given to the bank, a person is permitted to draw to a certain amount agreed upon, for which, with the interest that may fall due on the daily balances, security is given. This security is called as above, or simply a cash-credit B. It may be either heritable or personal.

Bonds of Bottomry and Respondentia.—See BOTTOMRY.

Bonded Warehouse.—This institution was first authorised by Act of Parliament in 1802. Various Acts regarding its arrangements have since been passed, the whole having been embodied in the Customs' Consolidation Act of 1853. The immediate payment of duty on articles imported was found to press heavily on the merchant, as he got no return for it until his goods reached the retail dealer, and his purchasing power was thus crippled. Hence the system conducted through the B. W. was adopted. The Commissioners of the Customs, under direction of the Treasury, may appoint warehouses or places of security, in which goods may be deposited, without payment of duty, until it suits the owners to remove them, the warehouse-keeper or the importer giving a B. for the payment of the duties on withdrawal of the goods. Any importer or proprietor fraudulently getting access to the warehouse, without the proper officer, forfeits £500. Goods must be removed and duty paid within three years; ship-stores within one. Right of property to goods in B. is transferred by what are called Dock-Warrants (q. v.). Goods in B. W. may be legally regarded as *in transitu*; hence very nice questions of law often arise regarding them.

Bon'di, Clemente, an Italian poet, born at Mizzano, Parma, in 1742, entered the order of Jesuits, and while still young be-

came Professor of Rhetoric in the Seminary at Parma. An ode on the suppression of the order having subjected him to the resentment of the Spanish court, he concealed himself in the Austrian Tyrol. B. died at Vienna, June 21, 1821. His poems are especial favourites with the ladies of Italy, from the noble simplicity of the style and the easy elegance of the versification. His version of the *Æneid* (Parm. 1797) is also much esteemed. A complete edition of his works (3 vols. sm. 4to) was published at Vienna in 1808. Separate productions are *La Conversione* (Ven. 1783), *La Felicità* (Mil. 1797), &c.

Bondu', or **Bondou**, a Fellatah state in Senegambia, West Africa, with an estimated pop. of 1,500,000, extending in lat. 14°-15° N. and long. 11°-13° W. It is a dependency of France, and exports corn, gums, indigo, tobacco, and gold-dust. The country is in part hilly, with a healthy climate, and is bounded on the E. by the river Falemé. A large proportion of the inhabitants are slaves, and the religion is a corrupt form of Mohammedanism. The capital is Bulibani, a collection of miserable huts, surrounded by mud walls, situated on the left bank of the Falemé, with a pop. of about 2200.

Bone forms the framework of all vertebrate animals. The various bones, when united together, constitute the Skeleton (q. v.), support the animal, and are the passive instruments of locomotion. They maintain the shape of the body, give attachment to the soft parts, and form cavities for the protection of the more important vital organs. Being jointed together, they serve as levers for effecting the various movements of the body.

B. is one of the hardest structures of the body, but it also possesses an amount of elasticity and toughness. The ribs are the most elastic bones. B. in the living body is somewhat pink in colour, and is nearly but not quite twice as heavy as water. Bones differ much in shape and size, and hence anatomists have divided bones into four classes, according to their form.

1. **Long Bones**.—These are chiefly the limbs. The Collar-B. (q. v.) is also a long B. Long bones consist of a shaft and two ends or heads. The shaft is composed of dense texture, and has a hollow canal internally filled with marrow. The two ends or extremities are generally more or less expanded, are composed of spongy tissue, and have their surfaces covered with a smooth cartilage for the purpose of articulating with neighbouring bones to form joints.

2. **Short Bones**, sometimes called round bones, are found in the wrist and ankle. They are firmly bound together by fibrous tissue, and the movements of the joints formed by them are very limited.

3. **Flat Bones**.—These bones are composed of two layers of compact tissue enclosing between them a variable amount of cancellated texture. The bones of the cranium, which form the roof and sides of the skull, the lower jaw, the ribs, and the shoulder-blade, are examples of flat bones.

4. **Irregular Bones**, sometimes called mixed bones. These cannot be included under any of the other heads on account of their form; they are generally situated in the middle line of the body. The vertebrae and certain bones about the head may be taken as examples.

Structure of Bones.—B. is composed of two structures—a hard, dense material like iron externally, and a reticulated, softer part internally, called the *spongy* or *cancellous* tissue. On examination with a microscope, the difference between these two kinds

Bone.

of tissue is found to be one of degree more than one of kind; for B. is everywhere porous, only in the hard external portion the meshes are much smaller and more filled with earthy materials. The one structure gradually passes into that of the other.

The relative proportions of these two kinds of tissue differ very much. In long bones the shaft is composed mostly of compact B., whereas the ends are composed to a great extent of spongy tissue. In flat bones this spongy tissue is scanty, and exists between the two layers of compact tissue. In the flat B. of the skull the spongy tissue is called *diploe*. The short bones are composed chiefly of spongy tissue. The spongy or cancellous texture of B. is composed of slender bars or spicula of B., forming a kind of network with spaces between them; and these spicula run in the line of greatest pressure, thus giving the greatest amount of strength with the least weight of B. These open spaces contain blood-vessels and marrow. The compact tissue also contains canals or tubes running in the long axis of the B., termed *Haversian canals*—so called in honour of the anatomist who first described them. Small blood-vessels run in these canals. The width of the Haversian canals varies from $\frac{1}{16}$ to $\frac{1}{8}$ of an inch. These are well seen on a transverse section of a long B. These canals are surrounded with concentric rings.

Chemical Composition of Bones.—B. consists of earthy and animal matter. The former renders the B. hard, the latter tenacious. The earthy matter consists chiefly of phosphate of lime, with some carbonate of lime. It also contains a small amount of other salts. The animal matter is chiefly Gelatine (q. v.). When bones are burned, the animal portion is consumed, and the earthy material remains behind. It constitutes about two-thirds of B. and is very brittle. By steeping B. in hydrochloric acid diluted with water, the earthy matter is dissolved out, and the animal portion remains behind, which is tough and quite flexible. It constitutes about one-third of B. When, from disease or other cause, one or other of these two portions is deficient, the B. becomes brittle or flexible, according as the earthy or animal matter is deficient. In the disease called *Rickets* (q. v.), there is a great deficiency in the earthy materials. Various chemists have analysed B. Their results are somewhat different, but the following may be regarded as the average.

Animal matter	•	•	•
Phosphate of lime	•	•	•
Carbonate of lime	•	•	•
Other salts	•	•	•

Growth of B. proceeds in two ways—either from cartilage becoming ossified, as in long bones, or by membranous tissue becoming ossified by the deposition of earthy matters, as in the flat bones of the skull.

The surfaces of B. have many marks upon them as eminences for the attachment of muscles, grooves for lodging vessels and nerves, holes or foramina for the transmission of vessels and nerves. Some have depressions forming the cavities of joints. In the centre of the shaft of most long bones may be seen a hole running obliquely into the centre of the B., for the entrance of the artery which supplies the marrow with blood.

Bones are richly supplied with blood-vessels and nerves. They are covered with a fibrous membrane termed Periosteum (q. v.).

Bone Ash, or Bone Earth, is the mineral matter that remains after bones are calcined, consisting of from 70 to 80 per cent. of calcium phosphate with other earthy salts. Large quantities of B. A. are imported from S. America; it is used in Assaying (q. v.) for making cupels, and though little employed as a manure by itself, it enters largely into the composition of Superphosphate of Lime (q. v.) and other artificial manures; it also forms a polishing powder for plate and other articles.

Bone Beds, the name applied in geology to deposits or formations of varying age, which contain organic remains of various kinds. Thus in the Upper Silurian rocks and in the Tilestones strata, one of the bands, containing the remains of fishes and Crustacea, have received the name of B. B.; whilst in the Triassic system, and beneath the White Lias strata, the Phœtic B. B. occur. These contain scales, teeth, and coprolites or excreta of fishes and reptilia. The name B. B. thus appears to be applied to formations more from the general appearance of their contained fossils, than from these consisting always of definite osseous structures.

Bone Black, or Animal Charcoal, the black product obtained by the destructive distillation of bones, consisting chiefly of phosphate of lime, intimately blended with the carbon of the organic matter of the bones. From 100 lbs. of large bones about 60 lbs. of commercial B. B. are obtained, of which only about seven lbs. are pure carbon or animal charcoal. The destructive dis-

tillation of the bones is conducted by placing them in iron pots, luting on the covers, and then exposing the pots to a red heat in a kiln for some hours. B. B. has the remarkable property of removing colouring matter from solutions of organic compounds, an action which is quickened by heat. It is on this account used on a large scale as a decolorising agent in the refining of sugar. B. B. also exerts its absorbent action on inorganic compounds, removing lime and other metallic oxides from their aqueous solutions. It is also valuable as a deodorising agent from its power of absorbing gases. After being used for a length of time as a decolorising or deodorising agent, B. B. becomes inactive, but its efficiency may be revived by treatment with acid or water, or by raising it to red heat; and when worthless in either respect, it is still useful as a fertilising agent from the phosphoric acid and nitrogen it contains. B. B. thoroughly ground, mixed into a paste with water and then dried, is also employed as a pigment called *Ivory Black*.

Bone Dust is the name given to the finest particles resulting from the disintegration of bones in a bone-mill, the other fragments being assorted according to size, as 'inch,' 'half-inch,' and 'quarter-inch' bones. It is usual to deprive the bones, by boiling, of a large part of their organic matter before breaking them. B. D. is valuable as a manure where rapid fertilising agency is necessary.

Bone Gelatine, or Osssein. See GELATINE.

Bone, Henry, a distinguished enamel-painter, born at Truro, Cornwall, in 1755, removed in 1790 to London, where he was engaged in painting brooches, lockets, &c., in enamel for jewellers. In 1780 he exhibited an enamel-portrait of his wife in the Royal Academy, and at once established a reputation in this department. He was appointed enamel-painter to the Prince of Wales in 1800, and was admitted a member of the Royal Academy in 1811. His pictures in enamel, from their beauty and size, form an era in this art. The chief of them are 'Bacchus and Ariadne' (sold for 2200 guineas), the 'Death of Dios,' 'Venus,' and 'Bathsheba,' besides numerous admirable portraits. B. died in London, 17th December 1834.

Böner, Ulrich, one of the best of the early writers of fable in German, sprung from an old Bernese family, was a preaching friar, and flourished in the earlier half of the 14th c. He dedicated 100 fables, some in prose, others in rhyme, to his friend, the song-writer, Johann von Ringenberg, under the title *Der Edelstein* ('The Precious Stone'). They are full of keen observation of life, expressed with pungent wit and caustic humour. Lessing, who may be said to have disinterred this gem of middle age literature, devoted much of his time to the study of *Der Edelstein*, and wrote two papers about it. The first edition was printed at Bamberg, in 1461, and the copy in the Wolfenbüttel Library is the sole remnant of this edition that is known to exist. J. G. Scharf published, from the Strasburg MS., fifty-one of the fables, from 1704 to 1714. Bodmer and Breitingen, of Zurich, issued a fuller edition in 1757. The first complete edition, from the original text, was published at Berlin in 1816, with notes and a glossary; the latest is a critical edition, published at Leipzig in 1844.

Bones, Dissolved. The manure called *dissolved bones* is prepared by acting on Apatite (q. v.), Coprolites (q. v.), or on bones or bone ash with slightly diluted oil of vitriol. By this treatment the insoluble phosphate of lime, $\text{Ca}_3\text{P}_2\text{O}_7$, of which these substances are principally composed, is converted into soluble or *biacid* phosphate of lime, $\text{CaH}_2\text{P}_2\text{O}_7$, sulphate of lime or *gypsum* being formed at the same time. This manure is especially adapted for root crops, but is also of much value for cereals if mixed with guano previous to distribution.

Bonet, Juan Paulo, a Spanish philanthropist, born in the kingdom of Aragon, and lived in the first half of the 17th c. Out of friendship to the Constable of Castile, whose secretary he was, he undertook to instruct his brother, who had been a deaf mute from the age of two years. He afterwards applied himself with success to the instruction of others similarly affected, and in 1620 published at Madrid *Reduccion de las Letras y Arte para enseñar a hablar los Mudos*, in which he described the method adopted by him, and of which he claimed to be the inventor. The Benedictine Peter Ponce, also a Spaniard, had, however, succeeded in the previous century in instructing the deaf and dumb.

though B. does not appear to have known anything of the method of his predecessor. B. imparted information to his pupils principally by the eye, availing himself of the manual alphabet (essentially the same as that now in use), writing, and gesture. He also made use of artificial pronunciation. See Sir Kenelm Digby's treatise *Of Bodies*, ch. 28.

Bonfire, a large fire kindled on occasions of public rejoicing, on the top of a hill, or in some open space near a town or village. These fires are now lighted to celebrate great events, such as victories, royal marriages, &c.; but in the earliest times they were kindled to celebrate seasons—e.g., Beltein (q. v.) and Midsummer Eve. It was also a custom to light large fires as beacons. It seems to be admitted that *bon* is the same as the Dan. *baun*, beacon, and the Welsh *ban*, high: thus B. signifies a high or lofty fire, a fire on a high place, a beacon-fire.

Bongar (*Bungarus*), a genus of serpents belonging to the *Venosa* or poisonous section of the sub-order *Colubrina*. These forms are allied to the genera *Elaps* and *Naja*, to which latter the cobras belong. The bongars are distinguished by the back being keeled or ridged, owing to the development of a row of hexagonal scales. The head is broad and flat. These snakes occur in the E. Indies, and are popularly known as 'rock snakes.' *B. annularis*, a familiar species, attains a length of six feet.

Bongardia, a genus of plants of the natural order *Berberidaceæ* (q. v.), natives of the East (Greece, Syria, Persia, and on to Afghanistan and Scinde), the leaves of one of which (*B. chrysogonum*) are eaten as a salad, and the bulbs of another *B. Rautwolfi* in Persia. Some botanists consider both species identical.

Bongay, the name of an islet and group of islets in the E. Indian Archipelago, to the E. of Celebes.

Bongo, a people of Central Africa, inhabiting a country in the Upper Nile district, to the S.W. of the basin of the Bahr-el-Ghazal, between 6°–8° N. lat. and 27°–28° E. long. Estimated area, 9000 sq. miles; pop. 10,000. The country is flat and ferruginous, and is abundantly watered by five large tributaries of the Gazelle, and by many smaller streams. The chief natural products are sorghum, maize, beans, bamia, tobacco, and various tubers. *Parkia terminalia*, the butter-tree, and fungus abound, while there have been collected as many as 700 flowering plants. The rainy season extends from April to November. Formerly a great field for elephant-hunting, Bongoland has now only antelopes, ichneumons, civets, genets, wild-cats, and caracals. Its domestic animals are poultry, goats, and dogs. The B., who believe in witchcraft, and speak a harmonious language of simple structure (Dr Schweinfurth, *Linguistische Ergebnisse einer Reise nach Central Afrika*, Berl. 1873), live by agriculture, and occasional hunting and fishing. They have a red-brown complexion, not unlike the colour of the soil, and are muscular and compact in limb, with an average height of 5 feet 7 inches. Almost without tools, they produce beautiful ironwork, besides rude musical instruments, and a variety of wooden articles. About the year 1855 the Nulian slave-dealers began their raids upon the B., whom they found living in petty communities, and therefore incapable of combined defence. The B. soon became much prized as slaves, being docile and industrious, and within ten years there were eighty slave seribas or forts scattered over the country, while half the natives had been kidnapped, and great numbers had taken to flight. The country is still under vassalage to the Khartoom slave-dealers, and forms a convenient base for further slave operations in the lands of the Niam-Niam, Mittoo, &c. See Dr Schweinfurth's *Heart of Africa* (2 vols. Lond. 1873).

Bonheur, Mdle. Rosalie, an animal painter of remarkable genius, born at Bordeaux, 22d March 1822, received instruction in art from her father. She exhibited 'Two Rabbits' and 'Goats and Sheep' in the French Exhibition of 1841, and from that year to the present she has continued to enrich and distinguish the exhibitions of Europe with works, the number of which manifests her entire devotion to her art. She is best known in this country by her 'Horse Fair,' in which the action of the animals in motion seems to be nature itself. This famous work, which was the chief attraction of the French Exhibition of 1853, and of the French collection exhibited in London in

1855, has been admirably engraved. In the opinion of some, however, her chief work is 'Le Labourage Nivernais' (1849), which has won the highest honour conferred in France, a place in the Gallery of the Luxembourg. In the B. family there are as many painters and sculptors as there are members. Besides the father, Raymond B. (died 1853), there are her brothers, Auguste B., landscape and genre painter, Jules-Isidore B., sculptor, and Juliette B. (Madame Peyrol), her sister. The studio and residence of Rosa B. at Fontainebleau were spared and respected by special order of the Crown Prince of Prussia during the siege of Paris in 1870–71.

Boni, or **Bony**, a considerable native state, forming the S.W. peninsula of the island of Celebes, E. Indian Archipelago, and tributary to the Dutch. Pop. about 200,000, engaged in the manufacture of cotton, articles of gold and iron, and, especially in the N., where the soil is very fertile, in agricultural pursuits. The Bonese have been twice attacked by the British for injury done to their commerce, and for selling the crews of British ships as slaves. B., Gulf of, separates the S.E. and S.W. peninsulas of Celebes. It is 200 miles long, and has a breadth varying from 40 to 80 miles.

Boniface, a Roman general of the 5th c. A.D., was a native of Thrace. His career is divisible into two periods, the first marked by the greatest loyalty to the empire, the second memorable for a great political crime which has covered him with disgrace. In 413 he defended Marseille against Ataulf, the Visigothic king; in 422 distinguished himself in Spain against the Vandals; and after being raised to the rank of tribune and *comes*, was charged by Honorius with the command of the Roman forces in Africa. He enjoyed for a time the confidence of Placidia (sister of Honorius) when she undertook the government of the empire during the minority of her son, Valentinian III., but the rivalry between him and Aëtius (q. v.) is said to have prompted the latter to subtly undermine his influence at court during his absence abroad. The story of the fraud perpetrated by Aëtius is recorded by Procopius, and accepted by Gibbon (*Decl. and Fall*, ch. 33), but it is probably exaggerated. Falsely induced, it is said, to believe that the empress meditated his death, in a moment of rash ire he traitorously allied himself with the Vandals, invited them over to Africa, and offered to give them a perpetual settlement. In 429 Genseric appeared at the head of 50,000 warriors, and B. discovered when too late that he had been basely deceived, and had fatally injured the empire. Returning to his allegiance, he twice sustained a defeat from the Vandals, and in 431 embarked for Italy, but in the following year died of a wound received in a battle fought against Aëtius.

Boniface, St. 'the apostle of Germany,' whose original name was Winfrith, was born at Kirton (Crediton), Devonshire, about 680. Ordained a priest at the age of thirty, he set out in 715 to preach the gospel in Friesland; but being discouraged by the king, and hindered by a war then being carried on, he gave up the idea for a time, and returned to England. In 718 he went to Rome, and got the sanction of the pope to preach to the tribes of Germany. He at once commenced his labours, and converted many in Thuringia, Bavaria, Friesland, and Hesse, turning heathen temples everywhere into Christian churches. On a second visit to Rome, he was made a bishop, and his name changed from Winfrith to B. Returning to Germany through France, with letters of recommendation to Charles Martel and the German princes, he set about destroying all relics of heathenism. On the accession of Pope Gregory III. (731), B. was made an archbishop. In 738 he again visited Rome, attended by a great train of priests and monks, and was made papal legate. On his return he appointed four bishops over Bavaria, and four more in Germany in 741. In 745 he was made Archbishop of Mainz. In 754 he returned to Friesland, to complete the evangelisation of that country, where, however, he and fifty-two companions were massacred by the pagans (755). B. left *Sermons* and *Letters* (Serrarius, Par. 1605; best ed. Würdtwein, Mainz, 1789), which are valuable for biographical purposes, and a very curious historical commentary on his own times. Dr Giles has published his entire remains (*Opera Omnia*, 2 vols. Lond. 1845). See Eudenius, *Dis. de S. Bonifacio, Germ. Apost.* (1722); the *Acta Sanctorum*, and the Church Histories of Neander, Mosheim, &c.

Boniface. Nine popes have been so named, of whom only three are conspicuous in history.—**B. I.** (418–422), memorable as the earliest Bishop of Rome who assumed the title of the First Bishop of Christendom, a title not recognised by the Greek emperors till 606, when Phocas conceded it to **B. III.**—**B. VIII.**, whose family name was Gaetano (Lat. *Cajetanus*), one of the important pontiffs and juriconsults of the middle ages, born at Anagni about 1228. He studied at Paris and Bologna, and, in the capacity of secretary to various papal legates, visited France, England, and Germany, thoroughly mastering the condition of ecclesiastical politics. In 1281 he was raised to the cardinalate, and was elected pope December 24, 1294, when the kings of Hungary and Sicily held his bridle-reins as he rode to the Lateran, and waited on him at table, wearing their crowns. The great principle of B.'s policy was to assert papal supremacy over states as well as over the Church. In 1296 began his grave quarrel with Philippe le Bel, by the publication of his bull *Clericis laicos*, and ere long he rashly excommunicated the French monarch; but his language and his pretensions were so insolent that the nation supported Philippe in his defiance of the papal curse. There was hardly a question in which B. did not interfere. In the Sco-to-English wars, in the affairs of Sicily, Denmark, Germany, Bohemia, &c., we see him meddling and muddling. Finally Philippe roughly ended the conflict by seizing and imprisoning B. in his native town. Dreading poison, the pope abstained from food for two days, in consequence of which he died a few weeks after (October 11, 1303). His enemies accused him of licentiousness and infidelity. His simony was well known, and he has found an unenviable immortality in Dante's *Inferno*. See M. Isambert's elaborate paper in the *Nouvelle Biographie Générale*, and Drumann's *Geschichte B.'s VIII.* (Königsb. 1852).—**B. IX.**, originally Pietro Tomacelli, a Neapolitan, was elected pope in 1389, and had for rivals at Avignon Clement VII. and Benedict XIII. He practised simony without concealment or restriction; trafficked in indulgences and dispensations; over-awed Rome by fortresses; and to protect himself against the enemies whom his imperious spirit had raised against him, he had to purchase the services of powerful allies by granting them as fiefs portions of the patrimony of the Church. B. died 1st October 1404.

Bonifacio, Strait of (Lat. *Fretum Gallicum*), the channel which separates Corsica from Sardinia, named after the fortified Sardinian town of B., which has large coral and tunny fisheries, and a pop. of 3453. The strait narrows at one point to about seven miles, and is difficult of navigation. To the E. lie the Bucinaric or Magdalen Islands (anc. *Insula Canicularia*), belonging chiefly to Sardinia, but mostly inhabited by Corsicans.

Bonill'o, a town in the province of Albacete, Spain, 38 miles S.W. of the city of the same name. Pop. 5980.

Bo'nin, or **Archbishop Islands**, a group of some ninety small islands situated in the Pacific Ocean, near long. 142° E. and lat. 27° N. The larger islands (Peel Island, Stapleton, Buckland, Hillsborough, &c.) are fruitful, producing, among other things, maize, yams, tobacco, sugar-cane, melons, and lemons. Of domesticated animals, pigs, goats, and fowls abound. This group was discovered in 1827 by Captain Beechey; was at one time a Japanese colony, and though claimed by England and Russia, was again taken possession of by the Japanese in 1877.

Boni'to, a term applied to various Teleostean fishes, but more particularly to a species of tunny (*Thynnus pelamys*), included in the *Scomberidae* or Mackerel family. This fish chiefly inhabits the warmer seas, and relentlessly pursues the flying-fishes. This species, often named the 'stripe-bellied tunny,' averages about 24 inches in length, and is coloured bluish, being darkest on its upper parts. Four lines of dark hue mark the sides of the belly. The flesh is of a dry, unpalatable nature. The lower jaw protrudes and is slightly deflected, and large scales exist on the throat. The *Pelamys sarda*, belonging to an allied genus, inhabits the Black Sea and Mediterranean, and is also known as the B.; and the *Auxis vulgaris* (Cuvier), also found in the Mediterranean, is locally named the Plain B. This latter species is coloured blue, and has no stripes or bands. The flesh is preserved for use. The dorsal fins are placed far apart in the *Auxis*.

Bonn, a town of Rhenish Prussia, on the left bank of the Rhine, 15 miles above Cologne (with which it is connected by

rail), formerly the residence of the Electors of Cologne. Pop. (1871) 26,244. Though an ancient town, it has a modern appearance, and the environs are pleasant and cheerful. The finest building is the cathedral, probably of the 12th or 13th c. The university, re-established in 1818, has five faculties, two of these in theology, for Protestants and Roman Catholics respectively. It has a high reputation, and reckons in its roll of professors the names of Niebühr, Schlegel, Dörner, Rott, Ritschl, Brandis, Jahn, Lassen, Simrock, Diez, Dahmann, Von Sybel, &c. The library has upwards of 200,000 volumes. In the same year the Leopoldine Academy of Physical Science was transferred to B. from Vienna. These educational facilities attract a large body of students, and the late Prince Consort studied here for some time. The manufactures are cottons, sulphuric acid, soap, and earthenware. The fortifications of the town, which suffered several bombardments, were razed in 1717. See Ritter's *Entstehung der Allensteinstädte am Rhein, Köln, Bonn, und Mainz* (Bonn, 1851).

Bonn'er, Edmund, better known as the 'bloody Bishop B.,' was born about the end of the 15th c. The son of a peasant in Hanley, Worcestershire, he was educated at Pembroke College, Oxford, where in 1525 he was made a Doctor of Canon and Civil Law. Being fortunate enough to secure the favour of Wolsey, he also gained that of Henry VIII., whose chaplain he became, took an active part in the Reformation, was employed on embassies to France, Germany, and the Pope, and was raised to the see, first of Hereford (1538), and then of London (1540). He lapsed, however, into Popery, and in the reign of Edward VI. was deprived of his bishopric and put in prison. Mary restored him; and he earned the name by which he is still known by his official prominence in connection with the persecutions of Protestants in the reign of this queen, although there is some reason to believe, with Mr Green and other of the later historians, that he was at heart a good-natured, and even merciful man. Refusing to take the oath of supremacy after the ascension of Queen Elizabeth, he was deposed once more, and thrown into the Marshalsea prison, where he died 5th September 1569. B. was a man of considerable learning, and believed to have a thorough knowledge of canon law.

Bon'net, a kind of cap or head-dress, generally of a flat shape, and fitting closely to the head. At the present day the name is chiefly restricted to the principal head-gear of women, which alters so frequently in shape, material, and decoration that it defies all definition or description. Bonnets, as an article of male attire, consist of the indigo-blue knitted and felted caps which are regarded as a peculiarly Scotch production, and chiefly manufactured at Kilmarnock and the surrounding Ayrshire villages. In the 18th c. a broad flat B. with a large red tassel, known as the 'bratid bannet,' was the distinguishing head-dress of the Scottish peasantry. This form of B. has now entirely disappeared, but the 'Glengarry' and other fancy shapes have still a wide popularity, and are sent in great numbers to all parts of the world in which a Saxon population is found, and it forms the regulation-cap of British foot-regiments. The name B. is not found commonly applied to caps till the time of Henry VIII., of whom we read that at a banquet at Westminster he wore a B. of damask silver, flat woven in the stole, and thereupon wrought with gold, with rich feathers on it. At that period Milan bonnets, or Mellayne bonnets, came much in vogue, and were worn by both sexes, whence to this day the makers of female head-dresses are known as 'milliners.' Milan bonnets of the 16th c. were generally made of costly materials, and richly decorated with gems, precious stones, and metals.

Bonn'et, in permanent fortification, is a small defence-work, consisting of two faces only, with a parapet three feet high by ten or twelve feet broad. It is constructed at the salient angles of the glacis of larger works. *B. de prétre* is a term in field fortification applied to an indented line of parapet having three salient angles.

Bonnet, Charles, a distinguished naturalist and philosopher, was born at Geneva, March 13, 1720, and at the age of twenty was elected a corresponding member of the Paris Academy of Sciences for a dissertation on aphides. He now devoted himself wholly to scientific investigations. After publishing his *Traité d'Insectologie* (Paris, 1745), and his *Recherches sur l'Usage des Feuilles des Plantes* (1754), he was forced to discontinue his

researches for a time, owing to inflammation in the eyes; whereupon he turned his attention to psychology, and published several works distinctly materialistic in their teaching, though he always remained a sincere Christian, and wrote in defence of Christianity. We may mention in particular his *Essai de Psychologie* (1754), *Essai Analytique des Facultés de l'Âme* (1760), *Contemplation de la Nature* (1764-65), *Recherches Philosophiques sur les Preuves du Christianisme* (1773). B. died at Geneva, May 20, 1793. His *Œuvres Complètes* were published at Neuchâtel (8 vols. 1779-83), and most of them have been translated into nearly all the languages of Europe. See Trembicy's *Mémoire pour servir à l'Histoire de la Vie et des Ouvrages de Ch. B.* (Berne, 1794).

Bonn'et-Pepp'er, derived from the ground capsules of *Cap-sicum tetragonum*, a native of India.

Bonn'et-Piece, a Scottish gold coin of the reign of James V., struck in 1539 from native gold, and exquisitely beautiful in design and workmanship. It derives its name from the royal head, on the obverse side, being covered with a bonnet instead of with a crown. The weight is 72 grains.

Bonne'val, Claude Alexandre, Comte de, latterly known as Achmed Pasha, was born of a noble French family at Coussac, in Limousin, July 14, 1675. He served in the Guards with great distinction in Italy (1701) and the Netherlands; but being condemned to death by a court-martial for his insolent behaviour to the Minister of War (1702), he fled to Germany, entered the Austrian service (1706), distinguished himself against his native country, and also against the Turks under Prince Eugene, and was raised to the rank of lieutenant-field-marshal (1719). In 1723 he was sent to the Netherlands as master-general of ordnance; but here again a court-martial condemned him to death for his insolence. The Emperor changed the sentence to one year's imprisonment, and he was banished from Germany. He found a welcome asylum in Constantinople, became a Mohammedan (1730), was made a pasha of three tails, and did good service for Turkey against Russia and Persia. After defeating a large Austrian army on the Danube, he fell into disgrace, and was banished to Asia Minor (1738-39), but was afterwards recalled. B. died at Constantinople, March 27, 1747. The only book which can be safely used for a knowledge of B. is *Mémoires du Comte de B.* by the Prince de Ligne (Par. 1817). Other professed memoirs are mere romances.

Bonnycastle, John, a self-taught mathematician, born at Whitchurch, Buckinghamshire. After acting for some time as tutor to the two sons of Lord Pomfret, he became Professor of Mathematics at the Royal Military Academy, Woolwich, a position retained by him for more than forty years. Of his numerous treatises, elementary and more advanced, on the several branches of mathematical science, the best known is his once popular *Elements of Algebra* (2 vols. 8vo, 1813), which has been superseded by the more modern works of Todhunter, Colenso, and Hamblin Smith.

Bonn'y River, the largest and most easterly mouth of the Niger, Upper Guinea, West Africa, falling into the Bight of Biafra. Its bar forms a safe anchorage, convenient at all seasons and tides. On its east bank, near the mouth, is the town of B., formerly infamous for its slave traffic, but now more creditably occupied in the export of palm oil.

Bono'rum, Cess'io. See CESSIO BONORUM.

Bonpland, Aimé, a celebrated traveller and botanist, born at La Rochelle, August 22, 1773. After studying medicine and serving as a ship's surgeon, he accompanied Humboldt during five years of travel in America. On returning to France, B. was made superintendent of the gardens at Malmaison. In 1816 he went to Buenos Ayres to introduce European trees and plants. Five years afterwards, when journeying to Bolivia, he was seized and kept prisoner by Dr Francis, then Dictator of Paraguay. Freed in 1831, he fixed his abode at San Borja, in the S. of Brazil. In 1853 he removed to Santa Anna, in the Argentine province of Corrientes, where he devoted himself to science until his death, 4th May 1858. His chief works are *Plantas Equinoxiales Recuellies au Mexique*, &c. (2 vols. Par. 1805, et seq.), *Monographie des Miliatomies*, &c. (2 vols. Par. 1806, et seq.). His

exceedingly rich collections, part of which he intended to present to the Paris museums, still remain in Corrientes.

Bon'us. The dividend to the shareholders of a company is called a B. in so far as the directors do not wish to lead the shareholders to expect its repetition. Thus the declaration of a dividend of 5 per cent. with a B. of 2, would mean that at next period the directors fully expected to repeat the 5 per cent., but that repetition of the 2 per cent. is not to be expected.

Bon'yhád, or Bonhard, an antique town in the county of Solna, Hungary, 23 miles N.E. of Fünfkirchen, and 98 miles S.S.W. of Buda, Pesth. It is about a mile distant from a branch line of railway by which it has now (1875) communication with Vienna, Italy, the S. of Hungary, and N. of Bosnia. It has an increasing trade in corn, wine, and tobacco. Pop. (1869) 5340.

Bony Pike (*Lepidosteus osseus*), a genus of *Ganoid* (q. v.) fishes, not at all allied to the common or *Teleostean* pikes, and found in the lakes and rivers of N. America. This fish possesses a complete armour of *ganoid* scales, which are arranged obliquely in transverse rows. This is the only fish in which the bodies of the vertebrae are *opisthocœlous*—that is, hollow behind and convex in front—all other fishes possessing *amphicœlous* vertebrae, or those hollow at both ends. The spine is well ossified. The jaws are prolonged to form a snout, and are provided with double rows of teeth. The tail is *heterocercal*, or unequally lobed. Both edges of the tail-fin, and the front edges of the other fins, are furnished with small bony pieces termed *fulcra*. These fishes possess opercular gills and *pseudo-branchiae* as well. The air-bladder is large and cellular. These fishes attain a length varying from two to four feet, and their flesh is esteemed for table.

Bonz'es, from Japanese *Busso*, a pious man, a name applied originally to the priests of Japan, but now extended by the Portuguese to other priests in China, Cochinchina, &c., especially those of Buddha. There are both male and female B., and they have their respective convents.

Boo'by (*Sula fusca*), a genus of *Natatorial* birds belonging to the Gannet (q. v.) genus, and included in the family *Felcanidae*.

This name is applied to these birds from the inactivity they display, and from the ease with which they may be caught; the boobies allowing their captors actually to seize them as they sit. The B. inhabits the warmer latitudes of the world, and is chiefly found in the neighbourhood of rocky coasts. It frequently flies far out to sea, and is an expert fisher; although the Man-of-war Bird (q. v.) and Frigate Bird (q. v.) persecute the B., and force it to disgorge the finny prey it has just captured. The colour of this bird is a dark brown on the upper, and white on the under parts; the young birds being of a more uniform brown. The bill is longer than the head, and is of straight, conical form and shape. The nest is placed on the ground, and but one egg is produced and hatched at a time. The flesh is dark coloured and not esteemed. The northernmost American limit (on the east coast) of these birds appears to be at Cape Hatteras. Audubon says these birds are not invariably listless, but become wary and active enough in certain cases.

Boo'y Island, a flat, dangerous, and barren rock in Torres Strait, off the N. of Australia, about 3 feet in height and $\frac{1}{4}$ mile in diameter.

Boodroom', or Bodrun', a dirty seaport town of Asia Minor, in the vilayet of Aidin, built on the site of the ancient *Halicarnassus*, the birthplace of Herodotus and Dionysius, about 96 miles S. of Smyrna. It is finely situated on the N. shore of the Gulf of Kos, and its harbour, where some shipbuilding is carried on, is defended on the east by a fortress built by the Knights of Rhodes. Pop. about 11,000.

Booby.

Book. This Teutonic word, as well as the Greek *biblos* and the Latin *liber*, is connected with the name of the rude material originally employed for the purpose of recording events. Inscriptions on tree-bark or leaves, on brass or stone, or on the tiles and bricks used at Nineveh, are not books. The idea of a B. is that of a record rolled up, as was done with the *scapi* or rolls of papyrus which for many centuries were exclusively used at both Rome and Alexandria. Parchment, consisting of the skins of lambs, sheep, and calves, was also rolled in the same way. In the 7th c. mixed rolls of parchment and papyrus were not uncommon. Another type of B., in which not only paper and parchment, but also the waxen tablets of the Romans, were used, is seen in the *Codex*, which, differing from the continuous *volumen*, consisted of separate leaves or pages fastened together at one corner. Official documents, named *libelli*, were also constructed in this way. When the multiplication of copies was carried on systematically in the Benedictine and other monasteries, this form was preserved, and binding in wood, metal, or leather was added. The rolls had previously been preserved in boxes. Till after the introduction of printing, the monks and scribes at the great universities chiefly exercised themselves in producing copies of the Bible, the classics, and certain theological works. In the 16th c., however, an enormous impetus was given to production, 326 editions of the Bible being printed in English between 1526 and 1600. As the modern manufacture of paper was established, and the writings of the essayists excited a taste for popular literature, books increased rapidly in number, 5280 appearing between 1700 and 1756, a very large proportion of which, however, belong to divinity and law. It would be tedious to enumerate the varieties of B. which have succeeded to the folios and quartos of the 17th c. The circle of readers and of subjects has been constantly extending. Formerly respectable authors, like Rushworth and Ockley, were ruined by a single B., but now literature is a secure profession, and there is active competition among publishers. Apart from its importance as the vehicle of literature, the B., viewed as a mere permanent record, has had important social effects. Thus *Boc-land*, or land of which the title is in a definite B. or record, is really equivalent to full private property in land, as distinguished from *Folc-land*, in which public interests were preserved. In Scotland, a statute was thought necessary in 1696 to authorise the writing of deeds 'bookwise,' i.e., in leaves, instead of in a continuous roll as formerly.

Book-binding. When the printed sheets of a volume leave the hands of the printer, they are delivered to the bookbinder to be made up into proper book form. This work is done partly by men and partly by women. The sheets pass first into the hands of the women, who fold them into their proper size, 4to, 8vo, 12mo, 18mo, 24mo, 32mo, the sizes being so named from the number of pages on each side of the sheet. They are then gathered in the order of the book, and plates inserted, if any; and generally at this stage the sheets are pressed closely together, either in a rolling machine, a hydraulic press, or a new machine called a 'smasher,' to exclude the air and give solidity to the book. Afterwards they are sewed sheet by sheet on tape, if for cloth binding, and on cord, if for stronger binding.

In cloth binding, the sewed books are next rounded in the back by a hammer, and jointed by a 'backing machine.' The cases or boards are made separately, of cloth and mill-board, and the gold and other ornaments stamped on their backs and sides by means of stamps fixed and heated in a blocking or arming press, and pressed with a heavy pressure on the boards. The accompanying fig. represents Gough's patent printing and arming press, the most useful recent invention in this department. By means of it 600 cases can be finished in black printing and gold per hour. If the books are to have gilt edges, they are first cut smooth all round by the guillotine or cutting machine, and then fixed into gilding presses, where the gilder washes the edges with an adhesive glaire, consisting of the whites of eggs. While the glaire is still moist the gold-leaf is laid on, and when dry the gilder burnishes the edges with an agate burnisher. The two parts being now finished, the book is fixed into the case by merely pasting the coloured papers at the ends, the small projecting tapes, and a small piece of thin cloth over the back of the sheets to each board. The books then get a nip in a hydraulic press to make them solid and firm. Great taste is now displayed in the outward appearance of cloth books, in many

cases helping the sale of an intrinsically worthless volume. But cloth bindings, however good and elegant they may be, have certainly not the property of durability to recommend them.

It is otherwise with books bound in leather. Indeed this only can be called 'binding.' The process differs considerably from that already described, so much so, that few cloth-binders can

Gough's Arming Press

do leather-work, and *vice versa*. For leather binding the sheets are folded and arranged as for cloth binding; they are sewed together, however, more firmly, and on three or more pieces of cord passing through the back, the ends of which are left an inch or so longer than the thickness of the book. In cloth binding the boards are made separately, and fastened loosely to the book; while in leather binding the ends of the cords above mentioned are securely fixed into the boards. The edges are then cut round, and gilt or marbled,—the latter effect being produced by colouring matter being sprinkled on the surface of water, and mixed by means of combs for producing the various patterns, and the book being lightly dipped in the colours, enough adheres to give the marbled edge. The *forwarder* next lays on the silk headbands at the top and bottom, and then prepares and draws on the cover, whether of calf, morocco, or russia leather. The books are then placed under a moderate pressure and allowed to dry. When this is done, the *finisher* takes them in hand, and by the skilful use of a variety of brass tools for the purpose, and of gold-leaf, he stamps on the letterings and the patterns which give to a well-bound book such an air of luxury. If books are *half-bound* in the same way, they should be as durable as full-bound ones; but the only saving effected can be in the smaller quantity of leather used.

In stationery B., such as ledgers, day-books, cash-books, &c., the process is much the same as above, the chief difference being in the materials used requiring to be stronger and heavier.

The B. trade is very extensive, and employs a large number of men and women in all large cities; and in the higher branches of it, such as finishing, there are men who may well rank as artists, whose productions are essential to the adornment of the noblest mansions.

Book-Club, a society for the purchase of books, to be used by the members, and then sold or distributed among them. The Bachelors' Club at Mauchline, to which Burns belonged, spent only its fines on books, but may be taken as a specimen of the reading-society not uncommon in Scotland at the end of the 18th c. Lord Brougham, in *Practical Observations on the Education of the People* (1825), warmly urged the establishment of such societies on the basis of weekly or monthly

contributions. They were chiefly useful in localities where a circulation could be conveniently carried on among a sufficient number, but where the ancient bookstall or the intermediate itinerant library did not come, and where the prospect of profit did not tempt the more recent lending-library. The feeling of corporate responsibility in these matters is rapidly growing, but voluntary agency is still active—(1) in connection with special subjects—e.g., a medical or legal reading-club; (2) in connection with a special propaganda—e.g., that of a congregation or Sunday-school—the selection of books being often very narrow.

Book-keeping is believed to have originated with the Venetians, who were the great traders of the 15th century, and the first treatise on the subject was written by Lucas Pacioli, usually called Lucas de Burgo, a learned monk of the Minorite order, and was published at Venice in 1494. The system expounded by De Burgo was universally practised by the merchants of Venice, and is still that generally used. It is known as the 'Italian method;' and was so perfect and complete at first, that but little improvement has been made upon it up till the present time.

The leading purposes of B. are—(1) to secure a correct record of all transactions between traders and those with whom they deal; and (2) to enable them at a given time to ascertain and exhibit the exact position of their affairs. The importance of these objects, it must be apparent, cannot be over-estimated; yet the reports of the Bankruptcy Courts show conclusively how many conduct their business either without books at all, or with these kept in a most unsatisfactory manner.

The principles of the Italian method are exceedingly simple, and may be apprehended and applied by any person with an ordinary amount of intelligence. Every trader will be the best judge what subsidiary books are necessary for fully and correctly recording all the transactions in his business, but there are several books which are quite indispensable. These are *day-book*, *invoice-book*, *cash-book*, and *ledger*. The *day-book* gives a record of all goods sold on credit, the buyer being debited for the amount. An entry should be made periodically for goods sold for cash, 'cash sales' being made *Dr*. In B. by double entry, either each individual entry may be credited to another account, or the summation of the whole month's entries may be credited to 'goods' account. In the *invoice-book* are entered all goods purchased, the amount or details of each invoice or account of purchases being specified. An entry should also be made periodically of goods purchased for cash, 'cash purchases' being *Cr*. The *cash-book* contains a record of all cash received and cash paid, the former being entered on the debit side, or left-hand page, the latter on the credit, or right-hand page. The difference of the summation of the columns, when a balance is made, is the cash on hand, which is carried forward to the next period. In some kinds of business a *journal* is kept, in which the entries of the other books are classed under general heads. All the entries during the month in which the same person or thing is *Dr* or *Cr* are collected under the title 'Sundries,' with the amounts. Thus the debit side of the cash-book is transferred under the title, 'Cash *Dr* to sundries,' and the credit side under that of 'Sundries *Dr* to cash.' All the entries in the day-book, invoice-book, and cash-book are posted direct, if a journal is not used, to their several accounts in the *ledger*, it being thus the summary of every transaction that has taken place. Every debtor and creditor named in these books must have a folio, or part of one, set apart for the transactions in his or its name. The goods sold, as in *day-book*, are posted to the debtor side of each customer's account; the goods bought, as in *invoice-book*, are posted to the credit side of each creditor's account; while the cash received is posted to the credit, and the cash paid to the debit, of the party in whose name the cash is entered. When every entry in these three books is correctly posted into the ledger, the position of every debtor's and creditor's account is seen at a glance. But besides ordinary debtors' and creditors' accounts—that is, personal accounts—there arise a number of other accounts which must be kept and balanced in order to complete the system. Among these miscellaneous accounts may be classed—(1) 'Goods,' the total of goods sold being posted to the credit side, and of goods purchased to the debit side—the difference being *gross profit*; (2) 'Profit and Loss,' to which the difference under (1) is carried, also the bad debts, expenses, &c.—the difference being

net profit or loss; (3) 'Charges,' which will embrace rents, taxes, postages, salaries, and wages, if these latter are not kept in a separate account, and which must be posted to the debit of profit and loss. In personal accounts, the balance shows the merchant's indebtedness to others, or theirs to him. When the books are balanced, the balance of the profit and loss is posted—if profit, to the credit, or if loss, to the debit of the stock account, representing the proprietor; or when there is a partnership, this same balance is divided according to the terms of co-partnership, and posted to each partner's account accordingly.

Business books, kept as above described, form a double-entry set, as it is termed, every debtor having a corresponding creditor, and *vice versa*.

There can be little doubt that commercial misfortune often comes of badly-kept books; yet the first formation of such a set of books, and their constant maintenance in a perfectly satisfactory state, requires only ordinary intelligence to express correctly and clearly the first record; promptitude in doing it while the transaction is fresh in the memory; punctuality, watchfulness, and clerical accuracy in advancing the record through the books. If this is conscientiously done, the scientific principles of the method will keep everything right. The state of the merchant's affairs can then be easily and readily ascertained; and in case of misfortune, his character will be vindicated from at least one reproach.

B. by single entry is devoid of any scientific method, is unsatisfactory in its working, and wholly inadequate for the proper exhibition of mercantile accounts, or the right conduct of a complex business. It answers, however, sufficiently well for the operations of a small retail trader. By this method the principle is kept out of view that every *Dr* must have a *Cr*, and every *Cr* a *Dr*; and the first record of a transaction is made with a *Dr* only or a *Cr* only, by the principles already explained; so that the ledger will contain an account for a *Dr* only or a *Cr* only, each entry being made but once in the ledger, either on a debit or a credit side. In a set kept on this principle, a *day-book*, *cash-book*, and *ledger* are deemed sufficient. The balancing is simply effected. The ledger accounts are closed with *To*. By balance as the case may be; and a *Dr* and *Cr* balance account being then formed, and the cash balance entered in it, the account is closed with the entry, 'By present nett capital.' It will be easy for a trader using such a set to have a few accounts made up by double entry at monthly or quarterly periods, in order to exhibit a clear summary of his transactions. For all the purposes required by a professional man, a simple ledger of this kind, combined with a cash-book or cash-ledger account, ought to be sufficient. See treatises on *Bookkeeping* by Theo. Jones (Lond. 1846), Dr J. Bryce (Glasg. 1873), and F. H. Carter, C.A. (Edinb. 1875).

Books of Adjournal are the records of the Court of Justiciary in Scotland.

Books of Sederunt are the books in which the Acts of Sederunt (see under ACT, *Act of Sederunt*) of the Court of Session in Scotland are recorded. They contain the names of the judges present at each meeting. Formerly most public papers of importance were recorded in these books, and even matters totally unconnected with the business of the Court were recorded, such as eclipses and other remarkable events.

Book Scorpion (*Chelifer*), the name applied to certain small Arachnidans (q. v.) belonging to the lower division (*Trachearia*) of that class. They are included in the order *Adelarthronomata*, and derive their name from the fact of their being commonly found amongst old books, whilst their general appearance resembles that of miniature scorpions. The abdomen is more or less distinctly segmented, and the maxillary *palsi* or appendages of the jaws are very long, and are terminated by *chela* or nipping-claws, so as to give the creature the appearance of possessing five pairs of limbs. They appear to subsist on small insects, and may occasionally be seen attacking the common fly.

Bookstalls. The practice prevailed in early times of exposing goods for sale on temporary structures, erected either in fairs or markets, or under the shadow of public buildings in towns, and, in connection with the sale of books, has lingered on, though in a very modified form, to our own time. B. are

very numerous in Paris, and are still to be found in London and Edinburgh. In many of them, however, cheap reprints in gay bindings have in a great degree ousted the old grey volumes in which the former salesmen exclusively dealt. Keepers of B. have occasionally risen to eminence in the trade. Of this we have an example in the case of Lackington, an extensive London bookseller in the last c.; and in the present, in the great house of the Messrs Chambers in Edinburgh.

Book Trade. The important and interesting commerce in books as commodities comprises the two departments of publishing and bookselling. The latter of these sections of the trade was represented by the sellers of MSS. as far back as ancient Greek and Roman times; while publishing, as a distinct form of business, only came into existence with the invention of Printing (q. v.). Fust, Schœffer, Gutenberg, and Caxton—men occasionally combining in themselves the functions of printer, bookseller, and author—must be regarded as the founders of the modern trade. This article has for its subject the gradual growth and the development of the resources of that trade in the various countries where it has risen to importance.

England.—The B. T. of this country was beset in its infancy by proclamations and patents-royal, Star Chamber decrees, university licences, and charters of monopoly. In contradistinction to the early printers of the Continent, who mainly produced classics in the original, those of England supplied the aristocracy with classical translations and abridgements, French and Italian romances, old chronicles, devotional works, &c. Caxton (q. v.) issued 64 books, Pynson 212, while Wynkyn de Worde (1493-1535) actually published 408. There are on record the names of 350 English printers between 1474 and 1600; and, according to Evelyn, the loss of booksellers' stock at the Fire of London (1666) amounted to £200,000. (See STATIONERS' COMPANY.) In the fourteen years following 1666 there appeared 3550 books, of which a large proportion were theological. The beginning of a periodical literature consequent upon the Revolution of 1688 is a noteworthy event in the history of the trade. In 1738 the Copyright Act, 8 Anne, c. 19, the last of a long series of restrictive measures, expired, and the trade has ever since been free. It has extended marvelously, and has within late years developed quite a new phase in the issue of cheap literature, inaugurated by the appearance of Constable's *Miscellany* (1827), and the *Library* (1827) of the Society for the Diffusion of Useful Knowledge. Charles Knight, Archibald Constable, and W. & R. Chambers of Edinburgh, and H. G. Bohn, were the publishers who subsequently, perhaps, did most to foster the popular taste for literature.

A determined effort was made some years ago by the leading publishers and booksellers in Great Britain to regulate the prices at which books should be sold to the public, and the whole case was submitted for the decision of Lord Campbell. He decided against the movement, and the result has been that free trade has since been carried to such an extent in the operations of the B. T. as to be occasionally fruitful of serious evils.

The B. T. of the present day has assumed enormous proportions. Authors and publishers produce new works in extraordinary numbers, while the works of older and standard authors are largely reprinted in forms to suit all classes of purchasers. The publishers take the risk, in whole or in part, of publishing many of these works, but in many cases the authors are wholly responsible. Good authors have no difficulty in finding publishers, while indifferent authors have generally to guarantee outlays. This becomes a serious matter for many authors, and exposes publishers not unfrequently to unjust charges. It is extraordinary that the ambition of authors generally is not more moderated by the heavy losses they sustain. On the other hand, at no previous period in the history of the B. T. could the body of popular authors obtain such large returns for their productions. In some cases, no doubt, this is the result of the large sales which their works command, but the competition among publishers for the works of good authors is so great, that the value of an author's MS. is often increased fictitiously. It requires great discretion on the part of the publisher to determine what books to publish, and the success of the existing houses of note is in great part due to the judgment and enterprise with which they have carried on such operations. The principal publishers in Great Britain have their headquarters in London, where, too,

are agencies of the publishers of Edinburgh, Glasgow, Oxford, Cambridge, &c. Many of these have travellers who visit booksellers in the country, and supply them with their own publications. But a very large portion of the trade is done through the wholesale booksellers, who supply the periodicals and books of all publishers to the booksellers throughout the country. Many of these receive parcels daily, some even twice a day, from London to meet the demands of their customers.

In addition to the ordinary booksellers, the railway system has called into existence the railway bookstalls as a means of distributing in large numbers all classes of books and periodicals. The enterprising house of Messrs W. H. Smith & Son, London, have the contracts for these stalls on nearly all the leading lines in the country. The canvassing department of the B. T. is also carried on to a very large extent by several houses, who have agencies placed all over the country, and who take up such works as are usually sold in parts. Another extensive branch of this department is the canvassing of books, chiefly Family Bibles in a bound form. Many thousands of these have been sold of late years to parties who paid for them by instalments.

It may be of interest to give the number of books issued in Britain for a single year, together with a distribution of them into the various departments of literature and science to which they belong. In 1875 no fewer than 3577 new books were published, and, in addition, 1320 new editions. Of the new books, 644 were contributions to fiction, 556 to theology (including sermons), 430 to art and mechanical science, 272 to history and biography, 270 to educational and classical subjects and philology, 227 to the literature of travel and geography, 217 to poetry and the drama, 129 to belles lettres (essays, &c.), 68 to law, and 68 to medicine.

The foreign and colonial B. T. is large and increasing. The chief imports into England are from Germany, France, Holland, Belgium, and the United States, those from France being about one-third of the whole. The total imports of books for 1874 amounted to £178,936. The exports in books for the same year amounted to £904,792, the trade being with all foreign countries and the Colonies. Fully one-half of the total exports are sent to Australia and the United States. An international copyright law (see COPYRIGHT) exists between England and three European countries—the German Empire, France, and Italy.

Germany. Germany is to be regarded as the birthplace of the B. T. as well as of printing, and in early times Frankfurt was the metropolis of the trade; a position, however, which has been distinctly occupied by Leipzig since the end of the 17th c. Berlin, Vienna, Nürnberg, Augsburg, and Stuttgart have also of comparatively late years risen into importance as central marts. But these, it must be remembered, are only agency centres, and have but a greater or less share of publishing. In 1871 Leipzig contained 249 book firms; and out of a population of 106,925 there were 21 book commission merchants, and 114 publishers, the majority of whom had their own printing establishments. The total number of books published in Germany in 1875 was 12,300, of which 1084 were theological, 1177 were legal and political, while the rest were mainly histories, biographies, text-books, novels, and poems. From the various publishing cities packages containing copies of new books pour into Leipzig daily, to be at once circulated again by the commissioners to the remotest parts of the empire. And so complete is the organisation of the system, that all books almost equally procure the attention of the retail sellers, on whom greatly devolves the business of bringing them under the notice of the public, while little or no expense is entailed by the publisher in advertising. The Copyright Convention has existed with England since 1846. The most famous of modern German publishers are perhaps Perthes (q. v.), Tauchnitz (q. v.), and Brockhaus. See Kichhoff, *Beiträge zur Geschichte des Buchhandels* (Leips. 1861).

France.—Paris is, as it has been from the 16th c., the great centre of the French trade, and possesses especially many publishing works on a most extensive scale. Such, for example, is the unique *Imprimerie Nationale*, noted for the magnificence of its editions. This old establishment (1640), managed at the expense and in name of the state, employs about 1000 workmen, and publishes specially legal acts and public documents, but also, and this gratuitously, such works of an unofficial character as receive the approbation of a commission under the Minister of Justice. Its command of varieties of type is perhaps the largest in the world, including the characters necessary for

the printing of works in German, Anglo-Saxon, Arabic, Georgian, Greek, Hindustani, Sanskrit, Russian, Persian, &c. The French publishers generally issue a surprising number of large and costly books in all departments of literature. They are produced regardless of outlay, and many of them are of surpassing beauty. In paper, printing, and illustration they are greatly superior to anything produced elsewhere. As examples of this we may mention Doré's *La Sainte Bible* (published at Tours), *Le Dictionnaire de l'Architecture* by Viollet le Duc, and *L'Ornement Polychrome*, &c.

The various other countries of Europe have, without exception, experienced a rapid increase of prosperity in the B. T. of late years. Belgium has now an active and growing trade, centred in Brussels, while Holland, greatly the superior of Belgium in point of productiveness, is still vigorous in the publication of Dutch literature, but has greatly lost its character, acquired in the early days (see *ELZEVR*), for beautiful printing. Italy, the country of the immortal Aldines (q. v.), is yearly putting forth more voluminous fruits. In Egypt, also, there is a flourishing establishment at Bulac (q. v.) for printing works in Eastern languages.

America.—Like almost everything Transatlantic, the American B. T. is increasing immensely, the greatest firms being those of Lippincott and Harper. The chief publishing cities are New York, Philadelphia, and Boston. There is no copyright law between the United States and Great Britain, and one result of this is that almost every work of importance which is published in Great Britain is reprinted in the United States, frequently by arrangement with the original publisher, but probably as often not. These reprints of English works form a very large part of the B. T. in America. For many years attempts have been made by the Governments of both countries to establish an international copyright law, but the privilege of reprinting English publications, with or without nominal compensation, is so great, that the consent of the United States Government has not to this day been obtained. It may be hoped that the Royal Commission recently (1875) appointed by the British Government to inquire into the question of the copyright laws will be able to find some solution of this question. American publishers and booksellers have now formed an association, the chief object of which is to regulate the prices at which books are to be supplied to the trade and to the public. If they are successful in this, there will be hope for British publishers and booksellers attempting to do likewise. In America a fall trade-sale is annually held, at which nearly all the publishers dispose of large numbers of their publications. The system of canvassing for subscribers to their works is carried on in a most vigorous manner by most of the American publishing firms. See *English Catalogue of Books* (Sampson Low & Co., 1863-74), *A History of Booksellers* (Chatto & Windus, 1875), and a *Reference Catalogue of Current Literature* (Whitaker, 1875).

Book'um Wood, Bukk'um (or Wukkum) Wood, or Seppan, the wood of *Casalpinia Sappan* (natural order *Leguminosæ*, sub-order *Casalpiniceæ*), a native of India, which is used for dyeing red. The roots of the same tree, under the name of yellow wood, or sappan root, are used in Ceylon for dyeing yellow. It is also exported to Britain and other countries.

Boole, George, one of the most famous of modern mathematicians, was born at Lincoln, November 2, 1815. His father, though a tradesman of very limited means, was a man of thoughtful and studious habits; and from him B. received his instruction in elementary mathematics. After being an assistant-teacher for four years, during which he made himself proficient in ancient and modern literature, he opened a school in Lincoln when only twenty years of age. From this time his special study was mathematics. In 1839, his memoir, entitled *Researches on the Theory of Analytical Transformations*, was published in the *Cambridge Mathematical Journal*; and in 1844 he received the royal medal of the Royal Society of London for his paper *On a General Method in Analysis*. In 1847 the attention of B. was attracted to the subject of mental science, from the controversy between Sir W. Hamilton of Edinburgh and Professor De Morgan; and in the same year appeared his *Mathematical Analysis of Logic*. In 1849 he was appointed Professor of Mathematics in Queen's College, Cork, a position he held till his death. His most elaborate work, *An Investigation of the Laws of Thought*, was published in 1854; and in 1854 he received the Keith medal

of the Royal Society of Edinburgh for his memoir *On the Application of the Theory of Probabilities to the Question of the Combination of Testimonies or Judgments*. B. died at Ballintemple, 8th December 1864. As a pure mathematician he is well known by his numerous memoirs and his works on *Differential Equations* and *Finite Differences*, and also through his development of that method of solution of equations known as the separation of symbols.

Boomerang, a remarkable hunting instrument and weapon used by the aborigines of Australia. It is parabolic in shape,

Boomerang.

made of hard wood, and from 2 feet to 2 feet 8 inches in length, the average length being about 2 feet 4 inches. It is $\frac{2}{3}$ inches broad and one-third of an inch thick. The ends are rounded, and one of the sides is convex, the other flat. The B. is held by one end, with the convex side downwards, and thrown in the opposite direction to the object aimed at. It rises into the air with a gyratory motion and whizzing sound, and at length stops, then commences to return, and falls behind the user. The Australian blacks are very skilful in its use, but Europeans have never been able to master it. The B., although not known even to the aborigines of Tasmania, was used by the ancient Egyptians, and has also been traced by Colonel Lane Fox (*vide Report of the British Association*, 1872 meeting) to the Dravidian races of the Indian peninsula, whom Professor Huxley refers to an Australoid stock. The Dravidian B. differed from that now used in Australia in being thicker and heavier, and in not returning. In N. America, Dr E. Palmer has discovered that the B. is used by the Moqui Indians of Arizona and New Mexico to kill rabbits. They throw it with a motion similar to that by which a stone is made to skip on the surface of the water. Still more recently the B. has been found in use among some of the Indian tribes of California.

Boom, in a ship, the pole or yard to which the lower edges of some of the sails are attached or stretched. It receives the name also of the particular sail to which it is attached—*e.g.*, *jib-B.*

Harbour-Boom.

B., in harbours, a chain stretched across an entrance to prevent ingress of hostile vessels. B., in girder bridges, the upper and lower members or flanges of the girders.

Boom, a market-town in the province of Antwerp, Belgium, 11 miles S. of the city of Antwerp, on the navigable river Rupel, with some manufactures of leather, beer, ropes, sailcloth, and salt. Pop. (1873) 9508. It has the most important brick-kilns in Belgium, 12 corn-mills, 7 wharves, &c.

Boone, Daniel, the pioneer of the white settlers in Kentucky, was born in Pennsylvania, February 1735. He afterwards resided in N. Carolina, and there married; but, inspired by a love of nature and a fondness for adventure, he crossed the Alleghenies in 1769, and reached a branch of the Ohio called Kentucky. On its banks, in 1775, he built a fort named Boonesborough. Twenty years later he removed to Missouri, where he died, September 26, 1822. Kentucky, which owes so much to him, has ever held his memory in the highest respect, and his remains were finally interred with much pomp in Frankfort, the capital of the state. B. is the typical backwoods hero of all American youth.

Boonesborough, a small village in Madison county, Kentucky, U.S., founded by Daniel Boone, where he built the first fort in the state, in 1775. It stands upon the banks of the Kentucky river, above Frankfort, and near to Lexington. Here met the first state legislature W. of the Alleghenies.

Boot, an instrument of judicial torture, formerly used by the Privy Council and the Justiciary of Scotland to extort confession or

evidence. It consisted of a cylinder of iron rings, or of a wooden box, in which the leg was placed, wooden wedges being hammered in between the leg and the B. Shields, in a *Hind let Loose*, says this was done 'till the marrow came out of the bone.' The limb was often rendered useless. In 1579 the B. was inflicted on a clergyman and notary, false witnesses to a solemn deed. In 1583, Walsingham ordered Holt the Jesuit to undergo the B. in Scotland, and next year he ordered the same torture for Hurley the Jesuit, suspected of complicity in the Desmond rebellion. The cases of Fian (1591) and Balfour (1596) involved charges of witchcraft and murder. In Grant's case (theft and robbery, 1632), the plea that Grant, having passed the ordeal, should be set at liberty, was repelled. Except in extraordinary cases before the council, the B. was not used before the jury, but by way of precognition; what the prisoner confessed was afterwards proved at his trial. In Covenanting times the B. was used in the politico-military trials—e.g., Hugh M'Phail's. On the murder of President Lockhart (1689), and in Payne's case (the Montgomery Plot, 1690), the B. was used; in the latter case along with the thumb-screws, at the express desire of William III. The Claim of Right (1689) declares 'that the using torture *without evidence, or in ordinary crimes*, is contrary to law.' All torture was abolished by 7 Anne, c. 20. M'Laurin states the B. was brought from Russia: it was a new thumb-screw, which Drummond and Dalziel imported during the persecutions. The French *brodequin* resembles the B.

Boötēs (Gr. 'ox-driver'), according to the Roman mythographer Hyginus, was originally called Philomelos, and was the son of Ceres and Iasion; when he saw himself robbed of all his property by his brother, Plutos, he invented the plough, to which he yoked two steers, and began to till the ground. As a reward for this invention, he was, along with his plough and oxen, translated by his mother to the stars. According to another version of the myth, B. was the son of Lycæon and Callisto, and was placed by Zeus among the constellations, one of which, Arcturus, received his name.

Booth, a temporary structure of boards, boughs of trees, canvas stretched on a wooden frame, or other light material. The

Booth.

etymology is disputed, some deriving it from the Gaelic *both* or *bothag*, a bothy, or hut, others from the Greek *apothekē*, a magazine or storehouse, whence unquestionably the French *boutique*. But there is more probability in the conjecture that the word is of Teutonic origin, and connected with the Old Eng. *buan*, to dwell, Ger. *bauen*, to build. It is the same as the Dan. *by* (in Normandy *buc* and *bouf*), a dwelling-place. The prevalent Lowland Scotch form is *butth*. Booths, set up in a locality at the annual fair where the trade of the district was mainly transacted, were necessarily removed when the fair was ended; but when weekly markets superseded the annual fairs, the booths were often allowed to remain during the intervals, and gradually became permanent. Encroachments were thus made on the recesses of buildings, and even on the streets of towns; and the early monkish chroniclers are loud in their complaints against the appropriation of sites by stall-keepers without authority received from the superior. Licence to get out a stall frequently resulted in liberty assumed to build a house on the spot. In this way, according to Stow, arose Old Fish Street, London, and part of Cheapside. The *luckenbooths* in the centre of the High Street, Edinburgh, arose in similar fashion. The shed, at first movable, in time got attached to the wall of some cathedral or town-house, soon came to have a 'solar' or loft above it, in which the tradesman resided, and a cellar beneath it in which he stored his goods. Booths must now be licensed; if not, they are public nuisances, and subject those who erect them to punishment by

fine. But at fairs, if sanctioned by the local authority, they are still within the statute 6 and 7 Vict., c. 68, s. 23, if confined to histrionic spectacles.

Booth, Barton, a famous actor, related to the Earls of Warrington, and born in Lancashire, 1681. He was educated at Westminster, and afterwards at Cambridge University, but ran away at the age of seventeen, and became a strolling player. He played successfully at Bartholomew Fair and at Dublin, and finally (1701) made his appearance at Drury Lane, then under Betterton, where he soon became a great favourite, especially with the court and aristocracy. Among his chief parts were Othello and the Ghost in *Hamlet*, the impressiveness of his acting rendering the latter a wonderful performance. He also gained great praise in the rôle of Addison's *Cato*. On the first night on which the tragedy was performed, a purse of fifty guineas was collected in the boxes, and presented to the actor 'for his honest opposition to a perpetual dictator, and his dying so bravely in the cause of liberty.' After having succeeded Betterton as manager, he died May 10, 1733.

Boothia Felix, a peninsula on the N. of the American continent, bounded on the N. by Bellot Strait (q. v.). It was named after Sir Felix Booth by Sir John Ross, who discovered it, and supposed it to extend to Barrow Strait.—B., Gulf of, separates B. F. from Cockburn Island on the W.

Boots. (The word 'boot,' it may be noticed, is of Teutonic origin, being the Ger. *bütte*, whence the Fr. *botte*, and the Ital. *botta*, a 'butt,' or 'leathern bottle.' The transition from the leathern bottle to 'boot' is not peculiar to French; the Eng. 'boot' is used to signify both foot-gear and the luggage-box in a stage-coach.) Modern B. are strong, durable coverings for the feet, made of tanned leather, always reaching above the ankles, and sometimes extending to near the knees. There is considerable variety in their forms, and in the mode in which they are fastened to the feet, the most recent and now generally adopted fashion being by elastic-web gussets in the sides. Further details regarding bootmaking will be given under SHOES and SHOE-MAKING.

B. are of comparatively modern introduction, and appear to have gradually come into use after the Norman conquest. In *Les Mœurs, Costumes, et Usages au Moyen Âge* of Lacroix, an illustration of the 13th c. occurs, in which long B. like Hessians are seen. From the time of Edward IV. onward, long B. came into common use for gentlemen. The B. worn at this period were drawn out in front to long tapering points, and when this fashion was prohibited by law, the shape ran into an equally absurd breadth of toe, which in its turn had to be restricted by legal enactment. About the period of the Reformation, B. were worn wide at the top, and having a piece folded back which could be pulled up considerably higher than the knee. The courtiers of the time of Charles II. wore an edging of costly lace round the widely-expanded top of the B. then in fashion. The jack-boot came into use in the time of James II.; the Hessian was introduced during the reign of George III., and top-B. came into fashion about the end of last century. Wellingtons were introduced by the great Duke to supersede Hessians, and were worn under the trouser-leg.

Boot'y. This is technically a military term denoting the property taken in war. The corresponding naval term is *Prize* (q. v.). Nominally the property of the sovereign, B. is always divided among the captors. The officers and the field-officers appoint agents, who sell the captured property, and hand the proceeds to the authorities. A scheme of apportionment is then made out, in accordance with a list of those entitled to share, previously sent in by the commanding officer, and the money is paid accordingly.

Bopp, Franz, a distinguished Sanskrit scholar, was born at Mainz, September 14, 1791. From an early age he devoted himself to the study of Oriental languages, and continued his labours in that department at Paris, London, and Göttingen. He published a work on the Sanskrit verb, a Sanskrit grammar, a complete system of the Sanskrit language, a Sanskrit vocabulary, fragments of the *Mahabharata*, and a comparison of the Celtic languages with Sanskrit, &c. In 1821 he was appointed Professor of Oriental Languages at Berlin. His *Vergleichende Grammatik des Sanskrit, Zend, Griechischen, Lateinischen, Lithauischen, Altslavischen, Gotischen, und Deutschen*

(Berl. 1833-53; 2d ed. with the relations of the Armenian, 3 vols. Berl. 1856-61; 3d ed. 1868), may be said to have laid the foundation of the science of comparative philology. The first edition was translated into English by Eastwick (1845-50). B. died 22d October 1867.

Boppard, a town of the Rhine province, Prussia, 9 miles S. of Coblenz by rail, with several active industries. It is the ancient *Baudobriga*, was in the middle ages an imperial city, and still contains the ruins of the Roman fortress built by Drusus. Near it is Marienberg, the celebrated hydropathic resort. Pop. (1871) 2610.

Boquetin, or **Ibex of the Alps** (*Capra Ibex*), a species of goats inhabiting the lofty mountain ranges of the Alps and other European mountains, at a higher range than the Chamois (q. v.). It is named 'Steinbock' in German Switzerland. The ibex is of the size of an ordinary goat. The winter coat consists of long rough hair, covering a finer under-wool, which forms the summer coat. The head is small, but the horns are very large, curved upwards and backwards, and possess prominent cross-bars on their front surfaces. The horns of the female are very small as compared with those of the male, which may attain a length of 2 feet. The colour is light, brown above and white beneath, a black band existing on the back, and a brown line crossing the flanks. The tail is short. A small, rough, black beard is developed. The food consists of herbage, shrubs, and lichens. These animals are very active, and exercise a keen sense of smell, and of sight also. They execute considerable leaps, and may even escape uninjured, when pursued, by leaping from heights that would ensure the destruction of less agile animals. If hard pressed, the ibex may charge the hunter. These animals are readily domesticated, and will breed with the common goat. The hybrid progeny will breed with either the ibex or the goat.

Bora, Katharina von, the wife of Luther, was born at Lützen, in Saxony, 29th January 1499. While very young she was placed in the convent of Nimptschen. On reading some of the writings of Luther, she determined to abandon a monastic life, and, along with eight of her companions, she applied to Luther for help. Leonhard Koppe, a citizen of Torgau, at the instance of Luther, succeeded in effecting their escape on the night of 4th April 1523. Katharina found an asylum in the house of the burgomaster Reichenbach, at Wittenberg, and was married to Luther, 13th June 1525. This marriage proved eminently happy; and Luther in his will left all his property to her, whom he playfully termed *Catha mea* ('my Kath'). She died at Torgau, 20th December 1552. See Walch's *Geschichte der Kath. von B.* (2 vols. Halle, 1752-54), and Beste's *Geschichte Kath. von B.* (Halle, 1843).

Boric Acid is a white crystalline substance, which in the anhydrous condition is simply an oxide of the element *Boron*, having the formula B_2O_3 ; but in the hydrated states is a compound of oxide of boron and water, $B_2O_3 \cdot 3H_2O$, or $B(OH)_3$. It was discovered in 1702 by Homberg (*Homberg's sedative salt*), but it is supposed that the *chrysosella* of Pliny was the same substance. It occurs in the uncombined state in the crater of *Vulcano*, one of the Liparic islands, but is obtained in largest quantity from the *solfioni* or jets of vapour which issue from the ground in many parts of Tuscany. The *solfioni*, or *fumerolles*, containing, in addition to hot aqueous vapour, sulphuretted hydrogen and a small quantity of B. A., are directed into *lagoons* or ponds of water; the water takes up the B. A., and becomes heated to the boiling-point. The lagoons are arranged in such a manner that the water from the highest can reach the lowest after passing through the intermediate ones. The water is allowed to remain in each lagoon for from twenty to thirty hours, and finally contains from $\frac{1}{2}$ to 2 per cent. of B. A. It is then led into a series of shallow evaporating cisterns, made of lead, and heated by the *fumerolles* themselves, when it becomes sufficiently concentrated for the B. A. to crystallise out on cooling. Tuscany yields about 2,500,000 lbs. annually. B. A. combines with various bases to form a class of salts called *Borates*, the most important of which is the *Bis-borate of Soda*, or *borax*, $Na_2B_4O_7$. A few of them occur native as minerals, but are unimportant. B. A. is employed as a flux in the preparation of certain kinds of glass, and as an antiseptic dressing for wounds. It is chiefly employed in the manufacture of borax.

Borage (*Borago*), a genus of plants of the natural order *Boraginaceae* (q. v.). They are all rough, hairy annuals or biennials, with blue flowers in loose spirally coiled cymes. There are few species, and these chiefly from N. E. Europe and Western Asia. There is only one British species, the common B. (*B. officinalis*), which is doubtfully indigenous, and is probably originally an escape from gardens in which it was introduced long ago from the E. Mediterranean region. The young leaves and shoots are pickled, and sometimes served as a table vegetable; but beyond the range of the domestic pharmacopoeia, B., at one time held in great renown as a remedy in pectoral affections and as an exhilarant, is esteemed of little value as a medicinal plant.

Boraginaceae, or **Boragineae**, a natural order of dicotyledonous plants, to which *Echium*, *Mertensia*, *Lungwort*, *Hounds-tongue*, *Borage*, *Alkanet*, *Forget-me-not*, &c., belong. It is a numerous order, comprising nearly 58 genera and 700 species, chiefly natives of the northern hemisphere, and having but few representatives in the tropics or in the southern hemisphere. It differs from all the allied orders except the *Labiata* (q. v.) by the four-seeded nut, and from these by their alternate leaves and more regular flowers. The plants of the order are chiefly remarkable for their mucilaginous properties. Nearly all are harmless, and are of little value as medicinal agents. Alkanet (*Anchusa tinctoria*) roots yield a dark blood-red dye. The young shoots of Comfrey (*Symphytum officinale*) are eaten as a vegetable, and are a good substitute for spinach. The root contains much starch, and when scraped and laid on calico it forms a good bandage for wounds. Several plants of the order—e.g., *Sweet Heliotrope*—are cultivated in our gardens.

Bora Samba, a small half-independent Indian state, on the S.W. frontier of Bengal, paying an annual tribute of £16 to the British Government. The country is rugged, with an area of about 620 sq. miles; the pop. is estimated at 28,000.

Borassus. See PALMYRA PALM.

Borax is a colourless crystalline compound of boracic acid and soda. It occurs native in China, Persia, Ceylon, Peru, and on the shores of certain lakes in Thibet. Crude B. from the latter locality is called *Tincal*. B. is now principally prepared from the boracic acid of Tuscany, by neutralising a solution of that substance with one of carbonate of soda, and evaporating to crystallisation. If it be allowed to crystallise from its aqueous solution at a temperature of 25-30° C. it separates in prismatic forms (ordinary B.), and contains 10 molecules of water of crystallisation, its formula being $Na_2B_4O_7 \cdot 10H_2O$. If the crystallisation takes place at 56-79° C., the B. is octohedral in shape, and contains only half as much water of crystallisation, its formula being then $Na_2B_4O_7 \cdot 5H_2O$. B. is valuable to the chemist as a blow-pipe reagent. When strongly heated, it parts with its water of crystallisation, and fuses to a clear glass, which has the property, at a high temperature, of dissolving many metallic oxides, and forming coloured and characteristic compounds (*B. beads*). It is also used as a flux in soldering metals, as it protects their surfaces from oxidation, and at the same time dissolves any oxide that may be present. In the arts B. is employed in the manufacture of certain kinds of glass, enamel, and porcelain. It is used in medicine both as an internal and external remedy.

Borda, Jean Charles, an eminent French mathematician and astronomer, celebrated for many ingenious inventions and improvements, was born at Dux, May 4, 1733, and died at Paris, February 20, 1799. His scientific reputation rests chiefly upon his corrections of the seconds pendulum, and his improvement of the reflecting circle.

Bordeaux, a beautiful city, the capital of the department of Gironde, France, on the left bank of the Garonne, 60 miles from its mouth in the Atlantic, and 310 miles S.W. of Paris by railway. It consists partly of an old town, chiefly composed of dilapidated wooden houses of the 15th c., and of more modern portions laid out in regular streets, open squares, and beautiful boulevards. The principal buildings are the Cathedral of St André, commenced in the 11th c.; the Town-hall, partly destroyed by fire in 1875; the fine old churches of St Croix, St Seurin, and St Michel; the beautiful quadrangular clock-tower of Pey-Berland; a palace built by Napoleon in 1810; the Exchange; and the theatre (1777), one of the best in France.

There is here an *Académie Universitaire*, with fifteen professors, which took the place in 1839 of the old university, founded by Pope Eugenius IV. in 1441; also an academy of arts and sciences, established in 1712; many educational institutions and learned societies; one of the richest museums of precious stones in France; and a public library of 140,000 volumes. B. is connected with the suburb of La Bastide, on the right bank of the Garonne, by one of the finest stone bridges in Europe, erected by Deschamps the elder (1811-21). It is 532 yards long, and spans the river in 17 arches. B. is accessible by the Garonne at all times to ships of 600 tons, and at high tide to vessels of over 1000 tons; while by the Canals d'Orléans and Du Midi it has communication with the S. of France and the Mediterranean. It has regular packet service with Holland, England, the W. Indies, Brazil, and Australia. Its chief exports are the famous B. wines (see CLARET), brandy, vinegar, hams, glass bottles, turpentine, and dried fruits. There are also manufactures of sugar, liqueurs, printed calicoes, woollens, carpets, paper, nitric acid, and earthenware. Pop. (1872) 182,727.

Under the name *Burdigala*, of which B. is but the modern form, it was the emporium and port of the *Bituriges Vivisci*, and became a great commercial city under the empire. After the division of Aquitania into provinces, it obtained the title of *metropolis* of Aquitania Secunda. Ausonius the poet, who was born here, gives numerous descriptions of the city in his verse. The first Christian church was planted at B. in 272 A.D. The city passed successively into the hands of the Vandals, the Visigoths, and the Franks. Sacked by the Spanish Arabs in 732, it was reconquered by Charles Martel in 735. Charlemagne appointed a *Comes* (Count) of B. in 778. The city was repeatedly plundered by the Normans in the 9th c., and only began to recover in the 10th c. For nearly two centuries it continued to be ruled by the Dukes of Guienne, till the marriage of Eleanor of Guienne with Henry II. of England in 1154. It remained in English possession for three centuries, but was ultimately taken by Charles VII. of France, October 17, 1453. By resisting the salt-tax in 1547, B. incurred the bloody vengeance of the Constable Montmorency, and it was also the scene of a terrible massacre of the Huguenots in 1572. In the time of the Revolution, B. was conspicuous as the headquarters of the Girondists; and subsequently it was the first town (1814) to favour the return of the Bourbons. During the German war the Provisional Government was forced to retire from Tours to B., where a National Assembly, summoned by the Provisional Government in Paris, met, 13th February 1871, for the purpose of negotiating a peace, and continued to meet till March 20, when it was transferred to Versailles. See O'Reilly's *Histoire Complète de B.* (2 vols. Bord. 1853-60).

Bordelais, a district in the old province of Guienne, France, now included in the departments of Gironde and Landes. The name is still applied to the inhabitants of Bordeaux, formerly capital of B.

Border, a tract of territory lying on both sides of the frontier line between England and Scotland. This tract was variable at different epochs, as the fortunes of the war that raged between the two countries from the 11th to the 17th c. added to or diminished the frontier territories of either country; but it may be said to have always included those wild and lonely tracts, sometimes grassy, but often rugged, and impassable to all horsemen save those born and bred among their mosses, streams, and ravines, which still form so characteristic a feature of the region. In 1138 David I. (q. v.) of Scotland marched southward to assert his right to the province of Northumberland, of which his son was heir by inheritance, but was defeated and slain at the Battle of the Standard (q. v.). In 1157, Malcolm IV. (q. v.) agreed to give up any claims he might have to Northumberland and Cumbria, though on the same occasion he was reinvested in the honour and Earldom of Huntingdon. Malcolm's successor, William the Lion (q. v.), demanded restitution of Northumberland, and being captured in open war on English ground, was carried to Falaise in Normandy, and only released from captivity by signing the treaty of Falaise in December 1174, in which the Scottish king agreed to do homage in the future for the kingdom of Scotland to the King of England. This acknowledgment of feudal superiority was formally abandoned by Richard Cœur de Lion. On the accession of Alexander II. to the Scottish crown, an attempt was made to annex the northern provinces of England to Scotland, and

after invasion of each other's territories by both kings, the discussion of the claims on the Northumberland districts was proceeded with till 1237, when Henry III. agreed to give the Scots certain manors in Cumberland and Northumberland, not in sovereignty, but in feudal property,—an offer which was accepted. From this time the efforts of the Scots to extend their frontiers ceased, and the boundary of the two kingdoms began to be distinctly and permanently recognised. Thus, though the actual frontier of the kingdoms varied at different periods, the district which we now know as the B. has been the B. throughout all historical time. It has been said of Scotland that no country in the world is marked with so many battlefields, and it may be added that no district of Scotland is marked with so many sites of battle and foray as the B. The contests of the neighbouring kings led of necessity to frequent battle and constant feud between neighbouring B. families; and the history of the district, when it is not strictly a part of the history of Scotland, is mainly a record of deliberate battle, or sudden attack and reprisal. Yet the story is chequered with the tenderest passages. Between son and son of two hostile families the traditional hatred of their race was maintained; between son and daughter a different feeling was sometimes engendered, and the 'sad wooing' of young people belonging to the 'Capulets and Montagues' of the Scottish B. has formed the theme of many pathetic ballads (q. v.). Ridpath (*B. History of England and Scotland*) gives a very curious account of a number of articles drawn up by a joint-commission from the two kingdoms, in 1248, respecting the 'B. laws and customs,' the first of which articles was to the effect, 'that any subject of Scotland (or England) accused of committing robbery, theft, homicide, or any other crime that ought to be tried by single combat, shall not be obliged to answer in any other place but in the marches of the two kingdoms,' or in the B. In 1603 James I. of England, in pursuance of his purpose of extinguishing the hostilities between the B. families, forbade the use of the name of *The B.*; and commanded that thenceforth the name of the 'Middle Shires' should be applied to the counties on the frontier. See Scott's *B. Antiquities and Minstrelsy of the Scottish B.*, Chalmers's *Caledonia*, and J. Hill Burton's *History of Scotland* (1867). In recent times the districts of the B. are being in great part laid out in sheep farms, and under cultivation; the whole region is losing to a great extent the savage and gloomy appearance it wore before its slopes had ever been made 'blythe by plough and harrow.' The moor and moss country of the lower slopes of the Cheviots in Roxburghshire—formerly the 'impenetrable haunt of mostroopers'—is rapidly being converted into arable land. See Howitt's *Visits to Remarkable Places*.

Border Warrant is a warrant issued by the Judge Ordinary on the border between England and Scotland on the petition of a creditor, to arrest the person or effects of a debtor on the English side, and to detain him until he find security for his appearance in any action which may be brought for the debt within six months, and for his abiding the result of it.

Bordure, one of the subordinaries in heraldry, and a mark of Cadency (q. v.), is the border of a shield. It is borne plain or charged, and in it reference may be made to the profession of the bearer. Thus a judge's shield might appropriately show a B. ermine, and a soldier's a B. embattled.

Bore, a phenomenon observable in the estuaries of certain rivers, due to the tidal wave from the sea being impeded by the gradually narrowing channel, thus giving rise to a kind of watery ridge stretching across the stream, and travelling upwards with great velocity. The most celebrated bores are those of the Ganges, Brahmaputra, and Indus, though the phenomenon is also seen well in the case of some of our own rivers.

Bore, the internal cavity of a cannon, rifle, gun, pistol, or other kind of firearm. In some kinds of cannon, and in shot-guns, the B. is cylindrical, while in others and in modern small arms it is furrowed by spiral grooves, or in other words rifled. Technically the B. is the diameter of the cavity, and in the case of rifled arms the mean diameter is taken as the B. The B. of shot-guns and small arms was formerly regulated by the number of spherical bullets fitting the cavity that were in a pound weight; for example, the Enfield Snider rifle would have been called 24-B., because twenty-four spherical leaden bullets fitting the barrel would weigh one pound.

Boreas, in Greek mythology, the god of the north winter wind, son of Astræus and Eos, and father of Zetes, Calais, and Cleopatra (hence called Boreades), by Oreithyia, daughter of Erechtheus, king of Attica. Remembering this connection, B. (according to the Greek belief) answered the prayer of the Athenians by scattering the fleet of Xerxes near Cape Sepias. In token of gratitude, an altar was erected to him at Athens, and a yearly festival (*Boreasmas*) celebrated in his honour.

Borecole. See KALE.

Borelli, Giovanni Alfonso, a celebrated Italian mathematician, was born at Naples, January 28, 1669, and died at Rome, December 31, 1679. He wrote thirteen treatises, of which the most famous is *De Motu Animalium* (2 vols. Rome, 1680-81; Leyden, 1710), being the application of the laws of mechanics to the motion of animals. B. foreshadowed Newton's law of gravitation in his investigations of Jupiter's satellites.

Bo'rer, a name applied to the *Myxine* or *Hag-fish* (q. v.).

Bo'rer, the name given to certain beetles of the genus *Anobium*, to which genus the familiar 'Death-watch' (q. v.) belongs. The latter insect, indeed, in its caterpillar or larval state, bores into wood, and thus destroys furniture of all kinds. They belong to the tribe *Pentameræ*, the members of which possess five joints in their tarsi. The jaws in these larval insects are of strong make, and constitute the boring organs; and the larvæ reside in the burrows thus formed during their pupa state, emerging therefrom as the perfect beetle or *imago*. One species, *Lymexylon navale*, burrows into and destroys oak timber, and thus does great damage in dockyards. It is chiefly found in N. Europe.

The name 'B.' is also applied to certain *Lamellibranchiate* shell-fish or *Mollusca*, which bore into rocks by means of their shells. Of these latter forms, the *Pholas* (q. v.) or Piddock, the *Teredo* (q. v.) or Shipworm, &c., are familiar examples.

Borghese, a distinguished Roman family, originally of Sienna, where it occupied the most important positions from the middle of the 15th c. The foundations of its greatness at Rome were laid by **Camillo B.**, elected pope in 1605, with the title of Paul V., who loaded his relatives with wealth and honours. From his nephew, **Marco Antonio B.**, who died in 1658, is descended the present B. family. It greatly enriched itself by fortunate marriages, especially with the Aldobrandini, Spinola, and Colonna families. **Camillo Filippo Ludovico B.**, Prince of Sulmona and Rossano, was born at Rome, 19th July 1775. In 1803 he married Pauline, sister of Napoleon Bonaparte, was created Duke of Guastalla, and became for a time governor-general of the Transalpine provinces. He separated from Pauline after the fall of her brother; and died at Florence, 10th April 1832. The magnificent *Villa B.*, near the *Porta del Popolo*, at Rome, was built by Scipione Caffarelli B., in the 17th c., and had formerly a splendid art collection, now mainly to be found in Paris. The *B. Palace* is also one of the finest in Rome.

Borghesi, Bartolommeo, Count, an Italian antiquarian and numismatist, was born at Savignano, near Rimini, 11th July 1781. From an early age he devoted himself to archaeological studies, and arranged the collections of coins and medals in Milan and the Vatican. In 1821, B. withdrew to the little republic of San Marino, where he died, 16th April 1860. The French Government undertook the publication of his complete works, of which 7 vols. appeared 1862-71. His principal work is *Nuovi Frammenti dei Fasti Consolari Capitolini Illustrati* (2 vols. Mil. 1818-20). B. was a corresponding member of the Institute of France, and an Associate of the Academy of Berlin.

Borgia, the name of a Spanish family, the first important personage in which is **Alfonso B.**, Pope Calixtus III. (1455-58), who endeavoured to unite Europe against Mohammed II. His nephew by a sister, who married Godfrey Lenzuolo of Valencia, was **Roderigo B.**, born in 1431, who, at first an advocate and soldier, was appointed by his uncle Archbishop of Valencia and Cardinal S. Nicolo; was sent by Sixtus IV. to Spain to settle the Castile succession, and, on the death of Innocent VIII. in 1492, was elected through shameful bribery Pope Alexander VI. (q. v.). By one of his mistresses, named Rosa Vanozza, Roderigo had several children, of whom Cesare and Lucrezia B. are best known.

CESARE B., whom in his *Principe* and the *Descrizione del Modo tenuto dal Duca Valentino* the contemporary Machiavelli (for three months an ambassador from Florence to B.) quotes as a model of political sagacity, was appointed by his father Archbishop of Valencia. On the marriage of his brother Giovanni (Duke of Gandia) to Sancia of Aragon, he obtained a grant of money from Alfonso of Naples; and soon became Cardinal Valenza. He was given as a hostage to Charles VIII. on his march to Naples. Cesare now wished to pursue a scheme of his father's for obtaining the lands of the Roman nobility, which was to be carried out by destroying the Colonna, Savelli, and Orsini families. To this end money was required. Cesare therefore murdered the Duke of Gandia, and obtained the duchy of Benevento. In 1498 he carried to the court of France the papal divorce which permitted the marriage of Louis XII. with Anne of Bretagne, widow of Charles VIII. For this he was made Duc de Valentinois. Next year he married Carlotta, daughter of Jean d'Albret, King of Navarre. With the help of French troops, furnished under the treaty between France, Venice, and the Pope of 15th April 1499, Cesare in the beginning of 1500 reduced Imola and Forlì in the Romagna, and was made Gonfaloniere of the Church. Pesaro, Rimini, and Faenza were soon afterwards occupied, and the Florentines were compelled to appoint him their Condottiero, with a large annual tribute. After assisting Louis XII. in the joint-occupation of Naples, Cesare, whom his father had made Duke of Romagna, successfully attacked Piombino and Urbino, and would have occupied Florence, if the French king had not intervened. The blame of this expedition he skilfully threw on Orsino, Gravina, and others who were his allies, and whom he shortly afterwards, during their joint-attack on Sinigaglia, treacherously murdered. The death of Alexander VI. in 1503 stopped the success of Cesare. The Roman nobles combined against him; his newly-acquired dominions (except some districts in the Romagna, where he had instituted 'a system of justice') revolted, and the election of Julius II. decided his departure from Rome. After an attempt to raise forces at Naples, B. was imprisoned by Ferdinand of Spain in the castle of Medina del Campo. Escaping at the end of two years, he entered the army of Navarre, and was killed at Vienne in 1507. B.'s skill in diplomacy and war was greatly enhanced by his systematic and heartless treachery, a quality, however, which was very common among the leading Italians of the time. Fuller has called him 'the practical atheist.' (The Italian Life of B. is by Tomasi; there is one in English by Gordon. See also Roscoe's *Leo X.*, vol. i.)

LUCREZIA B., born in 1478, was married in 1493 to Giovanni Sforza, Lord of Pesaro, grand-nephew of Ludovico Sforza of Milan. Divorced from him, in 1498 she married the Duc de Bisceglie, a natural son of Alfonso II., receiving as dowry from her father Spoleto and Sermoneta. The Duke was murdered in 1500. After assisting her father in public business for a time, Lucrezia was married in 1501 to Alfonso of Este, son of Ercole, Duke of Ferrara, whose first wife, Anne Sforza, had died. Lucrezia's son by this marriage succeeded his father in Ferrara as Ercole II. At the court of Ferrara, where Ariosto, the Strozzi, Cicco, Bembo, Frissino, and Aldo Manuzio then lived, and where Boiardo had just died, Lucrezia's behaviour seems to have been worthy of her patriotic and virtuous husband. She organised charity, and promoted religion, and frequently in the absence of the Duke administered public affairs. In the wars of the Cambrai League and of Pope Julius II. against Ferrara she often distinguished herself by her courage and her sympathy with the people. She died 22d June 1519. The legend of Lucrezia's vices has been skilfully wrought up by a Neapolitan poet and a Neapolitan historian (Sarmazaro and Guicciardini), and has become the subject of Victor Hugo's magnificent tragedy. The historical evidence does not support the charge of double incest brought against her, and makes it certain that her later life was free from blame. (The most recent Italian Life is by Zuchetti, published at Mantua in 1860. See also Gilbert's *Life of Lucrezia B.*, and that of Gregorovius in German (1879). The most trustworthy account of the B. family is contained in the despatches of Antonio Giustiniani, Venetian ambassador in Rome from 1502 to 1505, edited by Professor Villari (Flor. 1875).)

Bor'go (Ger. *burg*, Eng. *borough* and *burgh*), the name of many villages and towns in Italy, the most important of which

are—1. **B. San Donnino**, a walled town, province of Parma, on the railway between Parma and Piacenza. It is a bishop's see (1501), and has a cathedral, with some remains of mediæval sculpture, several convents, a college, a gymnasium, and manufactures of silk, linen, and woollen fabrics. Wine and oil are produced in the neighbourhood. Pop. about 6000. It is named after a military saint, said to have been martyred here in 304 A.D.—2. **B. Taro**, a walled town in the province of Parma, N. Italy, situated on the Taro, a tributary of the Po, 35 miles S.W. from Parma. Pop. 6938.—3. **B. Manero**, a walled town, province of Novara, with a cathedral, two convents, and some manufactures. Pop. 6000. There is also **B.** in Finland, at the mouth of a river of the same name, with a considerable trade. Pop. 3182.

Boring. The tools used for this operation, and the mode of conducting it, vary altogether according to the nature of the material to be pierced. The principal tools used in the **B.** of timber or woodwork—the auger and the brace-and-bit for large holes, the gimlet and bradawl for smaller ones—are too well known to need description.

B. in metals is carried on either by *drills* or by *B.-bars*, the piece to be bored being fixed upon or beside a drilling or **B.** machine, by which the tool is caused to revolve. Drills of some kind are the tools commonly used when a hole has to be pierced, *ab initio*, through a solid. They are made of steel, and (in the form most commonly used) have one end to fit a socket in the machine, and the other flattened and pointed like a flat **V**, the two sides of which are bevelled slightly so as to form cutting edges. The greatest width of the **V** is the diameter of the hole to be bored. Steam cylinders and many other parts of machinery are cast or forged hollow, and in these cases the **B.** is only the removal of the skin of the metal so as to form an accurately cylindrical surface. Here one or more steel **B.** tools are fixed either directly upon a cylindrical spindle called a **B.-bar**, or upon a disc attached to it, the whole receiving a continuous rotation from the machine. In both the systems of **B.** mentioned, the mechanism is so arranged that the tool receives a forward motion simultaneously with the rotatory one, and it is thus caused to come into contact continually with fresh portions of material.

B. in earth or rock for geologic or engineering purposes is carried on principally with three classes of tools—augers, worms, and jumpers. Augers are used for **B.** through ordinary soils, clay,

gravel, chalk, and the softer rocks. They are in form hollow cylinders of wrought iron, steeled, generally about 3½ inches diameter and 18 inches long, having a sharp-edged slit down one side. The width given to the slit and the form of the lower end of the auger varies with the nature and hardness of the material to be pierced. On lifting the auger out of the hole, it brings with it the fragments of earth or stone which it has cut out, and these show to a certain extent what strata are being passed through. The worm is used for rocks too hard to be entered by the auger; it is in form like a large spiral gimlet. As it cannot bring up materials with it to the surface, an auger is used after it to enlarge and clear out the hole it has made. The process of **B.** with both kinds of tools is carried on by fixing a long crosshead to them above the level of the ground, and causing it to be turned round by men. As the hole deepens, a lengthening bar so

Warstop Rock-Drill for Boring Rocks, (Selig, London).

feet long is attached to the tool, then another similar bar is attached to the first, and so on until the desired depth is

reached. The *runner* is used for rock too hard to be drilled. It is simply a steel chisel, which, being continually raised and allowed to fall again, breaks the rock underneath it into fragments. The chips thus made are cleared out afterwards with an auger, or in some cases jumpers are used of such a form that they can themselves clear out the hole. The varieties of **B.** tools are almost innumerable, but most of them come in one or other of the three classes described. Special tools, with valves opening upwards at their lower ends, are used for soft or wet strata, in which also it is often necessary to line the bore with tubing. For very hard rock, diamond-pointed tools are now being used with great success, and in many cases they are worked by compressed air where hand-working would be impossible. Tools are also made which will bring up solid cylinders of the material bored through, instead of breaking it into fragments. See also MINING and TUNNELLING.

Borlase, Rev. William, an English antiquary, was born at Pendeen, Cornwall, February 2, 1696, educated at Exeter College, Oxford, and appointed vicar of St Just, 1732. He died at Ludgvan, 31st August 1772. **B.** is the author of *Antiquities of Cornwall* (1754), and *Natural History of Cornwall* (1758). **B.** was one of Pope's correspondents, and is the author of several religious pieces, now forgotten.—Another Cornishman of this name, **Henry B.** (died 1835), was the founder of the 'Plymouth Brethren' (q. v.).

Borneene'. See CAMPHOR, OIL OF.

Borneo, next to New Guinea the largest island in the world, and by far the largest in the Indian Archipelago, lies about 250 miles W. of the Malay peninsula, in lat. 7° N.—4° 20' S. and long. 106° 40'—116° 46' E. It is irregular in shape, some 800 miles long and 700 broad, and is bounded N. and W. by the Gulf of Siam and Chinese Sea, S. by the Sea of Java, and E. by the Sea of Celebes. Area, 279,400 sq. miles; pop. estimated at 3,000,000. It is traversed from S.W. to N.E. by two almost parallel mountain ranges, the space between which is flat, well watered, and fertile. There are many large rivers, chiefly in the N. and W., but they have usually bars at their entrance; and as the coasts do not present large indentations, there are few good harbours. The climate is temperate in the N., where the country is hilly, but in the lower parts is humid and unhealthy, the rainy season lasting from November to May. There are said to be many large lakes in the interior, but the island is unexplored in many parts. The botanical products are singularly various, including iron-wood, ebony, sandal-wood, gutta-percha, teak, ratans, benzoin, dragon's-blood, sago, and various vegetable oils, gums, and dye-woods. The exports also include spices, pepper, rice, yams, cotton, sugar-cane, indigo, fruits, cocoa-nuts, coffee, and tobacco, as well as gold, coal, diamonds, pearls, camphor (the finest in Asia), petroleum, iron, tin, and sulphur. The principal wild animals are the tiger, bear, ourang-outang, tapir, boar, and in the N. the elephant and rhinoceros. Among the birds are eagles, vultures, peacocks, Argus-pheasants, flamingoes, parrots, and many other species remarkable for their brilliant plumage. The population is mainly composed of—(1) Malays, formed into many independent states in the N., chief of which is Brunai or B. (pop. 225,000); (2) Dyaks, the aborigines (a negro race), chiefly engaged in agriculture; and (3) Chinese settlers, of whom there are some 75,000. The principal towns are Banjarmasin, Brunai, Sarawak, and Sambas. **B.** was discovered by the Portuguese as early as 1523, but the Dutch first permanently effected a settlement in 1643. In 1702, and again in 1774, the English were unsuccessful in attempting to establish a factory here. The Dutch now nominally possess the greater part of the island, their two residences being Pontianak in the S. and Banjarmasin in the E.; while the Sultan of B. Proper rules a comparatively small territory in the N.W., including Sarawak (28,000 sq. miles), of which Sir James Brooke (q. v.) was for several years rajah. Labuan (q. v.), a small island about three miles off the N.W. coast, was acquired by Britain in 1840. See Brooke, *Narrative of Events in B. and Celebes down to the Occupation of Labuan* (2 vols. Lond. 1848); Veth, *B.'s Wester-a'delsting* (2 vols. Zalt-Bommel, 1854-56); Spenser, *Life in the Forests of the Far East* (2 vols. Lond. 1862); *A Few Months in B.* (Society for the Promotion of Christian Knowledge, Lond. 1874); and Wallace, *The Malay Peninsula* (5th ed. Lond. 1875).

Bornheim, a pleasant village in the vicinity of Frankfurt-on-the-Main, of which, indeed, it is almost a suburb. It is a favourite summer resort of the Frankforters. Pop. (1872) 5397. On the *B. Heath* the members of parliament Prince Lichnowsky and Von Auerswald were murdered, 18th September 1848.

Bornholm, the most easterly of the Danish islands in the entrance to the Baltic, 95 miles E. of Zealand, and nearly midway between the coasts of Sweden and Germany. It is traversed from N. to S. by a range of high hills, which yields the clay used for the porcelain manufactures of Copenhagen. Rönne (q. v.) is the chief town. Area, 231 sq. miles; pop. 29,300, chiefly engaged in husbandry and fishing.

Bornu, a native state of the Sudan, Central Africa, to the W. of Lake Tchad, with an area of 52,800 sq. miles, and, it is estimated, 2,000,000 inhabitants. It was founded as a kingdom by Ali-Dunamani as early as 1472, and under Edriss Alamoia (1571-1603) reached its greatest power. The form of government is now despotic, and was vested in the Sultan Omar on the visit of Barth in 1835. The population is chiefly composed of the aboriginal Kanori, for the most part engaged in husbandry, and their conquerors the Shuas, a semi-nomadic Arab race. B. produces heavy crops of maize, rice, cotton, and indigo, and possesses abundance of oxen, sheep, and horses, while it abounds in wild animals. There are native manufactures of armour and cotton cloth. During the rainy season, October to April, fever prevails. The present capital is Kuka, on the W. shore of Lake Tchad. Dr Nachtigal visited B. in 1872.

Boro-Budor, a magnificent temple in the interior of Java, residency of Kadu, dedicated, as the name implies, to 'the Great Buddha.' It is the finest specimen of Buddhist architecture in existence, and is loaded with ornamentation, there still remaining not fewer than 400 life-sized figures of Buddha, ranged in niches, besides innumerable smaller statues of the god, bas-reliefs, and rich carvings. The temple is in the form of a quadrangular pyramid, 124 feet high by 561 feet broad at base, and rises in a succession of eight immense terraces, led up to by flights of steps; the highest terrace being surmounted by a pagoda or dome, covering a chamber supposed to have been the depository of sacred relics. B.-B. is supposed to belong to the 10th c. See Crawford, *On the Ruins of B. in Java*, in the *Transactions of the Lit. Soc. of Bombay* (2 vols. Lond. 1823); Mieling, *Prachtbauten van Javaasche Oudheden* (Haag, 1852); and Ferguson, *Handbook of Architecture*.

Borodino, a village in the government of Moscow, Russia, on the Kolocza, 55 miles W. of Moscow by railway, memorable for the bloody battle fought there, 7th September 1812, between the French under Napoleon I. and the Russians under Kutosow. The Russians, though forced to retreat, regarded this battle as a victory, and in 1839 a memorial column was erected on the site of the conflict.

Boron is one of the non-metallic elements, and is contained in borax, boracic acid, and a few comparatively rare and unimportant minerals. It was discovered in 1808 by Gay-Lussac and Thenard. Like carbon and silicon, it exists in two distinct conditions—the amorphous and crystalline; hence it is *allotropic*. (See ALLOTROPY.) *Amorphous B.* is obtained by heating boracic acid with sodium, and is a brown opaque powder, soluble in solutions of the alkalis, and can be burnt if heated. *Crystalline B.*, obtained by strongly heating amorphous B. with aluminum, resembles the diamond in hardness, transparency, and brilliancy, and is incombustible, even if heated in the oxy-hydrogen blow-pipe, neither is it attacked by solutions of the alkalis. Amorphous B. possesses the remarkable property of combining directly with nitrogen. The chemical symbol for B. is B, and its atomic weight 11. It forms a liquid chloride, BCL; a gaseous fluoride, BF₃; an oxide, B₂O₃ (boracic anhydride), and a sulphide, B₂S₃.

Borough (in Old Eng. *burh*, from 'beorgan,' to protect; hence a fortified place). As a suffix, the word appears in three forms—'bury' in the S. of England, as Canterbury; 'borough' in the midland and northern parts, as Peterborough and Middleborough; and 'burgh' in Scotland, as Roxburgh, Jedburgh. These forms represent dialectic differences; the first being, on the whole, confined to the parts which the West Saxons possessed;

the second and third are Anglian (Mercian and Northumbrian). As it was a Midland dialect from which modern English has sprung, the form which marks the independent use of the word is naturally 'B.' B., in England, is defined under the Municipal Reform Act to mean a city, B., port, or town corporate, whether represented in Parliament or not. By a Parliamentary B. is meant a B. sending a member, or more than one, to Parliament. Under the Reform Act of 1832, 56 boroughs in England and Wales were wholly disfranchised; 30 which had formerly returned two members were restricted to one; while 42 new boroughs were created, 22 having two new members, and 20 having one member. By the Reform Act of 1868, every B. having less than 10,000 inhabitants and two representatives was deprived of one of them, and seven boroughs were entirely disfranchised. Two English boroughs, and two in Ireland, have since been disfranchised for bribery. By the Reform Act of 1832, the B. franchise was given to all occupiers of houses of the value of £10 a year. The Act of 1868 extended the franchise to all occupiers of dwelling-houses who on the 31st July of each year have resided in them for twelve months, and have been rated to the poor rates, and have paid their rates up to the preceding 5th January; and to lodgers who, for the same period, have occupied lodgings of the annual unfurnished value of £12.

B. English is, in England, a law or custom under which the youngest son inherits real estate in preference to his elder brothers. It still prevails in Stafford, and in some other ancient boroughs. Should the youngest son die in his father's lifetime, leaving a daughter, she inherits her father's rights.

B. Fund.—The Municipal Corporation Acts defines the application of this term, and provides for the collection and disbursement of the funds of boroughs noted in the schedules annexed to the Act. Under it corporations may now, with certain restrictions, conduct parliamentary and law business at the expense of the B. F.

B. Justices.—Under the Municipal Corporations Act, these consist of the mayor during his tenure of office, and for one year afterwards, the recorder *ex officio*, and of justices appointed by the crown.

B. Laws are a collection of laws relative to Scotch boroughs, enacted in the reign of David I., in the 12th c. They are interesting only to the archaeologist.

B. Rate is a rate leviable within a B. when the B. Fund (q. v.) is deficient. It is of the nature of a County Rate (q. v.). It is regulated by the Municipal Corporations Act. For boroughs not within this Act, the B. R. is levied and applied under the Statute 17th and 18th Vict., c. 71. The rate cannot be made retrospective.

Boroughbridge, a market-town in the W. Riding, Yorkshire, on the right bank of the navigable river Ure, 17 miles N.W. of York, and 6½ S.E. of Ripon, with some trade in corn and hardware. It was the scene of the defeat of the barons under the Earl of Lancaster by Edward II. in 1321. Near it stand three singular stones ('Devil's Arrows') 16 to 24 feet high. B. is the terminus of a branch of the N. Eastern Railway. Pop. (1871) 2508.

Borovitchi, a town in the government of Novgorod, Russia, 140 miles S.E. of St Petersburg, situated on the Msta, and on the canal connecting the Volga with that river, and so with Lake Ladoga. Pop. 9150.

Borovak, a town in the government of Kalouga, Russia, 57 miles S.W. of Moscow, and 25 N. of the city of Kalouga, together with which it gives title to a bishop. Near it is one of the wealthiest of Russian convents, founded in 1444. B. has an active trade in leather, flax, hemp, and sailcloth, and is famed for its onions and garlic. Pop. 8826.

Borromeo's Islands, a beautiful group of islets, called also the *Enchanted Islands*, situated in Lago Maggiore, N. Italy, province of Novara, and which have been the residence of the Borromeo family since the 13th c. The most remarkable of the group are *Isola Bella*, containing the Borromeo Palace; *Isola Madre*, crowned by an old castle; *Isola del Pescatori*, inhabited by some 400 fishermen and smugglers; and *Isola di San Giovanni*, laid out in beautiful gardens and terraces.

Borromeo, Carlo, son of Gilbert, Count of Arona, and Margaret de Medici, was born 2d October 1538, at the Castle of

Arona on Lago Maggiore. After studying at the University of Pavia (in which city he afterwards founded the Borromean College), he was appointed by his uncle, Giovanni Angelo de Medici (Pius IV.), a Cardinal Deacon, Archbishop of Milan, and Legate of Bologna. While discharging the duties of these posts with great energy, he found time to form at Rome an academy for literature and elocution, the meetings of which were called *Avotes Vaticane*. During the later sittings of the Council of Trent (1562-64), B. was, with Guise and Morone, among the most active of the cardinals, and afterwards one of the authors of the 'Catechism of Trent.' After six years' residence at Rome, B., in obedience to the Tridentine Decree requiring residence of bishops, went to Milan. The whole diocese, with its 3200 clergy, was in a corrupt state, the sacraments of confession and confirmation being little used. B., who was now celebrated for his saintly austerities, at once held a council for enforcing the new decrees relating to faith and discipline. On his uncle's death, the saint spoke in the conclave in support of Cardinal Alexandrine, who became Pius V. (1566). B. now gave away in charity most of his large possessions, enforced the rule against pluralities in his diocese, and himself set an example of diligent work and fasting to his clergy. He also gave the Duomo of Milan its present choir and altar, and encouraged associations of lay catechists, such as the *Peccatori*. A searching general visitation of the whole diocese was made; and St John the Baptist's seminary for clerics was founded at Milan. In the famine of 1570 and the plague of 1576 the saint behaved nobly. In 1578 he founded the Oblates of St Ambrose, a fraternity of secular priests for special missionary work. These reforms brought B. frequently into collision with the regular orders (e.g., the Umiliati, who tried to murder him) and the Spanish governors (Albuquerque and Requesius). B. also founded the Borromean League of the Seven Catholic Twin Cantons. He died 3d November 1584, worn out by excessive self-mortifications, and was canonised in 1616. A colossal statue of the saint stands near Arona on the Lago Maggiore. His works were edited by Sax in 1747 in 5 vols. His life has been written by Giussano (Fr. transl. 1615), Godeau (Bruss. 1684; Par. 1747), Tournon (Par. 1761), and Stolz (Zür. 1781). See also Sala's *Documenti Circa la Vita e la Gesta di B.* (4 vols. Mil. 1857-59). There is an English biography in the Catholic Popular Library (1858).
